【英文关键词】Oryza sativa . SIZ1 . Growth . Development .Regulation
【中文摘要】无
【英文摘要】SAP and MIZ (SIZ) is a small ubiquitin-relatedmodifier (SUMO) E3 ligase that facilitates conjugation ofSUMO to protein substrates. Although there have been anumber of reports about the functions of SIZ1 inArabidopsis in the regulation of diverse

life processes, noinformation regarding the role of SIZ in other plants isavailable yet. In this work, two homologous genes fromrice (Oryza sativa) were isolated and designated as OsSIZ1and OsSIZ2 based on amino acid sequence homology toAtSIZ1 and their phylogenetic relationship. The function inthe vegetative growth and reproductive development in ricewas investigated using OsSIZ1 mutants containing aT-DNA insertion. The results showed that the mutantOssiz1 exhibited the significant changes in several growthand developmental parameters, including primary rootlength, adventitious root number, plant height, leaf andpanicle length, flower formation, and seed-setting ratecompared with wild type. Taking together these resultsindicate that OsSIZ1 plays an important role in regulatinggrowth and development in rice.

【题目】鲜食玉米果穗外观品质分级的计算机视觉方法

【中文关键词】鲜食玉米; 果穗; 外观品质; 分级; 计算机视觉; 神经网络

【英文关键词】Fresh corn, Ear, Appearance quality, Grading, Computer vision, Neural network

【中文摘要】在HSI颜色模型下, 通过计算机视觉检测技术实现对鲜食玉米果穗外观品质分级。提出垂直投影法确定秃尖位置并去除秃尖。对H 值进行双向一次微分运算以实现缺陷的识别。在此基础上获取果穗缺陷比、穗长、果穗最大直径、长宽比和矩形度作为外观品质特征参数, 并以此为输入向量构建广义回归神经网络对果穗外观品质分级。试验结果表明: 秃尖位置、穗长和果穗最大直径的平均误差分别为2.27mm、1.96 mm 和0.54mm, 缺陷误判率为3. 00%, 分级平均准确率为95. 91%。

【英文摘要】Appearance quality grading for fresh corn ear was implemented by computer vision based on HSI color model. Bare tip position was detected and removed using projection method. Defects of fresh corn ear were identified by the first order differential operation on H. Characteristic parameters of appearance quality, such as defect proport ion, ear length, ear max imum diameter, aspect ratio and rectangle factor were obtained. General regression neural network with five characteristic parameters as input was developed for grading. Experiment showed that average errors of bare tip position, ear length and ear max imum diameter were 2.27 mm, 1.96 mm and 0.54 mm, respectively. Mistake rate of defect proportion was 3.00%, and grading average ratio was up to 95.91% .

【题目】基于压力和图像的鲜玉米果穗成熟度分级方法

【中文关键词】分级,压力,图像处理,神经网络,颜色特征,鲜玉米果穗

【英文关键词】grading, pressure, image processing, neural networks, color characteristics, fresh corn ear

【中文摘要】为实现鲜玉米果穗成熟度等级的客观评定,提出了基于压力传感器和计算机视觉技术的综合分析方法。研制了玉米果穗成熟度检测装置,提取纹理信息所得惯性矩和压力检测装置所得最大压力值作为鲜玉米果穗成熟度等级评定的特征参数,通过系统聚类分级研究,确定成熟度等级为3 级。采用主成分分析法对11 个颜色特征进行优化筛选,用第一、二主成分可综合反映11 个颜色特征的分级信息,实现了参数的降维。试验结果表明:以最大压力值、惯性矩、颜色特征主成分分析第一、二主成分值作为构建概率神经网络的输入,进行鲜玉米果穗成熟度等级评定,正确率为96.67%。结合压力传感器和计算机视觉技术可实现对鲜玉米果穗成熟度的准确分级。

【英文摘要】In order to realize objective evaluation of maturity grading of fresh corn ear, a method using pressure sensor and computer vision was presented. Maturity grading detection device was developed. The inertia moment of texture information and the

maximum pressure obtained from pressure detection device were used as maturity grading characteristic parameters of fresh corn ear. Maturity was classified into 3 grades through system cluster method. Eleven color characteristics were optimized and screened by principal components analysis. The first and the second principal components were applied to represent the eleven color characteristics in the grading, so dimension reduction was implemented. Results showed that inertia moment, maximum pressure, the first and the second principal component values of color characteristics were used as inputs of the probabilistic neural network developed for maturity grading of fresh corn ear, with grading accuracy 96.67%. Fresh corn ear maturity grading can be implemented accurately by combination of pressure sensor and computer vision technology.

【中文关键词】食品机械;二维离散小波分解;鲜玉米果穗;成熟度;神经网络
【英文关键词】food machinery, two-dimension discrete wavelet decomposition, fresh corn ear, maturity grading, neural network
【中文摘要】采用计算机视觉技术,经二维离散小波分解后提取与玉米果穗成熟度相关的图像特征实现成熟度等级评定。在HSI颜色模型下对鲜玉米果穗图像H 分量进行二维离散小波分解,提取低频子带的颜色特征。在RGB颜色模型下提取鲜玉米果穗图像高频子带的纹理特征。通过主成分分析法实现特征参数的降维。以前4个主成分值作为网络输入,构建概率神经网络,实现鲜玉米果穗成熟度的等级评定,评定正确率为95%。
【英文摘要】Evaluation of maturity grading of fresh corn ears was realized through computer vision. Image characteristics of maturity grading were extracted after two-dimensional discrete wavelet decomposition. In HIS color model wavelet decomposition of H component was carried out, and the color characteristics of H component were extracted from low frequency sub-band. The texture characteristics were extracted from low frequency sub-band in RGB color model. Dimension reduction of characteristics parameters was implemented using principal component analysis method. The first four principal component values were taken as the network inputs. The probabilistic neural network was developed for maturity grading of fresh corn eras, and the grading accuracy is about 95%.

【题目】基于颜色传感器的玉米脂肪酸含量检测方法研究
【中文关键词】脂肪酸含量; 快速检测; 颜色传感器; 玉米
【英文关键词】content of free fatty acid, rapid detection, color sensor, corn
【中文摘要】玉米游离脂肪酸含量是判断玉米存储品质的重要指标。为此,提出了基于颜色传感器的玉米游离脂肪酸含量检测方法可实现现场快速检测。研究在提取玉米游离脂肪酸时使用了AOT - 异辛烷溶液,较好地解决了常规有机溶剂提取游离脂肪酸的同时会提取出玉米色素的问题; 同时,优化得到了玉米游离脂肪酸最佳提取及显色参数; 构建了BP 神经网络检测模型。研究结果表明: 用基于颜色传感器的玉米游离脂肪酸含量检测方法来判断玉米陈化情况的正确率高达96.7%。
【英文摘要】Content of free fatty acid in corn is a important index of storage quality of corn. The rapid detection method for content of free fatty acid in corn based on color sensor can be used in spot. A solution blended with bis(2-ethyl) hexylsulfosuccinate (AOT) and isooctane in the suitable ratio was used in extracting free fatty acids. The method can avoid that corn pigment was done synchronously as free fatty acids was extracted. The optimization parameters in extracting free fatty acid in corn and in colorimetry were obtained. A BP neural network was built. The experimentation results show that accuracy of estimating corn aging by the measured

content of free fatty acid in corn based on color sensor is 96.7%。

【题目】速冻玉米的微波解冻温度变化规律及能量利用研究
【中文关键词】速冻玉米;微波间歇解冻;微波吸收效率
【英文关键词】quick-frozen maize,intermittent microwave thawing,microwave absorption efficiency
【中文摘要】为探索一种更节能的解冻方式,采用微波场技术对速冻玉米进行解冻,以玉米穗数量为变量,通过连续解冻和间歇解冻两种解冻方式,研究玉米穗不同部位的温度变化规律及其对微波能量吸收效率的影响。结果表明,微波连续解冻和间歇解冻过程中,玉米穗不同部位呈现相同的温度变化趋势,即解冻初期,玉米的表面温度>籽粒温度>玉米轴的中心温度,随着解冻时间的延长,玉米轴的中心温度迅速升高,形成从玉米轴中心到表面的温度梯度。与微波连续解冻相比,微波间歇解冻得到的产品温度分布较均匀,微波吸收效率较高,且吸收效率随着速冻玉米数量的增加而增加,当玉米数量达到4穗时,对微波能量的吸收效率趋于稳定,此时微波能量利用率为50.2 %。
【英文摘要】To obtain a more energy-efficient thawing approach, quick-frozen maize was thawed by microwave field technology in either a continuous or intermittent mode under conditions of varying number of maize ears in this paper. The regularity of temperature change in different parts of maize ear and its effect on microwave energy absorption were explored. The results showed that different parts of maize ear displayed identical temperature change trend during both continuous and intermittent thawing. The surface of maize ear exhibited the highest temperature, followed by grain temperature and cob temperature during the early stages of thawing. As the thawing time was prolonged, the central temperature of maize cob was promptly elevated, forming a temperature gradient from the central axis of maize cob to the surface of ear. In comparison with continuous thawing, intermittent thawing resulted in more even temperature distribution and higher microwave energy absorption, which rose as the number of maize ear was increased and tended to remain stable at 50.2% until the number of maize ear reached 4.

【题目】超高压技术对玉米粉糊化度的影响研究
【中文关键词】玉米粉;超高压技术;糊化度
【英文关键词】corn flour, ultra high pressure technology, gelatinization degree
【中文摘要】为改善玉米粉加工和食用品质,以普通玉米粉为原料,分别采用单因素和正交试验研究压力、保压时间、玉米粉质量浓度对其糊化度的影响。结果表明:在实验范围内,随着超高压处理压力的增大、保压时间的延长、玉米粉糊化度逐渐升高、玉米粉质量浓度的增大,玉米糊化度均呈先增加后降低的趋势;通过正交试验可知,压力 500MPa、保压时间 20min、玉米粉质量浓度 15g/100mL 时,玉米粉糊化度达到最大为 98.66%。
【英文摘要】In order to improve process and edible quality, the effects of different pressure, holding time and corn flour concentration on gelatinization degree of corn flour were studied with corn flour as raw material by single factor experiment and orthogonal experiment, in order to improve the processing quality and food quality of corn flour. The results showed that with the increment of pressure and prolongation of holding time, the gelatinization degree enhanced. With the concentration of corn flour increasing, gelatinization degree enhanced firstly and then decreased. The results of orthogonal experiment showed that the corn flour which concentration is 15g/100 mL was gelatinized 98.66 % under pressure of 500 MPa for 20 min.

【题目】响应面法优化蛋白酶菌株发酵条件
【中文关键词】蛋白酶;玉米浸泡;优化;响应面
【英文关键词】protease, corn steeping, optimization, response surface
【中文摘要】目的:在单因素试验的基础上,应用响应面法优化可用于玉米高效浸泡的产蛋白酶菌株的发酵条件。方法:通过单因素试验及响应面方法研究C/N、MgSO4 和CaCl2、接种量等因素对菌株产蛋白酶酶活力的影响,确定发酵最佳工艺参数。结果:C/N 为2、MgSO4 0.5g/L、CaCl2 0.2g/L、接种量6%,该蛋白酶酶活力最大值为2504.8U/mL,酶活力较优化前提高了4 倍。同时建立蛋白酶酶活力与C/N、MgSO4 添加量、CaCl2 添加量、接种量之间的二次多项式模型,该模型可以很好地预测蛋白酶产量。结论:用响应面分析方法对该产蛋白酶菌株发酵培养基进行优化,可获得最佳的工艺条件。
【英文摘要】In our previous work, we have isolated a protease-producing Pichia kudriavzevii yeast strain. This study was undertaken to use response surface methodology to optimize fermentation conditions for protease production by the strain.Protease activity in fermentation broth was investigated with respect to C/N ratio, MgSO4 and CaCl2 concentrations, and inoculum size. A quadratic polynomial model describing the effects of the fermentation conditions on protease production was established. The highest protease production of 2504.8 U/mL was achieved under the following conditions: C/N ratio of 2, 0.5 g/L MgSO4, 0.2 g/L CaCl2, and inoculum size of 6%, which was four times higher than before optimization. In addition, the established regression model was found to have good effectiveness in predicting protease production.

【题目】响应曲面法对双螺杆挤压蒸煮玉米粉条件的优化
【中文关键词】挤压蒸煮;糊化度;响应曲面法
【英文关键词】extrusion cooking, degree of gelatinization, response surface methodology
【中文摘要】本研究以普通玉米粉为原料,通过双螺杆挤出对玉米粉进行改性,探讨了高水分条件下物料含水量,挤出温度,螺杆转速对挤出物糊化度的影响,并建立了物料含水量(X1),挤出温度(X2),螺杆转速(X3)之间的数学模型:Y=96.97-1.49 X1-1.21X2-1.85X3-0.37 X1X2-1.15X1X3-2.35 X2X3- 2.20X12-2.50 X22-3.77X32,确定了最佳蒸煮条件:含水量34%、挤出温度139℃、螺杆转速223r/min。在此条件下,玉米粉的糊化度为97.5%,与理论预测值基本相符。为进一步研究螺杆挤压蒸煮工艺提供一定的理论依据,具有很高的应用价值。
【英文摘要】Ordinary corn flour as raw material was modified by two-screw extrusion. Effects of high moisture content, extrusion temperature and screw speed on degree of gelatinization (DG) were investigated. Mathematical model between moisture content(X1),extrusion temperature(X2) and screw speed(X3) was established as follows: Y=96.97-1.49 X1-1.21X2-1.85X3-0.37 X1X2-1.15X1X3-2.35 X2X3- 2.20X12-2.50 X22-3.77X32. Optimal extrusion cooking conditions were obtained as follows: moisture content 34%,extrusion temperature 139℃ and screw speed 223r/min. Under these conditions, DG attained 97.5%, basically consistent with the theoretical prediction. This research has a high application value for providing theoretical basis for further study of screw extrusion cooking process.

【题目】生物酶修饰对于玉米粉品质的影响
【中文关键词】枯草芽孢杆菌;黑曲霉;生物酶;玉米粉;品质
【英文关键词】Bacillus subtilis , Aspergillus niger, biological enzymes, corn flour, quality
【中文摘要】为了改善玉米的加工及食用品质,探讨改性后玉米粉制作主食品的可行性。同时,开发生物酶应用在食品行业的新途径。采用枯草芽孢杆菌和黑曲霉分泌的生物酶对玉米粉进行修饰改性,实验结果表明,经过两种酶修饰后,玉米粉的真蛋白含量、总淀粉含量都明显下降,直链淀粉含量、溶解度都有所增加,枯草芽孢杆菌胞外酶修饰玉米粉的保水力、凝胶体积膨胀率和粘度都有所提高,而黑曲霉胞外酶修饰玉米粉的保水力、凝胶体积膨胀率和粘度都有所降低,在物性测定方面,两种酶修饰后玉米面团的延展性、韧性等都大幅度增加,具有加工面条、水饺等主食品的潜力,说明玉米粉的加工及食用品质得到了明显的改善。
【英文摘要】To improve processing and eating quality of corn, the corn flour was modified by biological enzymes from Bacillus subtilis or Aspergillus niger. The results indicated that the content of starch and protein in the corn decreased significantly with increasing in the solubility viscogram and straight chain starch. It was improved in quality of water retention capacity, gel dilatability and viscosity of corn flour modified by Bacillus subtilis on the contrary with flour modified by Aspergillus niger, but the physical properties of both corn flour dough modified by biological enzymes from Bacillus subtilis and Aspergillus niger were improved,So it has potential of making corn dumpling and corn noodles with its good viscosity, ductility, toughness. This kind of biological enzymes can be used to improve the quality of corn flour.the processing and eating quality of corn flour had been improved.

【题目】双螺杆挤出条件对玉米粉质构特性的影响
【中文关键词】玉米粉;双螺杆挤出;质构特性;TPA测试
【英文关键词】corn grits, Two-screw extrusion, Quality and structure characteristics, TPA test
【中文摘要】考察了不同加水量、机筒温度、螺杆转速对双螺杆挤出玉米粉质构特性的影响。试验结果表明:当加水量由10%增加到35%时,面团硬度增加了38.0%,而粘度和弹性分别下降了42.3%和66.8%;当温度由100°C增加到160°C时,面团硬度减少了19.5%,而粘度和弹性分别增加了92.9%和44.0%,温度由180°C增加到200°C时,硬度增加了41.0%,而粘度和弹性分别减少了34.8%和24.1%;当螺杆转速由180r/min增加到220r/min时,面团硬度和弹性分别增加了48.5%和7.7%,而粘度降低了

58.1%,当螺杆转速由240r/min增加到280r/min时,面团硬度和弹性分别降低了24.2%和20.5%,粘度增加了215.8%。因此,双螺杆挤出对玉米粉质构特性有较大的影响。

【英文摘要】Texture properties of corn were investigated as a result of extrusion condition, including water added, jet temperature and two-screw speed. The results indicate that the hardness of dough increased 38.0% with feed added increased to 35% by 10%, but the adhesiveness and springiness of dough decreased by 42.3, 66.8%, respectively. When the temperature up to 160°C from 100°C, The hardness of dough decreased 19.5%, and the adhesiveness and springiness increased 92.9%,44.0%, respectively. But with temperature increased to 200°C by 180°C, the hardness of dough increased by 41.0%, and the adhesiveness and springiness decreased by 34.8%, 24.1%, respectively. When the screw speed up to 220r/min from 180r/min, the hardness and springiness of dough increased by 48.5%, 7.7%, respectively, and the adhesiveness decreased by 58.1%. But with the screw speed increased to 280r/min by 240r/min the hardness and springiness decreased by 24.2%, 20.5%, respectively, and the adhesiveness increased by 215.8%. Therefore, Two-screw extrusion has a significantly effect on the texture properties of corn grits.

【题目】多酶复合对玉米粉质构特性的影响
【中文关键词】复合酶; 玉米粉; 改性; 质构特性
【英文关键词】multienzyme, corn flour, modification, texture property
【中文摘要】利用中性蛋白酶、谷氨酰胺转氨酶、普鲁兰酶和葡萄糖氧化酶复合作用对玉米粉进行修饰,改善其粘弹性和延展性。在研究多种蛋白酶和淀粉酶改性过程中,以改性条件和改性程度为基础,选择合适的酶进行复合改性,并利用 Stable TA. XT plus 质构分析仪对玉米粉的粘弹性和延展性进行分析。结果表明,单种酶对玉米粉的改性程度有限,不能满足加工

要求; 多种酶复合改性能使玉米粉的粘弹性和延展性有较大改善,使普通玉米粉的粘度由46.59 Pa. s 提高到 213.85 Pa. s,延展性由 10.21mm 提高到 28.26mm,恢复性由 7.84% 提高到 31.04% ,硬度由16.52g 提高到 276.13g。

【英文摘要】Corn flour was modified by neutral protease,glutamine transaminase,pullulanase,and glucose oxidase to improve viscoelastic and extensibility of corn dough. In the modification process of protease and amylase,modified conditions and degree selected as basis,the viscoelastic and extensibility of corn dough were measured with Stable TA. XT plus. Results showed that single species of enzyme had a limit extent of modification. Compound enzyme deeply improved the viscoelastic and extensibility,and viscoelastic,extensibility,resilience and hardness improved from 46. 59 Pa. s,10. 21mm,7. 84% ,and 16. 52g to 213. 85 Pa. s,28. 26mm,31. 04% ,and 276. 13g respectively.

【题目】微波辐射对玉米粉质构特性的影响

【中文关键词】微波辐射; 玉米粉; 质构特性

【英文关键词】microwave radiation, corn flour, texture property

【中文摘要】利用微波对玉米粉辐照,以面团的粘度和延展距离为指标,考察了加水量、微波功率和微波辐射时间对微波辐射玉米粉质构特性的影响,并利用 Stable TA. XT plus 质构分析仪的 A/DSC 和 HDP/TPB 模式对面团的质构特性进行分析。结果表明,加水量、微波功率和微波辐射时间对面团粘度和延展距离都有显著影响,通过微波改性能使面团的粘度由14. 320g 提高到53. 547g,面团的延展距离由10. 135mm 提高到22. 330mm。

【英文摘要】Effects of water addition,microwave power and microwave time on corn flour were researched with viscosity and extend distance as index. Using the A / DSC and HDP / TPB mode of Stable TA. XT plus,the texture property of dough was determind. The results showed that water addition,microwave power and microwave time had significant impact on the viscosity and extend distance of dough. By the microwave radiation,the viscosity of dough increased from 14. 320g to 53. 547g,and the extend distance increased from 10. 135mm to 22. 330mm.

【题目】辣味咸鸭蛋的研制
【中文关键词】咸鸭蛋;辣味;料液配比;研制
【英文关键词】salty duck egg;hot;feed solution proportion;develop
【中文摘要】以新鲜鸭蛋为原料,通过添加辣椒、八角、桂皮和生姜,采用正交实验,对腌制剂配比成分进行优化选择,研究出一种具有保健功能的咸鸭蛋。同时在腌制过程中,对料液中的NaCl浓度以及蛋内水分含量进行了测定,来检测鸭蛋的腌制过程。研究结果表明,对于24个鸭蛋(约2160g),辣味咸鸭蛋的最佳配方为:水1800g,NaCl270g,辣椒60g,八角2.4g,桂皮3g,生姜9.6g。
【英文摘要】This experiment took the fresh duck egg as a raw material by the addition of pepper, star anise, the Chinese cinnamon and the ginger,using the orthogonal experimental design to determine the optimized choice for the salt preparation and the best allocated proportion ingredient,to develop salty duck egg with the health care function. Meanwhile in the souse process,NaCl concentration and water content in the material fluid were detected. The findings indicated that the hot salty duck egg's best formula is 24 duck eggs (approximately 2 160 g),adds water 1 800 g,the salty 270 g,the hot pepper 60 g,the star anise 2.4 g,the Chinese cinnamon 3 g,the ginger 9.6 g.

【题目】杞柳瘿蚊生物学特性及防治
【中文关键词】杞柳瘿蚊;生物学特性;防治
【英文关键词】Rhbdophaga salics Schrank; biological characteristics; control
【中文摘要】杞柳瘿蚊(Rhbdophaga salics Schrank)是沿淮地区和黄河流域的一种危害杞柳的重要害虫。通过对该虫的室内饲养观察和田间调查,掌握了其主要的生物学特性,并对其进行了药剂防治试验。结果表明:该虫在沿淮地区1 年发生5 代,以幼虫在当年生被害杞柳柳条上的虫瘿内越冬。第一、二代幼虫发生盛期分别为4 月和5 月上旬,应作为防治的重点时期。防治试验所使用的4 种药剂中,啶虫脒对杞柳瘿蚊的室内毒力最高,LC50为9.1105 mg/L,乐斯本的毒力最低;药后7 天吡虫啉和啶虫脒对杞柳瘿蚊的田间防效都能达到50%以上,是田间防治杞柳瘿蚊的较理想药剂。
【英文摘要】Rhbdophaga salics Schrank is an important pest which endanger osier in Yellow River Basin andregion along Huaihe River. By means of indoor and field rearing and observation, we mastered its main biological characteristics and carried out chemical control tests. Experimental results showed thatRhbdophaga salics Schrank had five generations per year in low-lying area along Huaihe River. The matured larva overwintered in the galls of damaged wickers in the current year. The peak time for the larvae ’s hatching was first ten-day of April and May, which should be the focus period of control. According to chemical control experiment of four chemicals, laboratory toxicity of acetamiprid was the highest, the LC50 values was 9.1105 mg/L, while which of chlorpyrios was the lowest. Field control efficacy of imidacloprid and acetamiprid after 7 days were both over 50%, so imidacloprid and acetamiprid could be used as optimum agents in field control of Rhbdophaga salics Schrank.

【题目】基于电子鼻对水蜜桃货架期评价的研究
【中文关键词】久保水蜜桃;电子鼻;货架期;评价
【英文关键词】Jiubao juicy peach;electronic nose;freshness;evaluation
【中文摘要】利用 PEN3 电子鼻系统对早熟“久保”水蜜桃采后7d 货架期内的芳香成分进行检测分析,先通过电子鼻系统动态采集水蜜桃芳香成分并得到了电子鼻的响应值,再利用PCA(主成分分析)、LAD(线性判别)模式识别方法进行数据分析。结果表明 LDA 方法能够更好地区分第 1 天、第 2~4 天和第 5~7 天货架期的水蜜桃,进行交叉确认分析后,对第1 天、第2~4 天和第5~7 天的水蜜桃货架期区分准确率达91%,同时采用负荷加载(Loading)分析方法可以得知,传感器 W1S(甲烷)、W2S(乙醇)、W2W(硫化氢类)对水蜜桃货架期的评价起主要作用,这为进一步优化传感器以及探索方便快捷的水蜜桃无损检测技术提供了依据。

【英文摘要】In this study, a portable electronic nose PEN3 was used for the aroma analysis of Jiubao juicy peach, an early-ripening cultivar in order to provide experimental references for the evaluation of its freshness. Dynamic aroma sampling was achieved using PEN3 and the response values of the instrument were obtained. This was followed by data analysis using principal component analysis (PCA) and linear discrimination analysis (LDA). The results showed that the use of LDA was able to better discriminate peaches on the 1st, 2ndto 4th, and 5th to 7th days of postharvest storage in polyethylene bags under the conditions of (20 ±0.5)℃ and 65%-70% relative humidity. According to cross-validation analysis, the discrimination accuracy among these samples stored for different storage periods was as high as 91%. Meanwhile, it was indicated by loading analysis that sensors W1S, W2S and W2W played a central role in evaluating the freshness of juicy peach, which provides useful evidences for the optimization of sensors and exploration into a simple and convenient non-destructive technique for the evaluation of juicy peach freshness.

【题目】E ® ect of Nitrate on Activities and Transcript Levels of Nitrate Reductase and Glutamine Synthetase in Rice
【中文关键词】无
【英文关键词】ammonium, glutamine synthetase, nitrate, nitrate reductase, Oryza sativa L.
【中文摘要】无
【英文摘要】Real-time polymerase chain reaction analysis was used to compare the e ® ect of NO ¡ 3 on the activities of nitratereductase (NR) and glutamine synthetase (GS), and the transcript levels of two NR genes, OsNia1 and OsNia2, twocytosolic GS1 genes, OsGln1;1 and OsGln1;2, and one plastid GS2 gene OsGln2, in two rice (Oryza sativa L.) cultivarsNanguang (NG) and Yunjing (YJ). Both cultivars achieved greater biomass and higher total N concentration when grownin a mixed N supply than in sole NH+4 nutrition. Supply of NO ¡ 3 increased NR activity in both leaves and roots. Expression of both NR genes was also substantially enhanced and transcript levels of OsNia2 were signi ¯ cantly higher than those of OsNia1. NO ¡ 3 also caused an increase in GS activity, but had a complex e ® ect on the expression of the three GS genes. In roots, the OsGln1;1 transcript increased, but OsGln1;2 decreased. In leaves, NO ¡ 3 had no e ® ect on the GS1 expression, but the transcript for OsGln2 increased both in the leaves and roots of rice with a mixed supply of N. These results suggested that the increase in GS activity might be a result of the complicated regulation of the various GS genes.In addition, the NO ¡ 3 -induced increase of biomass, NR activity, GS activity, and the transcript levels of NR and GS genes were proportionally higher in NG than in YJ, indicating a stronger response of NG to NO ¡ 3 nutrition than YJ.

【题目】杞柳瘿蚊越冬虫源及越冬场所的研究
【中文关键词】杞柳瘿蚊;越冬虫源;越冬场所
【英文关键词】Rhbdophaga SP ; the overwintering generation; the overwintering place
【中文摘要】为了明确杞柳瘿蚊的越冬虫源和越冬场所,掌握该虫的生物学特性,为防控该虫提供科学依据,通过采摘剥查当年生被杞柳瘿蚊为害的杞柳枝头上形成的虫瘿,及将采摘的虫瘿和剥查出来的杞柳瘿蚊幼虫和蛹放置在不同的环境条件下研究其越冬情况,并调查该虫的越冬场所。结果表明:杞柳瘿蚊以幼虫和蛹在当年生被害杞柳枝头上的虫瘿内越冬,越冬场所在土壤外部,越冬虫源主要来自于杞柳加工过程中残留在下脚料上的虫瘿和集中堆放的未经加工的带虫瘿柳条;其次是杞柳收割过程中散落并残留在田间的虫瘿。实际生产中,对收割后杞柳枝头上的虫瘿进行摘除并集中销毁,同时清除残

留在田间的虫瘿,可有效降低杞柳瘿蚊的越冬虫源,减轻翌年杞柳瘿蚊对杞柳的危害。
【英文摘要】In order to make clear the overwintering generation and the overwintering place ofRhbdophaga SP, master its biological characteristics and provide the scientific basis to control this insect, the author picked and peeled the galls in the infested wickers, then put the larva and pupa into different environmental conditions to research the characteristic of overwintering and find the overwintering place. The results showed that: the larva and pupa overwintered in the galls of damaged wickers in the current year. The overwintering place of this pest was out of soil. The overwintering generation of the pest was mainly in the galls which were in the scrap after processing and in the outside branches before processing. The galls falling in the field in harvest was the other source. In the practical application, galls must be removed and destroyed centrally after wickers harvest. And the galls falling in the field must be eliminated simultaneously. It could largely reduce the number of overwintering generation after taking such measure. And the perniciousness ofRhbdophaga SP would be remitted the next year.

【题目】有机、无机肥对莲藕生长和品质的影响及施肥效益分析
【中文关键词】施肥;莲藕;生长;品质;效益
【英文关键词】fertilize; lotus root; growth; quality; efficiency
【中文摘要】为了提高莲藕产量和改善莲藕的品质,通过采用施用不同肥料,研究有机、无机2 种肥料对莲藕生长、品质及施肥效益的影响。结果表明,有机肥处理比无机肥处理莲藕茎秆粗壮,根茎肥大,节间短,单支主藕较重,纤维素含量低,还原糖、维生素含量高,硝酸盐含量低,即施用有机肥的莲藕长势强、品质佳、产量高、效益好。总之,施用有机肥不但能提高莲藕产量,而且还能改善莲藕品质。
【英文摘要】In order to improve the production and quality of lotus root, the author studied organic and inorganic on two kinds of lotus root through different methods, including growth, quality and efficiency of fertilization. The results showed that, the organic fertilizer treatment was better than the inorganic fertilizer treatment. It had the following advantages: lotus root thick stem, root hypertrophy, internodes short, the single main lotus heavy, low fiber content, rich in vitamin and reducing sugars, low nitrate content. The application organic fertilizer of the lotus had good quality, high yield and good benefits. In short, the application of organic fertilizers would not only increase production of lotus root, but also to improve quality.

【题目】模拟淹水对杞柳生长和光合特性的影响
【中文关键词】杞柳;淹水胁迫;生长;叶绿素荧光;光合速率
【英文关键词】Salix integra; flooding stress; growth; chlorophyll fluorescence; photosynthesis rate
【中文摘要】以一年生红皮柳(Salix integra cv. hongpi)和青皮柳(Salix integra cv. qingpi)为试验材料,研究了人工模拟淹水胁迫对两个杞柳品种的生长、气体交换及叶绿素荧光的影响。经过75天的淹水处理,两个品种的存活率均为100%。在试验过程中,红皮柳和青皮柳都产生了有利于吸收氧气的不定根和肥大的皮孔,但在产生的时间上红皮柳较青皮柳迟10天左右。渍水处理促进了青皮柳的生长和光合作用,而红皮柳在渍水和轻度淹水胁迫处理下的生长、叶绿素含量(Chl)、净光合速率(PN)和气孔导度(Gs)都明显低于对照。随着淹水时间的增加,红皮柳的非光化学淬灭系数((NPQ)持续增加并高于对照,最大光化学量子效率(Fv/Fm)持续下降且明显低于对照;青皮柳的非光化学淬灭的值增加幅度较小,最大光化学量子效率一

直在0.8-0.85之间波动,与对照相比都无显著差异。以上的实验结果表明在淹水胁迫下红皮柳的光合运转机构受到了一定程度的损伤,而渍水处理则促进了大青皮的生长,因此青皮柳较红皮柳而言更耐淹,更适合在河岸带和消落区生长。

【英文摘要】The effects of flooding on growth, leaf gas exchange and chlorophyll fluorescence of Salix integra seedlings were studied during a growth season (from August to October in 2011). Throughout a 75-day flooding period, the survival rates of seedlings of the two types of Salix integra were 100%. The seedlings of both types developed hypertrophied lenticels and adventitious roots at their stem base with the different formation time (Salix integra cv. hongpi was 10d later than Salix integra cv. qingpi). The growth and photosynthesis of S. integra cv. qingpi were promoted under the waterlogging stress, while the growth and photosynthetic properties (chlorophyll (Chl) content, net photosynthetic rate (PN) and stomatal conductance (Gs)) of S. integra cv. qingpi under waterlogging stress and slight flooding stress were all significantly lower than those of the control. Significant increases of non-photochemical quenching (NPQ) and reductions of maximal quantum efficiency of PSII photochemistry (Fv/Fm) in the flooded seedlings were observed for S. integra cv. hongpi. For S. integra cv. qingpi, however, the value of Fv/Fm was fluctuated from 0.80 to 0.85. There were no significant differences in NPQ and Fv/Fm between the treatments and control. Our results demonstrated that S. integra cv. hongpi of S. integra appeared a slight damage to its photosynthetic apparatus under slight flooding stress. In contrast, the slight flooding stress promoted the growth of S. integra cv. qingpi, indicating that S. integra cv. qingpi can tolerate prolonged soil flooding better than S. integra cv. hongpi. Thus S. integra cv. qingpi is more suitable for afforestation in the riparian zone.

【题目】Identification and expression analysis of OsHsfs in rice

【中文关键词】无

【英文关键词】Heat shock, Transcription factors, Rice, Protein structure, Expression analysis

【中文摘要】无

【英文摘要】Heat stress transcription factors (Hsfs) are the central regulators of defense response to heat stress. We identified atotal of 25 rice Hsf genes by genome-wide analysis of rice (Oryza sativa L.) genome, including the subspecies of O. japonica andO. indica. Proteins encoded by OsHsfs were divided into three classes according to their structures. Digital Northern analysisshowed that OsHsfs were expressed constitutively. The expressions of these OsHsfs in response to heat stress and oxidative stressdiffered among the members of the gene family. Promoter analysis identified a number of stress-related cis-elements in thepromoter regions of these OsHsfs. No significant correlation, however, was found between the heat-shock responses of genes andtheir cis-elements. Overall, our results provide a foundation for future research of OsHsfs function.

【题目】不同氮效率水稻的生长特性

【中文关键词】水稻; 氮效率; 根系; 硝酸还原酶活性; 谷氨酰胺合成酶活性

【英文关键词】无

【中文摘要】以氮高效水稻4007和氮低效水稻Elio为材料, 在水培条件下设置高(5172 mmol · L - 1) 、低(1143 mmol · L - 1)2个供氮处理, 研究2个水稻品种的籽粒产量及不同生育期的干物重、吸氮量和根系形态以及功能叶片硝酸还原酶活性(NRA) 、功能叶片和根系谷氨酰胺合成酶活性(GSA) 的差异。结果表明: 2个处理4007的籽粒产量均高于Elio。在分蘖期,

Elio的地上、下部生物量及氮积累量均大于4007, 至拔节期两者差距减小, 齐穗期Elio的地上部氮积累量只有4007的8614%, 且差异显著。高氮条件下, 在分蘖期4007的根系特征参数显著低于Elio, 而在拔节期两品种却没有显著差异, 在齐穗期4007的总根长、根表面积和根尖数已经显著高于Elio。高氮处理的叶片NRA、叶片和根系GSA均显著高于低氮处理; 在拔节期和齐穗期, Elio叶片NRA极显著下降, 而4007叶片则保持NRA的稳定; 在齐穗期4007的GSA显著高于Elio。

【题目】氮高效水稻品种苗期耐低磷种质的筛选与鉴定
【中文关键词】水稻; 苗期; 耐低磷; 筛选; 鉴定
【英文关键词】无
【中文摘要】以先前通过田间试验筛选出来的36 个氮高效水稻品种为供试材料, 在苗期进行了耐低磷筛选, 并对获得的3 个耐低磷和2 个低磷敏感品种响应磷素胁迫的生理机制进行了初步研究。结果表明: 1) 正常供磷和低磷条件下, 所有调查性状的相对值(低磷/ 正常供磷) 中, 相对根系干质量、相对地上部干质量、相对根冠比和相对分蘖数均具有较大的品种间变异(变异系数分别为16. 9%、1 0. 9%、11. 4%、16. 3%) 。相关分析表明, 它们呈显著或极显著正相关。因此, 这4 个性状可以作为水稻苗期耐低磷筛选的评价指标。2) 在低磷条件下, 筛选出的3 个耐低磷品种比2 个低磷敏感品种的根系生长旺盛且活力强, P 吸收动力学参数中Km 、Cmin 小, 而Vmax大, 酸性磷酸酶(APase) 活性升幅大, 磷效率在两者之间也存在显著差异。同时, 不同耐低磷品种适应低磷胁迫的调节机制也有所不同。表明筛选氮磷双高效的水稻品种是可行的, 同时也为后续基因定位和遗传机制的研究提供了材料和生理学依据。

【题目】花生不同种植方式对田间土壤微环境和产量的影响
【中文关键词】种植方式;花生;土壤微环境;产量
【英文关键词】planting patterns; peanut; soil microenvironment; pod yield
【中文摘要】在大田条件下,采用随机区组设计了春播覆膜(CBFM)、春播露地(CBLD)、麦田套种(MT)、麦田露地(MTLD)、夏播覆膜(XBFM)和夏播露地(XBLD)6种花生种植方式。研究了不同种植方式对花生田间土壤物理性状、土壤微生物量碳、活跃微生物量、土壤呼吸及花生产量的影响。结果表明,花生不同种植方式对土壤微环境和花生产量具有明显影响。花生春播覆膜和麦田套种种植提高了土壤孔隙度、毛管和非毛管孔隙度,增加了细菌和放线菌数,降低了土壤容重和真菌数,提高了土壤微生物量碳、活跃微生物量及土壤呼吸速率,有利于土壤养分的分解和有效化;花生覆膜种植可明显增加荚果产量,春花生覆膜的增产作用大于夏花生覆膜,麦田套种的花生产量最低。因此,在一年一熟的春花生产区应以覆膜种植方式为主;在小麦花生一年两熟的花生产区,可以推广收麦后直播花生的种植方式。
【英文摘要】Effects of different planting patterns on soil physical properties, bacteria, fungi, acyinomycete, soil microbiomass C, active soil microbiomass, soil respiration and pod yield of peanut were investigated using six planting patterns in a randomized design. Results showed that, effects of different planting patterns on soil microenvironment and pod yield of peanut were significant. In the patterns of plastic film mulching system of spring seeded and interplanting in wheat field system, total porosity, non-capillary, capillary porosity, bacteria, actinomycete numbers, soil microbiomass C, active soil microbiomass and soil respiration were increased, while bulk

density and fungi numbers decreased, conducing the decomposition and effectivity of soil nutrient. Pod yield of peanut were increased significantly in the plastic film mulching system, and spring seeded was more effective than summer-planting. The pod yield of interplanting in wheat field system was the lowest. Thus, plastic film mulching system should be the main planting pattern in annual planting regions of peanut, while open cultivation of summer-planting should be generalized in wheat and peanut interplanting regions.

【题目】不同种植方式对花生土壤微生物生物量及活性的影响
【中文关键词】花生种植方式 土壤 微生物生物量碳 活跃微生物生物量
【英文关键词】peanut planting pattern; soi;l microbialbiomassC; activemicrobialbiomass.
【中文摘要】在大田条件下,采用随机区组设计研究了春播覆膜(CBFM)、春播露地(CBLD)、麦田套种(MT)、麦田套种露地对照(MTLD)、夏播覆膜(XBFM)和夏播露地(XBLD)6种花生种植方式对土壤微生物生物量碳、活跃微生物生物量和土壤呼吸的影响.结果表明:花生生育期和种植方式均显著影响土壤微生物生物量及活性.从始花期开始,随着生育进程的推进,土壤微生物生物量碳、活跃微生物生物量和呼吸速率逐渐升高,到结荚期达到最大值,随后下降.露地栽培花生提高了土壤微生物生物量碳和土壤呼吸速率,但是降低了活跃微生物生物量,对土壤养分的转化和吸收不利;覆膜花生提高了活跃微生物生物量,促进土壤养分的分解和有效化;麦田套种花生比同期播种的露地对照花生提高了土壤微生物生物量碳、活跃微生物生物量和土壤呼吸速率,固结养分较多,不利于花生生长.
【英文摘要】A field experimentwith randomized design was conducted to study the effects of six planting patterns ofpeanu,ti. e., spring sowing and plastic film mulching, spring sowing and open cultivation, summer sowing and plastic film mulching, summer sowing and open cultivation, inter-cropped inwheat field, and controlof intercropped inwheat field, on soilmicrobialbiomassC, soil activemicrobial biomass, and soil respiration rate. The results showed that the growth stage and planting pattern ofpeanuthad significanteffectson soilmicrobialbiomass and respiration rate. With the prolonged time after anthesis, soilmicrobialbiomassC, activemicrobialbiomass, and respiration rate increased gradually, peaked at pod-setting stage, and decreased then. Open cultivation enhanced soilmicrobial biomass C and respiration rate but reduced soil active microbial biomass, being unfavorable to soil nutrient transformation and nutrient availability, while plastic film mulching increased soil activemicrobial biomass, and consequently, promoted soil nutrient transformation and nutrient availability. Comparingwith intercropped inwheat field and open cultivation, intercropped inwheat field and plastic film mulching increased soilmicrobial biomass C, activemi-crobial biomass, and respiration rate, which immobilizedmore soilnutrients andwas notconducive to peanutgrowth.

【题目】苗期遮荫对花生光合生理特性的影响
【中文关键词】花生;遮荫;光合作用;光抑制
【英文关键词】peanut; shading; photosynthesis; photoinhibition
【中文摘要】大田条件下,以花生品种“花育22号”为材料,齐苗期设置遮荫50%和85%两个遮荫强度分别处理40d,研究了遮荫对花生光合特性的影响及遮荫解除后的光合恢复规律。结果表明: (1)与正常光照条件相比,遮荫花生叶片净光合速率(Pn)、RuBP羧化效率降低,叶绿素含量、表观量子效率及光系统Ⅱ的最大光化学效率(Fv/Fm)增加,表明花生对弱光胁迫有一定的自我调节和适应能力。(2)遮荫和自然光下生长的花生中午强光下的Fv/Fm值均明显下降,表明发生了光抑制,遮荫程

度越大,光抑制愈严重。(3)Fv/Fm值和净光合速率Pn遮荫解除后5d之内持续下降,之后逐步恢复。遮荫50%处理的叶片Fv/Fm值和Pn分别于遮荫解除后8d和10d左右恢复到对照水平;遮荫85%的处理分别于遮荫解除后15d和20d左右才恢复到最大,但Pn不能恢复到对照水平,显著低于对照。

【英文摘要】The photosynthetic characteristics of a peanutvariety, Huayu 22, under shading treatments (50%, 85%) and subsequent recovery under full lightwere studied at seedling stage in the field. The shading treatments were last 40d.Relative to those under full light, the peanuts grew in shading environment had lower net photosynthetic rate (Pn), the light compensation point (LCP), the carboxylation efficiency (CE), the non-photochemical quenching (NPQ), higher apparentquantum yield (AQY), maxmi al photochemical efficiency (Fv/Fm) and the contentof total chlorophyll content. It shows that peanut has self-adjusting and adaptation ability to low light stress. When exposed to strong light at noon,Fv/Fm, which can reflect the efficiency ofPS Ⅱ, decreased obviously in both shading seedling leaves and full lightseedling leaves. In all treatments, Photoinhibition wasmore severe in lower light treatment seedlings. Otherwise, when removed shading stress, Fv/Fm and Pn of peanut seedling leaves continued to decrease in 5d relative to those of the controlunder full light, and began to increase subsequently.Fv/FmandPnof 50% shading seedlings recovered to the same level as the control in 8d and 10d, respectively; however,Fv/FmandPnof85% shading seedlings reached the top values in 15d and 20d, respectively, whereasPnwas still lower than thatof the control

【题目】麦套花生氮素代谢及相关酶活性变化研究
【中文关键词】套种花生;氮素代谢;硝酸还原酶;谷氨酰胺合成酶;谷氨酸脱氢酶;谷丙转氨酶
【英文关键词】relay-cropped peanutwith wheat; nitrogen metabolism; nitrate reductase;
【中文摘要】大田条件下,以花生“花育22号”为材料,研究了麦套花生的氮素代谢及相关酶活性变化情况。结果表明,麦套花生根、叶游离氨基酸、氮素平均含量及根系可溶性蛋白平均含量高于单作;而叶片可溶性蛋白平均含量则低于单作。与小麦共生期间,麦套花生根叶硝酸还原酶(NRase)活性、谷氨酸脱氢酶(GDH)活性、叶片谷氨酰胺合成酶(GS)活性及谷丙转氨酶(GPT)活性(除播后25 d)明显低于单作;整个生育期麦套花生根系GS平均活性及GPT活性高于单作花生。可见,花生苗期小麦遮荫对花生氮素代谢及酶活性有一定影响。

【英文摘要】Nitrogen metabolism and relative enzyme activities of peanutwere studied by comparing relay-cropped peanut(RP) with wheat and mono-cropped peanut (MP) under filed condition. The tested peanut cultivarwasHuayu 22 · The results showed that, free amino acids and nitrogen contents in leaves and roots, soluble protein contents were higher in roots of RP compared toMP. However, soluble protein contentwas lower in RP leaves than inMP leaves. Nitrate reductase(NRase) activities and glutamate dehydrogenase(GDH) activities in leaves and roots, glutamine synthetase(GS) activities and glutamate pyruvate transaminase(GPT) activities (except for 25 days after sowing) in leaves of RPwere significantly lower than those ofMP during the wheat and peanut symbiotic period. GS activities and GPTactivities in roots of RPwere higherthan those ofMP duringthe entire growth period. It can be concluded thatwheat shading in RP affected nitrogen metabolism and enzymatic activities at seedling stage.

【题目】花生抗旱性鉴定指标的筛选与评价

【中文关键词】花生,综合评价,抗旱性,品种(系),水分胁迫
【英文关键词】Arachis hypogaea,comprehensive appraisal,drought resistance,varieties,water stress
【中文摘要】为确定鉴定花生(Arachis hypogaea)品种(系)抗旱性指标体系,综合评价花生品种(系)的抗旱性,在人工控水条件下,通过盆栽试验,测定了29个花生品种(系)苗期和花针期的株高、分枝数、生物累积量、叶片含水量和光合色素含量等与抗旱性有关的13个表观形态性状和生理性状的指标,采用抗旱系数法和隶属函数值法,对各指标性状进行了水分胁迫下的抗性评价和鉴定。结果表明,29个花生品种(系)可划分为抗旱性较强、中等、较弱和不抗旱4类,其中‘唐科8号’、‘冀花2号’、‘大唐油’、‘花育25号’、‘花育17号’、‘鲁花14号’、‘丰花1号’7个品种(系)具有较强的抗旱能力;苗期同一品种(系)的主茎高、分枝数和生物累积量等形态指标和光合色素等生理指标的隶属函数值均有较大差别,苗期各指标隶属函数值与品种(系)抗旱性无显著相关关系,苗期单一形态指标不能作为鉴定品种(系)抗旱性的指标;但苗期抗旱性综合评价值(D)与抗旱系数间存在显著相关关系,D的大小可作为抗旱性的鉴定指标。花针期形态指标和生理指标D值间,以及各类指标D值与抗旱系数间均存在显著或极显著的相关关系,此期植株形态指标、生理指标隶属函数值以及综合D值均可作为鉴定品种(系)抗旱性的指标。
【英文摘要】Aims Our objective was to define an index of peanut(Arachis hypogaea)drought resistance and comprehensively evaluate drought resistance of peanut varieties under controlled water conditions.Methods The experiment was conducted on the farm of Qingdao Academy of Agricultural Science with 29 peanut varieties.Two levels of water content(80% – 85%and 45% – 50%of field moisture capacity)were used in arandomized complete block design with four replications.We measured 13 morphological and physiological characters such as plant height,branch numbers,biomass,leaf water content and photosynthetic pigment content in seedling and pod-pin stages. Important findings The 29 peanut cultivars can divided into four classes:high-,mid-and low-tolerant cultivars and intolerant cultivars.The high-tolerant cultivars included‘ Tangke 8 ’,‘ Jihua 2 ’,‘ Datangyou ’,‘ Huayu 25 ’,‘ Huayu 17 ’,‘ Luhua 14 ’and‘ Fenghua 1 ’.Subordinate function values of the morphological indexes including main stem height,branch number and biomass,and photosynthetic pigments contents of the same cultivars at seedling stage were different. In addition,the subordinate function value of the seedling stage was unrelated to drought resistance,so a single physiological index cannot be used to identify the drought resistance of peanut. But the values drought resistance comprehensive evaluation(D)of physiological indexes were significantly related to drought resistance and can be used to identify the drought resistance of peanut.At the pod-pin stage,the D values of morphological indexes and physiological indexes were both significantly related to drought resistance,so the subordinate function value and D value of morphological indexes and physiological indexes at this stage can serve as indexes for identifying peanut drought resistance.

【题目】种植方式对夏玉米光合生产特征和光温资源利用的影响
【中文关键词】夏玉米; 套种; 直播; 光合生产特征; 光温资源利用;
【英文关键词】ummer maize; interplanting; direct seeding; photosynthesis characteristics; utilization of solar and heat resources.;
【中文摘要】为研究套种与直播两种种植方式对夏玉米光合生产特征和光温资源利用的影响,选取郑单958和登海661为研究对象,设置3个播期,密度为67500株.hm-2,以地上干物质积累量和作物生长速率、叶面积指数、穗位叶的单叶光合速率来评价夏玉米的光合生产特征;以Richards模型拟合籽粒灌浆过程;结合气象数据计算夏玉米光能利用率.结果表明:直播处理比套种处理籽粒产量增加1.17%~3.33%(P<0.05),但千粒重显著降低;生育期随播期提前而延长;直播条件下叶面积指数和单叶光合速率在灌浆前期显著高于套种,但灌浆后期下降较快;与套种相比,直播开花前和开花后具有较高的干物质积累量和较快的作物生长速率.Richards模型解析表明,直播处理达到最大灌浆速率的时间明显早于套种,起始势较套种高,但灌浆期、活跃灌浆期和灌浆速率最大时的生长量均低于套种;与套种相比,直播处理生育期间总积温和总辐射量分别减少150~350℃.d和200~400MJ.m-2,但籽粒光能利用率较套种提高10.5%~24.7%.因此,直播较套种有优势,在夏玉米大田生产条件下,重视叶片的光合生产特征,延缓叶片衰老,有利于提高夏玉米的光能利用率,进一步挖掘增产潜力.
【英文摘要】In order to investigate the effects of interplanting and direct seeding on the photosynthesis characteristics of summer maize and its utilization of solar and heat resources,two summer maize cultivars (Zhengdan 958 and Denghai 661) were planted in the farmlands of Denghai Seed Co. Ltd in Laizhou City of Shandong Province,with 67500 plants · hm-2 and three sowing dates. The above-ground biomass,plant growth rate,leaf area index,and net photosynthetic rate per ear leaf were measured to reveal the photosynthesis characteristics of test cultivars. In the meantime,the characters of grain-filling were simulated by Richards ' model,and the solar resource utilization efficiency of the cultivars was calculated,in combining with meteorological data. Comparing with inter-planting,direct seeding increased the grain yield by 1.17%-3.33%,but decreased the thousand-grain weight significantly. Growth stages were extended under earlier sowing. The leaf area index and net photosynthetic rate from flowering to 30 d after anthesis were significantly higher under direct seeding than under interplanting,but after then,they decreased faster. Direct seeding induced a higher

accumulation of dry matter and a faster plant growth rate before and after flowering. Under direct seeding,the maximum grain-filling rate reached earlier,the starting potential was higher,but the grain-filling period,active grain-filling period,and Wmax were lower,compared with those under interplanting. Also under direct seeding,the total accumulative temperature and solar radiation during growth period decreased by 150-350 ℃ · d and 200-400 MJ · m-2,respectively,but the solar resource utilization efficiency of grain increased by 10.5%-24.7%. All the results suggested that direct seeding was superior to interplanting for the summer maize production under field condition. In order to enhance solar and heat utilization efficiency and excavate yield potential,it would be essential to improve the leaf photosynthesis efficiency and postpone leaf aging.

【题目】施氮水平对不同花生品种氮代谢及相关酶活性的影响
【中文关键词】施氮水平;花生品种;氮素代谢;硝酸还原酶;谷氨酰胺合成酶;谷氨酸脱氢酶
【英文关键词】nitrogen level; peanut cultivars; nitrogen metabolization; nitrate reductase; glutamine synthetase; glutamate dehydrogenase
【中文摘要】【目的】花生籽仁蛋白质含量较高,研究花生不同器官中氮代谢酶活性在施氮水平和品种间的差异及其与籽仁蛋白质含量间的关系,阐述花生氮素代谢的生理特性。【方法】选用生产中普栽品种花育22号和白沙1016,设置4个氮素水平,测定两品种不同生育期各器官中主要含氮物质(可溶性蛋白质(Pro)、游离氨基酸(AA))含量及主要氮代谢酶(硝酸还原酶(NRase)、谷氨酰胺合成酶(GS)和谷氨酸脱氢酶(GDH))活性。【结果】两品种各器官Pro、AA、NRase、GS、GDH活性的变化态势大致相同,但其含量的高低因品种和施氮量不同而变化,各器官中各指标含量均以白沙1016较高;适当提高氮素水平可增加各器官中可溶性蛋白质和游离氨基酸的含量和主要氮代谢酶活性;氮素水平过高虽能提高硝酸还原酶和籽仁蛋白质含量,但谷氨酰胺合成酶(GS)和谷氨酸脱氢酶(GDH)的活性下降;各营养器官中可溶性蛋白质含量与GS和GDH活性间的相关关系不明显,但与其相应器官中的NRase活性表现显著或极显著相关,荚果中Pro与AA和NRase间、GS和GDH、NRase与游离氨基酸间均呈极显著的相关关系。【结论】施氮量和品种差异对花生各器官中游离氨基酸和可溶性蛋白质含量及氮代谢酶活性有影响,白沙1016对高量氮肥较敏感,花育22号则较适应高氮;增施氮肥通过改变氮素代谢的生理特性改善花生品质。
【英文摘要】【Objective】This experiment was conducted to study the characters of nitrogen metabolism and provide a basis for high yield and quality of peanut,by determining the effects of nitrogen level and cultivars on nitrogen metabolism related enzymes,and analyzing their relationship with protein content in peanut kernel.【Method】The effects of four nitrogen levels and two cultivars,Huayu 22(High yield big peanut)and Baisha 1016(Small peanut),on soluble protein content(Pro),free amino acid content(AA),nitrate reductase(NR),glutamine synthetase(GS)and glutamate dehydrogenase(GDH)in different organs of peanut at different growth stages were determined.【Result】The results showed that the change trends of Pro,AA,NR,GS,GDH in different organs of the two types of peanut cultivars were similar.But the values of Baisha 1016 were higher than those of Huayu 22 in different organs.With the increase of nitrogen,Pro and AA were increased,and the activities of NR,GS and GDH were also increased.When excessive nitrogen was used,NR and Pro were increased,while the activities of GS and GDH were decreased.In each organ,Pro had no obvious relationship with GS and GDH activities,but was significantly related to NR activity.And the correlations between Pro and AA,Pro and NR,GS and GDH,and NR and AA,were all significant.【Conclusion】There are significant effects of nitrogen level and cultivars on AA,Pro and the nitrogen metabolism related enzymes in different organs.Baisha 1016 is more sensitivity to high nitrogen level than Huayu22.Application of more nitrogen could improve the quality of peanut by the changes of nitrogen metabolism.

【题目】施氮量对不同花生品种积累氮素来源和产量的影响
【中文关键词】花生;施氮量;氮素来源;产量
【英文关键词】peanut; nitrogen application amount; source of nitrogen; yield
【中文摘要】利用盆栽试验和15N示踪技术,研究了不同施氮量对两个花生品种氮素积累来源和产量的影响。结果表明,两个花生品种的茎、叶片,果针、幼果,根的干物重均表现出随着施氮量的增加而增加的趋势。大花生品种花育17号的荚果产量随着施氮量的增加而增加,而小花生品种白沙1016在施N 0~90 kg/hm2范围内表现为随着施氮量的增加显著增加,但过多施氮(N 135 kg/hm2)荚果产量反而下降,说明两品种对氮肥的增产效应存在差异。两个花生品种均随着施氮量的增加吸收土壤氮和生物固氮量而增加,表明增施氮肥促进了花生植株对土壤氮的吸收和对大气氮的固定。在施氮量0~135 kg/hm2下,花生吸收土壤氮的比例在41·85%~48·63%之间,吸收肥料氮的比例在0%~13·93%之间;生物固氮的比例在41·25%~56·85%之间。吸收肥料氮的比例随着施氮量的增加而增大,生物固氮的比例随着施氮量的增加而减小。
【英文摘要】Effects of nitrogen application amounts on source of nitrogen accumulation and yields of two peanut cultivars were studied by using the method of pot culture and15N tracer. The results indicate that dry matter weights of stem +leaf, peg + unfilled pod and rootofthe two cultivars are all increased underthe highernitrogen amounts. The pod yields of Huayu17 are increased alongwith nitrogen amount increases, while the pod yields of Baisha1016 are increased when nitrogen application amount is less than 90 kg/ha, the pod yield would decrease when the amount is larger than 135kg/ha. These indicate the yield increasing effects of the nitrogen application are different. The nitrogen amount absorbed from soil and fixed from air are both improved alongwith the increases of nitrogen application amount, which shows that the increases of nitrogen application could enhance the nitrogen amount absorbed from soil and fixed from air by peanut plant. Proportions of nitrogen absorbed from soil, fertilizer and fixed from air by peanut are 41·85%-48·63%, 0%-13·93% and 41·25%-56·85% respectively. The proportion of nitrogen absorbed from the fertilizer is increased, while the fixed proportion is decreased alongwith the increases of nitrogen application amount.

【题目】腐植酸肥料对生姜土壤微生物量和酶活性的影响
【中文关键词】腐植酸肥料;生姜;土壤微生物量;土壤酶
【英文关键词】humic acid; ginger; soilmicrobia;l soil enzyme
【中文摘要】设4个处理:空白对照、等量腐植酸、等量无机养分和腐植酸复合肥。通过小区试验,研究了腐植酸肥料在生姜不同生育时期对土壤微生物量和3种重要酶活性的影响。结果表明:与不施肥处理比较,施用腐植酸使前期的微生物量碳增加、脲酶活性降低,后期的微生物量碳减少、脲酶活性提高;施用腐植酸增加土壤活跃微生物量、提高酸性磷酸酶活性、降低蔗糖酶活性,全生育期平均土壤活跃微生物量和酸性磷酸酶活性分别提高17.34%和11.40%、蔗糖酶活性降低10.57%。与施用等量无机养分处理比较,施用腐植酸复合肥也使前期的微生物量碳增加、脲酶活性降低,后期的微生物量碳减少、脲酶活性提高;施用腐植酸复合肥增加土壤活跃微生物量、提高酸性磷酸酶和蔗糖酶活性,全生育期平均土壤活跃微生物量、酸性磷酸酶和蔗糖酶活性分别提高18.61%、10.07%和7.61%。
【英文摘要】This field study was conducted to investigate the effect of humic acid on microbial and the activities of three enzymes in the soilwhere gingers (Zingiber officinaleRose) were grown. Soilwas subjected to four fertilizer regmi es: contro,l humic acid only (19.6g/m2), inorganic nutrient (45.0 gN/m2, 15.0 g P2O5/m2, and 60.0 gK2O/m2), and humic acid compound (45.0 gN/m2, 15.0 g P2O5/m2, 60.0 gK2O/m2and 19.6g humic acid/m2). Microbial carbon levelwas greater during the early expermi ental period, but

lower during the late expermi ental period in humic acid only versus the control and in humic acid compound versus nutrient treatment. Urease activity levelwas lower during the early expermi ental period, butgreaterduring the late expermi entalperiod in humic acid only versus the controland in humic acid compound versusnutrient treatment. When datawere averaged over the entire expermi entalperiod, humic acid only treated soil exhibited a 17.3% higher activemicrobial carbon leve,l 11. 4% higher acid phosphatase activity, and 10. 6% lower invertase activity. than the contro.l Soil treatedwith the humic acid compound had 18.6% higher activemicrobial carbon leve,l 10.1% higher acid phosphatase activity and 7.6% higher invertase activity than inorganic nutrient treatment, when datawere averaged over the entire expermi ental period.

【题目】钙对镉胁迫下花生生理特性、产量和品质的影响
【中文关键词】花生钙肥镉胁迫生理特性产量籽仁品质
【英文关键词】peanut;Ca fertilizer;Cd stress;physiological characteristics;yield;kernel quality.
【中文摘要】通过盆栽试验,选用高油品种豫花15和高蛋白品种XB023,研究了不同浓度钙对镉胁迫下不同类型花生品种营养生长、叶片叶绿素含量、光合速率、保护酶活性等生理特性及产量和品质的影响.结果表明:施钙可以缓解镉胁迫对花生植株主茎高和侧枝长的抑制作用,增加花生植株干物质量,提高叶片叶绿素含量和光合速率,提高叶片超氧化物歧化酶(SOD)、过氧化氢酶(CAT)、过氧化物酶(POD)活性和可溶性蛋白质含量,降低丙二醛(MDA)的积累量,减轻镉胁迫对花生叶片的伤害;施钙可以缓解镉胁迫对花生的减产作用,增加花生荚果和籽仁产量,其增产的主要原因是增加了单株结荚数和出仁率;施钙可以促使籽仁中可溶性糖向粗脂肪和蛋白质转化,增加籽仁中脂肪和蛋白质含量,改善镉胁迫下花生籽仁品质.施钙可以降低两花生品种籽仁中镉含量,对豫花15的降低效果好于XB023.
【英文摘要】Taking high-oil peanut cultivar Yuhua15 and high-protein peanut cultivar XB023 as test materials,a pot experiment was conducted in both 2009 and 2010 to study the effects of applying different concentration calcium(Ca)on the vegetative growth,leaf chlorophyll content,photosynthetic rate,and protective enzyme activities,as well as the yield and kernel quality of the cultivars under cadmium(Cd)stress.Applying Ca alleviated the inhibitory effects of Cd on the height growth of peanut main stem and the length growth of the branches,resulting in the increase of plant dry mass,and mitigated the Cd damage on peanut leaf,manifesting in the increase of leaf chlorophyll content,photosynthetic rate,superoxide dismutase(SOD),peroxidase(POD),and catlase (CAT)activities,and soluble protein content,and the decrease of leaf malondialdeyde(MDA) content.Under the application of Ca,both the pod yield and the kernel yield increased,mainly because of the increase of pod number per plant and of the kernel number per pod.Applying Ca also promoted the transformation of soluble sugar into fat and protein in peanut kernel,increased the kernel fat and protein contents,and improved the kernel quality under Cd stress.Ca application decreased the kernel Cd content of the cultivars,with better effect on Yuhua15 than on XB023.

【题目】镉胁迫对花生生理特性、产量和品质的影响
【中文关键词】花生;镉胁迫;生理特性;产量;籽仁品质
【英文关键词】Peanut;Cd stresses;Physiological characteristics;Yield;Kernel quality

【中文摘要】选用高油花生品种豫花15和高蛋白品种XB023,研究了土壤不同浓度镉胁迫对花生生理特性和产量品质的影响。结果表明,轻、中度镉胁迫(促进花生营养生长,重、高度镉胁迫抑制营养生长;轻、中度镉胁迫增加XB023的叶绿素含量,重、高度镉胁迫降低两品种叶片叶绿素含量和净光合速率。镉胁迫降低了两品种荚果和籽仁产量,豫花15在中度镉胁迫下产量即开始明显降低,而XB023在重度镉胁迫时产量才开始显著下降。镉胁迫对花生不同品质类型品种的影响不同,镉胁迫增加了豫花15的籽仁可溶性总糖含量,降低了脂肪、蛋白质含量及油酸/亚油酸(O/L)比值;降低了XB023籽仁中可溶性糖含量、脂肪含量及O/L比值,轻、中度镉胁迫可增加籽仁蛋白质含量及赖氨酸和苏氨酸等氨基酸组分。镉胁迫导致花生体内镉含量增加,豫花15植株内镉含量高于XB023,但籽仁中镉含量小于XB023。

【英文摘要】A pot experiment was carried out to study the effects of different cadmium concentrations on peanut physiological characteristics,yield and quality using peanut cultivars of Yuhua 15 and XB 023.Five Cd concentrations light Cd stress, heavy Cd stress, and high Cd stresswere treated by basal dressing in 2009 and 2010.The results showed that light and medium Cd stresses could promote peanut vegetative growth,but heavy and high Cd stresses inhibit its growth.Heavy and high Cd stresses decreased the chlorophyll content and photosynthetic rate of the two peanut cultivars while light and medium Cd stresses increased the chlorophyll content of XB023 leaves.Cd stresses decreased the yield of pod and kernel.The yield of Yuhua 15 decreased obviously when the Cd concentration reached 2.5 mg kg – 1(medium Cd stresses),however,for XB023,reached 7.5 mg kg – 1(heavy Cd stresses).Cadmium stress had different influence on peanut quality in different cultivars.It could increase the content of soluble sugar,decrease the content of protein and oil,and reduce the ratio of oleic acid to linoleic acid(O/L)in Yuhua 15 kernels;but decrease the content of soluble sugar and oil,reduce the ratio of oleic acid to linoleic acid(O/L)in XB023 kernels.Light and medium Cd stresses could increase the content of protein and its components of Lys and Thr in peanut kernels.Cd stresses could increase the cadmium content in peanut.The cadmium content was higher in Yuhua 15 plants than in XB 023 plants,but was less in seed kernel than in XB 023 kernel.

【题目】Behavioral Equivalence Based Web Service Discovery
【中文关键词】无
【英文关键词】Behavioral Equivalence; Web service discovery
【中文摘要】无

【英文摘要】With the rapid expanse of the web service over the internet, discovering relevant web services becomes a significant challenge. To tackle this problem, a service-discovering framework based on behavioral equivalence is proposed in this paper. First, ¼-calculus as a formal tool is adopted to express service behavior, including the published services and the query services. Then, the reverse engineering and behavioral equivalence are exploited for service matchmaking. Last, an example is taken for illustrating this approach.

【题目】不同类型拌种剂对花生及其根际微生物的影响
【中文关键词】花生;拌种剂;产量;品质;根际土壤微生物
【英文关键词】groundnut;seed-dressing agent;yield;quality;rhizosphere soil microbes

【中文摘要】拌种处理对于花生一播全苗和稳定高产非常重要。选用不同类型的4种拌种剂即哈茨木霉菌剂(真菌拮抗剂)、甲基托布津(杀真菌剂)、适乐时(杀真菌剂)、好安威(化学杀虫剂)处理花生种子,通过测定花生农艺性状、品质指标、根际土壤微生物动态等来评价其对花生和环境的综合效应。结果表明:1)各种杀菌剂拌种均能提高花生成苗率,而好安威略差;各拌种剂促进花生株高、叶绿素含量,而单株叶片数适乐时增多,好安威减少,单株分枝数盛花期有所增多(好安威除外),结果期均略减少;单株烂、虫、芽果数均减少,单株秕果数增加,单株饱果数降低(好安威除外),百果重和百仁重提高(哈茨木霉除外),而饱满度降低;最终荚果产量除哈茨木霉略低,其余拌种剂增产效果极显著,甲基托布津、适乐时、好安威比对照分别增产34.58%、25.90%、22.82%。2)哈茨木霉拌种使蛋白质含量、亚油酸含量增幅最大,油份含量增幅较大,油亚比值降幅最大;甲基托布津处理的蛋白质和油份含量降幅最大;适乐时对提高油份含量、油亚比值效果最佳;好安威对品质指标的影响有限。3)从细菌及放线菌与真菌的比值来看,甲基托布津促细菌、抑真菌的效果好且长,对放线菌/真菌比值影响较小;哈茨木霉在前中期促细菌与放线菌、抑真菌的效果明显,但后期效果趋反;适乐时促细菌、抑真菌的效果短促,且一直强烈抑制放线菌;而好安威相比影响较小。4)好安威对根瘤菌具有显著的抑制作用,而哈茨木霉、适乐时、甲基托布津均极显著增加根瘤数量。结论:各拌种剂对花生产量、品质、根瘤、根际微生物产生了较大差异的综合效应,须因地、因时选用;化学杀菌剂甲基托布津的农艺效应、环境微生物效应均最好,唯蛋白质含量、油份含量略有降低,是一种较理想的综合优良拌种剂。

【英文摘要】Seed dressing of peanut playes an important role in full stand and achieving high and stable yield.Four different types of seed dressing agents Trichoderma harzianum(biological antifungi agent),Thiophanate-methyl(chemical fungicide,TM),Celest(chemical fungicide),Carbosulfan(chemical insecticide)were used to treat peanut seeds,and their comprehensive effects on peanut and environment were evaluated by measuring the growth and development,yield,quality of peanut,and soil microorganisms.The results are as follows:1)All antifungi agents increased seedling rate,while Carbosulfan had less effect.All seed dressing agents promoted plant height,chlorophyll content,however the number of branches and leaves per plant reduced except for Celest;The number of rotted,insects-damaged,and germinated pod per plant were reduced while blighted pod increased,whereas number of full pod per plant increased only for Carbosulfan.100-pod mass and 100-seed mass were significantly higher than the control,except for T.harzianum,while the fullness degree was lower than the control.In addition to slightly lower yields for T.harzianum,the others gave extremely significant increase of yield over the control.Of the treatments,TM,Celest,Carbosulfan gave rise to yield increase of 34.58%,25.90%,22.82%compared to the control,respectively.2)T.harzianum had the most increase in protein and Linoleic acid content,larger increase in oil content,and the most decrease in ratio of Oleic acid/Linoleic acid(O/L);TM decreased protein and oil content mostly;Celest increased oil content and O/L mostly;Carbosulfan had a limited impact on the quality indicators.3)With respect to the ratio of bacteria(actinomycetes)to fungi,TM kept on promoting bacteria and inhibiting fungi,while had less effect on ratio of actinomycetes to fungi;T.harzianum had significant effect on promoting bacteria and actinomycetes,and suppressing fungi at early and middle stage,but tended to the contrary at late stage;Celest produced temporary bacteria promotion and antifungal effect,and had been suppressing actinomycetes strongly;Carbosulfan had less effect.4)Carbosulfan significantly inhibited the number of nodules(rhizobia),while T.harzianum,Celest,and TM promoted it significantly.In conclusion,the seed dressing agents had large and different combined effect on the yield,quality,root nodule,rhizosphere microorganisms,they should be used in according to sites and time.Among the investigated agents,chemical fungicides TM gave the most agronomic and environmental-microbial effects with only slight decrease in protein and oil contents,which is an ideal seed dressing agent.

【题目】硼钼肥对旱地花生生长发育及产量的影响

【中文关键词】花生;硼肥;钼肥;配施;产量

【英文关键词】Peanut;Boron Fertilizer;Molybdenum Fertilizer;Combination application;Yield

【中文摘要】旱(薄)地条件下,研究了叶面喷施硼肥和钼肥对春播和夏播花生生长发育及产量的影响。结果表明:无论春播还是夏播,施肥处理的多数农艺性状明显好于对照,但不同施肥处理间存在较大差异,其中硼钼肥配施对花生营养性状的促进作用优于单施钼肥或硼肥,春、夏播结果一致;单施硼肥有利于提高春花生单株结荚数,单施钼肥有利于饱果率,硼钼配施有利于同时提高单株结荚数和饱果率;硼钼配施或单施硼肥有利于提高夏花生双仁果率,单施钼肥对提高夏花生产量性状

无明显影响;春、夏播4个施肥处理产量,以硼钼配施的处理最高,比对照平均增产12.0%,其次为单施硼肥,比对照平均增产7.0%,单施钼肥春播增产5.6%,夏播无明显增产作用。因此,生产中应注意硼钼肥配施。

【英文摘要】Under the condition of dryland or leanness soil,effects of foliar-spraying of boron fertilizer and molybdenum fertilizer on growth and development and yield of peanut sown in spring and in summer were studied.The results showed that main agronomic characteristics of peanut sown in spring and in summer under fertilizer treatment were better than CK,and there were significant differences among different fertilizer treatments.Furthermore,a combined application of boron and molybdenum fertilizer had more significant effect in improving the nutritional characteristics than single application of any kind of fertilizer.Single application of molybdenum fertilizer was helpful to increase the pod number.Single application of boron fertilizer could increase the pod number.Combined application of boron and molybdenum fertilizer or single application of boron fertilizer had favorable effect on improving double kernel plump pod rate of peanut sown in summer,and single application of molybdenum fertilizer had no significant effect in yield characteristics.Compared with CK,the yield of peanut sown in spring and in summer was remarkably increased by 12.0%after combined application of boron and molybdenum fertilizer,and single application of boron fertilizer could increase the yield by 7.0%.Compared with CK,single application of molybdenum fertilizer could increase the yield of peanut sown in spring by 5.6%,whereas it had no visible effect on yield of peanut sown in summer.Therefore,combined application of boron and molybdenum fertilizer should be noted in peanut production.

【题目】不同种植方式对花生田间小气候效应和产量的影响.

【中文关键词】花生;种植方式;群体;小气候;产量

【英文关键词】peanut;planting patterns;population;microclimate;yield

【中文摘要】在大田高产条件下,研究了同一密度下不同种植方式对花生田间小气候效应及产量的影响。结果表明:增大行距和采用大小行种植方式有利于增加田间透光率,提高冠层空气温度与地表温度,降低田间相对湿度,提高田间CO2 浓度,提高群体光合速率,进而增加荚果产量。但是行距过大,导致各种环境资源的浪费。采用大行距55cm小行距35cm的大小行种植方式是比较合理的种植方式。

【英文摘要】Peanut(Arachis hypogaea L.)is a high-value legume crop that has been grown successfully in China for many years.China leads in production of peanuts,having a share of about 41.5%of overall world production,followed by India (18.2%)and the United States of America(6.8%).Large scale production of peanut is concentrated in the major geographic areas of the China:Shandong,Henan and Hebei Province.Higher yields could be in store for peanut farmers, thanks to a new planting pattern designed by researchers,because spacing the plants in a uniform,staggered manner also promotes thicker,faster-spreading canopies that help keep the soil bed cool,moist and better protected from erosion,and moreover,improved weed control is another benefit.However,the actual optimum for any peanut will vary with variety,climate,soil,weed pressure,and equipment in use and will need to be adapted for each farm through observation and experiment.

【题目】苗期干旱及复水对花生光合特性及水分利用效率的影响.

【中文关键词】花生;干旱;复水;光合特性;水分利用效率
【英文关键词】peanut;drought;rewatering;photosynthetic characteristics;water use efficiency
【中文摘要】【目的】揭示苗期不同程度水分胁迫后复水对花生光合特性和水分利用效率的影响,以期为花生节水高产栽培提供理论依据。【方法】采用防雨棚池栽法,对比分析花生苗期不同程度的干旱及复水处理下花生光合速率、耗水量、产量和水分利用效率等相关指标的变化。【结果】花生苗期干旱,光合速率与蒸腾速率降低,干旱持续时间越长降低越明显,复水后光合速率和蒸腾速率均能较快恢复,产生一定的补偿效应;同时苗期干旱导致花生耗水量减少,且干旱程度越重耗水量越小;但水分利用效率并不随耗水量的减少而降低,干旱5 d处理产量水平的水分利用效率最高,对照次之,干旱15 d处理的最低。【结论】苗期适度干旱可减少花生的耗水量,提高产量水平的水分利用效率。
【英文摘要】【Objective】The objective of the experiment was to study the effects of different water stress at seedling stage and rewatering on photosynthetic characteristics and water use efficiency(WUE)of peanut,and to provide a scientific basis for water saving and high-yield cultivation of peanut.【Method】The method of pool culture in rainproof installations was used to study the effects of different drought at seedling stage and rewatering on photosynthetic characteristics,water consumption,yield,WUE and other indexes of peanut.【Result】Under drought at seedling stage of peanut,photosynthetic rate and transpiration rate both decreased,and furthermore,the longer the duration of drought was,and the more they reduced obviously,then,after rewatering,both the photosynthetic rate and transpiration rate can recover fast,and there was a compensation effect to some extent,but there were no over-compensation effects.Meanwhile,drought at seedling stage of peanut induced the reduction of water consumption,and the more severe droughts the smaller water consumption,however,WUE did not decrease with the water consumption decrease.Under the treatment of 5 d drought,WUE of the yield level was the highest,the control was the second,and the 15 d drought was the smallest.【Conclusion】At peanut seedling stage,the moderate drought process can reduce water consumption,and can also increase the WUE of production levels.

【题目】不同施肥处理对花生产量、品质及衰老的影响
【中文关键词】花生;肥料;衰老;产量;品质
【英文关键词】Peanut;Fertilizer;Senescence;Yield;Quality
【中文摘要】大田条件下,以“花育22号”品种为材料,研究了有机无机肥及其配施对花生产量和品质的影响。结果表明,不同种类肥料均能不同程度地提高花生根系活力、叶面积系数和叶片中叶绿素含量,延缓花生衰老,提高单株果数、饱果率和荚果产量。特别是有机肥可显著提高脂肪含量,无机肥可降低棕榈酸含量,提高亚油酸含量;施肥对硬脂酸、油酸、蛋白质及氨基酸等含量没有明显影响。有机无机肥配施对延缓植株衰老、提高荚果产量和脂肪含量效果优于单独施用其中任何一种肥料。
【英文摘要】A peanut variety,“Huayu22”,was used to investigate effects of different fertilizers on yield and quality of peanut.The results showed that all types of fertilizers could enhance root activity,leaf area index,and chlorophyll content at different degrees.Peanut senescence could be delayed and finally the number of pod per plant,rate of full pod and yield of pod were increased.Especially,the organic fertilizer significantly could increase fat content,and the inorganic fertilizer could reduce the content of palmitic acid and increase the content of linoleic acid.Fertilizer application had no markedly effect on the contents of stearic acid,oleic acid,protein and amino acid.Application of a combination of organic and inorganic fertilizer was superior to single application of any kind of fertilizer on delaying plant senescence and the increase of pod yield and fat content.

【题目】超高产夏玉米田土壤微生物与土壤酶的动态变 化
【中文关键词】夏玉米; 超高产; 细菌; 真菌; 放线菌; 脲酶; 转化酶;
【英文关键词】summer maize; super-high yielding; bacteria; fungi; actinomycetes; urease; invertase;
【中文摘要】为揭示超高产夏玉米田(产量>15000kg.hm-2)土壤微生物与土壤酶活性动态变化特性,在国家玉米工程技术研究中心(山东)试验场进行夏玉米生长季农田土壤微生物与土壤酶活性研究.在连续3年产量15000kg.hm-2以上的超高产夏玉米田中选择一块超高产田(HF,产量为20322kg.hm-2)与常规生产田(CF,产量为8920.1kg.hm-2)进行对比分析,主要测定0~20cm土层土壤细菌、真菌与放线菌数量及脲酶和转化酶活性.结果表明:播种后超高产田与常规生产田土壤微生物(细菌、真菌与放线菌)数量均表现出先升高后下降的趋势,超高产田在玉米生长后期土壤微生物数量低于常规生产田,细菌与放线菌表现尤其明显,收获期超高产田B/F值(细菌与真菌数量比)比播种期高2.03倍,比常规生产田高3.02倍,常规生产田收获期与播种期的B/F值变化不显著;超高产田土壤脲酶活性在播种31d(拔节期)后低于常规生产田,转化酶活性播种58d(开花期)后快速下降,低于常规生产田. 更多还原
【英文摘要】To reveal the characteristics of the dynamic changes of soil microbial populations and enzyme activities in super-high yielding(>15 000 kg · hm-2) summer maize farmland soil,a comparative study was conducted in the experimental fields in National Maize Engineering Research Center(Shandong).On the fields with an annual yield of >15 000 kg · hm-2 in continuous three years,a plot with the yield of 20 322 kg · hm-2(HF) was chosen to make comparison with the conventional farmland(CF) whose maize yield was 8920.1 kg · hm-2.The numbers of bacteria,fungi,and actinomycetes as well as the activities of urease and invertase in 0-20 cm soil layer were determined.The results showed that in the growth period of maize,the numbers of bacteria,fungi,and actinomycetes in the two farmland soils increased first and declined then.At the later growth stages of maize,the numbers of soil microbes,especially those of bacteria and actinomycetes,were lower in HF than those in CF.At harvest stage,the ratio of the number of soil bacteria to fungi(B/F) in HF was 2.03 times higher than that at sowing stage,and 3.02 times higher than that in CF.The B/F in CF had less difference at harvest and sowing stages.The soil urease activity in HF was significantly lower than that in CF at jointing stage,and the invertase activity in HF decreased rapidly after blooming stage,being significantly lower than that in CF.

【题目】Wide dissemination of multidrug-resistant Shigella isolates in China
【中文关键词】无
【英文关键词】ESBLs, ciprofloxacin, characterization
【中文摘要】无
【英文摘要】Objectives: To evaluate the prevalence of antimicrobial resistance and selected antimicrobial resistancemechanisms in Shigella isolates recovered in outpatients from 1997 to 2009 in China.Methods: The isolates were subjected to serotyping and antimicrobial susceptibility testing. Shigella isolatesproducing extended-spectrum b-lactamases (ESBLs) or resistance to ciprofloxacin were further characterizedby PFGE to determine the genetic relatedness. These isolates were also screened for b-lactamase genes andmutations in the quinolone resistance-determining regions (QRDRs) by PCR. DNA sequence analysis was alsoperformed.Results: After serotyping, 301 Shigella isolates were grouped into three subgroups and 13 distinct serotypes.The antimicrobial resistance profiles differed among subgroups and serotypes. Ciprofloxacin-resistant isolateswere mainly Shigella flexneri serotypes f2a and f4a, which were resistant to at least four additionalnon-quinolone antimicrobials. Three point mutations in the QRDRs of gyrA and parC were identified in all30 ciprofloxacin-resistant S. flexneri isolates. Plasmid-mediated blaCMY-2, blaCTX-M-14, blaCTX-M-15 and blaCTX-M-55-like genes were found in 29 ESBL-producing isolates and three clavulanic-acid-resistant isolates, and six isolatesalso exhibited resistance to ciprofloxacin. Distinct genetic differences in both serotypes and PFGE profiles wereobserved for these ciprofloxacin- or extended-spectrum-cephalosporin-resistant isolates.Conclusions: ESBL-producing or fluoroquinolone-resistant Shigella is no longer an unusual phenomenon in thelocal community. The monitoring programme in China should stay vigilant to the dissemination of these isolatesand the health agencies must take appropriate measures to restrict the abuse of antimicrobials, especiallyin the community.

【题目】Vibrio parahaemolyticus Isolates from Southeastern Chinese Coast Are Genetically Diverse with Circulation of Clonal Complex 3 Strains Since 2002
【中文关键词】无
【英文关键词】Vibrio parahaemolyticus Isolates, Diverse, Clonal Complex 3 Strains
【中文摘要】无
【英文摘要】Multilocus sequence typing (MLST) was used to examine the clonal relationship and genetic diversity of 71Vibrio parahaemolyticus isolates from clinical and seafood-related sources in southeastern Chinese coast between2002 and 2009. The tested isolates fell into 61 sequence types (STs). Of 17 clinical isolates, 7 belonged to ST3 of thepandemic clonal complex 3, with 3 strains isolated in 2002. Although there was no apparent clonal relationshipfound between clinical strains and those from seafood-related sources positive with pathogenic markers, therewere clonal relationships between clinical strains from this study and those from environmental sources in otherparts of China. Phylogenetic analysis showed that strains of 112 STs (61 STs from this study and 51 retrievedfrom PUBMLST database covering different continents) could be divided into four branches. The vast majorityof our isolates and those from other countries were genetically diverse and clustered into two major branches ofmixed distribution (of geographic origins and sample sources), whereas five STs representing six isolates split astwo minor branches because of divergence of their recA genes, which had 80% – 82% nucleotide identity to typicalV. parahaemolyticus strains and 73.3% – 76.9% identity to the CDS24 of a Vibrio sp. plasmid p23023, indicating thatthe recA gene might have recombined by lateral gene transfer. This was further supported by a high ratio ofrecombination to mutation (3.038) for recA. In conclusion, MLST with fully extractable database is a powerfulsystem for analysis of clonal relationship for strains of a particular region in a national or global scale as well asbetween clinical and environmental

or food-related strains.

【题目】Effect of soil salinity on physiological characteristics of functional leaves of cotton plants
【中文关键词】无
【英文关键词】Flowering and boll-forming stage; Physiological mechanism; Salt stress
【中文摘要】无
【英文摘要】This study analyzes the effects of soil salinity on fatty acid composition, antioxidative enzyme activity, lipid peroxidation, and photosynthesis in functional leaves during the flowering and boll-forming stages of two cotton cultivars, namely, CCRI-44 (salt-tolerant) and Sumian 12 (salt-sensitive), grown under different soil salinity conditions. Saturated (C16:0 and C18:0) and unsaturated fatty acid (FA) contents (C18:1), as well as superoxide dismutase activity increased, whereas high-unsaturated FA (C18:2 and C18:3) decreased, with the increase in soil salinity. The production of malondialdehyde increased with increasing lipoxygenase (LOX) activity, indicating that LOX catalyzed FA peroxidation under salt stress. Soil salinity had no significant effect on catalase (CAT) and peroxidases (POD) activity in the salt-sensitive cultivar Sumian 12, but significantly increased CAT and POD activities in the salt-tolerant cultivar CCRI-44. Net photosynthesis and stomatal conductance of the cotton cultivars decreased in response to salt stress; however, CCRI-44 showed a smaller reduction in photosynthesis than Sumian 12. The results indicated that stomatal apparatus limited leaf photosynthetic capacity in the salinity-treated plants of both cultivars. The net photosynthetic rate, maximum photochemical efficiency, and photochemical quantum yield of the cotton functional leaves showed positive correlation with double-bond index (DBI). These results suggested that salt stress caused DBI reduction and decreased the photochemical conversion efficiency of solar radiation and, thereby resulting in lower net photosynthetic rates.

【题目】Disruption of InlC2 enhances the internalization of Listeria monocytogenes by epithelial cells
【中文关键词】无
【英文关键词】L. monocytogenes, inlC2, Internalization, Epithelial cells
【中文摘要】无
【英文摘要】The LPXTG internlin gene inlC2 is L. monocytogenesspecific and formed an internalin cluster withinlD, inlE and, in some cases, inlG between ascB and dapE.Of note, inlC2 was transcribed monocistronically, and ofthese internalin genes, only inlC2 expression was enhancedin synthetic human gastric fluid. Disruption of inlC2 did nothave a polar effect on its downstream internalin genes, butenhanced the production of InlA without changing inlAtranscript level, suggesting a link between inlC2 expressionand inlA posttranscriptional regulation. The adhesion andinvasion rates of DinlC2 mutant in epithelial cells weresignificantly higher than those of parent strain. Also,recovery of listerial cells from the liver and spleen wasmuch higher in mice inoculated with DinlC2 mutant than itsparent strain. Thus, we speculate that increased invasion ofDinlC2 mutant into epithelial cells might be due to elevatedproduction of InlA, a major invasin, that could lead furtherto increased listerial virulence. Overall, this studypresents supportive evidence that internalization ofL. monocytogenes could be a complex network or unknownmechanisms requiring further study.

【题目】Monitoring the leaf water content and specific leaf weight of cotton (Gossypium hirsutum L.) in saline soil using leaf spectral reflectance
【中文关键词】无
【英文关键词】Cotton; Saline soil; Spectral reflectance; Leaf water content; Specific leaf weight; Monitoring model
【中文摘要】无
【英文摘要】The objectives of the present study are to determine the relationships of equivalent water thickness (EWT), fuel moisture content (FMC) and specific leaf weight (SLW) of cotton leaves with leaf spectra reflectance, and to find sensitive spectral bands and best spectral indices to establish quantitative models for the quick and accurate estimation of EWT, FMC and SLW in cotton plants under different salinity levels. Plot experiments were conducted at different levels of salinity and cotton cultivars during three consecutive growing seasons. Time-course measurements of the leaf spectral reflectance, leaf fresh weight, leaf dry weight, leaf area, and leaf ion content of cotton were recorded under various treatments. Then, the normalized difference spectral indices (NDSI) and ratio spectral indices (RSI) based on the leaf spectrum were obtained within 350 – 2500 nm, and their correlation with EWT, FMC and SLW were quantified. The results show that the EWT, FMC and SLW of cotton leaves increased with increasing soil salinity levels and that the changes in leaf spectral reflectance under varied salinity levels are highly significant, with consistent patterns across the two cultivars tested. As the soil salinity levels increased, the Na+, Cl − , and SO42 − content in the cotton leaves increased, whereas K+ and Ca2+ decreased at the same growth stage. In addition, the relationships among ion content, EWT, FMC and SLW were significant ($P < 0.01$). The sensitive spectral bands for EWT, FMC and SLW occurred mainly within the near infrared (NIR) and short-wave infrared (SWIR) ranges. The best spectral indices for estimating EWT, FMC and SLW in cotton were found to be NDSI (R1347, R2307), RSI (R2307, R1347); NDSI (R1650, R1801), RSI (R1801, R1650); NDSI (R1300, R2308), RSI (R2307, R1347) and 1650/2220 nm ratio, and the regression models based on the above spectral indices were identified as the best equations for the effective estimation of EWT and SLW in cotton. After testing these derived equations, the models for EWT and SLW estimation based on NDSI and RSI yielded an R2 of over 0.73, with more satisfactory performance under different ecological conditions, but the estimated accuracies of FMC models were very low and may not be suitable for estimating vegetation water content in saline conditions from leaf-level reflectance. The high fit between the measured and estimated values indicates that the EWT and SLW models based on new spectral indices from leaf-level reflectance could be used for the indirect estimation of plant salinity status by monitoring the changes in EWT and SLW caused by soil salinity in cotton plants.

【题目】有机-无机肥配施对紫色土坡耕地氮素淋失的影响
【中文关键词】有机;无机;紫色土;氮素;淋失
【英文关键词】organic2inorganic fertilization; purp le soil; nitrogen; leaching
【中文摘要】通过坡地渗漏小区定位试验,研究总施氮量相同情况下,施肥方式对紫色土坡耕地氮素淋失的影响. 结果表明,有机2无机肥配施会影响紫色土硝酸盐向下累积过程,显著降低紫色土坡耕地硝酸盐累积量. 渗漏液中硝态氮含量在0.15~46. 99mg · L -1之间,占总氮含量的66.4% ~96.3%;总氮淋失量在(4.05 ±0.37) ~(37.82±0.86) kg · hm - 2之间,占当季施氮

量的2.7%~25.2%. 在维持总施氮量相同的条件下,与常规氮磷钾施肥相比,农家肥、秸秆与化肥配合施用的渗漏液总氮含量分别降低了71.0%、61.4% ,总氮淋失量分别降低了48.1%、31.6%. 这表明有机2无机肥配施能显著降低紫色土坡耕地氮素淋失量,对有效控制紫色土区浅层地下水硝酸盐污染具有重要作用.

【英文摘要】Lysimeter experiments in a purp le soil with a hilly slope were performed to study the effects of combined app lication of organic and inorganic fertilizers on nitrogen leaching. The results showed that accumulated nitrate decreased significantly due to organic2inorganic fertilization, suggesting that the nitrate accumulation p rocess of slop ing crop land in purp le soil was affected by fertilization styles. Measured nitrate2N contents were in the range of 0115~46. 99 mg · L - 1 during the period 2004 to 2006, which accounted for 66. 4% ~96. 3% of the total nitrogen. Total soil nitrogen contents of organic inorganic fertilization (OMNPK, RSDNPK) declined by 71. 0% and 61. 4% , respectively, and total nitrogen leaching fluxes of OMNPK or RSDNPK treatments decreased by 48. 1% and 31. 6%, respectively, compared to conventional NPK fertilizer treatments at the same total N app lication rates. It could be concluded that nitrogen leaching decreases through the combination of organic and inorganic fertilization. Therefore, it is important to control nitrate pollution of shallow groundwater in the area of purp le soil via changing fertilization modes.

【题目】紫色土坡耕地硝酸盐流失过程与特征研究
【中文关键词】紫色土;坡耕地;硝酸盐;流失
【英文关键词】Purple soi;l Slope cropland; Nitrate; Loss load
【中文摘要】通过对紫色土坡耕地地表径流、壤中流径流过程及其硝酸盐含量的长期监测,研究紫色土坡耕地硝酸盐流失特征。结果表明,径流过程对紫色土坡耕地硝酸盐流失过程影响明显。地表径流过程中硝酸盐含量随降雨历时表现为先升后降的趋势,而壤中流过程则表现为不断上升、趋于稳定的趋势。紫色土坡耕地硝酸盐流失潜在的环境风险极大,历次降雨产流事件中地表径流和壤中流NO3--N平均含量分别为0·73±0·17 mgL-1、21·72±2·05mgL-1,其中, 75%的地表径流NO3--N含量超过0·5mgL-1, 85%的壤中流NO3--N含量超过10 mg L-1。紫色土坡耕地地表径流NO3--N年流失负荷为0·93±0·05 kg hm-2,壤中流NO3--N年流失负荷为33·51±2·73 kg hm-2,分别占当季施肥量的0·62%、22·34%,随壤中流淋失是紫色土坡耕地硝酸盐流失的主要途径。紫色土坡耕地硝酸盐流失不仅可能造成当地地表水富营养化,而且可能造成当地浅层地下水硝酸盐污染,将加剧长江上游水环境压力。
【英文摘要】Nitrate loss is an important route ofnitrogen loss, and itsmechanism in flatcropland has been documented · However, it is stillunclearhow nitrate loss takes place in sloping cropland · Long-term plotexperiments on field runoffwere performed tomonitornitrate losswith runoff process in a sloping cropland of purple soil · Results show thatrunoffaffected the process ofnitrate loss from the slope cropland · Nitrate content in runoff increased at the initialperiod ofa rainfalleven,t and then declined, and in the subsurface flow, it increased steadily and leveled offgradually · The potential environmental risk of the nitrate in surface runoff from slopeland ofpurplish soil is extremely high · The average nitrate content in surface runoff and subsurface flows of several rainfall eventswasN 0·73±0·17 mgL-1andN 21·72±2·05 mgL-1, respectively · In about75% of the surface runoffs, nitrate contentwas aboveN 0·5 mgL-1and in about85% of the subsurface flow aboveN 10 mgL-1· Itwas calculated that that the nualnitrate losswith surface runoff from the slope cropland ofpurple soilwasN 0·93±0·05 kg hm-2, accounting for0·62% of the fertilizer-N applied in the currentcrop season, whilewith the sub-surface flow, it was N 33·51±2·73 kghm-2, accounting for22·34%, suggesting hatnitrate lossvia subsurface flow is themain route ofnitrate loss from the sloping cropland ofpurple soi,l notonly leading to eutrophication ofsurfacewaterbodies and pollution fgroundwater, butalso aggravating environmentalpressure in the upper streams of heChangjiangRiver

【题目】基于RBF 神经网络的土壤有机质空间变异研究方法
【中文关键词】径向基函数网络,误差分析,土壤,有机质,空间异质性,普通克里格
【英文关键词】radial basis function networks, error analysis, soils, organic matter, spatial heterogeneity, ordinary kriging
【中文摘要】通过研究土壤性质的空间变异和空间插值方法,快速准确获取土壤性质的空间分布是精确农业和环境保护的基础。该文以四川眉山一块约40 km2 的区域为试验区,采集表层土壤(0~20 cm)样点80 个,利用径向基函数(RBF)神经网络建立空间坐标和邻近样点与土壤有机质间的非线性映射关系(RBF2),模拟土壤有机质的空间分布。与普通克里法(OK)和仅以坐标为网络输入的神经网络方法(RBF1)相比,RBF2 的插值精度有显著的提高;相同样点密度下其相对预测误差分别较OK 和RBF1 减小了9.87%、1.97%(样本A)和3.09%、2.36%(样本B);即使样点数减半的情况下RBF2 的相对预测误差也分别较OK 和RBF1 减小了10.23%和2.33%,并且插值图差异相对较小,可以更好地反映土壤有机质空间分布的异质性。因此,利用以坐标和邻近样点为输入的神经网络方法可以相对准确、快速地获取区域土壤性质空间分布的异质性信息。
【英文摘要】Fast and accurate simulation of the spatial distribution of soil properties from the study on soil spatial variability and spatial interpolation was the basis for precision agriculture and environmental protection. In this paper, 80 topsoil samples were collected in a 40 km2 test area in Meishan, Sichuan Province. Nonlinear mapped relations between spatial coordinatesand neighbor samples and the content of soil organic matter were established based on radial basis function neural network (RBF2) to simulate the distribution of the content of soil organic matter in the test area. Compared with ordinary kriging method (OK) and radial basis function neural network method only using spatial coordinates as inputs of net (RBF1), thepredicted errors achieved by RBF2 were much smaller, which were reduced by 9.87%, 13.09% and 1.97%, 2.36%, respectively;even samples were cut in half, the predicted error was still reduced by 10.23% and 2.33%, respectively, compared with OK and RBF1 which used in all samples. Besides, RBF2, which was able to make the interpolation maps and had smaller difference comparatively in different samples, could express the spatial heterogeneity of soil organic matter well. Thus, the spatial heterogeneity information of soil properties could be achieved exactly and quickly by the method of radial basis function neural network which used spatial coordinates and neighbor samples information as inputs of net.

【题目】官司河流域防护林结构调整及景观格局变化
【中文关键词】官司河流域; 防护林; 结构调整; 景观格局; 物元分析
【英文关键词】GuansiRiverw atershed; protection forests; structure regulation; landscape structure; matter element analysis
【中文摘要】利用2005年度的IKONOS4卫片解译数据、1B1万林相图、2007年度森林资源二类小班调查资料, 结合样地调查数据以及四川省林业科学研究院森林生态效益定位站(四川绵阳新桥) 径流场的有关数据, 对绵阳官司河流域的防护林结构进行了调整, 并对调整前后的生态经济效益和景观格局的变化进行了对比分析。结果表明: 目前本区的林地面积分配不合理。针阔混交林面积偏小, 仅占整个有林地面积的14197%, 而针针混交林的面积却占了27137%, 针叶纯林的面积更是占了421 48%。从物种多样性、均匀度以及生态优势度综合来看, 均表现出混交林优于纯林。经调整后各类防护林面积比例为针阔混交林281 05%、灌木林171 28%、经济林3127%、阔叶纯林13113%、针针混交林111 04%、针叶纯林101 89%、草地61 34%。针阔混交林面积明显增加, 从原来的124139 hm2增加到现在的2331 13 hm2, 增加了871 42%。经济林的面积有所增加, 从原来的961 67 hm2 增加到调整后的110130hm2。本区防护林土地利用的生态效益指数由调整前的2 0531 93点上升到调整后的2327139点, 净增了13131%,经济效益指数则从调整前的2 3001 40点上升到调整后的2 493163点, 净增了8140%。景观多样性指数(H)和景观均匀度指数(E)分别由调整前的11826 1和01523 8增加到调整后的211923和017683, 分别增加了20105%和46168%。景观优势度和蔓延度指数由调整前的017348和01 7327减少到调整后的013816和016928。说明景观的异

质性提高,向着多样化和均匀化方向发展。调整后各景观要素的边缘密度和斑块密度减少,其斑块向小型化发展,景观破碎度增加。调整后各要素的散布与分列指数IJ I 都有明显的增加,说明其空间关系趋于复杂化。聚集度指数AI 增大,其斑块越来越聚集,斑块的结合底在增大。各景观要素的LSI 都有不同程度的减少,而分维数都有不同程度的增加,说明其斑块复杂程度减少,稳定性增加。

【英文摘要】By application of interpreted IKONOS4 in 2005, 1B10 000 forest map, data of C lass II forest survey in 2007, as we ll as runoff data in permanent runo ffmon ito ring field, the structure o f pro tection forest systems in Guangsi r iver inM ianyang munic ipality w ere regulated; besides, the eco-econom ic bene fits and landscape pattern before and after regulation w ere analyzed. The resu lts indicated that the forest distribu tion in this area is not rationa,l the area ofm ixed forest betw een coniferous and broad-leafed species is re lative ly low (14197%) , the area of mixed forest by con iferous spec ies and pure con iferous forestw as 27137% and 42148% respectively. Judging by biodiversity,evenness and eco-dom inance, them ixed forest ismuch better than that o f pure fores.t A fter regu lation, the areaofm ixed coniferous and broad-leafed fo res,t shrub fores,t econom ic fores,t broad-leafed fores,t m ixed forest by coniferous species, pure coniferous forest and grassland w as 28105% , 17128%, 13127% , 13113%, 11104% ,10189% and 6134% respect ively1The area of m ixed fo rest betw een coniferous and broad-leafed spec ies increases sharply, from 124139 hm2 to 233113 hm2 (by 87142%) ; the econom ic forest goes up from 96167 hm2 to 110130 hm21M eanwhile, the ecolog ica lbenefit index increases from 2053193 to 327139(or by 13131%), economic benefit index goes up from 2 300140 to 2 493163(o r by 8140%) 1The landscape diversity index (H) and evenness index (E) change from 118261 and 01523 8 before regulation to 211923 and 017683 (or by 20105% and 46168% respective ly) 1A fter regu lation, the index of landscape dom inance and contag ion decreases from 01734 8 and 017327 to013816 and 016928 respectively, th ismeans that the heterogene ity of landscape increases and develops tow ard diversity and evenness1Besides, themarg in density and patch density of landscape elements go down; the patch develops tow ard sm all size and the degree of fragmentation increases1Meanwh ile, the dispersion and IJI increase obviously, wh ich means the spatia l relationship becom e more complicated1H igher AI means increase of congregation 1LSI of landscape elements decrease but fractura ld imension goes up to some exten;t this in dicates that the complexof patches decrease and stability increases.

【题目】官司河流域防护林景观结构及生态功能研究

【中文关键词】官司河流域;防护林;景观要素;景观结构;生态功能
【英文关键词】Guansi River watershed; protection forests; landscape elements; landscape structure; ecological function

【中文摘要】利用2005 年度的IKONOS4 卫片解译数据和2007 年度小班调查资料,结合样地调查资料以及四川省林业科学研究院森林生态效益定位站(四川绵阳新桥)径流场的有关数据,对绵阳官司河流域的防护林体系景观结构及生态功能进行了分析。结果表明:该区域防护林景观中,以松柏混交林(Mixed Alnus-Cupressus forest)面积最大,占27.37%,其次是马尾松纯林(Pinusmassoniana forest),占25.41%。栎柏混交林(Mixed Quercus-Cupressus forest)最少,只占0.96%。纯林面积明显大于混交林,前者比后者大45.31%。栎柏混交林、松柏栎混交林(Mixed Pinus- Cupressus- Quercus forest)最大斑块指数(LPI)、边缘密度(ED)和斑块密度(PD)较小,分布较为破碎。而马尾松纯林、松柏混交林和柏木纯林(Cupressus forest)分布较为集中。桤柏混交林(Mixed Alnus-Cupressus forest)和松柏混交林的散布与并列指数(IJI)较大,其空间关系较为复杂。栎柏混交林、柏木纯林的聚集度(AI)较小,斑块分散度大,连接性较差;而桤柏混交林、松柏混交林的分散度较大,连接性较好。桤柏混交林、松柏混交林的形状指数(LSI)较小,形状分布较规则,而马尾松纯林、柏木纯林的形状指数较大,形状较复杂。从不同景观类型林下灌草层的生物多样性指数可知,松柏混交林、栎柏混交林的灌草多样性指数均较大,而马尾松纯林、柏木纯林则较小。从保持水土功能来看:桤柏混交林、松柏混交林的水土保持效果优于柏木纯林、马尾松纯林,桤柏混交林的水土保持效果优于松柏混交林。因此,对长江防护林进行空间结构调整,应多采用混交林模式,针阔混交林代替针针混交,乔灌草结合,调整合理的密度,使防护林景观的生态功能更好地发挥。

【英文摘要】Based on the translated data from remote sensing images (IKONOS4) in 2005, the survey data of sub-compartments in 2007 and data from the runoff plots in Xinqiao positioning research station, the landscape structure and ecological function of protection forests in Guansi river watershed were analyzed. The results have shown that the area of mixed Pinus-Cupressus forest is the largest one, occupying 27.37%, the Pinus massoniana forest was the second, accounting for 25.41%, while mixed Quercus-Cupressus

forest is the least, occupying 0.96% only. The area of pure forest is obviously large, which is 45.31% higher than mixed forests. The LPI(largest patch index),ED(edge density and PD(patch density) of mixed Quercus-Cupressus forest and mixed Pinus-Cupressus-Quercus forest is smaller, which mean that the distribution is fragmentized; while the Pinus massoniana forest, mixed Pinus-Cupressus-Quercus forest and Cupressus forest is centralized. The IJI (interspersion juxtaposition index)of mixed Alnus-Cupressus forest and mixed Pinus-Cupressus forest is bigger, which implies that the spatial relationship is the more complicated.The AI(aggregation index) of mixed Quercus-Cupressus forest and Cupressus forest is smaller, which means that the patch dispersion degree is bigger and connection is worse, while mixed Alnus-Cupressus forest and mixed Pinus-Cupressus-Quercus forest is opposite. The LSI of mixed Alnus-Cupressus forest mixed Pinus-Cupressus-Quercus forest is smaller, which indicates that the shape distribution is more regular, while Pinus massoniana forest and Cupressus forest is opposite. The diversity of shrub and herb of mixed Pinus-Cupressus-Quercus forest and mixed Quercus-Cupressus forest is bigger, while Pinus massoniana forest and Cupressus forest is opposite. From the function of water and soil conservation,the effectiveness of mixed Alnus-Cupressus forest and mixed Pinus-Cupressus-Quercus forest is better than Cupressus forest and Pinus massoniana forest, the effectiveness of mixed Alnus-Cupressus forest is better than mixed Pinus-Cupressus-Quercus forest. Thus, in the process of restructuring the protection forests in the upper reach of Changjiang river, more mixed forest models, especially with combination of trees, shrubs and grasses would be applied; besides, dense stands should be regulated in order to exert sound ecological function.

【题目】Virtual Visualization System for Growth of Tobacco Root
【中文关键词】烟草,根系,仿真模型,虚拟植物,可视化
【英文关键词】Tobacco, root, simulation model, virtual plant, visualization
【中文摘要】形态可视化技术是虚拟植物研究的关键技术之一。本研究以烟草根系为对象,将系统分析方法和数学建模技术应用于烟草根系的形态建成,通过对烟草根系形态数据的定量分析,并结合前人的研究成果,构建了烟草根系生长模型(纵向伸展速率、横向伸展速率、根系生长方向)、根系分枝模型(分枝方向、分枝位置、分支数量)等。以此为基础,运用计算机图形学技术,构建了烟草根系虚拟生长系统。系统运行结果表明该系统能较好的模拟烟草根系的形态特征,能较逼真的实现烟草根系生长过程的虚拟显示。

【英文摘要】Abstract :Visualization study on the growth of virtual plant roots is of great significance to enhance the overall level of research on virtual plant growth. In this study, with the tobacco root as the object, its growth was divided by systematic analysis into three stages: root emergence, root growth, and root branching. Through the quantitative analysis of the morphological data of the tobacco root and in combination with results of previous studies, the tobacco root growth, branching and other models were established, and parameter values of the models were extracted. On this basis, computer graphics technology was applied to establish a virtual visualization system for tobacco root growth that should be capable of simulating root growth and computing indicators of roots including the number, length, density, etc. Results indicated that this system can do a better job of simulating the morphological features for the tobacco root and virtually displaying the process of tobacco root growth in a more realistic way.

【题目】乳酸菌胞外蛋白水解酶基因的克隆及在大肠杆菌中表达
【中文关键词】关键词:乳酸菌;胞外蛋白水解酶;降血压肽;克隆;表达
【英文关键词】Key words:Lactobacillus;extracellular protease;anti-hypertensive peptide;cloning;expression
【中文摘要】目的:构建连接乳酸菌胞外蛋白水解酶基因的非抗性重组质粒。方法:以瑞士乳杆菌基因组DNA 为模板,克隆胞外蛋白水解酶基因,连接到以thyA 为选择压力的非抗性穿梭表达载体pW425et 上,构建重组质粒pW425et-R,转化入thyA 基因缺陷型E.coli X13 感受态细胞,SDS-PAGE 电泳检测显示该水解酶得到了表达。结果:成功构建了重组质粒pW425et-R,胞外蛋白水解酶基因在E.coli X13 中得到正确表达。结论:成功地表达了乳酸菌胞外蛋白水解酶基因,可为进一步制备具降血压功能基因工程乳酸菌提供参考。
【英文摘要】Objective: To construct a recombinant plasmid carrying extracellular protease gene from Lactobacillus. Methods:The extracellular protease gene was cloned from genomic DNA of L. helveticus and inserted into the expression vector pW425et.Then the recombination plasmid was transformed into the competence thyA gene-mutant E. coli X13. The expressed protein wasanalyzed by SDS-PAGE. Results: The recombinant shuttle plasmid pW425et-R was constructed successfully and the Lactobacillusextracellular proteinase gene was expressed in E. coli X13. Conclusion: Our research idea is feasible for the successfulexpression of Lactobacillus extracellular protease gene in E. coli X13, which will provide a basis for further preparation ofrecombinant Lactobacillus with anti-hypertensive function.

【题目】Studies on construction of a recombinant Eimeria tenella SO7 gene expressing
【中文关键词】none
【英文关键词】Eimeria tenella
SO7 gene
Non-antibiotic
Escherichia coli
Protective effect
【中文摘要】none
【英文摘要】Eimeria spp. are the causative agents of coccidiosis, a major disease affecting the poultry industry. Arecombinant non-antibiotic Escherichia coli that expresses the Eimeria tenella SO7 gene was constructed andits protective efficacy against homologous infection in chickens was determined. The three-day-old chickenswere orally immunized with the recombinant non-antibiotic SO7 gene expressing E. coli and boosted twoweeks later. Four weeks after the second immunization, the chickens were challenged with 5×104homologous sporulated oocysts. The protective effects of the recombinant non-antibiotic E. coli weredetermined by measuring body weight change, mortality, histopathology, lesion scores, oocyst counts, thespecific antibody response and the frequency of CD4+ and CD8+ lymphocytes in peripheral blood. Theresults showed that immunization with SO7 expressing E. coli resulted in significantly improved body weightgain, reduced lesion scores and oocyst shedding in immunized chickens compared to controls. Furthermore,administration of recombinant SO7 expressing E. coli leads to a significant increase in serum antibody, CD4+and CD8+ T cells in peripheral blood of chickens. These results, therefore, suggest that the recombinant nonantibioticE. coli that expresses the SO7 gene is able to effectively stimulate host protective immunity asevidenced by the induction of development of both humoral and cell-mediated immune responses againsthomologous challenge in chickens.

【题目】猪白细胞介素18 成熟蛋白基因的克隆与表达
【中文关键词】猪; 白细胞介素18; 乳酸菌; 克隆; 基因表达
【英文关键词】【Key words】Pig; Interleukin 18; Lactic acid bacteria; Cloning; Gene expression
【中文摘要】目的克隆猪白细胞介素18(pIL-18) 成熟蛋白基因,并在植物乳杆菌(Lb. plantarum) NC8 中进行表达。方法通过RT-PCR 方法从猪脾脏细胞中扩增出pIL-18 成熟蛋白基因,克隆到T 载体pMD18-T 后测序; 将阳性基因片段克隆至大肠埃希菌- 乳酸菌穿梭表达载体pSIP-409 构建重组表达载体pSIP-409-IL-18,进行酶切和PCR 鉴定;应用电穿孔技术将其转化至Lb. plantarum NC8 中,经SppIP 诱导表达后,进行SDS-PAGE 及Western-blot 分析。结果经测序,pIL-18 成熟蛋白基因核苷酸长度为579 bp,编码193 个核苷酸; 酶切和PCR 鉴定证明成功构建了重组表达载体pSIP-409-IL-18; SDS-PAGE 及Western-blot 分析表明重组菌表达了18 kD 的融合蛋白,该重组蛋白可以与鼠抗猪IL-18多克隆抗体反应。结论成功克隆了pIL-18 成熟蛋白基因,并获得有生物活性的pIL-18 重组乳酸菌,为研制开发IL-18 重组乳酸菌制剂奠定基础。【关键词】猪; 白细胞介素18; 乳酸菌; 克隆; 基因表达
【英文摘要】【Abstract】Objective To clone porcine interleukin 18 mature protein gene and express it in Lactobacillus plantarumNC8 (Lb. plantarum NC8) . Methods The porcine interleukin 18 mature protein gene (pIL-18) was amplified from its spleencells by RT-polymerase chain reaction (PCR) method,then subcloned to pMD18-T and sequenced. The positive gene fragmentwas subcloned to lactic acid bacteria expression vectors PSIP-409 to construct recombinant expression vector PSIP-409-IL-18and identified by enzyme digestion and PCR. The recombinant expression vector PSIP-409-IL-18 was transformed to Lb. plantarumNC8 through electric perforation techniques. After the recombinant strains were induced to express,the expression productwas analysed by SDS-PAGE and Western-blot. Results Sequencing results showed that the pIL-18 mature protein genecontained 579 bp of bases and coded 193 nucleotides. The recombinant expression vector pSIP-409-IL-18 was proved to havebeen successfully constructed by enzyme digestion and PCR. SDS-PAGE and Western-blot analysis indicated that 18 kD fusionprotein was expressed by these recombinant strains and it can react with the IL-18 polyclonal antibody of mouse anti-porcine.Conclusion The pIL-18 mature protein gene was amplified. And the pIL-18 recombinant Lactic acid bacteria with boligicalactivity was successfully

constructed,which lay the foundation for the development of IL-18 recombinant Lactobacillus.

【题目】牛乳中乳酸乳球菌nisRK 基因的克隆与序列分析
【中文关键词】关键词: 乳酸乳球菌; nisRK 基因; 克隆; 序列分析
【英文关键词】Key words : Lactococcus lactis ; nisRK gene ; cloning ; sequence analysis
【中文摘要】以一株分离自牛乳中乳酸乳球菌染色体DNA 为模板,采用PCR 技术扩增出乳链菌肽生物合成的双组分调控元件(nisRK 基因) 。试剂盒回收纯化nisRK 基因后将其克隆入以氨苄青霉素为选择压力的pGEM2T克隆载体中,再转化E. coli DH5 α 感受态细胞,筛选阳性克隆,提取重组体,进行酶切鉴定和PCR 鉴定,并对nisRK基因进行序列测定,与已知序列进行同源性比较。结果表明成功地克隆出nisRK 基因,全长为2 035 bp ,与国外报道的nisRK基因同源性高达9919 %。关键词: 乳酸乳球菌; nisRK 基因; 克隆; 序列分析
【英文摘要】Using chromosome DNA of Lactococcus lactis isolated from milk as template , nisRK gene wasamplified by PCR with Pf u DNA polymerase. After purification , the PCR product was cloned into pGEM2T vector containing ampicillin resistance gene to generate recombinant plasmid pGEM2T：：nisRK. ThenpGEM2T：：nisRK was transformed into E. coli DH5 α competent cells. Identification by restriction en2donuclease digestion and PCR technique showed that the whole nisRK gene was cloned successfully. Se2quence analysis indicated that nisRK gene , 2 035 bp , displayed 9919 % nucleotide homology with thepublished abroad.

【题目】赣无1油茶优良无性系经济性状与气象因子的典型相关分析
【中文关键词】森林培育学;油茶;优良无性系;经济性状;气象因子;典型相关分析.
【英文关键词】siviculture;Camellia oleifera;superior clone,economic characters,meteorological factors;canonical correlation analysis.
【中文摘要】分析了油茶赣无1优良无性系连续3年的经济性状的变化规律,并运用典型相关分析研究了其与气象因子的相关性,结果表明:(1)典型相关分析可以综合地反映油茶优良无性系的经济性状及与气候因子之间关系,探索其经济性状与环境因子之间的变化机理。(2)赣无1油茶在2004年至2006年间每年自8月初至10月下旬的干出籽率、鲜果含油率及干籽含油率与日均气温、最高气温、最低气温之间相关程度最高,其中2004年与2005年其鲜果含油率与日均气温、日最高温及最低气温呈逆向趋势,干籽含油率与日最高气温、日均气温呈正向趋势,但与日最低气温呈反向趋势;2006年其鲜果含油率与日最低气温及日照时数呈逆向趋势,干籽含油率与日均气温呈反向趋势,但干籽含油率与日照时数及最低气温、鲜果含油率与日均气温呈正向趋势。(3)油茶赣无1鲜出籽率在各年度间及同一年度不同考种时间段间表现稳定,而干出籽率、鲜果含油率及干籽含油率在不同年度与时间段间受气象因子影响变化较大。
【英文摘要】This article analyzes the three-year continuous variation regularity about the economic properties of Ganwu 1 Camellia oleifera superior clones,and studies on the correlations between these economic properties and the meteorological factors based on application of canonical correlation analysis.The results show as follows:(1) It can synthetically express the relationship between the meteorological factors and the main economic properties of Camellia oleifera superior strains in accordance with canonical correlation analysis,and explore the veriatson mechanism of its economic characters and the environmental factors.(2) There were closest degree of correlation among the given dry seed rate,oil content of fresh seed,oil content of dry seed and daily mean tempeerature,maximum

temperature,minimum temperature from the early August to late October in the three years from the period of 2004 to 2006,and the associations among the oil content of fresh seed and the daily mean temperature,maximum temperature,minimum temperature;There were positive trends among the oil content of dry seed and the daily mean temperature,maximum tempearture,and there was a reverse trend between minimum temperature and the oil content of dry seed in 2004 and in 2005;but there were reversed tendency among oil content of fresh seed and daily minimum temperature,sunshine hours,also oil content of dry seed and daily mean temperature;but the positive trend among oil content of dry seed and sunshine duration,daily minimum temperature,oil content of fresh seed,daily mean temperature in 2006.(3) The fresh seed yield of Camellia oleifera clone dsplayed stability among each year and the different periods of time in the same year about the seed testing;but given dry seed rate,oil content of fresh seed and oil content of dry seed has been greatly affected by meteorological factors in the different years and various time quantum.

【题目】Glutamine transport and feedback regulation of nitrate Glutamine transport and feedback regulation of nitrate cytosolic nitrate pools
【中文关键词】无
【英文关键词】Feedback regulation, glutamine transport, Hordeum vulgare L., nitrate reductase, nitrogen status.
【中文摘要】无
【英文摘要】The size of tissue amino acid pools in plants mayindicate nitrogen status and provide a signal that canregulate nitrate uptake and assimilation. The effects oftreating barley roots with glutamine have been examined,first to identify the transport system for theuptake of the amino acid and then to measure rootNR activity and cellular pools of nitrate. Treating Nreplete roots with glutamine elicited a change in thecell membrane potential and the size of this responsewas concentration dependent. In addition, the size ofthe electrical change depended on the previous exposuresof the root to glutamine and was lost aftera few cycles of treatment. Whole root tissue pools ofglutamine and phenylalanine increased when rootswere incubated in a nutrient solution containing 10 mMnitrate and 1 mM glutamine. Treating roots with 1 mMglutamine increased cytosolic nitrate activity from3 mM to 7 mM and this change peaked

after 2 h oftreatment. Parallel measurements of root nitrate reductaseactivity during treatment with 1 mM glutamineshowed a decrease. These measurements provideevidence for feedback regulation on NR activity thatresult in changes in cytosolic nitrate activity. After 6 hin glutamine both root NR activity and cytosolic nitrateactivity returned to pretreatment values, while tissueconcentrations of glutamine and phenylalanine remainedelevated. The data are discussed in terms ofthe mechanisms that are most likely to be responsiblefor the changes in cytosolic nitrate.

【题目】单核细胞增生性李斯特菌prfA 基因缺失株的构建及其生物学
【中文关键词】单核细胞增生性李斯特菌,突变株,prfA 基因,同源重组,生物学特性
【英文关键词】Listeria monocytogenes,mutant,prfA,homologous recombination,biological characteristics
【中文摘要】【目的】单核细胞增生性李斯特菌(Lm) 是人兽共患李斯特菌病的病原菌,其致病性与调控因子PrfA 蛋白作用下毒力基因的表达有着密切关系,本文初步探讨了PrfA 蛋白对细菌毒力因子的调控作用。【方法】利用同源重组技术对血清型分别为1 /2a 和4b 的LM4、F4636 进行prfA 基因的敲除,并构建其回复突变株,对获得的突变株LM4 Δ prfA、F4636 Δ prfA 进行生物学特性研究。【结果】实验结果表明: 两株缺失株的溶血活性丧失、回复突变株的溶血活性得到恢复,突变株还丧失磷脂酶活性,黏附和侵袭特性显著下降(P < 0. 05) ,对BALB / c 小鼠的半数致死剂量提高了105 个数量级。【结论】由此表明,PrfA 蛋白对hly、plcB、inl 家族基因的表达及细菌毒力具有重要的调控作用。prfA 基因缺失株的构建为进一步研究PrfA 蛋白的调控功能提供了材料,为研究其在Lm 致病性中的作用奠定了基础。
【英文摘要】[Objective] Listeria monocytogenes (Lm) is an important pathogen that can cause serious listeriosis in humansand animals. The pathogenicity of Lm has a close relationship with the PrfA protein regulating the expression of virulencegenes. Therefore,we studied the regulation functions of PrfA and its role on Lm's virulence. [Methods] The prfA genesof LM4,serotype 1 /2a,and F4636,serotype 4b,were deleted by homologous recombination technology, and thebiological characteristics of the mutants were further studied. [Results] The prfA gene deleted strains LM4 Δ prfA andF4636 Δ prfA and their back mutation strains were successfully constructed. The results show that the hemolysis activity waslost in prfA deleted strains and was recovered in the reverse mutant strains. The prfA deleted strains lost phospholipaseactivity; their adhesion and invasion ability significantly decreased. Furthermore,their 50% lethal doses (LD50) were 5logs higher comparing with wild type strains. [Conclusion] PrfA regulates hly,plcB and inl gene family and affectssignificantly Lm's virulence.

【题目】肠炎沙门氏菌鸡源株ompR 基因缺失株的构建及生物学特性
【中文关键词】肠炎沙门氏菌,生物被膜,ompR 基因,缺失,毒力
【英文关键词】Salmonella enteritidis,biofilm,ompR gene,mutant,virulence

【中文摘要】【目的】为了探讨ompR 基因在肠炎沙门氏菌生物被膜形成及毒力中的作用。【方法】以肠炎沙门氏菌作为母本,运用自杀性载体pGMB151 构建了ompR 基因缺失株,结晶紫染色法和扫描电镜观察测定缺失株的生物被膜形成能力,细胞的吸附和侵入及小鼠攻毒试验测定缺失株的毒力。【结果】RT-PCR 和蛋白表达证明了ompR 基因缺失株构建成功; 该缺失株不表达纤维素和菌毛,不形成生物被膜; 上皮细胞吸附和侵入试验表明缺失株与野生株具有相同的吸附和侵入率; BALB / c 鼠腹腔感染性试验表明,缺失株的半数致死量为106. 67CFU,而野生株的半数致死量小于2 CFU。【结论】ompR 基因既是肠炎沙门氏菌生物膜形成的调控基因,又是重要的毒力基因。

【英文摘要】[Objective]To investigate the role of ompR gene from Salmonella enteritidis in biofilm formation and virulence.[Methods]We constructed an ompR mutant of Salmonella enteritidis by suicide plasmid pGMB151. Biofilm formingability of the mutant was detected by crystal violet assay and scanning electron micrography. Virulence of the mutant wasdetermined by assay of adherence to and invasion of epithelial cells,and mouse challenge experiments. [Results] TheompR mutant was confirmed by RT-PCR and the pattern of outer membrane protein. The mutant did not produce cellulose,curli,and biofilm,and showed similar adherence percentage to and invasion percentage of epithelial cells as wild typestrain. In addition,intraperitoneal challenge of bacteria in BALB / c mice revealed that LD50 of the mutant strain was 106. 67CFU,while that of the wild type strain was less than 2 CFU. [Conclusion] These data indicate that the ompR gene isinvolved in both biofilm formation and virulence in Salmonella enteritidis.

【题目】Amino acids and nitrate as signals for the regulation of nitrogen acquisition

【中文关键词】无

【英文关键词】amino acids, ammonium uptake, feedback regulation, nitrate uptake, nitrogen sensor.

【中文摘要】无

【英文摘要】The uptake of nitrogen (N) by roots is known to change with supply in a manner that suggests that the N status of plants is somehow sensed and can feedback to regulate this process. The most abundant source of N in most soils is nitrate. As nitrate is assimilated via conversion to nitrite, then ammonium into amino acids, it has been suggested that the internal pools of amino acids within plants may indicate nitrogen status by providing a signal that can regulate nitrate uptake by the plant. In support of this idea, both nitrate and ammonium influx and transporter transcript were shown to decrease in root tissue treated with exogenously applied amino acids. Several different amino acids have been tested for their effects on influx and transcription and glutamine was most effective. The feedback regulation occurs by changing the expression of transporters, but may also involve the post-translational modification of proteins. For example, some of the cytoplasmic enzymes responsible for nitrate assimilation are regulated by phosphorylation and binding of a 14-3-3 protein. We have examined the effects of treating plants with glutamine to first identify the uptake of the amino acid and then to measure tissue nitrate reductase activity and cellular pools of nitrate. These results are reviewed in terms of feedback regulation and the putative cell sensing systems for N status including a possible specific role for cytosolic nitrate.

【题目】江苏某地健康绵羊群产志贺毒素大肠杆菌体内分离株的分子

【中文关键词】产志贺毒素大肠杆菌,PCR,O 抗原,H 抗原,半数致死量,Vero 细胞

【英文关键词】Shiga toxin-producing E. coli,multiplex polymerase chain reaction,O-antigen,H antigen,LD50
【中文摘要】【目的】探讨江苏某羊场健康绵羊体内产志贺毒素大肠杆菌的带菌和流行情况,同时就分离株的致病力和对Vero 细胞的毒性作用作了研究。【方法】基于本实验室已经建立的EHEC O157:H7 EDL933W 株的stx1、stx2、eaeA、hlyA四个基因的多重PCR 检测并配合选择性增菌、平板筛选等方法对STEC 进行分离鉴定。【结果】在为期6 个月的连续跟踪调查中,共分离到STEC 菌株107 株,分离率为19. 4% (107 /550)。分离株属于41 种O 血清型、62 种O:H 血清型,未定型(ONT)有22 株,粗糙型(OR)1 株。其中属于绵羊STEC 的优势血清型有O5(2 株)、O91(1 株)、O103(1 株)。本文检测到的优势血清型为O93,stx2 阳性菌株的分离率较stx1 阳性菌株的分离率高,LD50测定结果表明分离株对小鼠致病力不高,受试的3 个分离株均不能致小鼠死亡。对107 株stx 阳性分离株噬菌斑试验表明,71 株阳性菌株携带噬菌体(66. 3% ,71 /109)。受试分离株进行Vero 细胞毒性试验,其中有一个菌株stx 基因阳性但不能使Vero 细胞产生病变。【结论】绵羊是STEC 的天然宿主,可健康带菌。虽然STEC 分离株对小鼠的致病力较弱,但不能排除其对人类安全的威胁。STEC 携带志贺毒素基因并不意味着一定表达志贺毒素,需对志贺毒素的表达及调控机理做进一步的研究。
【英文摘要】[Objective]In order to investigate the distribution of Shiga toxin-producing Escherichia coli (STEC) amonghealthy sheep in a farm and the pathogenicity to mice and Vero cells of these STEC isolates. [Methods]We usedpolymerase chain reaction (PCR) to detect genes of eaeA,stx1,stx2,hlyA,which had been developed in this laboratorypreviously,combing the selective cultivation and Chrom-Agar (CA) O157 plates to isolate STEC strains. [Results]Atotal of 107 STEC strains were isolated in a sheep farm during six visits from August,2008 to January,2009. The isolationrate was 19. 8% (107 /550) . These isolates belonged to 41 O serotypes and 60 O: H serotypes,except that 21 were Onon- typable and 1 was rough. O93 was the common serotype. Some isolates such as O5,O91,O103,which are reportedin other countries originated from healthy sheep were also isolated in this study. Stx2 positive rate was higher than that ofstx1. 50% lethal dose assay in mice indicated the pathogenicity of isolates was low and none of the 3 tested isolates causedmice death. We selected 107 stx gene positive STEC strains to induce the lambdoid bacteriophages. The results showedthat 71 out of 107 isolates formed plagues,while 28 did not after induction. Detection of Shiga toxins for three testedisolates in Vero cell assay indicated one stx gene positive strain lacked the toxigenicity to Vero cells. [Conclusions]Sheep are the natural reservoirs of STEC and they are healthy to carry STEC. Although these STEC isolates experience lowpathogenicity to mice,they are potential threat to human health. Shiga toxin gene positive were not equal to production ofShiga toxins,so we need to further study the Shiga toxin expression and regulation mechanism.

【题目】油茶成龄低产林种群的产量结构与改造对策研究
【中文关键词】油茶;产量;群体;种群;定位改造
【英文关键词】Camellia oleifera; yield; population; localization improvement
【中文摘要】对50 年生的油茶成龄低产林的研究表明,油茶成龄林群体鲜果产量的差异较大,这种产量差异与林分密度几乎无关(r = 0.4971),但与单株平均产量有一定的关系(r = 0.765 1),种群的鲜果产量结构总体表现为:单株在2 kg 以下的低产植株占80%左右、在2 ~ 5 kg 的中产植株占10% ~ 15%、在5 kg 以上的高产植株占6%左右,呈现明显的负指数分布(Y = 23.49X-1.587 8),并且构成产量的植株基本上是受品种的影响,因此导致油茶成龄林低产的主要原因是由于低产品种多、中高产品种少,由此提出除劣补优的良种定位置换改造对策。
【英文摘要】Studies on 50-year-old low-yield forest of Camellia oleifera showed, fresh fruit yield had great difference among the mature forests of C. oleifera. It was not correlated significantly with stand density (r = 0.4971), but it was correlated significantly with average yield per individual (r = 0.7651). The individual whose yield was less than 2 kg accounts for about 80%. The middle-yield individual whose yield was from 2 kg to 5 kg, accounts for 10% ~ 15%, and high--yield individual whose yield was more than 5 kg, accounts for about 6%. Individual yield displayed Negative exponential distribution(Y = 23.49X-1.587 8).This paper proposed transformation countermeasure of low-yield mature forest of C. oleifera.

【题目】根际pH 对水稻细胞膜质子泵基因表达的影响
【中文关键词】水稻; 细胞膜; 质子泵; 氢离子浓度指数(pH) ; 基因表达; 根际
【英文关键词】无
【中文摘要】通过水培试验研究了不同根际pH 对水稻(日本晴) 细胞膜质子泵基因表达的影响。以栽培在pH 5. 5 的营养液中的水稻作为对照, 然后分别转移到pH 3. 5 和pH 7. 5 的营养液中培养。研究发现, 质子泵基因OsPMA1 、OsPMA2 、OsPMA3 、OsPMA7 在根系和叶片中均有表达; 当营养液pH 为3. 5 或7. 5 时, 上述质子泵基因的表达总体上均比对照(pH5) 降低。但植物地上部的质子泵表达不受根际pH 的影响。而且, pH 越低, 水稻生物量与体内的氮含量越低。其可能的原因是, 水稻在pH 骤然降为3. 5 的营养液中没有及时适应高浓度的H+胁迫, 导致根系细胞膜质子泵受抑制, 进而影响水稻对养分的吸收。而pH 7. 5 与植物细胞质pH 相当, 质子泵无需过量表达即可用于养分吸收。说明根际pH 直接影响到根系细胞膜质子泵在转录水平上的表达, 并间接影响根系对养分的吸收和植物的生长。

【题目】Functional co-expression of two insect nicotinic receptor subunits (Nlα3 and Nlα8) reveals the effects of a resistance-associated mutation (Nlα3Y151S) on neonicotinoid insecticides
【中文关键词】nicotinic acetylcholine receptor, Nilaparvata lugens,
resistance-associated mutation, subunit composition
【英文关键词】乙酰胆碱受体,褐飞虱,抗药性相关突变,亚基组成
【中文摘要】由于Y151S在褐飞虱的两个亚基(Nlα1和Nlα3)上的首次发现,因此南京农业大学昆虫神经毒理学实验室以这两个亚基为中心,对褐飞虱nAChRs的亚基组成进行了深入研究。对褐飞虱的Nlα1和Nlα2进行体外表达,发现这两个α亚基与哺乳动物的β2亚基共聚,组成一个三亚基五聚体受体(Nlα1/Nlα2/rβ2)。对褐飞虱内源nAChRs进行免疫共沉淀分析,证实了这两个亚基在褐飞虱神经系统中确实共聚于一个五聚体中。由于Nlα3亚基独立表达或者与哺乳动物rβ2共表达都不成功,这促使研究者寻找与Nlα3亚基共表达的褐飞虱其他亚基。褐飞虱nAChRs亚基不同组合表达发现,Nlα3亚基可以与Nlα8亚基共表达,与哺乳动物rβ2在体外重组成另外一个三亚基五聚体(Nlα3/Nlα8/rβ2),这在昆虫nAChRs亚基组成中为首次发现(Zhang et al., 2009)。随后,研究者以这两个三亚基五聚体为基础,对Nlα1和Nlα3中发现的Y151S突变功能影响进行了分析。Nlα3/Nlα8/rβ2对吡虫啉的敏感性(EC50= 3.2±0.5 μmol/L)比Nlα1/Nlα2/rβ2(EC50=350.4±16.8 μmol/L)高出109倍。与敏感受体(Nlα1/Nlα2/rβ2)相比,Nlα1Y151S突变只造成受体Nlα1Y151S/Nlα2/rβ2(EC50=624±24 μmol/L)对吡虫啉敏感性下降1.8倍。而与敏感受体(Nlα3/Nlα8/rβ2)相比,Nlα3Y151S突变造成受体Nlα3Y151S/Nlα8/rβ2(EC50= 29.5±3.9 μmol/L)对吡虫啉敏感性下降9.2倍。结合两个受体敏感性差异,说明Nlα3Y151S突变在吡虫啉靶标不敏感性中的作用更重要。
【英文摘要】Neonicotinoid insecticides, such as imidacloprid, are selectiveagonists of insect nicotinic acetylcholine receptors (nAChRs)and are used extensively to control a variety of insect pestspecies. Previously, we have identified a nAChR pointmutation (Y151S) associated with insecticide resistance in thebrown planthopper Nilaparvata lugens. Although this mutationhas been identified in two different N. lugens nAChR subunits(Nla1 and Nla3) because of difficulties in heterologousexpression of Nla3; its influence on agonist potency has beenexamined only in Nla1-containing nAChRs. Here we describethe cloning of a novel nAChR subunit from N. lugens (Nla8),together with evidence for its co-assembly with Nla3 in nativeand recombinant nAChRs. This has, for the first time,

enabled the functional effects of the Nla3Y151S mutation to beexamined. The Nla3Y151S mutation has little effect on agonistpotency of acetylcholine but has a dramatic effect on neonicotinoidinsecticides (reducing Imax values and increasingEC50 values). The apparent affinity of neonicotinoids washigher and the effect of the Y151S mutation on neonicotinoidagonist potency was more profound in Nla3-containing, ratherthan Nla1-containing nAChR. We conclude that Nla3- andNla1-containing nAChRs may be representative of two distinctinsect nAChR populations.

【题目】江苏某奶牛场健康奶牛体内产志贺毒素大肠杆菌的分离鉴定及其对小鼠致病性的研究
【中文关键词】产志贺毒素大肠杆菌;奶牛;多重PCR;O抗原;H抗原;毒力基因
【英文关键词】Shiga toxin-producing E.coli;cattle;multiplex polymerase chain reaction;O antigen;
H antigen;virulence genes
【中文摘要】:通过对江苏省某奶牛场连续6个月的定群、定畜跟踪调查,获得产志贺毒素大肠杆菌(STEC)在该牛场分布的广泛性、持续性和血清型多样化的资料,并对一些重要血清型分离株作致病性的鉴定。基于本实验室已经建立的多重PCR方法对stx1、stx2、eaeA、ehxA 共4个基因进行检测,对检测出的阳性样品,非O157STEC采用多重PCR结合CT-SMAC平板的分离方法,而O157STEC通过免疫磁珠结合O157显色平板的分离方法。结果表明,该奶牛场STEC的初筛率为16.1%(112/696),分离率为11.1%(77/696)。分离株属于35种O血清型和60种O：H血清型。该场的优势血清型为O4、O26和O93,O157在该场存在,但并非优势血清型。77个分离株中,stx2基因的检出率为68.8%,远远高于其它毒力基因,如stx1(19.5%)、eaeA(11.7%)和ehxA(20.8%)。该场分离到一些O157和O26血清型的菌株,对小鼠具有较强的致病性。奶牛是STEC的天然宿主,可健康带菌。除了O157STEC外,非O157STEC中一些高致病力菌株对人类的健康也存在威胁。
【英文摘要】Through investigating a herd of cattle from a farm in Jiangsu Province for Shiga toxinproducing Escherichia coli (STEC)over a period of 6months,we obtained the information of theepidemicity,persistence and diverse serotypes of STEC in this farm and the pathogenicity of someisolates.Polymerase chain reaction(PCR)that had been developed in this laboratory previouslywas carried out to detect genes of eaeA,stx1,stx2,ehxA.Non-O157STEC were isolated by usingmultiplied PCR and CT-SMAC separation,and O157STEC were isolated by using immunomagnetic combining Chrom-Agar(CA)O157plates separation from the PCR positive samples.stxgenes were detected in 112of the 696faecal samples(16.1%),but only 77STEC were isolated(11.1%).These STEC isolates belonged to 35Oserogroups and 60O：H serotypes.O4,O26,O93were the common serotypes.O157existed in this farm,but not popular.Stx2positive rate(68.8%)was higher than other genes,e.g.stx1(19.5%),eaeA (11.7%)and ehxA (20.8%),among all STEC isolates.Some of the tested isolates were highly pathogenic to mice.The presentresults showed that the cattle are the natural reservoirs of STEC and they are healthy to carrySTEC.In addition to O157STEC,non-O157STEC are potential threat to human health.There-fore,to prevent the transmission of STEC from cattle to beef and milk products might be the keyroute to diminish the infection of STEC in human

【题目】Identification of two Lynx proteins in Nilaparvata lugens and the modulation on insect nicotinic acetylcholine receptors.
【中文关键词】neonicotinoids resistance, nicotinic acetylcholine
receptor modulator, nicotinic acetylcholine receptors, Nilaparvata

lugens
【英文关键词】新烟碱类杀虫剂抗药性,烟碱型乙酰胆碱受体调控蛋白,烟碱型乙酰胆碱受体,褐飞虱
【中文摘要】总结前期抗药性机理的研究成果,发现褐飞虱烟碱型乙酰胆碱受体(nicotinic acetylcholine receptors, nAChRs)具有特异性,其中Nlα1亚基和Nlα2亚基共聚,而Nlα3亚基和Nlα8亚基共聚。验证我们先前在Nlα1亚基和Nlα3亚基上发现的Y151S突变,发现Nlα3亚基的突变重要性更强,与抗药性的关系更为密切,为褐飞虱抗吡虫啉检测技术的开发提出了指导。同时,研究发现除了吡虫啉的作用靶标nAChRs外,褐飞虱体内的一些附属蛋白也在抗药性中扮演了影响因子,如近期发现的Lynx1和Lynx2蛋白,可以抵消抗性突变带来的部分影响,这方面取得了突破性进展。
【英文摘要】Nicotinic acetylcholine receptors (nAChRs) mediate fast cholinergicsynaptic transmission in the insect brain and are targetsfor neonicotinoid insecticides. Some proteins, other thannAChRs themselves, might play important roles in insectnAChRs function in vivo and in vitro, such as the chaperone,regulator and modulator. Here we report the identification oftwo nAChR modulators (Nl-lynx1 and Nl-lynx2) in the brownplanthopper, Nilaparvata lugens. Analysis of amino acid sequencesof Nl-lynx1 and Nl-lynx2 reveals that they are twomembers of the Ly-6/neurotoxin superfamily, with a cysteinerichconsensus signature motif. Nl-lynx1 and Nl-lynx2 onlyincreased agonist-evoked macroscopic currents of hybridreceptors Nla1/b2 expressed in Xenopus oocytes, but notchange the agonist sensitivity and desensitization properties.For example, Nl-lynx1 increased Imax of acetylcholine andimidacloprid to 3.56-fold and 1.72-fold of that of Nla1/b2 alone,and these folds for Nl-lynx2 were 3.25 and 1.51. When thepreviously identified Nla1Y151S mutation was included(Nla1Y151S/b2), the effects of Nl-lynx1 and Nl-lynx2 on imidaclopridresponses, but not acetylcholine response, were differentfrom that in Nla1/b2. The increased folds in imidaclopridresponses by Nl-lynx1 and Nl-lynx2 were much higher inNla1Y151S/b2 (3.25-fold and 2.86-fold) than in Nla1/b2 (1.72-fold and 1.51-fold), which indicated Nl-lynx1 and Nl-lynx2might also serve as an influencing factor in target-site insensitivityin N. lugens. These findings indicate that nAChRschaperone, regulator and modulator may be of importance inassessing the likely impact of the target-site mutations suchas Y151S upon neonicotinoid insecticide resistance.

【题目】Native subunit composition of two insect nicotinic receptor subtypes with differing affinities for the insecticide imidacloprid
【中文关键词】烟碱型乙酰胆碱受体,亚基组成,吡虫啉,褐飞虱
【英文关键词】Nicotinic acetylcholine receptor,Subunit composition,Imidacloprid,Nilaparvata lugens
【中文摘要】通过免疫共沉淀技术,发现Nlα1和Nlα2亚基在褐飞虱神经系统中共聚于同一个受体中,与褐飞虱Nlβ1构成五聚体受体(Nlα1/Nlα2/Nlβ1);Nlα3和Nlα8亚基共聚于同一个受体中,与褐飞虱Nlβ1构成五聚体受体(Nlα3/Nlα8/Nlβ1)。通过同位素结合和敏感性差异分析,发现Nlα1/Nlα2/Nlβ1和Nlα3/Nlα8/Nlβ1均与吡虫啉的结合相关,其中Nlα3/Nlα8/Nlβ1构成吡虫啉高亲和力位点,而Nlα1/Nlα2/Nlβ1构成吡虫啉低亲和力位点,Nlα3/Nlα8/Nlβ1对吡虫啉的敏感性比Nlα1/Nlα2/Nlβ1高出109倍。
【英文摘要】Neonicotinoid insecticides, such as imidacloprid, are selective agonists of insect nicotinic acetylcholine receptors (nAChRs) and are used extensively to control a variety of insect pest species. The brown planthopper (Nilaparvata lugens), an insect pest of rice crops throughout Asia, is an important target species for control with neonicotinoid insecticides such as imidacloprid. Studies with nAChRs purified from N. lugens have identified two [3H]imidacloprid binding sites with different affinities (Kd ¼ 3.5 0.6 pM and 1.5 0.2 nM). Co-immunoprecipitation studies with native preparations of N. lugens nAChRs,using subunit-selective antisera, have demonstrated the co-assembly of Nla1, Nla2 and Nlb1 subunits into one receptor complex and of Nla3, Nla8 and Nlb1 into another. Immunodepletion of Nla1 or Nla2 subunits resulted in the selective loss of the lower affinity imidacloprid binding site, whereas immunodepletion of Nla3 or Nla8 caused the selective loss of the high-affinity site. Immunodepletion of Nlb1 resulted in a complete absence of specific imidacloprid binding. In contrast, immunodepletion with antibodies selective for other N. lugens nAChR subunits (Nla4, Nla6, Nla7 and Nlb2) had no significant effect on imidacloprid binding. Taken together, these data suggest that nAChRs containing Nla1, Nla2 and Nlb1 constitute the lower affinity binding site, whereas nAChRs containing Nla3, Nla8 and Nlb1 constitute the higher affinity binding site for imidacloprid in N. lugens.

【题目】Selectivity of lynx proteins on insect nicotinic acetylcholine receptors in the brown planthopper,Nilaparvata lugens
【中文关键词】烟碱型乙酰胆碱受体,受体调控蛋白,褐飞虱,新烟碱类杀虫剂抗药性
【英文关键词】nicotinic acetylcholine receptors
(nAChRs), nAChR modulator, Nilaparvata lugens,
neonicotinoids resistance
【中文摘要】试图外源组建昆虫功能性nAChRs(所有亚基均来源于昆虫)的研究一直是国际研究热点,但近20年来一直没有突破。通过褐飞虱EST文库筛选、免疫沉淀和体外验证等技术手段,从褐飞虱中鉴定了两种调控蛋白,同样属于Ly-6/neurotoxin家族,分别命名为Nl-lynx1和Nl-lynx2,这两个调控蛋白都可以提高昆虫α亚基与哺乳动物β亚基复合受体的表达水平,而且在不同的亚基组成受体间存在显著的差异性。研究同时发现,这两个调控蛋白都与Y151S突变的功能有关,影响褐飞虱对吡虫啉的抗性水平,预示着这类蛋白质同样可以成为杀虫剂的攻击靶标。由于Lynx蛋白与褐飞虱nAChRs亚基并不能成功组建体外受体,说明还有其他小分子附属蛋白存在,未来在这方面将开展研究。
【英文摘要】Neuronal nicotinic acetylcholine receptors (nAChRs)are major excitatory neurotransmitter receptors inboth vertebrates and invertebrates. Two lynx proteins(Nl-lynx1 and Nl-lynx2) have been identified in thebrown planthopper, Nilaparvata lugens, which act asmodulators on insect nAChRs. In the present study,two lynx proteins were found to act on the tripletreceptor Nla1/Nla2/b2 expressed in Xenopus oocytes,increasing agonist-evoked macroscopic currents, butnot changing agonist sensitivity and desensitizationproperties. Nl-lynx1 and Nl-lynx2 increased Imax(maximum responses) of acetylcholine to 4.85-foldand 2.40-fold of that of Nla1/Nla2/b2 alone, and theyalso increased Imax of imidacloprid to 2.57-fold and1.25-fold. Although, on another triplet nAChRs Nla3/Nla8/b2, Nl-lynx2 increased Imax of acetylcholine andimidacloprid to 3.63-fold and 2.16-fold, Nl-lynx1 hadno effects on Imax of either acetylcholine or imidacloprid.The results demonstrate the selectivity of lynxproteins for different insect nAChR subtypes. Thisselectivity was also identified in native N. Lugens.Co-immunoprecipitation was found between Nla1/Nla2-containing receptors and both Nl-lynx1 andNl-lynx2, but was only found between Nla3/Nla8-containing receptors and Nl-lynx2. When the previouslyidentified Nla1Y151S and Nla3Y151S mutations wereincluded (Nla1Y151S/Nla2/b2 and Nla3Y151S/Nla8/b2), theincrease in Imax of imidacloprid, but not acetylcholine,caused by co-expression of Nl-lynx1 and Nl-lynx2 wasmore noticeable than that of their wildtype counterparts.Taken together, these data suggest that twomodulators, Nl-lynx1 and Nl-lynx2, might serve as aninfluencing factor in target site insensitivity in N.lugens, such as Y151S mutation.

【题目】微卫星标记对牙鲆有丝分裂雌核发育家系的亲子鉴定
【中文关键词】牙鲆; 雌核发育; 微卫星标记; 亲子鉴定
【英文关键词】Japanese flounder (Paralichthys olivaceus); Gynogenesis; Microsatellite marker; Paternity testing
【中文摘要】利用18个微卫星标记,对6个家系的26尾有丝分裂雌核发育牙鲆进行亲子鉴定,PCR扩增产物经8%非变性聚丙烯酰胺凝胶电泳检测,结果表明:1个座位在母本中表现为相同的基因型,视为单态座位,其他17个座位为多态; 多态座位在亲子鉴定中的累计排除概率和累计个体识别概率分别为0.9985、0.9999; 根据被测个体在17个微卫星座位的基因型,最后确认26尾子代的母本,其中7尾子代在某些座位表现出与其母本不完全匹配的基因型。利用微卫星标记可确定雌核发育后代的

亲子关系,从而构建牙鲆雌核发育家系系谱,对牙鲆雌核发育的深入研究具有重要意义。
【英文摘要】Eighteen microsatellite markers were analyzed with a paternity testing application using 26mitogynogenetic Japanese flounder (Paralichthys olivaceus) progeny and their six assumed female-parents. The amplified products of PCR were analyzed by 8% polyacrylamide gel electrophoresis. Electrophoresis patterns showed that only one pair of primers had a monomorphic pattern, and the others were polymorphic. Cumulate exclusion probability of polymorphic loci was 0.9985 and cumulate power of discrimination was 0.9999. An effective method was applied to track the gynogenetic maternal parents of 26 progeny. The genotypes of six progeny were not completely identical to their mothers on some loci. The construction of pedigree was perfected by looking at microsatellite loci from paternity tests which are essential to the deeper analysis of gynogenetic Japanese flounder.

【题目】牙鲆5个养殖群体的遗传多样性分析
【中文关键词】牙鲆; 养殖群体; 遗传多样性; 微卫星
【英文关键词】Japanese flounder; cultured population; genetic diversity; microsatellite
【中文摘要】利用16对微卫星分子标记对牙鲆(Paralichthys olivaceus)的5个养殖群体进行遗传多样性分析。结果表明,等位基因数为2~9个,平均等位基因数为6.0625; 有效等位基因数1.2596~5.5161,平均有效等位基因数3.692; 各位点的杂合度观测值(Ho)0.2200~0.8000; 杂合度期望值(He)0.2061~0.8187。各群体之间无偏倚杂合度期望值从小到大依次为丹东、北戴河、威海、青岛、荣成。Kruskal-Wallis检验结果(H=0.672,df=4,P=0.955)则说明,5个群体遗传多样性差异不显著。群体间基因分化系数(GST)为0.0991,各群体之间存在中度遗传分化。采用UPGMA法对5个群体进行聚类,可分3类:丹东和北戴河各为一类,威海、荣成、青岛为一类,其中威海与荣成群体的分化最小。结合Hardy—Weinberg平衡x2拟合度检验和遗传偏离指数(d)的分析结果表明,各群体的遗传平衡状况存在很大差别。遗传变异的分析结果说明5群体遗传多样性比较丰富
【英文摘要】Genetic divergence within and between 5 cultured stocks (Dandong, Beidaihe,Weihai, Rongcheng and Qingdao) of Japanese flounder (Paralichthys olivaceus) was assessed by 16 microsatellite loci which in the 5 cultured populations showed allele number (A) was 2 to 9; average allele number was 6.062 5:effective allele number (Ne) was 1.2596-5.5161; average effective allele number was 3.692; observed heterozygosity value (Ho) is 0.2200 to 0.8000; excepted heterozygosity value(He)was 0.2061 to 0.8187. He values followed the order of Dandong, Beidaihe, Weihai, Qingdao, Rongcheng, and a comparison by Kruskal-Wallis test revealed that there was no significant difference in genetic diversity of the 5 cultured stocks (H=0.672, df=4, P=0.955).The results also showed that the coefficient of gene differentiation between the stocks (GST) was 0.0991,there were moderate genetic differentiation among these 5 cultured populations. The genetic distance of 5 cultured populations was calculated and the cluster analysis by UPGMA method was carried out that all populations were pooled into three groups: Dandong, Beidaihe and Shandong (including Weihai, Rongcheng and Qingdao).Among the 3 populations of Shandong, Weihai and Rongcheng were more similar. Hardy-Weinberg equilibrium analysis in 16 microsatellite loci by Chi Square test and genetic deviation index (d) showed a remarkable difference in populations.

【题目】牙鲆微卫星分子标记与生长性状的相关性分析
【中文关键词】牙鲆; 微卫星; 生长性状; 基因型; 相关性分析

【英文关键词】Paralichthys olivaceu; microsatellite marker; growth trait; genotype; correlation analysis
【中文摘要】研究利用30对牙鲆微卫星标记,对牙鲆雌核发育家系91个个体基因组DNA进行检测,在30对微卫星标记中,共检测到124个等位基因。其中,各座位的等位基因数3~8个,等位基因片段大小为80~170bp,平均有效等位基因数3.257。其中poli11座位的等位基因数目最多为8。平均多态信息含量为0.6197,平均杂合度为0.6672。利用SAS8.2中的一般线性模型(GLM)对30个微卫星标记与牙鲆的生长性状进行连锁显著性检验。发现在30个微卫星座位中,有8个座位分别与体重、体长、体高显著相关。其中,poli6TUF位点与体重相关; poli30TUF、poli107TUF、poli108TUF、poli116TUF、poli123TUF、poli130TUF6个座位与体长显著相关; poli145TUF与体重、体长显著相关,而与体高相关性不显著。poli9-8TUF与体重、体长、体高3个性状均显著相关(P<0.05)。将基因型与生长性状进行Duncan多重比较,找到4种与生长性状相关的基因型。
【英文摘要】 Total 30 microsatellite DNA markers were selected to analyze the genomic DNA of 91 gynogenesis progenies from the gynogenesis family. The results showed that total 124 different alleles were found,and the number of allele was 3-8 in each locus. The DNA fragment length was 80-170 bp,the number of mean valid alleles was 3.257,the value of mean heterozygosity was 0.6672 and the mean Polymorphism Information Content (PIC) was 06197. The SAS 8.2 was used to analyze the effect of these 30 microsatellites on body weight,length and height. Results uncovered poli30TUF,poli107TUF,poli108-TUF,poli116TUF,poli123TUF,poli130TUF had significant impacts on body length,poli6TUF had a significant impact on body weight,poli145TUF had significant on body weight and length,and the poli9-8TUF had a significant on body weight,body length and body depth. In addition,the genotypes of four correlative loci were determined.

【题目】建鲤GHR基因多态性及与增重相关的SNP位点的筛选

【中文关键词】建鲤; GHR; 多态性; 增重; 体型; 相关性

【英文关键词】Cyprinus carpio var. Jian; Growth hormone receptor; Single nucleotide polymorphism; Weight gain; Body form; Correlation

【中文摘要】生长激素是调控动物生长的关键因子, 它通过与膜蛋白生长激素受体结合后发挥作用, 因此生长激素受体基因的变异对动物生长有着重要的影响。实验根据已分离的4 个建鲤jlGHRs 基因, 通过测定来自6 尾建鲤的序列, 共找到38 个SNP 位点。使用PCR-RFLP 方法检测了353 尾建鲤在其中5 个SNP 位点 (1a 内含子3 A43G、1a 外显子8 A361G、1b 外显子8 C12T、2a 外显子8 A555G 和2b 外显子8 A315G)的基因型, 分析了不同基因型与生长性状的相关性。结果表明5 个位点均与增重显性相关; 1a 内含子3 A43G 还与体高/体长和体厚/体长显性相关; 1b 外显子8 C12T 与体高/体长和尾柄高/尾柄长显性相关; 1a 外显子8 A361G 和2a 外显子8 A555G 也与尾柄高/尾柄长显性相关。数据分析还显示增重标记个数富集4 个以上的个体明显比标记少的个体生长快, 在选育群中增重标记数有2 个的个体最多占30%, 而增重标记数4 个以上的只占14%,说明存在着较大的选育空间。实验筛选的5 个位点可以作为建鲤分子育种的有效标记。

【英文摘要】Growth hormone is one of the key regulators in animal growth, and combines with growth hormone receptors of membrane protein to function, so the mutations on growth hormone receptor gene have an important influence on animal growth. We identified 38 SNPs on four jlGHRs, by sequencing the genes from 6 individuals of Cyprinus carpio var. Jian. PCR-RFLP was applied to detect the genotypes of 5 SNPs loci (1a intron 3 A43G, 1a exon 8 A361G, 1b exon 8C12T, 2a exon 8 A555G and 2b exon 8 A315G) among 353 individuals and the relationship between the different genotypes and growth characteristics was also analyzed in this study. Results showed that all the five sites were associated with weight gain significantly. SNP locus 1a intron 3 A43G has a significant correlation with height/length and thickness/length as well, 1b exon 8 C12T has a significant correlation with height/length and caudal peduncle height/length, 1a exon 8 A361G and 2a exon 8 A555G also have a significant correlation with caudal peduncle depth/caudal length. Data analysis also showed that the individuals with more than four markers grew faster obviously than those with few markers. The number of the individuals with 2 markers is the most, with 30 percent in the investigated population. But the number of the individuals with more than four markers only has a percentage of 14, indicating the presence of large selection space. The 5 SNPs detected in this experiment can be used in molecular breeding.

【题目】建鲤生长激素受体基因分离、转录子多态性以及组织表达特性
【中文关键词】建鲤; 生长激素受体基因; 旁系同源基因; 组织表达
【英文关键词】Cryprinus carpio var. jian; Growth hormone receptor gene; Paralogs; Tissues expression
【中文摘要】使用PCR、RT-PCR 和RACE 方法分离克隆了建鲤基因组内的4 个jlGHRs 基因, 同源性分析和系统树表明它们两两分属于鱼类GHR1 和GHR2, 命名为jlGHR1a、jlGHR1b; jlGHR2a、jlGHR2b。jlGHR1s 和jlGHR2s 的两个旁系同源基因间氨基酸差异分别为5%和11%, 但功能保守区FGVFS 基序、Box1、Box2 基本一致, jlGHR1s 和jlGHR2s 氨基酸差异为41%。jlGHRs 和斑马鱼GHRs 基因结构相同, 在阅读框内存在7个内含子, 两旁系同源基因间内含子长度或序列存在差异。jlGHR1s、jlGHR2s 与不同鱼类GHR1、GHR2 同源性高低与传统分类地位一致。实验过程中发现建鲤肝脏存在jlGHRs 的多种转录子, 包括丢失了外显子4的jlGHR1b'、保留了内含子3 的jlGHR2a'、丢失了部分外显子8 的jlGHR2as。实时定量RT-PCR 组织表达结果显示4 个jlGHRs 在脑、肝、心、头肾、肾、肠、脾、肌肉各组织中均有表达, 但表达量差异明显, 其中肌肉组织中4 个基因表达量均最高, 脑中4 个基因的表达水平相当, 其余各组织中jlGHR2b 的表达量均最高。从多转录子和较低表达量推测jlGHR2a 所受的选择压力低于jlGHR2b。鲤鱼基因组内分离到GHR1、GHR2 的两个旁系同源基因在功能基因方面证实了鲤鱼体内存在两套基因, 表明鲤鱼是研究同源基因变异分化的好材料, 也为今后正确查找jlGHRs 基因上的SNP 位点奠定了基础。
【英文摘要】Four jlGHRs (jlGHR1a, jlGHR1b; jlGHR2a, jlGHR2b) were cloned by using PCR, RT-PCR and RACE methods in Cyprinus carpio var. jian. Homology analysis and phylogenetic tree showed that jlGHR1a,-1b and jLGHR2a,-2b belonged to fish GHR1 and GHR2, respectively. The differences of amino acid sequence were 5% and 11% between the two paralogs, but the functional conversation regions, such as extracellular motif FGVFS, Box1 and Box2 were mostly identical. The difference between jlGHR1s with jlGHR2s amino acid sequence was 41%. jlGHRs had the same genetic structure as zebrafish. There were 7 introns in the open reading frame. The lengths of specific introns between paralogs were obvious different. The comparability between jlGHR1, jlGHR2 and other GHR1, GHR2 was consisted with traditional staple. In this study, different jlGHR transcripts were found in the liver of Cyprinus carpio var. jian, including jlGHR 1b' (lost exon 4), jlGHR2a' (containing intron 3) and jlGHR 2as (lost partial exon 8). Real time-PCR results indicated that despite quite different quantity, 4 genes expressed in all the 8 tissues, such as brain, liver, heart, head kidney, kidney, intestines, spleen and muscle. Expression levels of 4 jlGHRs were the highest in muscle. Except brain, jlGHR2b expression was higher than other 3 genes in tissues. It was conferred that jlGHR2a was under lower selection stress than jlGHR 2b from the several transcripts and lower expression. The two paralogs jlGHR1s and-2s isolated from C. carpio approved that two sets of gene existed in Cyprinus carpio var. jian, which indicated that C. carpio var. jian was good material for homeotic genes differentiation researching. The two sets of gene existed in Cyprinus carpio var. jian also laid foundation for finding SNP loci in the GHR correctly.

【题目】建鲤IGF-Ⅰa 基因的SNPs 位点筛选及其与增重的相关性分析
【中文关键词】建鲤; IGF-Ⅰa; SNPs; 增重;
【英文关键词】Cyprinus carpio var. jian; insulin-like growth factor; single nucleotide polymorphisms; weight gain; correlation
【中文摘要】机体生长主要受到促生长激素释放激素—生长激素—胰岛素样生长因子(GHRH-GH-IGFs) 生长轴调控,类胰岛素生长因子IGF-Ⅰ是生长激素(GH) 发挥生物学功能的重要传导因子。实验特异性扩增了建鲤(Cyprinus carpio var. jian) IGF-Ⅰa 基因的5个外显子和3 个内含子(内含子1、内含子3 和内含子4) 。通过比对10 尾建鲤的序列,共找到SNPs 位点8 个。使用PCR-RFLP 方法检测了5 个家系共372 尾建鲤的内含子1_C175G, 12 个家系共987 尾的内含子1_A993G 和内含子4_A511C 3 个位点。内含子1_C175G 雌雄个体均以GG 型频率为最高,分别是0.44 和0.43; 此位点在幼鱼和成鱼时期与雌、雄建鲤增重均无相关性; 内含子1_A993G 雌雄个体均以AG 型频率最高,分别是0. 76 和0. 72; 此位点在成鱼阶段与雄性建鲤增重呈显著相关(P < 0. 05) ; 内含子4_A511C 在雌雄个体中均以CC 型频率最高,分别是0. 48 和0. 47;其在幼鱼和成鱼阶段均与增重存在极显著的相关性(P < 0. 01) 。本次试验表明在建鲤体内, IGF-I 基因在不同生长阶段的表达量不同,且处于同一生长阶段的雌雄个体间的表达也存在差异。内含子1_A993G、内含子4_A511C 均与建鲤增重存在相关性,可以考虑作为建

鲤分子育种的相关依据。

【英文摘要】The GHRH-GH-ⅠGFs growth axis plays an essential and central role in body growth. The insulinlike growth factor,located downstream of the axis,is a critical conduction factor of GH transmission and biological function exertion. In this experiment,we specifically isolated 5 exons and 3 introns (intron1,intron3,and intron4) of IGF-Ⅰa gene in Cyprinus carpio var. jian. A total of 8 SNPs were screened by comparing the sequences of 10 individuals. PCR-RFLP was applied in detecting the intron 1 _ C175G genotypes of 372 individuals from 5 families; the intron 1 _A993G and intron 4 _A511C genotypes of 987 individuals from 12 families. And then we identified the genotype,counted the allele frequency and analyzed the correlation between the three SNPs and weight gain. The results showed that the GG genotype frequency (male 0. 43 and female 0. 44) was the highest in intron 1_C175G,while this locus showed no association with weight gain. Intron 1_A993G locus significantly correlated with male weight gain in adult stages (P < 0. 05) and AG genotype displayed the highest frequency,0. 76 in female and 0. 72 in male. 0. 48 in female and 0. 47 in male of CC genotype was the highest allele frequency for locus intron 4 _ A511C,which was remarkably associated with both male and female weight gain in both juvenile and adult stages(P < 0. 01) .This experiment indicated that the expression of IGF-Ⅰ gene varied between the different growth stages in Cyprinus carpio var. jian. Furthermore,expression diversity also existed between male and female individualseven at the same growth stage. The intron 1_A993G and intron 4_A511C were found significantly related with weight gain and could be considered as references in molecular breeding in Cyprinus carpio var. jian.

【题目】建鲤IGFBP1 基因的克隆及与增重相关的SNP 位点分析

【中文关键词】建鲤; IGFBP1; SNP; 增重; 相关性

【英文关键词】Cyprinus carpio var. jian; Insulin-like growth binding protein 1; Single nucleotide polymorphism; Weight gain; Correlation

【中文摘要】旨为查找建鲤(Cyprinus carpio var. jian) 胰岛素样生长因子结合蛋白1(Insulin-like growth factor binding proteins1, IGFBP1) 基因上与增重相关的SNP 位点。利用基因克隆,Clustal W 比较8 个个体的DNA 序列,筛选SNP 位点。并采用PCR-RFLP 方法检测了其中2 个位点(1b-E1-A210G,1b-E3-C108T) 在913 尾建鲤(♂469,♀444) 中的基

【英文摘要】Two IGFBP1 genes were isolated from Cyprinus carpio var. jian. Seven and twenty-four SNP loci were identified on IGFBP1a and IGFBP1b, respectively. There are two and four SNPs were located at exons of 1a and 1b, respectively. PCR-RFLP was applied to detect genotypes of 913 individuals (♂469,♀444) at two SNPs (1b exon 1_A210G,1 b exon 3_C108T) . Correlation analysis between genotypes and weight gain showed: both two SNPs were associated with male weight gain significantly (P < 0. 01) . To these two SNPs loci,GG and CC genotype individuals grew faster than other individuals in the juvenile stage and it was AG and CC genotype in the adult stage. A210G was also significantly related to female juvenile weight gain (P < 0. 01) and AG individuals grew significantly faster than AA ones. The CC and CT type male adult weight gains of C108T were significantly (P < 0. 01) larger than TT type. Nine diplotypes were found in this experimental population. Multiple comparison results displayed that the body weight gains of D4,D5,D7 were significantly larger than those of D6,D9. D4,D5 and D7 individuals accounted for sixty percent in experimental population, so there still are spaces for further improved. A210G and C108T identified in this experiment can be used in molecular breeding of Cyprinus carpio var. jian.

【题目】建鲤IGFBP3 基因多态性对生长的影响
【中文关键词】建鲤; 胰岛素样生长因子结合蛋白3; 单核苷酸多态性; 增重; 相关性
【英文关键词】Cyprinus carpio var. jian; Insulin-like growth factor binding protein 3; Single nucleotide
【中文摘要】胰岛素样生长因子结合蛋白3 (insulin-like growth factor binding protein,IGFBP3) 是调节动物生长和代谢的重要基因。本实验查找了建鲤(Cyprinus carpio var. jian) IGFBP3s 基因上的SNP 位点。使用PCRRFLP检测了其中5 个位点(IGFBP3a-I3 _G-253T、IGFBP3b-I2 _G30T、IGFBP3b-I3 _A-341G、IGFBP3b-E4 _C54T、IGFBP3b-E4_C72G) 在931 尾(485♂,4
【英文摘要】Insulin-like growth factor binding protein 3 (IGFBP3) is a most important gene regulating animal growth and metabolism. We isolated two IGFBP3 genes from Cyprinus carpio var. jian in this experiment.Eighteen SNPs loci were identified on IGFBP3a and IGFBP3b respectively. Eight SNPs were located at exons.PCR-RFLP was applied to detect genotypes of five SNPs (IGFBP3a intron 3_G-253T,IGFBP3b intron 2_G30T,IGFBP3b intron 3 _A-341G,IGFBP3b exon 4 _C54T,IGFBP3b exon 4 _C72G) in 931 individuals (485♂,446♀) . Correlation analysis between genotypes and weight gain showed that five SNPs were associated with female juvenile weight gain significantly (P < 0. 01 or P < 0. 05) and individuals with these five SNPs loci,TT,GG,AG,CC and CG genotype grew faster than other individuals. Only G30T was significantly related to male juvenile weight gain (P < 0. 05) and the GG individuals grew significantly faster than TT ones. C72G and A-341G were significantly pertinent to adult weight gain (P < 0. 01 or P < 0. 05) . Individuals with CG at C72G were significantly larger than those with CC and GG types. The AG and GG type male adult weight gain of A-341G were significantly higher than AA type,while AG type grew the fastest in female adult fish. G30T was significantly associated with female adult weight gain. The GG and GT type fish weight gain were significantly (P< 0. 05) higher than TT type,and the GG male adult individuals also grew obviously faster than other types. The GT type male adult weight gain of G-253T was significantly higher than GG and TT type (P < 0. 01) ,while nosimilar situation was found in female adult individuals. To conclude,with the fastest weight gain,GG type of G30T,AG type of A-341G and CG type of C72G could be used as molecular markers in C. carpio var. jian breeding. In addition,weight gain increased with the enrichment of molecular SNPs markers,consistent with the characteristics of quantitative traits.

【题目】不同年龄柏木混交林下主要灌木—黄荆生物量及分配格局研究
【中文关键词】柏木混交林; 黄荆; 生物量; 分配格局; 预测模型;
【英文关键词】mixed forest of cypress; Vitex negundo L.; biomass; allocation; allometric equation;
【中文摘要】灌木是森林生态中一个重要组成部分,以柏木林下主要灌木种-黄荆为研究对象,研究其在不同年龄柏木林下的生物量以及分配格局,同时利用简单指标对其生物量建立估测模型。研究表明:①随着林分年龄的增加,林下黄荆单丛生物量以及各器官生物量也随之增加,其中枝生物量相差值最大,差距达24.3倍,而生物量最小的叶片,其差距也达6.9倍。②黄荆地上各器官生物量分配大小表现为干生物量>枝生物量>叶生物量>皮生物量;根系生物量的分配以粗根和中根生物量为主,其中根桩和粗根生物量所占比重随着林分年龄的增加而增加,中根、小根和细根生物量所占比重则随着林分年龄的增加而减小;地上生物量所占比例较大,并随着林分年龄的增加逐渐降低,并最后趋于稳定。③建立生物量模型的简单指标以基径(D)作为自变量优于利用株高(H)和HD2模型的建立;最优预测模型多为二次或三次次曲线模型。其中干、枝和粗根生物量、地上生物量、地下生物量、单丛生物量建立的预测模型较好,其模型的相关系数在0.8107—0.9293,达到极显著水平;皮生物量和根桩生物量的次之,模型相关系数分别为0.7689和0.7926;中根和小根的生物量预测模型相对最差,模型的最大相关系数仅在0.4410—0.4830。
【英文摘要】The bush is an important component in forest ecosystem.In the hilly area of central Sichuan Basin,the biomass and its allocation of undergrowth Vitex negundo L.in different age classes of mixed cypress forest were measured and analysed,and the biomass allometric equations has been established.The results showed that: ①With the increase of forest age,the biomass and its components of the undergrowth single Vitex negundo L.increased.In which the difference of branch biomass is biggest,the disparity achieves 24.3

times;leaf biomass is the smallest which achieves 6.9 times.②The aboveground biomass allocated in the order stem biomass > branch biomass > leaf biomass > bark biomass.The coarse roots and middle roots dominated the underground biomass.With the increase of forest age,the biomass proportions of stump and coarse roots increased,while those of middle roots,small root and fine root reduced.As a main part of biomass,the proportion of aboveground biomass in total biomass decreased with the increase of forest age and finally tended to stabilize.③ The biomass as well as its component are more relevant to basal diameter(D) alone than the height(H) and HD2.

【题目】紫色土坡耕地磷素流失特征及施肥方式的影响
【中文关键词】磷素流失;壤中流;地表径流;流失负荷;施肥影响
【英文关键词】phosphorus loss;interflow;overland flow;loss flux;fertilization effects
【中文摘要】通过雨季典型降雨-径流事件中不同施肥方式下土壤磷素流失的野外定位观测,研究紫色土坡地磷素随地表径流和壤中流流失的通量、过程特征及其施肥方式的影响。结果表明,紫色土坡耕地地表径流过程呈多峰的时间变化特点,壤中流呈单峰且其产流时间滞后于地表径流;雨季次降雨平均径流量为23.6~29.1mm,壤中流是雨季的主要径流输出方式。地表径流总磷(TP)平均浓度远高于壤中流,泥沙吸附态磷(PP)是地表磷素流失的主要形态;溶解态有机磷(DOP)是壤中流流失的主要磷素形态。施肥方式显著影响地表径流TP浓度,常规施肥(NPK)、有机肥-化肥配施(OMNPK)、有机肥(OM)、秸秆-化肥配施(RSDNPK)各施肥处理的地表径流TP平均浓度呈依次减小的顺序。次降雨平均磷素流失负荷呈RSDNPK<OMNPK<OM<NPK的规律;壤中流是紫色土坡耕地磷素流失不可忽视的重要通道。施肥方式仅能控制地表径流磷素流失,而控制壤中流磷流失的效果不佳,有待更深入的研究。
【英文摘要】The phosphorus losses and effects of fertilization on sloping cropland of purple soil were studied by in situ field monitoring. Results showed that the average discharges of runoff were 23.6~29.1mm in wet season,and the interflow was the main pathway of runoff for sloping cropland of purple soil in. The average contents of total phosphorus (TP) of overland flow were 0.65~1.81mg/L, particulate phosphorus (PP) was the main form of P lost by overland flow. The average contents of total dissolved phosphorus(TDP) of interflow were 0.024~0.037mg/L. The dissolved organic phosphorus(DOP)was the main form of P lost by in.terflow. The TP lost by overland flow were influenced by fertilization distinctly. The TP contents in runoff were in the following sequence related to fertilizations:RSDNPK<OM<OMNPK<NPK. The TP loss fluxes related to fertilizations was in the sequence:RSDNPK<OMNPK<OM<NPK. The interflow was also an important pathway of phosphorus losing from purple soil. Phosphorus losses through overland flow could be controlled by fertilization practices. However,phosphorus loss fluxes through interflow can not be effectively reduced by fertilization modes,which needs more researches in the future.

【题目】四川省降水空间分布的插值分析
【中文关键词】降水; 空间插值; 克里金法; 四川省
【英文关键词】precipitation; spatial interpolation; Kriging method; Sichuan Province
【中文摘要】降水的空间分布特征是区域生态研究的重要内容, 基于GIS 的空间插值是获取降水分布特征的主要方法, 以四川省49 个气象站(其中15 个为校验站点) 2000~ 2007年的年平均降水量和四川省DEM 为数据源,选取了反距离加权法(IDW) 、普通克里金法(Ordinary Kriging,OK) 和考虑高程、坡度、坡向的协克里金法(Co- Kriging, CK)3 种空间内插方法,

对四川省降水的最优空间插值方法的选取进行了探讨。结果表明: 考虑高程、坡度、坡向的协克里金插值取得了较好的效果; 四川省降水存在较大的空间变异性,有明显由东往西递减的趋势, 最大降水量主要分布于东北部的达州、巴中地区以及东南部的乐山、雅安地区。

【英文摘要】The spatial distributio n o f pr ecipitation is an impo rtant par t of reg io nal eco lo gical study and spat ial inter polation based on GIS is the main method to obtain the pr ecipitation dist ribution char acter istics. Based on the annual precipitation data fr om 2000 to 2007 at 49 meteo ro log ical stations and DEM o f Sichuan Pro vince, we made a scussio n on the select ion of the best spat ial inter po lation metho ds in Sichuan Prov ince by t hr ee inter polat ion metho ds of inv erse distance weig ht, o rdinary Kr ig ing and co-Kriging considering elevation, slope and aspect. The results show that better effects have been attained by co- Kriging method; great spatial heterog eneity of precipitat ion ex ists in Shichuang Pro vince, decreasing from the east to the w est and the maximum precipitation mainly distributes in Dazhou and Bazhong of the northeastern region and Leshan and Ya'an of the southeastern region.

【题目】单核细胞增生李斯特菌荧光定量PCR 检测试剂盒的研制

【中文关键词】单核细胞增生李斯特菌; 荧光定量PCR; 检测试剂盒

【英文关键词】Listeria monocytogenes; Real-time PCR; detection kit

【中文摘要】目的:建立一种用于单核细胞增生李斯特菌快速检测的荧光定量PCR 试剂盒。方法:根据本课题组前期工作基础,针对单核细胞增生李斯特菌hly 基因序列设计TaqMan 探针和引物,建立荧光定量PCR 检测方法,将反应试剂组装成试剂盒,并对该试剂盒的各项参数进行评价。结果:特异性试验表明,组装的试剂盒对8 株单核细胞增生李斯特菌标准菌株的检测均呈阳性反应,对6 株其它种的李斯特菌及13 株食品(环境)中常见的非李斯特污染菌(如沙门氏菌、金黄色葡萄球菌)呈阴性反应。该试剂盒的基因组DNA 检测灵敏度为3.94 fg/反应(约合1.34 CFU/反应)。该试剂盒批内平均变异系数为2.2%,批间变异系数为1.9%,具有良好的重复性;同时稳定性强,反复冻融处理对其无明显影响;可在-20 ℃下避光保存1 年。结论:该试剂盒具有特异性强、灵敏度高、重复性好、稳定性强等优点,可应用于单核细胞增生李斯特菌的快速检测。

【英文摘要】Objective: The purpose of this study was to develop a Real-time PCR detection kit for the rapid detectionof Listeria monocytogenes. Methods: The Taqman probe and primers for a Real-time PCR detection kit were designedaccording to the conserved gene hly of L. monocytogenes based on the previous study in our laboratory. The optimizationof the kit components and the evaluation of its performance such as its specificity, sensibility, reproducibilityand stability were carried out in this study. Results: A Real-time PCR detection kit was successfully developed in thisstudy, which was used to specifically identify 8 reference strains of L. monocytogenes, while the strains from otherspecies of Listeria and non-Listeria strains were not amplified with this kit. The detection limit of the kit was 3.94 fg/reactionwith L. monocytogenes genomic DNA, i.e., 1.34 CFU/reaction. The average inter-assay CV% of the kit was 2.2%and the intra-assay CV% was 1.9%, which showed a good reproducibility. The repeated frozen-thaw had no significantinfluence on the activity of this kit. Besides, this kit worked well after being stored at -20 ℃ for 1 year away fromlight. Conclusion: The Real -time PCR detection kit developed in this study is suitable for the rapid detection of L.monocytogenes for its high specificity, high sensitivity, good reproducibility and strong stability.

【题目】土地整理中土壤肥力保持价值比较研究
【中文关键词】土地整理;土壤肥力保持价值;整理类型
【英文关键词】land consolidation, keep value on soil fertility, the types of land consolidation
【中文摘要】:土地整理不可避免地会对项目区的环境要素及其生态过程产生影响,基于生态服务价值理论,对邛崃市孔明乡土地整理项目区不同整理类型土壤肥力保持价值进行了比较研究,可为该地区土地整理决策、土地整理质量与效益评价等提供定量依据。结果表明,土壤肥力保持每公顷累积价值土地开发区为1.51 万元,土地复垦区1.85 万元,土地整理区0.49 万元。土地复垦区积累价值率达到147.2%,远大于开发区和整理区,这一结果与复垦区土壤全部通过客土改造有关。土地整理后项目区土壤肥力保持总价值增加了733.88 万元,其来源一是新增耕地面积,二是农地地力的提高。土壤肥力保持效费比分别为开发区0.05,复垦区0.09,整理区0.46,效益以土地整理区最高。说明以改善农业基础设施、提高地力为主要特征的土地整理类型投资少,土壤肥力保持效益高,值得提倡。
【英文摘要】Land consolidation will unavoidably impact the environmental elements and ecological process, we conducted a comparative study on soil fertility's maintaining value in different types of Qiong Lai city's land consolidation program zone base on the theoretical value of ecosystem services, which can provide quantitative basis for the land consolidation decision-making, quality and efficiency evaluation. The results show that, soil fertility keeps accumulated value of land development zone 15 100 RMB per hectare, and land reclaim zone 18 500 RMB, and land consolidation zone 4900 RMB. The rate of accumulated value of land reclaim zone reachs to 147.2%, which higher than land development zone and land consolidation zone. This result related to the land reclaim zone by soil transformed. The total value of soil fertility in program zone after land consolidation keeps increasing 7 338 800 RMB, which comes from the increased cultivated land and the improvement of family land. The soil fertility keeps scale in development zone is 0.05, reclaim zone is 0.09,consolidation is 0.46, from which land consolidation have highest benefit. It shows that improve agricultural infrastructure and improve soil fertility as the main characteristics of the type of land investment inless-effective to maintain soil fertility, should be advocated.

【题目】添加有扩增内标的沙门氏菌荧光定量PCR 检测体系的建立与评价
【中文关键词】沙门氏菌,靶点筛选,EvaGreen 荧光定量PCR,扩增内标
【英文关键词】Salmonella,Target mining,EvaGreen real-time PCR,Internal amplification control
【中文摘要】【目的】建立添加有扩增内标(IAC,Internal amplification control) 的沙门氏菌EvaGreen 荧光定量PCR检测体系,提高PCR 检测可靠性。【方法】通过比较已有沙门氏菌属细菌的基因组序列,筛选沙门氏菌属特异检测靶点,设计特异引物; 再用复合引物法构建扩增内标,优化参数,建立沙门氏菌内标PCR 检测体系,利用特异性和灵敏度实验评价体系的检测性能。【结果】筛选得到的新特异靶点基因编码III 型分泌系统蛋白(ssaQ) 。针对该基因设计特异引物(SsaQ6) ,建立了添加有扩增内标的常规PCR 和EvaGreen 荧光定量PCR检测体系; 二者对151 株沙门氏菌和34 株非沙门氏菌的检测符合率均达100% ,对基因组DNA 的检测下限达14. 9 拷贝/PCR 和2. 76 拷贝/PCR; 人工污染牛奶样品(初始染菌量: 4 - 6 cfu /10 mL) ,增菌10 h 和8 h 后分别可检出沙门氏菌。【结论】本研究发掘的新靶点基因ssaQ 特异性强,基于这一新靶点建立的添加有扩增内标的EvaGreen 荧光定量PCR 比常规内标PCR 的检测限更低,重复性更好,快速方便,在12 h 内即可得出检测结果,并且定量准确,有利于推进沙门氏菌PCR 检测方法的标准化应用。
【英文摘要】[Objective] The aim of this study was to establish a new EvaGreen real-time IAC-PCR for the rapid detectionof Salmonella. [Methods] We used Salmonella genomic comparison analysis to mine Salmonella-specific targets,andPrimer Premier 5. 0 to design primers which were evaluated by specificity and sensitivity tests. [Results]We obtained aSalmonella-specific gene that encodes putative type III secretion protein (ssaQ) ,and specific primers (SsaQ6L / SsaQ6R)were designed based on this gene. Then we established IAC-PCR and EvaGreen real-time IAC-PCR assays,which showed100% inclusivity and 100% exclusivity on all strains tested. Their detection limits of purified Salmonella genomic DNAwere 14. 9 copies /PCR and 2. 76 copies /PCR respectively. Artificial contamination assays showed that Salmonella couldbe detected after 10 hours and 8 hours enrichment when the original bacterial concentration was 4. 2 cfu /10 mL.[Conclusion] A new EvaGreen real-time IAC-PCR with high specificity and sensitivity was successfully developed for therapid detection of Salmonella.

【题目】北盘江流域降雨量和径流量年际变化研究
【中文关键词】小波变换; 年降雨; 年径流; 周期
【英文关键词】wavelet t ransform; annual precipitation; annual natural runoff ; periodic changes
【中文摘要】对北盘江流域的降雨和径流实测序列进行多尺度时频分析, 可为喀斯特地区流域的综合治理、水资源的合理利用、水电设施设计标准的制定及地区的可持续发展提供保证, 尤其对解决喀斯特地区的季节性干旱具有一定的指导意义。采用小波变换方法对北盘江流域年均降雨量和径流量的变化周期性进行分析, 研究结果表明: 北盘江流域1956- 2000年降雨量和径流量均具有中等程度的变异, 且径流量的增加速率大于降雨量; 降雨和径流存在明显的年际和年代变化, 且降雨量和径流量的变化周期具有同步性; 降雨量的主周期依次为23, 45, 5, 12a, 而23a 尺度的周期具有全局性; 径流量的变化周期大致为24, 6, 13, 40a, 而24a 尺度的周期具有全局性。
【英文摘要】Research o n the multiple time..frequency analy sis of annual precipitation and annual runof f is help to integrated manage o f Karst ar ea, ef ficient ly use of w ater r esources, co nstitute criterion of designing water and elect ricity establishment . T his paper analyzes tendency and periods of annual precipitation and annual natur al runoff in Beipan River w atershed based on Morlet wvelet transform. The results showed: annual precipitation has middling variance and no obvious increase tendency from 1956-2000, but annual runoff hasmiddling variance and o bvio us increase tendency; periodic changes o f annual precipitat ion and annual runoff are isochronous; periods of precipitat ion is 23, 45, 5, 12 years, and 23 years are overall; periods of runoff is 24, 6, 13, 40 years, and 24 y ears are o verall.

【题目】一种抗性淀粉测定方法的改进
【中文关键词】淀粉水解; 抗性淀粉; 抗生素; 水稻
【英文关键词】starch hydrolysis; resistant starch; antibiotics; rice
【中文摘要】通过淀粉水解动力学分析,比较了防腐剂和抗生素抑制淀粉消化液发酵的效果,以改进Goni等分析抗性淀粉的方法。结果表明,抗生素和防腐剂均能有效抑制消化液中微生物的生长,但防腐剂的使用需要无菌条件,而且对淀粉酶活性的抑制比抗生素强,因此使用抗生素是比较好的选择。为加快淀粉水解速率,降低抗生素对淀粉酶的抑制作用,淀粉酶用量从120 mg增至160 mg,但对水解速率较低的籼稻品种南京11未有改善,因此仍选择120 mg的酶量。这些结果为建立稳定可靠的抗性淀粉测定方法及筛选高抗性淀粉的水稻品种奠定了良好的技术基础。
【英文摘要】The inhibitory effects of preservatives and antibiotics on incubation mixture were compared through the analysis of starch hydrolysis kinetics to improve the procedure of Goni et al. for the determination of resistant starch. We showed that both preservatives and antibiotics could effectively inhibit the growth of microorganisms in samples. Preservatives must be used under sterile conditions and showed a stronger inhibition on amylase than antibiotics. Hence antibiotics were better choices compared to preservatives. To accelerate the hydrolysis rate of starch and reduce the inhibition of antibiotics on amylase, the amount of amylase was increased from 120 mg to 160 mg, except for the indica cultivar Nanjing 11 with a low hydrolysis rate, which showed no significant improvement with a high amylase amount. These results were helpful for the establishment of a reliable method for resistant starch measurement and screening of rice cultivars with a high content of resistant starch.

【题目】铅胁迫对茶树生长及叶片生理指标的影响
【中文关键词】铅;茶树生长;茶叶;生理指标
【英文关键词】lead; growth of tea tree; tea leaves; physiological index
【中文摘要】通过盆栽试验,研究了不同土壤铅浓度对茶叶生长及叶片生理特性的影响。结果表明,随着土壤铅浓度的升高,夏茶叶绿素含量显著下降,并有失绿现象,茶树生长受到一定程度的抑制。春茶叶绿素含量呈上升趋势,夏茶叶绿素含量呈先增加后降低的趋势。当铅浓度为100 mg·kg-1时,叶绿素含量达到最大值2.93 mg·g-1;铅浓度为1 500 mg·kg-1时,叶绿素含量达到最小值2.28 mg·g-1;随铅浓度增加,叶片中游离脯氨酸、丙二醛含量显著增加,两者与铅浓度呈显著正相关,春茶的相关系数分别为0.922(P<0.01)和0.880(P<0.01),夏茶的相关系数为0.871(P<0.05)和0.971(P<0.01),且夏茶中的游离脯氨酸、丙二醛含量大于春茶。铅对春茶、夏茶中可溶性糖的合成有一定的抑制作用,相关系数分别为-0.715(P<0.01)和-0.912(P<0.01)。在铅浓度为0~200 mg·kg-1时,春茶可溶性糖有小幅度增加;在铅浓度为200 mg·kg-1时,春茶、夏茶可溶性糖含量都同时达到最大值。
【英文摘要】Effects of different lead concentrations on growth and physiological index in leaves of tea were studied with the tea cultured in pots.The results showed that, with the increasing concentrations of lead , lead had a significant effect to the yield of summer tea, and the green deficiency symptoms were visible, and the growth of tea was inhibited. The chlorophyll(Chl)content of spring tea was enhanced with the increasing concentrations; The Chl content of summer tea was first stimulated and then inhibited with increasing concentration of lead. When the lead concentration in nutrient solution was 100 mg·kg-1, the Chl content reached the maximum 2.93 mg·g-1 and when the concentration was 1 500 mg·kg-1, Chl content reached the minimum 2.28 mg·g-1. Meanwhile, with increasing concentration of lead, the free praline and malondialdehyde(MDA)content in leaves were significantly enhanced, There was a positive correlation between the free praline, MDA content and the lead concentration, which the coefficient of correlation is 0.922(P<0.01)and 0.880(P<0.01)respectively on spring tea, and , the coefficient of correlation is 0.871(P<0.05)and 0.971(P<0.01)on summer tea,and then the summer tea ′s was higher than spring tea ′s; Lead would inhibit the synthesis of soluble sugar in the tea, the coefficient of correlation is -0.715(P<0.01)and -0.912(P<0.01)respectively. The soluble sugar of spring tea has a little increase when the lead concentration was 0~100 mg·kg-1 and the soluble sugar of spring tea and summer teareached the maximum at the same time when the lead concentration was 200 mg·kg-1.

【题目】鸡白痢沙门菌分离株的耐药性及磺胺类耐药机制研究
【中文关键词】鸡白痢沙门菌;耐药性;Ⅰ类整合子
【英文关键词】Salmonella pullorum;drug resistance;class Ⅰ integrons
【中文摘要】采用药敏纸片法,对33株鸡白痢沙门菌进行了药敏试验,结果显示丁胺卡那、卡那霉素、庆大霉素、环丙沙星、氟苯尼考的抑菌作用较强,所有受试菌株均对其敏感;58%~94%的受试菌株对氯霉素、新霉素、恩诺沙星和羧苄青霉素敏感;61%~88%的受试菌株对四环素、复方磺胺、磺胺异恶唑耐药。33株鸡白痢沙门菌分离株出现了多重耐药性,2耐及以上占85%,3耐及以上占66%,4耐及以上仅占27%。根据发表的序列设计了3对引物,分别扩增磺胺类耐药基因sul1、sul2和Ⅰ类整合子,所选的18个对磺胺及磺胺增效剂均耐药。分离株中94.4%(17/18)的菌株携带sul1基因,没有sul2基因,同时

94.4%(17/18)的菌株携带Ⅰ类整合子,大小分别为0.7 kb和1.6 kb。研究表明这些鸡白痢沙门菌的耐药谱较窄,且Ⅰ类整合子在磺胺类耐药菌株的产生中起到很重要的作用。

【英文摘要】The susceptibility to antimicrobials of 33 Salmonella pullorum(S.pullorum)isolates was determined. All isolateswere sensitive to amikacin,kanamycin,ciprofloxacin,gentamycin,florfenicol. 58% to 94% of isolates were sensitive toneomycin,chloramphenicol,enrofloxacin and carbenicillin. 61% to 88% of isolates had resistance to tetracycline,sulfamethoxazole and trimethoprim,sulfamethoxazole. The pattern of drug resistance showed that 85% of isolates wereresistant to two or more antimicrobials,66% of isolates were resistant to three or more antimicrobials,and only 27% of isolates were resistant to four and more antimicrobials. Sul1 gene,Sul2 gene, or class Ⅰ integrons was chosen to PCRamplification in 18 S.pullorum isolates with resistance to sulfamethoxazole. Sul1 gene was amplified in 17 of 18 strains,andno sul2 gene was amplified. Among the 18 strains,17 of these isolates carried class Ⅰ integrons,the size of which was 0.7and 1.6 kb,respectively. These results implied that drug resistance spectrum of these S.pullorum isolates was narrow andclass Ⅰ integrons might play a critical role on resistance to sulfamethoxazole in S.pullorum.

【题目】Fine mapping of the grain chalkiness QTL qPGWC-7 in rice (Oryza sativa L.).

【中文关键词】垩白;精细定位;胚乳;水稻

【英文关键词】chalkiness;fine-mapping;endosperm;rice

【中文摘要】水稻籽粒垩白是重要的品质性状,对食味和研磨品质有重要的影响。用一套培矮64s和9311的染色体片段置换系研究了垩白率(PGWC)的遗传。在第6和7号染色体上分别定位到两个控制垩白的位点,qPGWC-6和 qPGWC-7。比较株系C51(含qPGWC-7的CSSL株系、胚乳有垩白)和轮回亲本9311(透明胚乳),分析透明胚乳和垩白胚乳之间的理化差异。与透明胚乳不同,垩白胚乳的淀粉粒排列疏松,而且C51和9311之间支链淀粉结构和晶体程度也有显著差异,但是直链淀粉含量或淀粉粘滞性没有显著差异。C51和9311的F2群体进行分离分析表明,垩白率是一个半显性性状,受单个核基因控制。用C51和9311的构建了一个大F2群体用于qPGWC-7的精细定位,已定位于44kb的DNA片段,含13个预测基因。这个结果为qPGWC-7的图位克隆提供了平台,使得胚乳品质的分子标记选择成为可能。

【英文摘要】Chalkiness of rice grain is an important quality component of rice, as it has a profound influence on eating and milling qualities. We has determined the inheritance of percentage of grain with chalkiness (PGWC) using a set of chromosome segment substitution lines, made from a cross between cv. PA64s and cv. 9311. Two loci controlling PGWC, designated as qPGWC-6 and qPGWC-7, were located on, respectively, chromosomes 6 and 7. Comparisons were made between C-51 (a CSSL harbouring qPGWC-7 and having a chalky endosperm) and the recurrent parent 9311 (translucent endosperm) to characterize the physical and chemical differences between translucent and chalky endosperm. Unlike the translucent endosperm, the chalky endosperm contains loosely packed starch granules, and there were significant difference between C-51 and 9311 for amylopectin structure and degree of crystallinity, but not for either amylose content or starch viscosity. Segregation analysis of the F2 population from the cross between C-51 and 9311 showed PGWC is a semi-dominant trait, controlled by single nuclear gene. A large F2 population was constructed from the cross C51 9 9311, and used for the fine mapping of qPGWC-7, which was located to a 44-kb DNA fragment, containing thirteen predicted genes. This result provides a springboard for the map-based cloning of qPGWC-7 and allowed for marker-assisted selection for endosperm texture.

【题目】稻米脂肪与米粉RVA谱特征的关系分析
【中文关键词】稻米; 品质; 脂肪; RVA谱
【英文关键词】rice (Oryza sativa L.) ; quality; lipid; RVA profile
【中文摘要】应用水稻新品系W1721和大面积应用的杂交粳稻恢复系轮回422构建了重组自交系群体,分析了稻米脂肪与米粉RVA谱特征间的关系。结果表明,脱脂米粉的峰值黏度和热浆黏度都显著高于未脱脂米粉,冷胶黏度也表现同样的趋势,说明脱脂后米粉的黏度显著上升;峰值黏度、热浆黏度、冷胶黏度与脂肪含量都分别存在着极显著的负线性关系,其线性变异的成分分别占10105%、16119%、27153% ,说明脂肪含量升高,米粉黏度下降。本研究从正反两方面取得了一致的结果,提示脂肪对食味品质的影响主要是通过脂肪的润滑作用降低黏度来实现的。
【英文摘要】A R IL population derived from a cross between two japonica rice, W1721 and Lunhui 422, was developed. The RIL population exhibited a p lenty of variation in traits studied, which was an idealmaterial for investigating relationship between lip id and flour viscosity properties. The results showed that removal of lip ids from rice flour led to a significant increase in peak viscosity (PV) and hot viscosity (HV) , and an insignificant increase in final viscosity (FV). Furthermore, the relationship between RVA profile eigenvalue and lipid content was analyzed by a linear regression method,and the results showed that the PV, HV and FV had a negative correlation with lipid content explaining 10.05% , 16.19% and 27.53% of the phenotypic variance, respectively. Results above indicated the lipids affected rice eating and cooking quality mainly through its lubricant effect which led to a decrease in viscosity.

【题目】名山河流域水稻土组分对微团聚体吸附解吸锌的影响
【中文关键词】微团聚体, 土壤组分, Zn2+ ,吸附解吸
【英文关键词】microaggregate; soil component Zn2+; sorption desorption
【中文摘要】通过模拟..培养试验和选择溶解法, 研究了四川省名山河流域水稻土各土壤组分对原土和不同粒径微团聚体吸附解吸Zn2+ 能力的影响. 结果表明: 原土和不同粒径微团聚体对Zn2+ 的吸附与有机质、游离氧化铁、无定形氧化铁、阳离子交换量(CEC)含量极显著相关, 原土去除各土壤组分前后对Zn2+ 的吸附均用reundlich方程拟合最佳, 对Zn2+ 的吸附能力大小顺序为: 小于0.002mm > 0.25~ 2 mm > 原土> 0.002~ 0.053mm > 0.053~ 0.25 mm. 与未去除土壤组分相比, 去除土壤组分的原土和微团聚体对Zn2 + 的吸附量均有一定程度减小,吸附量的减小以< 0.002 mm 粒径最高, 0..25~ 0.053 mm 粒径最低, 原土介于各微团聚体中间. 去除有机质后, < 0.002mm、 0.053~ 0.25 mm 和原土吸附Zn2 + 的减少量依次为39.56%. 1.97%、 26.68% . 4.21%和36.39% . 2.31% ; 去除游离氧化铁后, 吸附Zn2+ 的减少量依次为30.41% . 1.91% 、 20.14% . 3.33% 和 28.73% . 1.22%; 去除无定形氧化铁后, 吸附Zn2+的减少量依次为22.12% . 1.27% 、 12.43% . 2..11%和20.15% . 2.62%. 吸附减少量大小顺序为: 去除有机质> 去除游离氧化铁> 去除无定形氧化铁, 不同处理间差异极显著. 去除各土壤组分后, 原土和各粒径微团聚体对Zn2+ 的非专性吸附量显著上升, 增加了Zn2 + 在土壤中的流动性; 而专性吸附量降低, 降低了原土和各粒径微团聚体对Zn2 + 的缓冲能力和固持能力.
【英文摘要】By using simulation..incubation test and se lective dissolution method, th is paper studiedthe effects of soil components on the zinc sorption..desorption by the microagg regates from a typical paddy soil in Mingshan R iver watershed. The Zn2+ sorption capacity of bulk soil and microaggregatesw as sign if icantly correlated with the contents of soil organic matter, free oxide iron, amorphous oxide iron, and cation exchange capacity. Whether or not the soil components w ere removed,the Zn2+ sorption by the bulk soil and microaggregates fitted well to the Freundlich isotherm mode,land the Zn2+ sorption capacityw as in the order of < 0.002mm m icroaggregates > 0.25- 2mm microaggregates> bulk soil > 0.002 - 0.053 mm microaggregates > 0.053 - 0.25 mm microaggregates. After the removal of the soil components, the Zn2+ sorption capacity by bulk soil and microaggregates decreased, and the decrement was in the order of < 0.002 mm microaggregates >bulk soil > 0.053-0.25 mm microaggregates, compared with that be fore the removal of the soil components. After the removal of organicmatter, the decrement o f the Zn2+ adsorption capacity of < 0.002mm microaggregates, 0.053- 0.25 mm microaggregates, and bulk soil was 39.56% ,1.97% , 26.68% . 4.21%, and 36..39% ,2.31%; after the removal of free oxideiron, the decrement was 30.41% , 1.91% , 20.14% , 3.33%, and 28.73% , 1.22%; and after the removal of amorphous oxide iron, the decrement was 22.12% , 1.27% , 12.43% ,2.11%, and 20.15%, 2.62%, respectively. The decrement of Zn2+ sorption by bulk soil and microaggregates after the removal of the soil componentsw as in the o rder of removal of organicmatter> removal of free oxide iron > removal of amorphous oxide iron, and the difference among the treatments was significant After the removal of the soil components, the nonspecific adsorption of Zn2+ by bulk soil and microaggregates increased significantly, wh ich increased the Zn2+ mobility in soil while the specific adsorption decreased, resu lting in the decrease of the buffering. and retention capability of the bulk soil and microaggregates to Zn2 + .

【题目】名山河流域水稻土组分对微团聚体吸附-解吸铜的影响
【中文关键词】微团聚体;土壤组分;Cu2+ ;吸附-解吸
【英文关键词】microaggregates; soil components; Cu2+; adsorption and desorption
【中文摘要】以名山河流域典型的水稻土为例,利用模拟-培养试验和选择溶解法,研究各土壤组分对原土和不同粒径微团聚体吸附解吸Cu2+ 能力的影响. 结果表明,去除土壤组分前后的原土和不同粒径微团聚体对Cu2 + 的吸附均用Langmuir 方程拟合效果最佳,原土和不同粒径微团聚体对Cu2 + 的吸附能力大小顺序为: < 0. 002mm > 2.000 ~ 0.250mm > 原土> 0.053 ~ 0.002mm > 0.250 ~ 0.053mm. 与未去除土壤组分的原土相比,去除土壤组分的原土和微团聚体对Cu2 + 的吸附量均有所减小

,尤其以去除有机质后对Cu2+ 吸附量的减小最为显著,在< 0.002mm 微团聚体中减小值高达44.50% ± 2.77%,0.250 ~ 0.053mm 微团聚体中Cu2 + 吸附量减小值最低,为37. 68% ± 3. 11%. 经不同处理后原土和各粒径微团聚体吸附量减少的顺序为:去有机质> 去游离氧化铁> 去无定形氧化铁. 去除各土壤组分后,原土和各粒径微团聚体对Cu2 + 的专性吸附降低,非专性吸附显著上升,降低了原土和各粒径微团聚体对Cu2 + 污染的缓冲能力,同时显示了各土壤组分在专性吸附中的重要性.

【英文摘要】Typical paddy soil,collected from the Mingshan River,was used to investigate the effect of paddy soil components on adsorption and desorption of copper by microaggregates in the soil. Simulation and incubation tests were used along with selective dissolution. The results howed that whether or not the paddy soil components were removed,the sorption of Cu2 + by the bulk soil and microaggregates fit well to the Langmuir isotherm model. The Cu2+ capacity was in the order: < 0.002mm > 2.000 ~ 0.250 mm > bulk soil > 0.053 ~ 0.002 mm > 0.250 ~ 0.053 mm for different size soil particles.The Cu2 + adsorption capacity of bulk soil and microaggregates decreased after removal of soil components,especially after removal of rganic matter,up to 44.50% 2.77% in the < 0.002 mm and 37.68% 3.11% in the 0.250 ~ 0.053 mm sizes. The decrease of Cu2 + adsorption by bulk soil and microaggregates after removal of soil components occurred in the order: removing organic matter> removing free iron oxide> removing amorphous iron oxide. The bulk soil and microaggregates capability to buffer the Cu2 + pollution was decreased with the decrease of specific adsorption after removal of soilcomponents,suggesting the importance of soil components in the specific adsorption. Simultaneously,the non-specific adsorption was increased.

【题目】稻米蛋白质组分及总蛋白质含量与淀粉RVA 谱特征值的关系
【中文关键词】水稻; 蒸煮食味品质; 谷蛋白; 醇溶蛋白; 蛋白质含量; 淀粉黏滞性谱
【英文关键词】rice ; eating and cooking quality ; glutelin ; prolamin ; protein content ; starch viscosity

【中文摘要】利用低谷蛋白含量(low glutelin content , LGC) 粳稻品种W1721 与大面积应用的杂交粳稻恢复系轮回422 构建了重组自交系群体。根据种子总蛋白质的SDS2PAGE带型,推断各单株LGC位点的基因型。在排除脂肪的影响下,比较了基因型LGCLGC(谷蛋白含量较醇溶蛋白低) 与基因型lgclgc(谷蛋白含量较醇溶蛋白高) 在RVA谱特征值上的差异,以及同一基因型内总蛋白质含量与淀粉RVA谱特征值的关系。结果表明基因型LGCLGC 的崩解值和回复值的平均值分别显著和极显著大于基因型lgclgc ;LGC对崩解值和回复值的相对加性效应分别为3.91 %和4.45 % ,贡献率分别为4.81 %和12.81 %。LGCLGC 型的稻米,总蛋白质含量与崩解值和消减值分别存在显著的负线性回归和正线性回归关系,贡献率分别为9.86 %和11.48 %; lgclgc 型的稻米,总蛋白质含量与消减值和回复值都存在极显著的负线性回归关系,贡献率分别为13.41 %和27.88 %。结合前人研究认为,稻米食味品质受谷蛋白相对于醇溶蛋白的含量以及总蛋白质含量的影响;而总蛋白质含量对食味品质的影响因谷蛋白相对于醇溶蛋白的含量的不同而异。因此,育种工作中应当把谷蛋白相对于醇溶蛋白的含量以及总蛋白质含量同时作为选择指标。

【英文摘要】A recombinant inbred line (RIL) population derived f rom the cross between two japonica rice , W1721 with low glutelin content (L GC) and Lunhui 422 with normal glutelin content , was developed to investigate the effect of L GC gene on RVA profile properties and relationship between total protein content and starch RVA profile properties. According to SDS-PAGE band type , genotypes of individuals at L GC locus were estimated : LGCLGC with low glutelin content and high prolamin content , lgclgc with high glutelin content and low prolamin content in the RIL population. The RVA profile characteristics of defatted rice showed breakdown and consistence values of LGCLGC were ext remely significantly higher than those of lgclgc.The LGC gene exhibited a highly significant relative additive effect on consistence value (4.45%) , explaining 12.81 % of the phenotypic variance , whereas the LGC exhibited a significant relative additive effect on breakdown value (3.91 %) , explaining4181 % of the phenotypic variance. For the genotype LGCLGC , total protein content had a negative and positive linear regression relationship with breakdown value (P < 0. 045) and setback value (P < 0. 030) , explaining 9. 86 % and 11. 48 % of the phenotypic variance , respectively , whereas for the genotype lgclgc , total protein content had a negative linear regression relationship with setback value (P < 0. 006) and consistence value (P < 0. 000) , explaining 13. 41 % and 27. 88 % of the phenotypic variance , respectively. Combined with previous studies , it is deduced that eating quality of rice is determined , at least in part ,by both the relative proportions of the two major protein f ractions , glutelin and

prolamin , and total protein content . Effect of total protein content on eating quality of rice varied with the relative proportions of glutelin and prolamin. Therefore , it may be possible to develop rice with desired levels of eating quality by breeding varieties with particular proportions of glutelin and prolamin and appropriate total protein content.

【题目】农用地抵押制度建设研究——以成都市龙泉驿区为例
【中文关键词】土地管理; 农用地抵押; 制度建设; 龙泉驿区;
【英文关键词】land administration; agricultural land mortgage; system establishment; Longquanyi District;
【中文摘要】研究目的:为农用地抵押制度建立提供参考依据。研究方法:在分析农用地抵押争议点的基础上,结合龙泉驿区农用地流转的现状,采用文献资料法、法理分析法、中外比较法、实证研究法及收益还原法进行分析研究。研究结果:全面阐述了农用地抵押的必然性和可行性,探讨了农用地经营权抵押制度建设的问题,确定了农用地抵押的基准价格,提出了完善农用地抵押制度相关法规的建议及健全相关配套组织的设想。研究结论:在规范制约机制、明确抵押责任的前提下农用地抵押权可以实现,龙泉驿区试点对推广农用地抵押制度建设工作具有借鉴意义。 更多还原
【英文摘要】The purpose of this paper is to provide reference basis for the establishment of agricultural land mortgage system.Method employed is the combination of documentation,legal analysis,China-foreign comparison,empirical study and income approach,which is based on the dispute points of agricultural land mortgage and the current condition of agricultural land transfer in Longquanyi District.The results indicate:(1)the necessity and feasibility of agricultural land mortgage have been thoroughly illustrated;(2)problems related to the establishment of mortgage system for the contractual right of agricultural land have been discussed and the benchmark prices of agricultural land mortgage have been determined;(3)suggestions on how to perfect the regulations of agricultural land mortgage system and the supplemented organizations have been proposed.It is concluded that under the preconditions of formal restriction mechanism and the clarification of mortgage responsibilities,the agricultural land mortgage right can be realized,and the trail of Longquanyi District can provide meaningful reference for the extension of agricultural land mortgage system in China.

【题目】秸秆覆盖对土壤理化性状、微生物及生态环境的影响
【中文关键词】秸秆还田; 土壤理化性状; 土壤微生物;
【英文关键词】straw mulching; soil physical and chemical properties; soil microorganism;
【中文摘要】归纳了国内外学者关于秸秆还田对土壤理化性状、微生物及生态环境影响的研究,研究表明:相对秸秆焚烧,秸秆还田不但可以减少大气污染,更重要的是秸秆还田可以有效调节土壤水、肥、气、热,提高土壤孔隙度、提高水分渗透率、增加土壤水稳性团聚体含量、提高土壤有机质、提高土壤有效养分(N、P、K等)、提高土壤微生物生物量、增强各种土壤酶的活性,同时还可以有效降低各种重金属对土壤的污染;从经济效益来讲,还可以提高作物的产量。提出应该加大对新的还田技术与方法理论以及秸秆的加工技术的研究,以提高秸秆的利用效益和效率,减少其负面效应。总之,因地制宜地利用秸秆可以使生态、社会和经济效益显著提高,是农业持续发展的有效措施和途径之一。
【英文摘要】The author concluded the effects of straw mulching on soil physical and chemical properties,soil microorganism and environment in home and abroad.Previous studies had showed that straw mulching treatmentc an reduce the atmosphere pollution

compared with burning straw.But the most important effect of it is that itc an efficiently accommodate soil water,fertility,soil atmosphere and heat.It can also increase soil porosity,soilw ater permeability,the content of water stable aggregate,soil organic matter,soil available nutrient,the soil microbial biomass and enhance the activity of soil enzyme.Meanwhile,straw mulching treatment can decrease the contamination of series heavy metal to soil.Considering the economic benefit,mulching straw can also improvec rop yields.The author considered that the researcher should enhance the research of method and technology of straw mulching and straw process so as to increase the using efficiency and decrease the negative effect.In conclusion,using mulching straw with suit measures to local conditions can improve ecological,social and economic benefits.This is one of the efficient measures of the agricultural sustainable development.

【题目】Identification and characterization of a novel Waxy allele from a Yunnan rice landrace
【中文关键词】水稻 Waxy基因 颗粒结合淀粉合酶 直链淀粉含量 dCAPS标记
【英文关键词】Rice (Oryza sativa L.) Waxy gene Granule-bound starch synthase (GBSSI) Amylose content dCAPS marker
【中文摘要】低直链淀粉含量对于水稻蒸煮品质是有利性状,在软米育种中是被选择的性状。为更好的了解直链淀粉含量控制的分子机制,筛选了83个云南地方品种并鉴定了一个低直链淀粉含量的品种,毫屁。遗传分析和转基因实验表明毫屁的低直链淀粉是Wx的一个新等位基因控制的,Wxhp,编码颗粒结合淀粉合酶(GBSSI)。Wxhp和Wxb(日本晴)序列比较表明在上游调控区(包括启动子、5’非翻译区和第一个内含子的5’拼接位点)。有趣的是,这些变化对Wx转录本的转录水平和拼接效率没有明显影响。同时,对编码区的检查发现Wxhp从起始密码子第497个核苷酸处有一个A到G的改变,导致Asp165/Gly165的替换。这个替换对体外酶活没有检测到影响,但明显降低了酶与淀粉颗粒的结合,导致种子中直链淀粉含量的降低。同时,3个低直链淀粉的其他云南地方品种也有相似的替换,表明他们来自于共同祖先。基于核苷酸多态性,开发了dCAPS标记用于水稻控制胚乳直链淀粉含量的育种实践。
【英文摘要】Low amylose content (AC) is a desirable trait for rice (Oryza sativa L.) cooking quality and is selected in soft rice breeding. To gain a better understanding of the molecular mechanism controlling AC formation, we screened 83 Yunnan rice landraces in China and identified a rice variety, Haopi, with low AC. Genetic analyses and transgenic experiments revealed that low AC in Haopi was controlled by a novel allele of the Wx locus, Wxhp, encoding a granule-bound starch synthase (GBSSI). Sequence comparisons of Wxhp and Wxb alleles (from Nipponbare)showed several nucleotide changes in the upstream regulatory regions (including the promoter, 50-untranslated region, and first intron 50 splicing junction site). Interestingly, these changes had no obvious effect on the expression level and splicing efficiency of Wx transcripts. In addition, an examination of the coding region revealed that the Wxhp allele

carries an A-to-G change at nucleotide position 497 from the start codon, resulting in an Asp165/Gly165 substitution. The amino acid substitution had no detectable effects on GBSSI activity in vitro; however, it notably reduced the binding of GBSSI to starch granules, resulting in a reduction of AC in rice seeds. Moreover, three other Yunnan landraces with low AC also carry a nucleotide substitution identical to Haopi at the ?497 position of the Wx gene, suggesting common ancestry. Based on the single-nucleotide polymorphism, we have developed a new derived cleaved amplified polymorphic sequence marker for use in breeding practice to manipulate AC in rice endosperm.

【题目】脐橙大枝修剪技术操作实施要点
【中文关键词】脐橙;大枝修剪;栽培
【英文关键词】无
【中文摘要】大枝修剪是指以主枝、副主枝及较大侧枝为剪除象的一种修剪技术,一般在5年生以上结果脐橙园开展。较常规修剪(精细修剪)而言,因其在实施过程中所针对的主要对象的有所不同,每一工序所产生效果或对树体所产生的破坏程度均有较大差异。所以在实施脐橙大枝修剪过程中须掌握方法。1、脐橙大枝修剪技术要点;2、脐橙大枝修剪操作程序;3、注意事项。

【题目】Partial and total replacement of fish meal with poultry by-product meal in diets for gibel carp, Carassius auratus gibelio Bloch
【中文关键词】无
【英文关键词】fishmeal, poultry by-product meal,replacement, gibel carp Carassius auratus gibelio
【中文摘要】无
【英文摘要】Triplicate groups of gibel carp Carassius auratus gibelio Bloch (initial body weight: 4.89 g) were fed for 8 weeks at 24.8^30.8 1C with nine isonitrogenous and isoenergetic diets. The control diet (F1) used white fishmeal as the sole protein source. In the other eight diets (F2^F9), 40.5^100% of FM protein was substituted by poultry by-product meal (PBM) at 8.5% increments. The speci ¢ c growth rate (SGR), feed e ⁄ ciency ratio, protein e ⁄ ciency ratio, protein retention e ⁄ ciency and energy retention rate for ¢ sh fed PBMdiets (F2^F9)were all higher, but not always signi ¢ cantly, than those for ¢ sh fed F1. All apparent digestibility coe ⁄ cients for ¢ sh fed PBM diets were lower than those for ¢ sh fed F1. Fish fed F1had a signicantly higher hepatosomatic index value than ¢ sh fed PBM diets (Po0.05). No signi ¢ cant (P40.05) ¡ ect of diet was found in whole-body moisture and fat content. Whole-body protein and energy content for ¢ sh fed PBM diets were slightly higher than that for ¢ sh fed F1.The optimal replacement level of FMby PBM was estimated by second-order polynomial regression to be 66.5% in protein.

【题目】Effect of inclusion of blue-green algae meal on growth and accumulation of
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】Six isonitrogenous (crude protein content: 38%) and isoenergetic(gross energy content: 17 kJ g)1) diets were formulated to investigate the effects of inclusion of blue-green algae meal ongibel carp (Carassius auratus gibelio). In each diet, 15% of the protein was supplied by fishmeal; the remainder was supplied bysoybean meal and blue-green algae meal. Diet 1 was used ascontrol with no blue-green algae meal whereas the content indiets 2 – 6 was 15.15, 29.79, 44.69, 59.58 and 74.48%, respectively.Each diet was fed to five groups of gibel carp for 12 weeksin a flow-through system. Final body weight and specific growthrate (SGR) of fish fed diet 5 were significantly lower than thecontrol diet ($P < 0.05$). Mortality of gibel carp increased withincrease in algae meal inclusion ($P < 0.05$), but there was nosignificant difference between fish fed diets 3 – 6 ($P > 0.05$).Feed conversion efficiency (FCE) decreased with the increase inalgae meal inclusion ($P < 0.05$). Fish-fed diet 6 showed thehighest feeding rate ($P < 0.05$), while there were no significantdifferences among the other groups ($P > 0.05$). Apparentdigestibility coefficient of dry matter, protein, and energydecreased with increasing algae meal inclusion in the diets($P < 0.05$). Aspartate aminotransferase (GOT) activity in theliver was not significantly different among groups ($P > 0.05$).Liver alanine aminotransferase (GPT) activity of fish-fed diets4, 5 and 6 was significantly lower than the control diet (diet 1;$P < 0.05$). Microcystins in the muscle, liver, gallbladder, andspleen increased with increasing algae inclusion ($P < 0.05$).

【题目】Growth performance and tissue mineral content of juvenile grouper (Epinephelus coioides) fed diets supplemented with arious levels of manganese
【中文关键词】无
【英文关键词】grouper, interactions, manganese, requirement,toxicity
【中文摘要】无
【英文摘要】This study was conducted to investigate the effect of dietary manganese (Mn) on growth, vertebrae and whole-body Mn content of juvenile grouper, and to examine the effect of dietary Mn on copper (Cu), iron (Fe), zinc (Zn), calcium (Ca), phosphorus (P) and magnesium (Mg) content of vertebrae and whole body. Seven casein-gelatin-based diets were supplemented with 0, 5, 10, 15, 20, 50 and 1000 mg kg)1 of Mn from MnSO4ÆH2O. Grouper with an initial weight of 12.9 ± 0.4 g were fed to satiation with one of the seven diets for 8 weeks. Growth was not significantly affected by dietary Mn supplements. Vertebrae Mn increased from 31.7 to 118.1 mg kg)1 dry weight with dietary Mn supplement increasing from 0 to 50 mg kg)1 (y =)0.0002x3 + 0.0162x2 + 1.3903x + 26.27, R2 = 0.9561, where y is the vertebrae Mn content and x is the dietary Mn content). Whole-body Mn increased from 2.5 to 7.8 mg kg)1 wet weight with dietary Mn supplement increasing from 0 to 50 mg kg)1 (y = 0.00001x3) 0.00107x2 + 0.11054x + 2.24615, R2 = 0.9080, where y is the whole-body Mn content and x is the dietary Mn content). Dietary Mn had no significant effect on vertebrae Fe, Ca, P and Mg content, and whole-body Cu, Zn and Mg content. However, vertebrae Zn and whole body Ca, P were highest in fish fed diet supplemented with 15 mg kg)1 of Mn. Based on this, Mn supplement of 15 mg kg)1 mightbe the optimum when the basal diet contained 4 mg kg)1 of Mn. Fish fed diet supplemented with 1000 mg kg)1 of Mn did not show any gross abnormality or change in feeding behaviour, but Mn contents of vertebrae and wholebody were as high as 695.1 mg kg)1 dry weight and42.5 mg kg)1 wet weight, respectively. Also, whole body Fe decreased significantly when Mn supplement was up to1000 mg kg)1.

【英文关键词】growth, Juvenile gibel carp, manganese, tissue manganese concentrations
【中文摘要】无
【英文摘要】A 68-day growth trial was conducted in a flow-through system to determine the effect of dietary manganese levels on growth and tissue manganese concentration of juvenile gibelcarp (Carassius auratus gibelio). Seven purified diets containing 7.21, 8.46, 9.50, 10.50, 13.03, 19.72 and 22.17 mg manganese (as manganic sulfate) per kilogram diet were fedto triplicate groups of fish (initial weight 3.21 ± 0.01 g). The results showed that dietary manganese levels did not significantly affect feed intake of the fish. Specific growth rate, feed efficiency, total hepatic superoxide dismutase activity, carcass and skeletal manganese concentration increased significantly with increased dietary manganese($P < 0.05$) while condition factor decreased significantly($P < 0.05$). It was concluded that dietary requirement of manganese was 13.77 mg Mn per kilogram diet. Carcass and skeletal manganese concentration could also be used to evaluate the manganese requirement. Total hepatic superoxide dismulase activity was not a sensitive indicator for dietary requirement.

【题目】Effect of dietary iron supplement on growth, haematology and microelements of juvenile grouper, Epinephelus coioides
【中文关键词】无
【英文关键词】copper, grouper, interactions, iron, manganese, zinc
【中文摘要】无
【英文摘要】An experiment was conducted to investigate the effect ofdietary iron supplement on growth, haematology and microelements of juvenile grouper,Epinephelus coioides .Casein – gelatine-based diets supplemented with 0, 50, 100, 150, 200 and 250 mg kg) 1 iron from ferrous sulphate were fed to grouper (mean initial weight: 21.0 ± 0.2 g) for8 weeks. Weight gain was highest in fish fed the diet supplemented with 100 mg kg) 1 iron, intermediate in fish feddiets with 50, 150, 200 and 250 mg kg) 1 iron and lowest in fish fed the basal diet. Feed efficiency followed a similar trend except that the lowest value was in fish fed the basal diet and the diet supplemented with 250 mg kg) 1 iron. Hepatic iron was highest in fish fed diets supplemented with iron ‡ 100 mg kg)1, followed by fish fed diet with50 mg kg)1 iron and lowest in fish fed the basal diet. The whole-body iron was lowest in fish fed the basal diet but not significantly different from other groups, as judged byANOVA . Iron supplement to the basal diet had no significant effect on haematological parameters (red blood cell count, haematocrit and haemoglobin), hepatic copper concentra-tion or manganese, zinc concentration in liver and whole body. Broken-line analysis of hepatic iron indicated that iron supplementation of 100 mg kg)1 satisfied the hepaticiron storage and that further supplementation did not expand the iron status.

【题目】Effect of faecal collection interval and dietary meat and bone meal levels on
【中文关键词】无
【英文关键词】Fecal collection interval ; Meat and bone meal ; Digestibility ; Carassius auratus gibelio
【中文摘要】无
【英文摘要】:The present study was undertaken to evaluate the effects of faecal collection interval (using a settling column) and the levels of dietary meat and bone meals (MBM) on the apparent digestibility coefficient (ADC) for dry matter , protein , energy and phosphorus in gibel carp. Six iso2nitrogenous (crude protein : 410 g/ kg) and iso2energetic (gross energy : 18 kJ / g) diets were used in which fish meal (FM) protein was gradually replaced byMBM at 0 % , 20 % , 40 % , 60 % , 80 % and 100 %. These diet combinations were fed to juvenile gibel carp for 11 weeks. The faecal samples were collected two weeks after the beginning of thexperiment using a settlement column starting 1 min after excretion started , or 4h and 16h after feeding. The results showed that the ADCs of dry matter , protein , energy and phosphorus increased significantly as the time from excretion to faecal collections in2creased while not being significant for the high MBM inclusion diets. ADCs of dry matter , crude protein , energy and phosphorus decreased linearly or almost linearly with the increase in dietaryMBMlevels. These findings suggest that faeces should be collectedsoon after they had settled under the conditions of this study for digestibility determination while rapid leaching is apparently re2sponsible for this false reading of digestibility with increasing sampling interval. It is also apparent that the digestibility is one of the problems affecting the use of MBM in juvenile gibel carp

【题目】草鱼鱼种叶酸营养需要量的研究
【中文关键词】草鱼;叶酸;需要量
【英文关键词】grass carp ;folie acid;requirement
【中文摘要】以酪蛋白和明胶为蛋白源,配制叶酸含量分别为0,0.5,1.0,2.0,5.0,10.0,20.0 mg/kg的7组精制试验饲料,投喂初始体重为(5.78±0.17)g的草鱼鱼种8 w,考察不同叶酸添加量对草鱼鱼种生长和部分血液指标的影响,以确定草鱼鱼种的叶酸需要量。结果表明:添加叶酸5.0 mg/kg使草鱼鱼种增重率(WG)、饲料效率(FE)、血液中血红蛋白含量(Hh)和血小板数(PlJT)比未添加叶酸的对照组有显著增加(P<0.05),而使血清中甘油三脂(TG)、总胆固醇(Tc)和低密度脂蛋白胆固醇(LDL—C)含量比对照组有显著降低(P<0.05);添加叶酸对草鱼鱼种存活率(SR)、血清中总蛋白(TP)和高密度脂蛋白胆固醇(HDL.C)含量,以及血液中红细胞数(RBC)无显著影响(P>0.05);对WG、TG、Tc、Hh和PLT进行折线回归分析得出草鱼鱼种对叶酸的需要量为3.6—4.3 mg/kg饲料。
【英文摘要】A feeding trial was conducted to determine the folic acid requirement of grass carp (Ctenopharyngodon idella)fingerling.Purified basal diets were formulated using vitamin—free casein and glutin as the protein source.Different levels of folic acid(0,0.5,1.0,2.0,5.0,10 and 20 mg folic acid/kg diet)were graded in the basal diet,resulting in seven dietary treatments in the experiment.Each diet was fed for 8 weeks to triplicate groups of grass carp with initial average weight(5.78±0.17)g.Grass carp fingerling fed diets supplemented with 5.0 mg folic acid/kg diet had significantly higher(P<0.05)weight gain,feed eficiency,hem0gl0binassay and platelet counting in blood than the control group fed without folicacid supplement.In contrast,the test groups had significantly lower(P <0.05)triacylglycerol,totalcholesterol and low density lipoprotein cholesterol in serum than the control group. Supplementati0n of dietaryfolio acid had no efect on survival rate,total protein and high density lipoprotein cholesterol levels in serumand red blood cell counting in blood. Weight gain,triacylglycerol,total cholesterol,hemoglobinassay andplatelet counting analyzed by broken—line

regression indicated that the requirement for dietary folic acid inrearing grass carp is approximately 3.6—4.3 mg/kg diet

【题目】Effect of dietary carbohydrate sources on growth performance and utilization for gibel carp (Carassius auratus gibelio) and Chinese longsnout catfish (Leiocassis longirostris G ü nther)
【中文关键词】无
【英文关键词】carbohydrate, Chinese longsnout catfish, gibel carp, gluconeogenesis, growth, lipogenesis
【中文摘要】无
【英文摘要】The nutritional function of monosaccharides, disaccharides and polysaccharides for omnivorous gibel carp and carnivorous Chinese longsnout catfish were investigated and the ability of these two species to utilize carbohydrates was compared. For each species, triplicate groups of fish were assigned to each of five groups of isoenergetic and isonitrogenous experimental diets with different carbohydrate sources: glucose, sucrose, dextrin, soluble starch (acid-modified starch) and a-cellulose. The carbohydrates were included at 60 g kg) 1 in Chinese longsnout catfish diets and at 200 g kg) 1 in gibel carp diets. A growth trial was carriedout in a recirculation system at 27.8 ± 1.9 C for 8 weeks. The results showed that fish with different food habits showed difference in the utilization of carbohydrate sources.For gibel carp, better specific growth rate (SGR) and feed efficiency (FE) were observed in fish fed diets containing soluble starch and cellulose, but for Chinese longsnout cat-fish, better SGR and FE were observed in fish fed diets containing dextrin and sucrose. Apparent digestibility coefficient of dry matter (ADCd) and apparent digestibility coefficient of energy (ADCe) were significantly affected by dietary carbohydrate sources in gibel carp. ADCd and ADCe significantly decreased as dietary carbohydrate complexityincreased in Chinese longsnout catfish except that glucose diet had medium ADCd and ADCe. In both species, no significant difference of apparent digestibility coefficient of protein was observed between different carbohydrate sources. Dietary carbohydrate sources significantly affected body composition, and liver phosphoenolpyruvate carboxykinase(PEPCK), pyruvate kinase (PK), glucose 6-phosphate dehydrogenase (G6PD) and malic enzyme (ME) activities also varied according to dietary carbohydrate complexity. Fish with different food habits showed different abilities to synthesize liver glycogen, and the liver glycogen content in gibel carp was significantly higher than in Chinese longsnout catfish. The influence of carbohydrate source on gluconeogenesis and lipogenesis was also different in the two fish species.

【题目】Meat and bone meal replacement in diets for juvenile gibel
【中文关键词】无
【英文关键词】Carassius auratus gibelio, growth performance,loading, meat and bone meal, nitrogen, phosphorus, retention
【中文摘要】无
【英文摘要】A 11-week growth trial was conducted in a flow-throughsystem with juvenile gibel carp Carassius auratus gibelio toevaluate the effects of gradual replacement of fish meal (FM)by meat and bone meal (MBM) on growth performance,phosphorus (P) and nitrogen (N) loading. Six isonitrogenous(crude protein: 410 g kg)1) and isoenergetic (gross energy:18 kJ g)1) diets were formulated. FM was used as the control protein. In the other five diets, 20, 40, 60, 80 and 100% FM protein was substituted with MBM20, MBM40, MBM60,MBM80, MBM100, respectively. Total P content in the diets ranged from 16.0 to 28.3 g kg)1 and the

available P was 5.0 – 6.6 g kg)1. The results showed that the best growth wasachieved with fish fed on the control diet and MBM20. Final body weight, weight gain, feed efficiency, protein retention efficiency and energy retention efficiency decreased with increased dietary MBM. No significant differences were found in the feeding rate and hepatosomatic index between the groups. Apparent digestibility coefficient (ADC) of drymatter, protein and P decreased with increase in dietary MBM, while there were no significant differences in the ADC of energy. P and N retention decreased linearly while P andN loading increased linearly with the increased dietary MBM levels. No significant differences were observed in the activity of alkaline phosphatase, aspartate aminotransferase and alanine aminotransferase, as well as pyruvate kinase in liver or in serum. Total superoxide dismutase activity in MBM20 was significantly higher than that of MBM100.

【题目】Effects of dietary thiamin on the physiological status of the grouper Epinephelus coioides
【中文关键词】无
【英文关键词】Epinephelus coioides ,Grouper ,Superoxide dismutase(SOD), Thiamin, Thiobarbituric acid reactive substances(TBARs),Transketolase
【中文摘要】无
【英文摘要】This study was conducted to evaluate the effects of dietary thiamin on the physiological status of the juvenile grouper, Epinephelus coioides. Graded levels of thiamin(0.08,0.50,2.12,3.15,4.63,12.37 mg thiamin kg – 1diet)werefed to grouper juveniles(mean weight:16.97±0.14 g)for 10 weeks. Although fish fed the thiamin-deficient(TD)diet showed no obvious symptoms of thiamin deficiency or increased mortality, those fed the lowest doses of thiamin(0.08 and 0.50 mg thiamin kg – 1diet)had significantly decreased transketolase activity in the liver.In addition, the level of liver thiobarbituric acid reactive substances in fish fed the TD diet was 33 – 67%higher than that in fish with the thiamin-supplemented diet. There were no significant differences in superoxide dismutase activity between the different groups of fish.

【题目】硒对草鱼生长、营养组成和消化酶活性的影响
【中文关键词】硒;草鱼;生长;营养组成;消化酶
【英文关键词】selenium; Cenopharyngodon idellus; growth performance;nutritional composition;digestive enzyme
【中文摘要】选用体长(10.16±0.14)em,体重(21.20±0.24)g的草鱼种630尾,随机分为7个试验组,每组设置3个重复,每个重复30尾草鱼。在纯化饲料中添加0、0.15、0.3、0.6、1.2、2.4、4.8 mr/kg的硒,以0 mr/kg添加组为对照组,进行为期84 d的生长试验以研究饲料不同硒水平对草鱼生长、营养组成和消化酶活性的影响。结果表明:饲料中添加硒能促进草鱼的生长,提高饲料效率,提高体蛋白含量,降低脂肪含量,提高草鱼消化酶活性。饲料硒对草鱼脂肪酶活性的影响最为显著(P<0.05)。当

硒添加量为0.6 mr/kg时,草鱼的特定生长率、增重率、饲料效率、蛋白质效率和饲料蛋白沉积效率为最大值,与对照组相比,其特定生长率和饲料效率分别提高了28.37%和38.30%;草鱼鱼体蛋白含量最高,脂肪含量最低;草鱼的肝胰脏和肠道蛋白酶、淀粉酶以及脂肪酶活性均达最大值,其中肝胰脏和肠道脂肪酶活性分别比对照组提高了205.55%和249.33%。上述研究表明饲料中适量添加硒能提高消化酶活性,改善草鱼品质,促进生长。

【英文摘要】Abstract:630 grass carps[initial length:(10.16±0.14)am,initial weight:(21.20±0.24)g]wererandomly divided into 7 treatments(90 for each treatment,30 for each replicate)to study the effects of dietary selenium on growth performance,nutritional composition and digestive enzyme activities of grass carp by feeding 7 pure diets with 0,0.15,0.3,0.6,1.2,2.4 ,4.8 mg Se/kg diet.The basal diet which was added 0 mg selenium per kilogram was used as control group.After a 84一day feeding trail,the results showed that:dietary selenium had significantly affected growth, nutritional composition and digestive enzyme activities of grass carp(P<0.05).The special growth rate(SGR) ,weight gain(WG),feed eficiency(FE),proteieficiency ration(PER),protein reservation rates(PRR),the crude protein of fish body and muscle as well as the activities 0f the three digestive enzymes were highest in fish fed diet with 0.6 mg Se/Kg diet;while the flat content is the lowest.The specific growth rates(SGR),feed eficiency(FE)increased 28.37% and 38.30% respectively while hepatic and intestinal lipase increased 205.55% and 249.33% respectively compared with the control group.All of these results demonstrated that the activities of digestive enzyme were enhanced by adding selenium SO as to improve fish quality and accelerate grass carp to growth.

【题目】Effect of dietary calcium and phosphorus on growth, feed efficiency, mineral content and body composition of juvenile grouper, Epinephelus coioides

【中文关键词】无

【英文关键词】Grouper; Calcium; Phosphorus; Magnesium

【中文摘要】无

【英文摘要】A study was conducted to investigate the effects of dietary calcium (Ca) and phosphorus (P) on juvenile grouper, and to characterize P deficiency signs. Six isoenergetic and isonitrogenous diets with two P levels (with or without P supplement) were prepared using casein and gelatin as the main protein sources. Juvenile grouper with an initial weight of 29.8 ± 0.15 g were fed to satiation with one of the six diets for 10 weeks. Fish fed diets without P supplement showed reduced growth, poor feed efficiency, loss of appetite, reduced ash content and mineral (Ca, P and Mg) deposition in scales, vertebrae and opercula, and an increase in body lipid content. When P was not supplemented, Ca supplement of 6 g kg − 1 had no significant effect on growth, ash content in scales, vertebrae and opercula, or mineral (Ca, P, Mg and Zn) deposition in scales and vertebrae, but increased feed efficiency, and Ca and P depositions in opercula, and lowered protein level in liver. When diets were supplemented with 6 g kg − 1P, C a supplement of 6 g kg − 1 had no significant effect on growth, or the ash and mineral (Ca, P and Mg) content in scales, vertebrae and opercula, but excess Ca supplement (up to 12 g kg − 1) had a negative effect on scale ash, mineral (Ca, P and Mg) deposition and vertebrae Zn deposition. Second-degree polynomial regression analysis has revealed a slight trend towards reduced growth at the high Ca levels. Interestingly, dietary Ca supplement also increased feed efficiency at the level of 6 g kg − 1 supplemental P. If feed efficiency and scale mineralization are taken into account, Ca supplement of 6 g kg − 1 (Ca / P = 1) might be optimum when diet wassupplemented with 6 g kg − 1P.

【题目】饲料Vc对草鱼生长、肌肉品质及非特异性免疫的影响
【中文关键词】:草鱼:V ;生长;肌肉品质;非特异性免疫
【英文关键词】无
【中文摘要】:采用维生素C(Vc,以Vc磷酸酯为Vc源)添加量分别为50 mg&g、100 mg/kg、l50 mg&g、200 mg&g、300 mg/l(g饲料的配合饲料,喂养体质量(42.4+5.0)g的草鱼(Ctenopharyngodon idellus)60 d,以不添加V 的基础饲料饲喂组为对照,探讨v 对草鱼生长性能、肌肉品质和非特异性免疫的影响。结果表明,饲料中添加V 能显著提高草鱼增重率,降低饲料系数,当v 添加量为150~200 mg/l(g时,草鱼生长性能最佳;随V。添加量增加,肌肉失水率、肌纤维直径和肌原纤维耐折力呈增加趋势;肌肉胶原蛋白含量和肝脏V 含量随V 添加量的增加而增加;V 添加量为150 mg&g及以上水平时,各实验组草鱼血清碱性磷酸酶(AKP)活性比对照组显著提高(P<0.05);V。添加量达到300 mg,kg后血清溶菌酶(LSZ)活性比对照组显著提高(P<0.05);各组问血清超氧化物歧化酶(SOD)活性差异不显著(P>0.05)。上述研究表明,饲料中添加V 能促进草鱼生长,改善肌肉品质,增强非特异性免疫力。适宜的V 添加量为150mg/l(g饲料。

【题目】单核细胞增生李斯特菌弱毒株主要毒力基因表达水平分析
【中文关键词】单核细胞增生李斯特菌;弱毒株;毒力基因;表达水平
【英文关键词】Listeri a monocy togenes, low2pathogenicity, virulence gene, expression level
【中文摘要】单核细胞增生李斯特菌是重要的食源性病原菌,可引起人与动物的胃肠炎、脑膜炎、败血症、流产等。其感染过程的每一步均由特定的毒力因子介导。本试验应用荧光定量PCR ,比较分析单核细胞增生李斯特菌弱毒株H4 (4a 型) 与强毒株10403S(1/ 2a 型) 、681 (4b 型) 主要毒力基因(prfA、plcA 、hly、mpl 、ac2tA 、plcB、inlA 、inlB 和sigB) 的表达水平差异。除应激调控因子σB (sigB) 外,H4 株主要毒力基因的表达水平均显著高于10403S 与681 。膜裂解因子的高表达导致H4 更易暴露于宿主免疫系统而被清除,从而引起毒力下降。本研究为探明这类菌株的弱毒机制奠定了基础。
【英文摘要】Listeri a monocy togenes is an important foodborne pat hogen wit h manifestations ranging f romgast roenteritis to meningitis , septicemia and abortion. Each step of it s infection p rocess is mediated byspecific virulence factors. This study was at tempted to compare the expression levels of major virulence2as2sociated genes (prfA , plcA , hly , mpl , actA , plcB , inlA ,inlB and sigB) in low2pat hogenicity isolate H4(4a) wit h t hose in pat hogenic st rains 10403S (1/ 2a) and 681 (4b) using real2time PCR assay. Major viru2lence2associated genes in H4 were expressed at higher levels t han t hose in st rains 10403S and 681 , exceptfor alternative sigma factor σB (sigB) . Due to over2expression of membrane2damaging factors , t he bacteriaare more likely to be exposed to t he host immune systems and readily eliminated f rom t he body. This st udypresent s some clues of t he molecular mechanisms of low2pat hogenicity of L . monocy togenes .

【题目】基于生态足迹的雅安市土地生态安全研究
【中文关键词】土地生态安全; 生态足迹; 生态承载力; 生态压力指数;

【英文关键词】land ecological security; ecological footprint; ecological capacity; ecological tension index;
【中文摘要】以雅安市1999-2006年的统计数据为基础,利用生态足迹理论与方法,对雅安市的生态足迹、生态承载力、生态赤字进行了研究,对雅安市的生态安全情况进行了评价。结果表明:雅安市人均生态足迹从1999年的1.068 hm2增加到2006年的1.657 hm2,而同期的人均生态承载力则由0.925 hm2下降到0.833 hm2,人均生态赤字由0.143hm2增大为0.825 hm2,生态压力指数由0.858上升为1.126;万元GDP生态足迹在1.87~2.78 hm2之间上下波动,平均值为2.212 hm2。研究期内雅安市的人均生态足迹超出了人均生态承载力,表现出巨大的生态赤字,且生态赤字基本上呈直线上升趋势,雅安市的经济社会发展处于不可持续状态,土地生态系统始终处于超负荷和不安全的状态。这为揭示区域土地生态安全的本质提供一定参考,同时也指出协调人口、资源和区域经济发展可缓解这种不安全状态。
【英文摘要】Based on the statistical data of Ya ’an in 1999-2006,we carried out initial research for the city ’s ecological footprint,ecological capacity and ecological deficit.The results showed that the ecological footprint per capita in Ya ’an city increased from 1.068 hm2 in 1999 to 1.657 hm2 in 2006,whereas,the ecological capacity per capita decreased from 0.925 hm2 to 0.832 hm2;the ecological deficit per capita increased from 0.143 hm2 to 0.825 hm2;the ecological tension index increased from 0.858 to 1.126.Ecological footprint million GDP fluctuation was between 1.87 hm2 and 2.78 hm2 with national average of 2.212 hm2.Ya ’an ecological footprint per capita exceeded the ecological carrying capacity per capita,showing a huge ecological deficit and ecological deficit is basically linear upward trend.The results indicated that the development model of Ya ’an city was not sustainable,and the land resources was almost in the ecology over burden condition,suggesting that the land ecological environment is at risk.The results would provide theory basis for revealing the essence of regional ecological safety of land,and at the same time,it pointed out that the coordination of people,resources and regional economic development might alleviate the situation of insecurity.

【题目】草鱼幼鱼肌醇营养需要量的研究
【中文关键词】草鱼;肌醇;生长;血清
【英文关键词】Ctenopharyngodon idella;myo-inositol;growth;serum
【中文摘要】以酪蛋白、明胶和鱼粉为蛋白源,配制含肌醇水平分别为0、50 mg/kg、100 mg/kg、200 mg/kg、400 mg/kg、800 rag/kg、1 600mg/kg的7组实验饲料。每组设3个重复,连续投喂体质量(4.78±0.18)g的草鱼(Ctenophar2mgcMon idella)幼鱼9周,通过测定生长指标、部分血清生化指标和全鱼营养成分来评价饲料肌醇添加水平对草鱼幼鱼的影响。结果表明,饲料中肌醇添加水平≥2mg/kg使草鱼幼鱼增重率(WGR)、特定生长率、血清中总胆固醇(TC)和低密度脂蛋白胆固醇(LDL—C)含量与对照组相比有显著提高(P<0.05),而血清甘油三酯(TG)含量比对照组有显著降低(P<0.05);200mg/kg和400mg/kg肌醇添加组草鱼幼鱼饲料系数(FCR)比对照组有显著降低(P<0.05);饲料中添加肌醇对草鱼幼鱼存活率、血清中高密度脂蛋白胆固醇和全鱼营养成分无显著影响(P>0.05)。对WGR、FCR、TC、TG和LDL—C进行折线回归分析得出饲料中肌醇添加水平为166~214 mg/kg对草鱼幼鱼的生长比较适宜。
【英文摘要】Abstract:An 9一week growth experiment was conducted to estimate the requirement of myo-inosito1(MI)for grass carp,Ctenopharyngodon idella fingerling.Half—purified basal diets were formulated using the fishmeal,glutin and casein as the protein source.M 1 was supplemented at 0, 50,100,200,400,800,and1 600 mg/kg diet in the basal diet.Each diet was fed to triplicate groups of grass carp with initial averagebody weight(4.78±0.18)g.Gras carp fingerling fed diets supplemented with≥200 mg MI/kg had significantly higher weight gain,specific growth rate,total cholesterol and low density lipo protein cholesterol in serulTl than the control group fed diet without MI supplement(P<0.05).In contrast.the test groups had significantly lower triacylglycerol in serum than the control group(P<0.05).Also gras carp fingerling fed diets with 200 mg(MI)/kg and 400 mg(MI)/kg had significantly lower feed conversion rate than the cOntrol group(P<0.05).Supplementation of dietary MI had no effect on survival,high density lipoprotein cholesterol in serum and the whole fish biochemical composition of gras carp fingerling(P>0.05).Weight gain rate,feed conversion rate,total cholesterol,triacylglycerol and low density lipo protein cholesterol of gras carp analyzed by broken—line regresion indicated that the suitable requirement for dietary M I of growing gras carp was approximately 166—214 mg/kg diet。

【题目】Dissecting soil CO2 fluxes from a subtropical forest in China by integrating field
【中文关键词】无
【英文关键词】CO2 fluxes;subtropical forest;modeling approach
【中文摘要】无
【英文摘要】Terrestrial carbon sequestration involves a series of processes, including photosynthesis, plant autotrophic respiration and soil microbial heterotrophic respiration. Field measurements of carbon dioxide (CO2) using either eddy covariance or chamber methods usually provide bulk CO2 fluxes from more than one sink or source. For the purpose of estimating the C budget in ecosystems, it is inherently important to determine the individual sinks or sources. This report describes how we tested the Forest-DNDC model using a dataset collected at a subtropical forest site in Sichuan Province, China. One-year field measurements were conducted using a chamber method at four plots with different treatments that were specifically designed to distinguish the CO2 fluxes produced from three sources: root respiration, forest floor respiration and mineral soil respiration. The obtained datasets were utilized to verify the modeled CO2 fluxes from the corresponding sources for the tested forest ecosystem. Results from the tests indicated that Forest-DNDC was capable notonly of quantifying the total CO2 emissions but also of distinguishing their sources related to plant autotrophic and soil microbial heterotrophic respiration. Because measuring root respiration is always difficult in field investigations, adopting Forest-DNDC for quantifying root respiration represents an appropriate complement to most field measurements.

【题目】脐橙大枝修剪技术试验研究
【中文关键词】大枝修剪;赣南脐橙;栽培技术;试验
【英文关键词】无
【中文摘要】脐橙大枝修剪技术具有显著改善树体通风透光条件、增强树势、提高单株产量及省工省力等优点,为赣南脐橙产区大力推广的一项技术。在生产实际中,许多果农对脐橙大枝修剪技术掌握还不到位。2008~2009年,我们特开展了脐橙大枝修剪技术试验,旨在研究脐橙大枝修剪方法、修剪量、最佳修剪时期、大枝修剪与常规修剪(精细)效果比较与成本分析,形成一套较为完整的脐橙大枝修剪技术。研究表明,采用脐橙大枝修剪技术:1、有效降低脐橙生产成本;2、能有效提高植株果实商品率;3、春季为实施大枝修剪的适宜期;4、修剪量控制在20%以内为宜。

【题目】川中丘陵区紫色土坡耕地土壤侵蚀特征
【中文关键词】川中丘陵区; 紫色土; 坡耕地; 土壤侵蚀
【英文关键词】central hilly areas of Sichuan; purple soil; sloping field; soil erosion
【中文摘要】通过径流小区定位观测, 研究了川中丘陵区坡耕地土壤侵蚀特征。结果表明, 坡面径流量和土壤侵蚀量年际间存在差异; 随着坡度的增加, 坡面径流量和土壤侵蚀量呈增加的趋势。多元回归分析表明, 降雨量与坡面径流深、土壤侵蚀量之间存在显著的线性关系; 而降雨强度、降雨历时与土壤侵蚀量分别存在着显著的幂函数和二次函数关系。主成分分析表明, 降雨量和降雨强度为坡耕地主要的土壤侵蚀因子, 降雨历时对土壤侵蚀的贡献率随坡度的增加逐渐加强。
【英文摘要】T he study w as carried out to do research o n the characterist ics of soil ero sion in sloping fields at the central hilly areas of Sichuan by observing the water and soil loss of runoff observation field. The results indicated that the runoff and soil erosion were differ ent between different years. Runoff and soil erosion increased with the rise of slope. Multiple regression analysis showed that significant liner relationship existed between r ainfall and runoff depth, soil erosion.How ever, the signif icant power and quadratic relat ionships were found between rainfall intensity and soil erosion, rainfall duration and soil erosion respectively. The principal component analysismanifested that rainfall and rainfall intensity were the major factors for soil erosion. The effect degree of rainfall durat io n on soil erosion was enhanced with the rise of slope.

【题目】用四重PCR 检测方法检测产单核细胞李斯特菌
【中文关键词】关键词: 产单核细胞李斯特菌; 四重PCR; 检测
【英文关键词】Li ster ia monocy togenes ; quadr up l e PCR; detect ion
【中文摘要】为了同时快速准确的检测产单核细胞李斯特菌以及是否为有毒力的产单核细胞李斯特菌, 根据相关文献报道的四重PCR 方法, 针对该菌的种特异性基因inlA 基因进行引物设计, 扩增片段大小为800bp, 结果应用该PCR 法可特异性的扩增出目的基因片段, 与GenBank 上发表的序列同源性为97. 3%。同时通过对毒力基因inlB, inlC 和inlJ 的检测用来判断菌株的相关毒力。而同一属的其他菌种无害李斯特菌(L . innocua) , 韦氏李斯特菌(L . w elshimeri) 均无特异条带, 嗜水气单胞菌(J 1) , 产气荚膜梭菌(C57 13) ,大肠埃希菌(AT CC 25922) , 鼠伤寒沙门菌(C79 32) , 金黄色葡萄球菌(AT CC 25923) 结果均为阴性。对临床上送检的23 份样品进行四重PCR 方法检测并同时与国家标准GB/ T 22429- 2008 食品中单核细胞增生李斯特氏菌的快速筛选检验中使用的检测方法进行比对, 两种检测方法的结果完全符合, 均检测出7 份阳性样品。并且四重PCR 法表明这7 份阳性样品中的产单核细胞李斯特菌均携带有3 种毒力因子(inlB, inlC和inlJ) , 因此该四重PCR 法可用于快速鉴定是否是有毒力的产单核细胞李斯特菌, 为有效预防控制产单核细胞李斯特菌污染提供技术支撑。
【英文摘要】In order to detect List er ia monocy togenes and it s virulence, PCR primers of species specif ic inlAgene w ere designed and the amplif ied pr oduct w as 800 bp according to the quadruple PCR. The homo logyof amplified gene fragment and the published sequence in GenBank w as 97. 3% . At the same t ime, the v ir ulence o f these st rains w as ascer tained by the fo rmat ion o f 884 bp and / or 517 bp and/ or 238 bp f ragmentsw ith the inlB, inlC and inlJ primers, respect ively. How ever, no PCR products w ere detected f rom L.innocua, L . wel shimer i , Aeromonas hy d rop hi la (J 1) , Clostr idium p erf r ingens (C57 13) , Escher i chia coli(AT CC 25922) , S. ty p himur ium (C79 32) , Stap hy lococcus aureus (A TCC 25923) . The tw enty threeclinical samples w ere detected by the mult iplex PCR assay and the method int roduced in GB/ T 22429-2008. T he r esult s of these tw o methods w er e accordant . Among these samples both methods detected sev en posit ive samples and this mult iplex PCR detected the thr ee virulence genes (inlB, inlC and inlJ) all exis ted in the sev en posit ive samples. So this assay can provide a rapid method for searching pathog enic L.monocy togenes st rains and pro vide technolog y support for ef fectiv e co nt rol of L . monocy togenes contamination.

【题目】草鱼幼鱼对饲料中泛酸需要量的研究
【中文关键词】泛酸钙;草鱼;生长;需求量
【英文关键词】clacium D—pnatohtenate;grasscarp;growth;requirement
【中文摘要】研究了饲料中泛酸钙添加量对平均体重(4.80±0.32)g的草鱼幼鱼生长和部分生理指标的影响。在相同基础配方中分别添加泛酸钙0、8、15、30、60、120、240mg/kg饲料,进行为期8周的养殖试验,每个处理3个重复。结果表明:饲料中添加泛酸钙能提高草鱼幼鱼的增重率和特定生长率,降低饲料系数,对成活率无显著影响(P>0.05)。对照组的总胆固醇、高密度脂蛋白胆固醇和低密度脂蛋白胆固醇含量显著低于添加组(P<0.05),各添加组无显著差异(P>0.05)。鱼体灰分含量不受饲料中泛酸钙含量的影响,但能提高鱼体水分、蛋白和脂肪含量(P<0.05)。基于特定生长率折线法分析,草鱼幼鱼获得最佳生长时的饲料泛酸钙最低需求量为25mg/kg。

【题目】柑橘溃疡病综合防治试验研究
【中文关键词】柑橘溃疡病;防治;试验;植保
【英文关键词】无
【中文摘要】柑橘溃疡病 (Citrus bacterial canker disease, CBCD) 是一种细菌性病害。在自然条件下,该病菌可以侵染脐橙枝条、叶片和果实,严重时造成异常落叶、落果,影响树势和果实产量与质量,对赣南脐橙出口和产业发展造成严重的经济损失。针对目前生产中存在的是否清病原及春梢防治时期等争议,2008~2009年,我们开展了柑橘溃疡病综合防治试验。试验结果表明:1、春梢喷药防治柑橘溃疡病,能显著减轻夏秋梢发病率,且花前喷药比花后喷药效果更好;2、病原基数的高低,很大程度上决定了生长季节新梢溃疡病的防治效果,其决定因素大于春季喷药防治时期因子,因此,秋梢老熟后至次年萌芽前清除病原、减少柑橘溃疡病基数是关键的技术措施之一。

【题目】饥饿对草鱼血清游离氨基酸的影响
【中文关键词】草鱼(Ctenopharyngodon idella);血清;游离氨基酸;禁食
【英文关键词】无
【中文摘要】:将池塘捕获的体重(1.70±0.80)kg的草鱼(Ctenopharyngodon idella)饲养在室内水族箱内,分别测定了空腹(禁食1 d,26样本)、饥饿15 d(15样本)、饥饿30 d(15样本)的草鱼血清游离氨基酸含量。结果显示:草鱼血清游离氨基酸总量基本恒定,空腹、饥饿15 d和饥饿30 d的氨基酸总量无显著差异;处于饥饿状态的草鱼血清游离必需氨基酸总量极显著地高于空腹状态,非必需氨基酸总量极显著地低于空腹状态;血清赖氨酸、氨酸、异亮氨酸、亮氨酸和胱氨酸含量因饥饿显著升高,而组氨酸、苯丙氨酸、天冬氨酸、丝氨酸、谷氨酸和酪氨酸因饥饿显著降低;饥饿15 d和饥饿30 d各氨基酸含量均未见差异。草鱼血清游离氨基酸含量在正常摄食情况下主要受饲料蛋白质影响,处于饥饿状态下主要来源于肌体蛋白质的分解,比较正常摄食后和饥饿状态下血清游离氨基酸的组成可评价饲料蛋白质的质量。

【题目】健康猪直肠粪便中沙门菌I 类整合子与耐药基因的检测

【中文关键词】临床健康猪; 多重耐药; 沙门菌; I 类整合子; 耐药基因
【英文关键词】Clinical healthy swine; Multiple resistance; Salmonella; Class I integron; Antibiotic resistance gene
【中文摘要】目的了解安徽省规模化猪场健康猪直肠粪便中沙门菌分离株多重耐药情况及其与I 类整合子和耐药基因的携带关系。方法采用标准K-B 纸片法对22 株沙门菌分离株进行15 种抗生素敏感试验; 应用PCR 技术对沙门菌分离株进行I 类整合子及耐药基因检测。结果22 株沙门菌分离株中有20 株(90. 91%) 对2 种以上抗生素耐药,属于多重耐药株,羧氨苄青霉素-四环素-卡那霉素-氯霉素-氟苯尼考是主要多重耐药谱; 22 株沙门菌中有19 株(86. 4%) 携带I 类整合子, tetB、aph(3) -IIa 和cmlA 基因分别检出最高。结论沙门菌多重耐药性与整合子携带之间的关系密切,耐药表型测定结果与耐药基因检测结果基本一致,基因组DNA 携带的耐药基因种类多于质粒。
【英文摘要】Objective To understand the relationship between multiple-resistance of Salmonella isolates from rectafaeces of clinically healthy swine and the conditions of carrying class I integrons and antibotic resistance genes. MethodThe susceptibility testing of 22 strains of Salmonella isolates to 15 antibiotics were performed by means of K-B disc method.PCR technique was used to detect the presence of class I integrons and antibiotic resistance genes. Result 20 strains of the22 isolates (90. 91%) exhibited resistance to at least two antibiotics. The dominating multiple resistant spectrum wasAmoxicillin-Tetracycline-Kanamycin-Chloromycetin-Florfonicol. In the 22 Salmonella strains,19 strains(86. 4%) carriedclass I integrons and the most prevalent genes detected by PCR were tetB,aph(3) -IIa and cmlA genes. Conclusion Aclose correlation exists between the multiple resistance and the carrier condition of class I integrons. The phenotype of multipleresistance is consistent with the antibiotic resistance genes. The genome DNA carries more genes than plasmid does.

【题目】Effects of vanillic acid on the growth and development of Fusarium oxysporum f. sp. niveum
【中文关键词】无
【英文关键词】Allelopathy, biomass, Fusarium oxysporum f.sp.niveum (FON),mycotoxin; phytopathogenic enzymes activities, vanillic acid.
【中文摘要】无
【英文摘要】To determine the possible role of vanillic acid in a root exudates, in the development of fusarium wilt caused by Fusarium oxysporum f.sp. niveum (FON), the effects of vanillic acid on the growth and development of FON were studied. Vanillic acid was added into the media to culture the FON. Vanillic acid stimulated the FON growth and biomass production, increased the fungal mycotoxin production, increased the proteinase and amylase activity and altered the fungal morphology. However, it inhibited the conidial germination. We concluded that secretion of vanillic acid by roots of plants susceptible to fusarium wilt might facilitate the development of this disease.

【题目】油茶林中药材GAP立体种植与推广
【中文关键词】油茶;GAP;中药材;套种;立体种植
【英文关键词】Camellia oleifera; GAP; Chinese traditional medicinal herbs; interplanting; stero-planting

【中文摘要】在油茶林合理套种中药材有助于增加农民收入。对江西永丰等地的油茶示范林进行环境评价,均符合中药材GAP基地的标准,适宜发展中药材GAP立体种植。本文对 2006年以来在江西永丰、樟树、东乡等地油茶林套种中药材的示范推广经验进行总结,提出几种适宜套种的中药材,以及相应的栽培管理技术。
【英文摘要】It will be helpful for farmers to interplant Chinese traditional medicinal herbs in Camellia oleifera reasonably by increasing their earnings. Evaluation on C. oleifera demonstration forest environment was carried out in several places including Yongfeng county, Jiangxi province. The results shown that the environments all reached national GAP standards of Chinese traditional medicinal herbs. Stero-planting Chinese traditional medicinal herbs in C. oleifera was feasible. The papper summerized the popularizing experiences of interplanting Chinese traditional medicinal herbs in C. oleifera in several places including Yongfeng county, Zhangshu county, and Dongxiang county, Jiangxi province. Several Chinese traditional medicinal herbs were recommended. The forest management methods corresponding to GAP were suggested.

【题目】水稻耐盐性的遗传和分子育种的研究进展
【中文关键词】水稻, 耐盐性, 种质, QTL, 克隆, 分子育种
【英文关键词】Rice, Salt-tolerance, Germplasm, QTL, Genetics and breedin
【中文摘要】盐胁迫是造成水稻减产的重要环境因素之一。本文从维护膜系统的完整性、离子的区隔化以及渗透调节等三个方面介绍了水稻耐盐性的机理;简要描述了水稻生物耐盐能力、农艺耐盐能力和离体细胞对盐害反应等三种耐盐鉴定方法。总结了近年来对水稻耐盐种质资源的发掘、耐盐性QTL定位和重要基因的克隆以及耐盐水稻选育所取得的进展。通过长期水稻耐盐性评价、已发掘了一些耐盐的水稻种质;定位了七十多个控制 Na+/K+含量、存活天数等耐盐性相关性状的 QTL;两个水稻耐盐基因 SKC1 和 DST 已被克隆;我们已获得系列不同程度耐盐的转基因植株和SKC1/BADH两类耐盐基因聚合系。本文进一步讨论了水稻耐盐性机制的研究以及在生产实践中应用的前景,试图为深入开展水稻耐盐性研究提供参考。
【英文摘要】Salt stress is one of the main environmental constraints for the losses of rice yield. In this paper, we introduced the mechanisms of rice salt-tolerance by the following three aspects: the integrity of membrane systems, ionic compartmentation, and osmotic adjustment. We also briefly presented the three methods for identifying rice salt-tolerance, which specifically refer to biological and agronomic salt resistance, as well as the response of in vitro cells to salt stress. Then we summarized the progresses of mining salt-resistance rice germplasm resources, mapping the QTLs conferring salt-tolerance, cloning slat-tolerant genes of importance and

breeding salt-tolerant rice varieties. Through a long-term evaluation of this trait, some rice germplasm involved in salt tolerance have been identified. More than 70 QTLs controlling the salt-related traits of Na+/K+ contents and survival days in rice have been identified. Two salt-tolerance genes SKC1 and DST have been cloned. A series of transgenic lines with salt-tolerance and polymerization lines of two salt-resistant genes (SKC1 and BADH) in rice have been developed in our lab. Finally, we discussed the prospects of rice salt-tolerant mechanism research and their applications in practice, which might provide an important reference for further studies of salt-tolerance in rice.

【题目】水稻芽期与幼苗前期耐碱性状QTL分析
【中文关键词】水稻;碱性盐胁迫;数量基因座位;DH群体
【英文关键词】rice, alkali stress, quantitative trait locus, double haploid population
【中文摘要】利用包含120个株系的籼粳交来源(春江06/TN1)的加倍单倍体群体,在Na2CO3胁迫下,以发芽期和幼苗前期的相对发芽势等10个性状作为耐碱性评价指标,进行水稻耐碱性的QTL定位。相关性分析表明,相对发芽势和相对发芽率显著正相关,相对苗高、相对根数和相对根长之间显著正相关。采用QTLNetwork统计软件共定位到14个加性QTL和13个上位性QTL。在第3染色体RM251-RM3280间有2个QTL,在第7染色体RM3286-RM1279区域有3个QTL;在第1、2和7染色体同一位置同时检测到2个上位性QTL,在第12染色体RM1246~RM5199之间集中了4个上位性QTL,耐碱数量基因表现出一因多效或紧密连锁现象。耐碱性盐QTL可能包括两类,一类与K+、Na+离子胁迫有关,另一类与高pH胁迫有关。水稻品种都具有一些耐碱基因,可以通过有性杂交和分子标记辅助选择的方法选育优良的耐碱品种。
【英文摘要】A double haploid(DH) population including 120 lines derived from a cross between indica rice (Oryza sativa L.) TN1 and japonica CJ06 was used to detect quantitative trait loci (QTLs) for 10-trait relative values of alkali damage at germination period and early seedling stage under0.15% Na2CO3 stress. Correlation analyses showed that alkali damage rate in germination period (ADG) had significant positive correlation with relative germination energy (RGE), relative germination rate (RCG) and relative germination index(RGI),and alkali damage rate at early seedling stage (ADS) had significantly correlation with relative seedling height (RSH),

relative root length (RRL), relative root number(RRN) and relative seedling dry weight (RDW). ADG and ADS can be used as evaluation indexs of alkaline tolerance in rice. By using QTLNetwork 2.0 software,14 additive QTLs and 13 epistatic QTLs, on chromosome 3, and three main effect QTLs were mapped between RM3286 and RM1279 on chromosome 7. Epistasis analysis showed that some epistatic loci, like RM1-RM1195,RM1358-RM290, RM1279-RM505, and RM1246-RM519 on chromosome 1, 2,7, and 12 respectively were important under alkali stress, included two or more epistatic QTLs, indicating that the QTLs displayed their effects through different ways of interaction. Among the key loci under alkali stress one may by pleiotropic or some closely linked each other. Comparing QTLs with those found in other researches, some alkali resistance QTLs were likely to be in the same region with some salt resistance QTLs. A presume was made that QTLs in this article might include two types, one for resistance to ions (K+ or Na+) stress and other for resistance to high PH stress, the latter may play an important role for tolerance to alkali. Many rice varieties have different resistance QTLs for alkali stress; we can pyramid them through marker-assistant selection to breed varieties suitable to growth in saline-alkalized land.

【题目】油茶新造林不同经营模式经济概算
【中文关键词】油茶;技术经济;现金流量;投资回收期;套种
【英文关键词】Camellia oleifera; Technical economy; Cash flow; Investment recovery period; Interplanting.
【中文摘要】为进一步提高油茶的经营效益,调查分析了油茶新造林5种复合经营模式的投入产出情况,并采用技术经济分析方法分析其现金流量和投资回收期。经济概算结果表明:套种紫珠收回投资最快,第1年的投入最大;套种西瓜、大豆、花生模式投资收回较快,8年累积净收入最高,第1年的投入相对较低;大容器苗新造林模式在投资回收期、8年累积净收入、第1年的投入等3个方面均居于中等;这3种经营模式适宜在不同的情况下推广。
【英文摘要】In order to enhance economic incomes further, investment and output of young plantation managed by five different models in Camellia oleifera were analyzed, and cash flow and investment recovery period were calculated by technical economy analysis method. The results were as follows: The model of interplanting Callicarpa kwangtungensis with Camellia oleifera was the shortest one in investment recovery period and the largest one in the first year investment. If interplanted watermelon, soybean and peanut with Camellia oleifera, the first year investment was relatively lower, the investment recovery period was relatively short, then the highest accumulated net profit could be obtained during eight years. In the case of young plantation afforested with four-year seedlings, three economic index were all middling, including investment recovery period, eight-year accumulated net profit and first-year investment. Abovementioned three models were suited to spread in different conditions.

【题目】两个水稻DH群体发芽期和幼苗前期耐碱性状QTL定位比较
【中文关键词】水稻,DH群体,发芽期和幼苗前期,耐盐碱性状,QTL
【英文关键词】ice, Double haploid population, Germination period and early seeding stage, Alkali stress, QTL
【中文摘要】利用两个不同的加倍单倍体群体,在 0.15% Na2CO3胁迫下,以发芽期和幼苗前期的发芽势(GE)等10个性状碱害相对值作为耐碱指标,进行耐碱性状QTL定位比较。碱害相对值相关分析表明,多个性状的碱害相对值存在显著或极显著相关。采用 QTL Mapper 1.6 统计软件对碱害相对值进行QTL分析。DH-1群体定位到10个主效QTL和15个上位性

QTL,DH-2群体定位到14个主效 QTL 和15个上位性QTL。两群体定位列线比对发现:1个控制相对根长的QTL,qRRL3-1,两群体定位在第 3 染色体对应的区域(CT339-G62 和 RM7-RM3280)。其他性状两群体没有定位在相同的区域,但存在多个重要的数量基因座位,如CT158-CT550、RM3755-RM418 和RM1349-RM1061等区域。在这些相同基因座位上两群体都检测到控制不同性状的主效QTL或上位性QTL,耐碱性QTL可能存在多效性、连锁性,在不同遗传背景下加性效应和上位性效应可以相互转化。多个QTL不仅与水稻耐碱性有关,还与多种抗逆性有关。这些结果将有利于耐碱性分子机制的剖析和强耐碱性水稻品种的选育。

【英文摘要】Two rice double haploid (DH) populations were used in this study to detect quantitative trait loci (QTLs) of tolerance to alkali at germination period and early seedling stage. Relative 10trait values under 0.15% Na2CO3 stress were used as the index of tolerance to alkali. Correlation analyses showed that relative germination rate and relative vigor index had significant positive correlation with the others. Total 10 QTLs and 15 epistatic loci were mapped from DH-1 population (ZYQ8×JX17) and 14 QTLs and 15 epistatic loci were mapped from DH-2 population (CJ06×TN1). Alignement of QTL mapping between these two DH populations showed that one QTL controllingroot length, qRRL3-1, were mapped on same region of CT339-G62 and RM7-RM3280 on chromosome 3 both in DH-1 and DH-2. There was no same region from the QTLs affecting other traits between these two populations. However, some QTLs controlling different traits were detected in the same region on chromosome 1, 3, 7 and 12 between DH-1 and DH-2, such as the regions of CT158-CT550、RM3755-RM418 and RM1349-RM1061, which indicated that those loci might be pleiotropic or closely linked QTLs. Some alkali resistant QTLs had adversity resistance, salt tolerance especially. The results will be beneficial to the dissection of molecular mechanism and breeding of rice with tolerance to alkali.

【题目】水稻基因设计育种的研究进展与展望

【中文关键词】水稻,育种,功能基因组学,基因设计育种,分子标记辅助选择

【英文关键词】rice; breeding ; functional genomics; gene-design breeding; marker-assisted selection

【中文摘要】分子标记、基因工程(转基因技术) 和基因组学的研究成果为实现对基因型的直接选择和农作物新品种设计育种提供了可能。设计育种旨在控制所有重要农艺性状基因的所有等位性变异。通过精细遗传定位、高饱和染色体片段系的构建和表型鉴定, 可以实现设计育种。鉴于一系列可以得到的标记技术、软件工具以及已定位和克隆的水稻基因、已建立的基因-表型(G-P)数据关联信息, 设计育种目标已成为现实。主要介绍了设计育种、分子育种及一些基本技术, 当前重点应用的基因功能研究与水稻功能基因分子利用的研究进展, 并对水稻基因设计育种的前景进行了展望。

【英文摘要】Progress in molecular markers, gene engineering and genomics are beneficial to direct selection and crop breeding by design. Breeding by design is a concept that aims to control all allelic variation for all genes o f agronomic importance. This concept can be achieved through a combination of precise genetic mapping , high- resolution chromosome haplotyping and extensive phenotyping. Thanks to marker technology and software tools available today, and the fine- mapped/ cloned genes in rice and their related GP data bank, this goal can now be achieved. Some related techniques concerning molecular breeding and breeding by gene-design, a highlight of breeding by gene design and progress in functional research for key genes and their molecular utilization in rice breeding are presented in the paper. In addition, the prospects of rice gene-design breeding are discussed.

【题目】Interactive effects from combining inorganic and organic fertilisers on phosphorus availability
【中文关键词】无
【英文关键词】combining organic and inorganic fertilisers, grain yield, Po and Pi fractions, microbial biomass P,32P.
【中文摘要】无
【英文摘要】A pot experiment was conducted using different ratios of triple superphosphate (TSP) to pig manure (PM) to determine the best ratio for combining inorganic and organic fertilisers to attain optimum crop yields, and investigate the mechanisms affecting P availability in a wheat (Triticum aestivum L.) – soybean (Glycine max L.) rotation in eastern China. The TSP/PM treatment ratios used were: T1, 0/0 as a control; T2, 100/0; T3, 90/10; T4, 80/20; T5, 70/30; T6, 0/100. All treatments except T1 received the same amount of P. Treatment T4 gave significant yield increases of 25.6% in 2008 and 16.8% in 2009 compared with T2. Regarding the various forms of organic P (Po) under different fertilisation treatments, the labile Po of treatment T4 was 60.0% higher than that of T2. The contents of moderately labile Po were inthe order T6 > T5 = T4 > T3 > T2 > T1. The addition of pig manure decreased the contents of iron (Fe)-P and calcium-P and occluded-P more than the content of aluminium-P. Compared with the T2 treatment, soil inorganic P decreased by 5.3%, 12.1%, and 15.0% when the ratios of TSP/PM in fertiliser were T3, T4, and T5, respectively. Microbial biomass and phytase activity of treatment T4 were not significantly different from those of T5 and T6, but significantly increased compared with T2. When the amount of leachate was 50mL, only 1.6%, 8.4%, and 9.8% of total 32P leached from the T1, T2, and T4 soils, respectively. Treatment T4 resulted in higher grain yield, increased labile Po and moderately labile Po, and decreased Fe-P and occluded-P, and promoted microbial biomass P and phytase activity, which were betteroutcomes for a wheat – soybean rotation. Fertilising soil with combined organic and inorganic P sources could lower P fixation and enhance P mobility.

【题目】A study of the in vitro protein digestibility of indica and japonica cultivars
【中文关键词】pH-下降方法 蛋白消化性 籼粳稻 醇溶蛋白
【英文关键词】pH-drop method Protein digestibility Indica and japonica rices Prolamin
【中文摘要】利用体外的pH-drop法,即3-或4-酶法,测定18个籼粳稻品种生精米的蛋白消化性。籼粳稻表现相似的蛋白消化性,与人体内结果相似。蒸煮提高了4酶法的测定值,而还原剂明显抑制了用多酶法测定籼粳稻的蛋白消化性。在蛋白含量和消化率间有显著相关,而直链淀粉含量和消化率间没有相关性。SDS-PAGE分析表明多酶和胃蛋白酶对醇溶蛋白的消化有显著差异,这点可能与本研究和前人结果之间的不一致有关,前人认为粳稻的体外蛋白消化率高于籼稻。另外,我们支持前人有关waxy基因产物不是精米蛋白消化率主要决定因素的报道。
【英文摘要】Protein digestibility was determined in 18 indica and japonica raw milled rices using an in vitro pH-drop method with three- or four-enzyme system. Similar protein digestibility was found between indica and japonica rices, which is in agreement with the in vivo digestibilities in human. Cooking improved protein digestibility in the four-enzyme assay, while reducing agents exhibited apparent inhibition in multienzyme digestibility of indica and japonica rices. A significant correlation was detected between protein content and the estimates of digestibility, whereas no significant correlation was found between amylosecontent and digestibility estimates. SDS – PAGE analysis showed a significant difference in the degradation extent of prolamin between multienzyme and pepsin digestion, which might contribute to the inconsistence between results of this study and previous findings that in vitro protein digestibility of japonica rice was higher than that of indica rice. In addition, our results supported the previous report that waxy gene product level is not a major determinant of protein digestibility in milled rice.

【题目】Antibiotic effect of exogenously applied salicylic acid on in vitro soilborne pathogen, Fusarium oxysporum
【中文关键词】无
【英文关键词】Antibiotic action;Biomass;Fusarium oxysporum f.sp. niveum (FON);Virulence factors;
Salicylic acid
【中文摘要】无
【英文摘要】Salicylic acid, which is biosynthesized inside plant and is often found and accumulated in soil due to plant debris decaying, is considered as a signaling substance during plant – microbe interactions. It is involved in the cycling of biogeochemistry and related to plant resistance to biotic and abiotic stress. The antibiotic effect of salicylic acid on Fusarium oxysporum f.sp.niveum (FON) was studied to investigate the relationships between the salicylic acid and the fungus in the ecological interaction of plant – microbe. Resultsshowed that the biomass, colony diameter, number of conidium germination and conidium production of FON were decreased by 52.0%, 25.7%, 100% and 100% at concentrations of 800 mg L 1. However, mycotoxin yield was increased by 233%, pectinase activity raised by 168.0% and cellulase activity increased by 1325% compared to control at higher concentrations. It was concluded that salicylic acid as an allelochemical greatly inhibited FON growth and conidia formation and germination, though stimulated mycotoxin production and activities of hydrolytic enzymes by FON.

【题目】In Vitro Physiological Responses of Fusarium oxysporum f. sp. niveum to Exogenously Applied Syringic
【中文关键词】无
【英文关键词】Phenolic acid, plant – microbe interaction.
【中文摘要】无
【英文摘要】Plant – microbe interactions are often accompanied by allelochemicals, such as syringic acid, released from the host plant.To explore the role of phenolic acids released from crop host plants in response to pathogen invasion, we examined the allelopathic effect of an artificially applied syringic acid on Fusarium oxysporum f. sp. niveum. We demonstrated that the growth and the conidial germination rate of F. oxysporum f. sp. niveum were stimulated at lower concentrations of syringic acid, though inhibited by higher dosage compared with control. The yield of fungus mycotoxin was increased from 60.9% to 561.5%. We conclude that syringic acid can be considered as a allelochemical inducer, stimulating the relative virulence factors of invading pathogens.

【题目】Nitrogen metabolism disorder in watermelon leaf caused by fusaric
【中文关键词】无

【英文关键词】Enzymes in relation to nitrogen metabolism; Fusaric acid (FA); Fusarium oxysporum f.sp. niveum; Programmed cell death; Stress; Watermelon fusarium wilt
【中文摘要】无
【英文摘要】The effect of fusaric acid (FA) on the activity of leaf nitrogen (N) metabolism enzymes in watermelon seedlings supplied with different N forms was studied. The results showed that FA inhibited nitrogen uptake and caused decreased leaf amide and protein but increased the content of ammonium and amino acids. When treated with FA the activities of enzymes in the pathway for the synthesis of amino acid in leaves (GS, GOGAT, and GDH) were decreased by 15 – 23%, 13 – 40%, and 71 – 86%, respectively. The activity of asparagine synthetase was decreased by 34 – 57%. The proteinase activity was initially increased by 37 – 125% at 12 h after treatment of FA but then subsequently decreased. The activity of glutamate-pyruvate aminotransferase was increased by 280 – 400%, though the activity of glutamate-oxaloacetate aminotransferase was decreased by 30 – 63%. It was suggested that FA inhibited the uptake of ammonium in seedlings and suppressed the activities of amino acid and amide synthases, while stimulating proteinase activity.A new pathogenic mechanism of watermelon infection by Fusarium spp. was found as FA caused the complete disorder and collapse of the host plant ’s nitrogen metabolism. This work provides a new insight into the progression of watermelon wilting caused by Fusariumoxysporum f.sp. niveum.

【题目】Responses of Fusarium oxysporum f. sp. niveum to exogenously added sinapic acid in
【中文关键词】无
【英文关键词】Fusarium oxysporum f. sp. niveum .Plant – microbe interaction . Sinapic acid .Virulence factors
【中文摘要】无
【英文摘要】To assess the influence of phenolic acids from plant root exudates on soil pathogens, we studied the effect of sinapic acid added to chemically defined media on the growth and virulence factors of Fusarium oxysporum f. sp.niveum. Sinapic acid inhibited the growth and conidial formation and germination of F. oxysporum f. sp. niveum by 6.7 – 8.8% and 11.2 – 37.3%, respectively. Mycotoxin production by F. oxysporum f. sp. niveum was stimulated by81.6 – 230.7%. Pectinase, proteinase, cellulase, and amylase activities were stimulated at a lower concentration of sinapic acid, while they were inhibited at a higher concentration.It is concluded that sinapic acid inhibited the growth and conidial germination of F. oxysporum f. sp. niveum and decreased the pathogenic enzymes ’ activity at higher doses.

【题目】培矮64S/93-11重组自交系分子图谱构建及千粒重QTL检测
【中文关键词】水稻;重组自交系;SSR;分子标记;遗传连锁图谱;千粒重;染色体片段置换系;QTL
【英文关键词】rice; RIL population; SSR; molecular marker; genetic linkage map; 1000-grain weight ; CSSL population; QTL
【中文摘要】利用光、温敏核不育系培矮64S 与常规品种93-11 进行杂交,以单粒传方法建立含217 个单株的重组自交系(RILs)群体。选用775 对SSR 引物进行亲本多态性筛选,共有170 对检测到多态性,频率为21. 9%。构建的水稻分子遗传图谱共包含141 个标记座位,总图距约2 060. 4 cM,标记间平均图距为14. 6 cM。群体中标记偏分离情况较严重。以该RILs 群体217 个株系为材料,对千粒重性状进行了QTL 分析。结果表明:在RILs 群体中检测到3 个与千粒重相关的QTL,分别在第1、

5、8 染色体上,命名为qTGW-1、qTGW-5、qTGW-8,其LOD 值为5. 51、3. 31、4. 94,贡献率为17. 90%、6. 12%、9. 59%。qTGW-1 控制千粒重的增效基因来自低值亲本培矮64S,qTGW-5 和qTGW-8 控制千粒重的增效基因来自高值亲本93-11。通过相应的含有154 个家系的全基因组染色体片段置换系(CSSLs) 群体图示基因型分析,证实了在第1 染色体上标记RM315 附近存在控制千粒重的增效基因,来源于染色体片段供体亲本培矮64S,使千粒重增加1. 03 g;在第5、8 染色体上标记 RM3663、RM310 附近存在控制千粒重的增效基因,来自染色体片段受体亲本93-11,使千粒重分别增加0.63 g 和0.80 g。

【英文摘要】The present study used the photo-thermo sensitive genic male sterile Peiai64S and 93-11 as the material to develop 217 recombinant inbred lines (RILs) by using SSR marker aided selection. A total of 775 pairs of SSR markers were used to analyze the polymorphism between Peiai64S and 93-11. It was shown that there were 170 pairs of polymorphism markers and their polymorphic ratio are 21.9%. The linkage map consists of 141 SSR markers. This map covered the rice genome about 2 060.4 cM with about 14.6 cM of average interval. Serious segregation distortion was observed in this RIL population. QTL analysis for the 1000-grain weight (TGW) was conducted with the RIL of " Peiai64S/93-11 " with 217 lines and a genome-wide chromosome segment substitution line (CSSL) population with 154 lines. The result indicated that in the RIL population of three QTLs controlling the TGW were detected on chromosome 1, 5 and 8, named qTGW-1, qTGW-5, qTGW-8, respectively. The LOD values of each QTL were 5.51, 3.31, and 4.94, and phenotypic variations explained by each QTL are 17.90%, 6.12% and 9.59%, respectively. The allele of qTGW-1 was derived from PA64S and the other two alleles of qTGW-5 and qTGW-8 were derived from 93-11. An analysis of CSSL graphical gene types also showed that there was a positive allele on the PA64S chromosome substitution segment near the marker RM315 locating on the chromosome 1 which certificated the existence of qTGW-1, also there were other two negative alleles on the PA64S chromosome substitution segment near the marker RM3663 and RM310 locating on the chromosome 5 and 8 which proved the existence of the qTGW-5 and qTGW-8.

【题目】A previously unknown zinc finger protein, DST, regulates drought and salt tolerance in rice via stomatal aperture control
【中文关键词】无
【英文关键词】Rice; zinc finger protein; drought tolerance; salt tolerance; stomatal aperture; hydrogen peroxide
【中文摘要】无
【英文摘要】Abiotic stresses, such as drought and salinity, lead to crop growth damage and a decrease in crop yields. Stomata control CO2 uptake and optimize water use efficiency, thereby playing crucial roles in abiotic stress tolerance. Hydrogen peroxide (H2O2) is an important signal molecule that induces stomatal closure. However, the molecular pathway that regulates the H2O2 level in guard cells remains largely unknown. Here, we clone and characterize DST (drought and salt tolerance)—a previously unknown zinc finger transcription factor that negatively regulates stomatal closure by direct modulation of genes related to H2O2 homeostasis—and identify a novel pathway for the signal transduction of DST-mediated H2O2-induced stomatal closure. Loss of DST function increases stomatal closure and reduces stomatal density, consequently resulting in enhanced drought and salt tolerance in rice. Thesefindings provide an interesting insight into the mechanism of stomata-regulated abiotic stress tolerance, and an important genetic engineering approach for improving abiotic stress tolerance in crops.

【题目】用两种粪便收集方法测定草鱼对九种饲料原料的表观消化率
【中文关键词】饲料;消化率;粪便收集方法;草鱼
【英文关键词】feed;apparent digestibility;fecal collecting method;grass carp
【中文摘要】在(21.5±1.0)℃水温下,以Cr:0 为指示物采用自排法和挤压法分别收集平均体重为65 g草鱼的粪便,测定草鱼对棉籽粕、花生粕、双低菜籽粕、秘鲁鱼粉、菜籽粕、小麦次粉、米糠、大豆粕和肉骨粉9种饲料原料主要营养成分的表观消化率。试验饲料以70%基础饲料和30%的待测饲料原料组成。结果表明:(1)草鱼对肉骨粉、秘鲁鱼粉、棉籽粕、大豆粕的干物质表观消化率较高,分别为60.69%、59.07%、61.08%、57.99%;(2)用自排法和挤压法测定草鱼对饲料原料的表观消化率时,干物质表观消化率有差异,而饲料原料粗蛋白质表观消化率基本保持一致;(3)草鱼对各种饲料原料的蛋白质表观消化率与氨基酸表观消化率的趋势基本一致。
【英文摘要】At the water temperature of(21.5±1)℃ ,apparent digestibility coefficients(ACDs)of grass carp for nutrients in nine main feed ingredients including cottonseed meal,peanut meal,double—low rapeseed meal,Peru fish meal,rapeseed meal,wheat middling,rice bran,soybean meal,meat and bone meal were determined by collecting fecal safllpies of grass carp the average body weight of 65 g in abdominal pressure method and siphoning method. Chromic oxide was used as an internal indicator.70% of the test diets was reference diet,in weight,and 30% of the test ingredient. Theresults showed that:(1)The ACDs for dry matter of the meat and bone meal,Peru fish meal,cottonseed meal and soybean meal were higher,which were 60.69% ,59.07% ,61.08% ,57.99% ,respectively.(2)The ACDs for dry matter in two methods indicated significant diferences。while the ACDs for crude protein showed no discrepancy.(3)The ACDs for amino acids were almost the same with the ACDs of crude protein,which suggested that the ACDs of protein were indicative of amino acid digestibility.

【题目】Evaluating the microtubule cytoskeleton and its interacting proteins in monocots by mining the rice genome
【中文关键词】无
【英文关键词】Cytoskeleton, kinesins, microtubules (MTs), microtubule-associated proteins (MAPs), motors, rice, Oryza sativa.
【中文摘要】无
【英文摘要】Background Microtubules (MTs) are assembled by heterodimers of α -and β -tubulins, which provide tracks for directional transport and frameworks for the spindle apparatus and the phragmoplast. MT nucleation and dynamics are regulated by components such as the γ -tubulin complex which are conserved among eukaryotes, and other components which are unique to plants. Following remarkable progress made in the model plant Arabidopsis thaliana toward revealing key components regulating MT activities, the completed rice (Oryza sativa) genome has prompted a survey of the MT cytoskeleton in this important crop as a model for monocots. Scope The rice genome contains three α -tubulin genes, eight β -tubulin genes and a single γ -tubulin gene.A functional γ -tubulin ring complex is expected to form in rice as genes encoding all components of the complex are present. Among proteins that interact with MTs, compared with A. thaliana, rice has more genes encoding some members such as the MAP65/Ase1p/PRC1 family, but fewer for the motor kinesins, the end-binding protein EB1 and the mitotic kinase Aurora. Although most known MT-interacting factors have apparent orthologues in rice, no orthologues of arabidopsis RIC1 and MAP18 have been identified in rice. Among all proteins surveyed here, only a few have had their functions characterized by genetic means in rice. Elucidating functions of proteins of the rice MT cytoskeleton, aided by recent technical advances made in this model monocot, will greatly advance our knowledge of how monocots employ their MTs to regulate their growth and form.

【题目】Overexpression of the trehalose-6-phosphate phosphatase gene OsTPP1 confers stress tolerance in rice and results in the activation of stress responsive genes
【中文关键词】无
【英文关键词】Abiotic stress tolerance,OsTPP1,Rice,Trehalose
【中文摘要】无
【英文摘要】Trehalose plays a protective role in yeast and microorganisms under abiotic stresses. However, little is known about its role in higher plants when subjected to environmental challenges. A systematic search of rice databases discovered a large TPS/TPP gene family in the rice genome, which is similar to that found in Arabidopsis thaliana, especially in the gene family structure. Expression analysis demonstrated that OsTPP1 was initially and transiently up-regulated after salt, osmotic and abscisic acid (ABA) treatments but slowly up-regulated under cold stress. OsTPP1 overexpression in rice enhanced tolerance to salt and cold stress. Analysis of the overexpression lines revealed that OsTPP1 triggered abiotic stress response genes, which suggests a possible transcriptional regulation pathway in stress induced reprogramming initiated by OsTPP1. The current study revealed the mechanism of an OsTPP gene involved

in stress tolerance in rice and also suggested the use of OsTPP1 in abiotic stress engineering of crops.

【题目】Effects of dietary canola meal on growth performance, digestion and metabolism of Japanese seabass, Lateolabrax japonicus
【中文关键词】wu
【英文关键词】Japanese seabass
Growth
Canola meal
Anti-nutrients
Digestion
Metabolism
【中文摘要】wu
【英文摘要】A 10-week feeding trial in seawater floating cages (1.5×1.5×2.0 m) was conducted to investigate the effects of dietary canola meal (CM) levels on growth, survival, digestion and selected immune parameters of Japanese seabass (initial average weight 8.3±0.15 g). Six isonitrogenous (crude protein 43%) and isoenergetic (20 kJg − 1) practical diets were formulated by replacing 0 (the control), 10, 20, 30, 40, and 50% of protein from fish meal with CM. Each diet was randomly fed to triplicate groups of fish, and each cage was stocked with 20 fish. Fish were fed twice daily (06:30 and 16:30) to apparent satiation. The results showed that with increasing dietary CM levels, the survival, specific growth rate (SGR) and feed efficiency (FE) decreased. The survival was ignificantly lower compared to the control group (Pb0.05) with a 40% substitution level. Fish fed the diet with 20% or more protein from CM had significantly lower SGR than the control group (Pb0.05), but there was no significant difference in FE at this level (PN0.05). The activities of digestive enzymes and apparent digestibility coefficients of dry matter, protein, lipid and phosphorus significantly decreased with increasing dietary CM level. A similar trend was observed in the immune response where lysozyme activity significantly decreased compared with the control group when the substitution level was more than 20%. Results of the present study indicated that protein from CM could substitute less than 20% for fish meal protein without influencing the growth of Japanese seabass. The higher substitution levels of CM induced negative influences on growth, survival and serum lysozyme of Japanese seabass.

【题目】Dietary Leucine Requirement for Juvenile Large Yellow Croaker Pseudosciaena crocea (Richardson, 1846)
【中文关键词】wu
【英文关键词】Pseudosciaena crocea; leucine; requirement; diets
【中文摘要】wu
【英文摘要】Dietary leucine requirement for juvenile large yellow croaker, Pseudosciaena crocea Richardson 1846 (initial body weight 6.0 g ± 0.1 g) was determined using dose-response method. Six isonitogenous (crude protein 43%) and isoenergetic (19 kJ g − 1) practical diets containing six levels of leucine (Diets 1 − 6) ranging from 1.23% to 4.80% (dry matter) were made at about 0.7% increment of leucine. Equal amino acid nitrogen was maintained by replacing leucine with glutamic acid. Triplicate groups of 60 individuals were fed to apparent satiation by hand twice daily (05:00 and 17:30). The water temperature was 26 − 32°C, salinity 26 − 30

and dissolved oxygen approximately 7 mg L − 1 during the experimental period. Final weight (FW) of large yellow croaker initially increased with increasing level of dietary leucine but then decreased at further higher level of leucine. The highest FW was obtained in fish fed diet with 3.30% Leucine (Diet 4). FW of fish fed the diet with 4.80% Leucine (Diet 6) was significantly lower than those fed Diet 4. However, no significant differences were observed between the other dietary treatments. Feed efficiency (FE) and whole body composition were independent of dietary leucine contents (P > 0.05). The results indicated that leucine was essential for growth of juvenile large yellow croaker. On the basis of FW, the optimum dietary leucine requirement for juvenile large yellow croaker was estimated to be 2.92% of dry matter (6.79% of dietary protein).

【题目】Responses of vegetative gametophytes of Undaria pinnatifida to high irradiance in the process of gametogenesis
【中文关键词】gametogenesis, light acclimation, reproduction, seaweed, Undaria pinnatifida.
【英文关键词】gametogenesis, light acclimation, reproduction, seaweed, Undaria pinnatifida.
【中文摘要】The population of Undaria pinnatifida in its ecologic niche sustains itself in high temperature summer in the form of vegetative gametophytes, the haploid stage in its heteromorphic life cycle. Gametogenesis initiates when seawater temperature drops below the threshold levels in autumn in the northern hemisphere. Given that the temperature may fall into the appropriate range for gametogenesis, the level of irradiance determines the final destiny of a gametophytic cell, either undergoing vegetative cell division or initiating gametogenesis. In elucidating how vegetatively propagated gametophytes cope with changes of irradiance in gametogenesis, we carried out a series of culture experiments and found that a direct exposure to irradiance as high as 270 mmol photons m-2 s-1 was lethal to dim-light (7 – 10 mmol photons m-2 s-1) adapted male and female gametophytes. This lethal effect was linearly correlated with the exposure time. However, dim-light adapted vegetative gametophytes were shown to be able tolerate as high as 420 mmol photons m-2 s-1 if the irradiance was steadily increased from dim light levels (7 – 10 mmol photons m-2 s-1) to 90, 180 and finally 420 mmol photons m-2 s-1, respectively, at a minimum of 1 – 3 h intervals. Percentage of female gametophytic cells that turned into oogonia and were eventually fertilized was significantly higher if cultured at higher but not lethal irradiances. Findings of this investigation help to understand the dynamic changes of population size of sporophytic plants under different light climates at different site-specific ecologic niches. It may help to establish specific technical details of manipulation of light during mass production of seedlings by use of vegetatively propagated gametophytes.

【题目】Breeding and trial cultivation of Dongfang No.3, a hybrid of Laminaria gametophyte clones with a more than intraspecific less than interspecific relationship
【中文关键词】Hybrid Laminaria;Dongfang No. 3;Gametophyte clone;Gametophyte clone hybridization;Hybrid seedling raising;Hybrid vigor;Heterosis
【英文关键词】Hybrid Laminaria;Dongfang No. 3;Gametophyte clone;Gametophyte clone hybridization;Hybrid seedling raising;Hybrid vigor;Heterosis
【中文摘要】Dongfang No. 3, a Laminaria hybrid, was bred by hybridizing a female gametophyte clone isolated from Line 7 of L. japonica with a male one isolated from Line LZZ which was developed through hybridizing female gametophyte clones of L. lonngissima and male gametophyte clones of L. japonica followed by continuous self-crossing and tolerances of strong irradiance and high seawater temperature targeted selection. The parental gametophyte clones of Dongfang No. 3 have a more than intraspecific but less than interspecific relationship. The seedlings of the hybrid were raised with the techniques of gametophyte clone asexual

reproduction and hybridization and cultivated on trial. The dark brown hybrid has a wide, uniform, rippleless and very tough blade and a very robust holdfast. A deep vertical groove and a half-round joint between stripe and blade distinguished also the hybrid from the varieties of L. japonica. The hybrid is tolerant of strong irradiance and high seawater temperature and resistant to the tissue rottenness of blade tip and edge. The hybrid matured later than the varieties of L. japonica widely used currently. The trial cultivation of this Laminaria hybrid has reached N406 ha in total. It increased the yield by 60.5% and 54.8% in average on that of Benniu (Control I) and Zaohoucheng (Control II), respectively, and by 62.4% and 75.8% on that of Line LZZ and Line 7, respectively, as were observed in Weihai, Shandong Province, China, in 3 continuous years, and by 57.0% and 32.1% in average on that of Control I and II, respectively, across 10 sites on the coast of north China in 2 continuous years. The breeding and application of Laminaria hybrids have paved an avenue of the direct use of heterosis, the easy integration of elite agronomical traits and fast renewing of Laminaria varieties.

【题目】High throughput culture and gametogenesis induction of Laminaria japonica gametophyte clones

【中文关键词】Gametophyte clone ;Growth dynamics;Induction of gametogenesis;Laminaria japonica ;Large-scale culture;Vegetative growth
【英文关键词】Gametophyte clone ;Growth dynamics;Induction of gametogenesis;Laminaria japonica ;Large-scale culture;Vegetative growth

【中文摘要】In anticipation of the application of a new sporelingraising method using gametophyte clones to Laminaria commercial cultivation in China, techniques of mass culture and gametogenesis induction of L. japonica gametophyte clones were developed, as a mass of fertile gametophytes is a prerequisite for sporeling-raising with the new method. Gametophyte clones which were subjected to fed-batch culture exhibited a classical logistic growth curve. Growth rates decreased gradually after 2 months of culture, and were negatively correlated to cell density. UNOVA also showed that only cell density has a significant effect on the growth of gametophyte clones under the experimental conditions. Based on the dynamics models revealed, a culture strategy only directed at the control of cell density was adopted. By this strategy, a total of 36 kg wet weight from an initial weight of 0.75 kg was achieved after 3 months culture in 100 20-L bottles. The final average density reached 24 g L − 1. For the subsequent gametogenesis induction, amplificatory male and female gametophyte clones were cut, mixed and cultured in bottles under the same conditions used in amplification except for a change of photoperiod from continuous irradiance to 10 h light: 14 h dark cycle. Egg discharge occurred 10 days after the mixed culture and increased gradually with the culture duration. Most gametophytes gave rise to sporophytes 20 days after induction. Large-scale culture of gametophyte clones and gametogenesis induction for commercial cultivation in 2003 – 2005 have been conducted successfully.

【题目】Assessing genetic identities of sporophytic offspring of the brown alga Undaria pinnatifida derived from mono-crossing of gametophyte clones by use of AFLP and microsatellite markers
【中文关键词】amplified fragment length polymorphism, gametophytes, genetic polymorphism, microsatellite, Undaria pinnatifida.
【英文关键词】amplified fragment length polymorphism, gametophytes, genetic polymorphism, microsatellite, Undaria pinnatifida.
【中文摘要】The haploid stage of gametophytes of the subtidal brown alga Undaria pinnatifida can be vegetatively propagated under favorable conditions. This unique characteristic makes it possible to establish independent gametophyte cell lines that are zoospore-derived. Sporophytic offspring can be generated through hybridizing the male and female gametophytes, which are derived from different cell lines. Accumulated experiences in this and other species in Laminariales demonstrated the applicability of this novel way to breed desired strains for open-sea cultivation. Sporophytic offspring originated from mono-crossing of male and female gametophyte clones were shown to have similar morphological characteristics under identical ambient conditions. However, there has been no report to relate this similarity on molecular levels. In this report, amplified fragment length polymorphism (AFLP) and microsatellite markers were used to analyze the genetic identity of sporophytic offspring of U. pinnatifida originated from two monocrossing lines (M1 and M2), two self-breeding lines (S1 and S2) and one wild population (W). Totally 318 AFLP loci were revealed by use of 11 primer sets, of which 4.7%, 0.3%, 17.9%, 16.4% and 36.5% were polymorphic in M1, M2, S1, S2 andW, respectively. The pairwise genetic identity among the individuals of the same line was assessed. It was shown that offspring from monocrossing lines had a higher degree of identity (95.6 – 100%) than self-breeding lines (87.7 – 98.4%) and the wild population (81.5 – 92.1%). Analysis by use of six microsatellite loci

also revealed a higher genetic identity among individuals of the mono-crossing line, further confirming the results of AFLP analysis. Results from this investigation support, on molecular levels, the novel way to produce and maintain strains in U. pinnatifida by use of different gametophyte cell lines.

【题目】Phylogenetic analysis of members of the order Laminariales based on rbcL genes and 5.8S rRNA genes

【中文关键词】rbcL genes; 5.8S rRNA genes; Laminariales; phylogenetic relationships

【英文关键词】rbcL genes; 5.8S rRNA genes; Laminariales; phylogenetic relationships

【中文摘要】Phylogenetic analysis is widely used to determine evolution and function of gene, to identify the genus of algae based on gene sequences. Phylogenetic trees showing the evolutionary relationship of 20 Laminariales based on rbcL and 5.8S rRNA gene sequences were compared. The validity and the reliability of phylogenetic trees were studied in this paper. The results show that rbcL gene sequences are reliable at determining relationships of Laminariales. 5.8S rRNA gene sequences are appropriate for describing phylogenetic relationships between some distantly related algae. It is useful to clarify the phylogenetic relationships of Laminariales combining rbcL with 5.8S rRNA gene sequences.

【题目】A sex-linked microsatellite marker detected in the female gametophytes of Undaria pinnatifida (Phaeophyta)
【中文关键词】gametophyte, microsatellite marker, sex determination, sex-related, Undaria pinnatifida.
【英文关键词】gametophyte, microsatellite marker, sex determination, sex-related, Undaria pinnatifida.
【中文摘要】In our microsatellite analysis of three male and three female gametophytes of Undaria pinnatifida (Harv.) Suringar, a microsatellite marker (part of the locus Up-AC-2A8, GenBank accession no. AY738602.1) was only polymerase chain reaction-

amplified in three female gametophytes. This putative female-specific marker was further tested by the use of 32 male and 21 female gametophytes maintained in the Marine Biological Culture Collection Centre, China. In addition, three sporophytes were included for confirmation. Results showed that the marker was present in all of the female gametophytes and sporophyte cultures, but absent in all of the male gametophytes. To our knowledge, this is the first sex-related marker ever reported in U. pinnatifida. The discovery of this marker will accelerate gender identification and shed light on our understanding of the mechanisms of sex determination at a molecular level in this commercially important seaweed.

【题目】海带配子体克隆中一株镰刀菌的分离鉴定

【中文关键词】镰刀菌, ITS, 系统发育树, 分离鉴定

【英文关键词】Fusarium, ITS, Phylogenetic analysis, Identification

【中文摘要】A fungal strain (No. 059601016C) was obtained from Laminaria Gametophyte Clones. Growth states, morphological characteristics and internal transcribed sequence (ITS) were studied.The results showed that colonics on PDA are white and cottony, the reverse color changed from white to dark purple. The aerial mycelium grew abundantly and the height reached 5 mm to 7 mm. Microconidia are in false head or chains, (5 − 10.5) μm × (1.2 − 2.5) μm. Macroconidia sickle-shaped were slightly bent, apex acuminate, 2 − 5 septate, mostly 3 − 4 septate. Based on the analysis of ITS and the phyogenetic tree, the strain showed a 100% homogeneous and the most close relationship to Fusarium proliferatum Nirenberg. Hence, the strain 059601016C isolated form Laminaria Gametophyte Clones belonged to the genus Fusarium sp. and the GenBank accession number of strain 059601016C ITS is GU951805.

【英文摘要】从海带配子体克隆中分离出一株真菌(菌株编号: 059601016C), 对其培养性状、形态特征和ITS基因进行研究分析。结果显示: 059601016C真菌在PDA培养基上呈棉絮状生长, 菌落背面颜色由白色变为深紫色。气生菌丝发达, 高度可达5 − 7 mm。小型分生孢子以链状或假头状着生于瓶状产孢细胞上, (5 − 10.5) μm × (1.2 − 2.5) μm。大型分生孢子镰刀状, 略有弯曲, 顶胞渐尖, 2 − 5个隔膜, 多3 − 4个隔膜。通过ITS基因序列同源性分析, 该菌株与层出镰刀菌的相似性为100%。系统发育树的分析结果也表明该菌株与层出镰刀菌的亲缘关系最接近, 因此将菌株059601016C鉴定为层出镰刀菌(Fusarium proliferatum Nirenberg)。在GenBank中申请的基因序列号为GU951805。

【题目】Microsatellite analysis of genetic diversity and population genetic structure of the sporophytes of Undaria pinnatifida (Phaeophyceae) in Dalian of China

【中文关键词】Undaria pinnatifida; Genetic diversity; Genetic structure; Microsatellite; Dalian

【英文关键词】Undaria pinnatifida; Genetic diversity; Genetic structure; Microsatellite; Dalian

【中文摘要】Genetic diversity and population genetic structure of Undaria pinnatifida populations in Dalian of China were studied based on fourteen microsatellite loci. A relatively low level of genetic diversity was observed from the accessions collected from 165 individuals of four populations, including two natural populations, one cultured population and introduced population from Japan. The fourteen microsatellites revealed a total of 42 alleles, with an average of 3 alleles per locus. A comparison of the parameters showing genetic diversity, including the observed heterozygosity (Ho), gene diversity (He) and Shannon ’s information index (I) of Undaria pinnatifida accessions from different populations in Dalian of China, indicated that four populations possesses similar genetic diversity. Genetic distance between two natural populations was low, confirming high gene flow between these two areas. Moreover, genetic distance between introduced population and other population was the highest.

【题目】裙带菜孤雌生殖幼孢子体体细胞诱导2n雌配子体研究

【中文关键词】孤雌生殖;幼孢子体;2n早配子体

【英文关键词】Undaria pinnatifida;parthnogesis;juvenile sporophtes;2n female gametophytes

【中文摘要】以实验室内保存培养的裙带菜(Undaria pinnatifida)2n~ 子体为实验材料,经切碎培养,促进2n早配子体成熟,排出卵进行孤雌生殖,形成幼孢子体。将0.5-1 cm 的孤雌生殖幼孢子体的假根切除,从其体细胞中诱导出2n早配子体 实验结果表明,在10-20℃范围内,培养20 d后,在15℃和20℃下的2n2配子体排出的卵的孤雌生殖率分别为8.4%和7.4%,明显高于10V下的 1%。20℃下诱导培养15 d后就出现了2n早配子体,培养60 d后,2n配子体的诱导率达到100%;15℃下培养30 d后才出现2n早配子体,60 d后的诱导率为38%;而10℃下诱导培养45d后才开始出现2n早配子体,60 d后的诱导率仅为l2%。将诱导产生的2n早配子体切碎,在20~C下培养10 d后的成熟率为34%,60 d的成熟率达到100%。通过孤雌生殖幼孢子体诱导产生的2n早配子体与正常 配子体杂交形成了3n裙带菜幼孢子体。本研究发现了获得大量2n2配子体的新方法,旨在为裙带菜三倍体幼苗规模化培育奠定基础。

【英文摘要】After being excised into several cells of fragments.the indoor incubated 2n female gametophytes of Undaria pinnatoqda matured and produced some iuvenile sporophytes without fertilization.Then,the 2n female gametophytes were induced from the vegetative cells of the obtained parthenogenetic 2n juvenile sporophytes,which were rem oved rhizoids and in a0.5-1cm 1ength.The parthenogenesis rate of the matured 2n female gametophytes reached 8.4% and 7.4% after 20 days of incubation at 20°C and 15°C .respectively,which were both higher than 1% at 10°C .The 2n female gametophytes were induced after incubation for 15 days at 20cm.but for 30 days at 15°C and for 45 days at 10°C .The induction rate of the 2n female gametophytes was 100% at 20。C.but was 3 8% at 1 5°C and 1 2% at l 0°C after 60 days of incubation.respectively.The maturation rate of the induced 2n female gametophytes.after being excised into fragments.reached 34% after incubation for 1 0 days and 1 00% for 20 days at 20°C ,respectively.The 3n juvenile sporophytes were produced by the cross between the induced 2n female gametophyte and the n male gametophyte.In present study a new method of mass production of 2n female gametophytes was founded,which laid a foundation for the scale production of triploid seedlings of Undaria pinnatifida.

【题目】Cloning and Comparative Studies of Seaweed Trehalose-6-Phosphate Synthase Genes
【中文关键词】comparative genomics of TPS genes; gene cloning; RACE-PCR; seaweed; trehalose-6-phosphate synthase gene
【英文关键词】comparative genomics of TPS genes; gene cloning; RACE-PCR; seaweed; trehalose-6-phosphate synthase gene
【中文摘要】The full-length cDNA sequence (3219 base pairs) of the trehalose-6-phosphate synthase gene of Porphyra yezoensis (PyTPS) was isolated by RACE-PCR and deposited in GenBank (NCBI) with the accession number AY729671. PyTPS encodes a protein of 908 amino acids before a stop codon, and has a calculated molecular mass of 101,591 Daltons. The PyTPS protein consists of a TPS domain in the N-terminus and a putative TPP domain at the C-terminus. Homology alignment for PyTPS and the TPS proteins from bacteria, yeast and higher plants indicated that the most closely related sequences to PyTPS were those from higher plants (OsTPS and AtTPS5), whereas the most distant sequence to PyTPS was from bacteria (EcOtsAB). Based on the identified sequence of the PyTPS gene, PCR primers were designed and used to amplify the TPS genes from nine other seaweed species. Sequences of the nine obtained TPS genes were deposited in GenBank (NCBI). All 10 TPS genes encoded peptides of 908 amino acids and the sequences were highly conserved both in nucleotide composition (>94%) and in amino acid composition (>96%). Unlike the TPS genes from some other plants, there was no intron in any of the 10 isolated seaweed TPS genes.

【题目】Development of EST-SSR primers and their practicability test for Laminaria.

【中文关键词】Laminaria, EST-SSRs, germplasm identification, polymorphism analysis

【英文关键词】Laminaria, EST-SSRs, germplasm identification, polymorphism analysis

【中文摘要】Laminaria (Saccharina) is one of the economic important seaweeds. Through sequence analysis of 4099 ESTs from Laminaria (971 were generated from our own cDNA laboratories and 3 128 were downloaded from updated EST databases) with SSRIT software, two hundred and fifty-four SSRs in 206 ESTs were found. From the 254 SSRs, sixty-three SSR primer-pairs were designed. In order to test their practicability, the 63 primer-pairs were tested in commonly used SSR reaction conditions using 12 Laminara DNA samples as templates. The results show that 23 SSR primer-pairs gave good amplification patterns on most (more than 80%) of the 12 Laminara DNA templates. Genetic diversity study of 12 Laminaria lines, which were widely used in breeding and economic cultivation in China, was performed based on the obtained SSR data.

【题目】Study on high temperature resistant and high-yield Laminaria variety
【中文关键词】Hybridization of gametophytes . Laminaria saccharina . RAPD . Phaeophyceae
【英文关键词】Hybridization of gametophytes . Laminaria saccharina . RAPD . Phaeophyceae
【中文摘要】Hybridization of gametophytes, continuous selfcrossing and targeted selection were utilized to breed a new Laminaria variety. After five-generation selection breeding, the new variety “ Rongfu ” was obtained. Its male parent “ Yuanza No.10 ” was the high-yield cultivation variety, and its female parent was variety “ Fujian ” which could tolerate relatively high seawater temperature. “ Yuanza No.10 ” and “ Fujian ” were different but complement in theirmorphological characteristics and biological habits. Variety “ Rongfu ” was bred through their hybridization which exhibited high-yield potential and high seawater temperature tolerance. The results of traits evaluation in consecutive years showed that “ Rongfu ” attained higher yields by 24 – 27% compared to the control (widely used commercial variety) and also contained considerable amounts of iodine, mannitol, and algin. When seawater temperature was 18 – 21 ° C, the blade growth of “ Rongfu ” was maintained and tissue loss by abrasion was significantly lower than the control. Since the adoption of variety “ Rongfu ” in 2001, its cultivation areas have been extended to Shandong, Fujian and Guangdong province and have reached 14,133 ha currently, i.e., almost one-tenth of the total cultivation areas of Laminaria in China. The results of Random Amplified Polymorphic DNA analysis showed that the relationship between “ Rongfu ” and other cultivation varieties in China was very close.

【题目】鲈幼鱼对饲料中苏氨酸的需要量
【中文关键词】鲈; 苏氨酸; 需求量; 摄食生长;
【英文关键词】Japanese seabass(Lateolabrax japonicus); threonine; requirement; feeding and nutrition;
【中文摘要】以初始体质量(8.00±0.20)g的鲈为实验对象,在海水网箱(1.5 m×1.5 m×2.0 m)中进行为期8周的摄食生长实验,研究鲈对饲料中苏氨酸的需要量。通过在半精制基础饲料中添加晶体L-苏氨酸使饲料中苏氨酸含量分别达到0.75%、

1.03%、1.36%、1.67%、2.04%和2.31%,配制成6水平等氮等能饲料(41.83%粗蛋白质,19.68 kJ/g总能)。每种饲料设3个重复,每个重复随机放养30尾鲈。实验采用表观饱食投喂方式,每天投喂2次(06:00和17:30),实验期间水温为26~32℃,盐度为22~28,溶解氧含量在7 mg/L左右。实验结果表明,各饲料处理组成活率(94.4%~98.9%)无显著差异。随着饲料中苏氨酸含量的增加,鲈的增重率显著升高(150.3%~256.9%)(P<0.05),且在1.67%苏氨酸饲料组达到最大值(256.9%),然而,随着饲料中苏氨酸含量的进一步增加,增重率有下降的趋势。鲈的氮累积率随着饲料中苏氨酸含量的增加而显著升高(13.18%~26.36%)(P<0.05),且在1.67%苏氨酸饲料组达到最大值(26.36%),随着饲料中苏氨酸含量的进一步增加,氮累积率有下降的趋势。饲料苏氨酸含量对鲈鱼体粗蛋白、粗脂肪和灰分含量无显著影响。以增重率和氮累积率为评价指标经二次回归分析得出,鲈对饲料中苏氨酸的需要量分别为1.77%和1.88%,占饲料蛋白质的4.21%和4.47%。

【英文摘要】A feeding experiment was conducted to determine the dietary requirement of threonine of juvenile Japanese seabass(initial average weight 8.00±0.20 g).Six isonitrogenous and isoenergetic semi-purified diets were formulated to contain 41.83% crude protein,19.68% kJ/g gross energy and six levels of threonine 0.75%,1.03%,1.36%,1.67%,2.04% and 2.31%(dry matter basis)at about 0.35% increment(diets 1-6).Each diet was randomly assigned to triplicate groups of 30 fish and fed to apparent satiation by hand twice daily(06:00 and 17:30)for 8 weeks in floating sea cages.The water temperature fluctuated from 26 to 32 ℃,salinity from 22‰ to 28‰ and dissolved oxygen was approximately 7 mg/L during the experimental period.No significant differences in survival were found among dietary treatments.Weight gain rate(WGR)significantly increased with increasing dietary threonine from 150.3 to 256.9%(P<0.05),and thereafter showed a declining tendency.Nitrogen retention(NR)significantly increased with increasing dietary threonine from 13.18% to 26.36%(P<0.05),same as above,declined.No significant differences in body composition were found among dietary treatment.On the basis of either WGR or NR,the optimum dietary threonine requirements of juvenile Japanese seabass were estimated to be 1.77% of diet(4.21% of dietary protein)and 1.88% of diet(4.47% of dietary protein),respectively,using second-order polynomial regression analysis.

【题目】环糊精葡萄糖基转移酶的结构特征与催化机理

【中文关键词】环糊精;环糊精葡萄糖基转移酶;结构特征;催化机理;环化反应

【英文关键词】Cyclodextrin; Cyclodextrin glycosyltransferase; Structural characteristics;Catalytic mechanism; Cyclization reaction

【中文摘要】随着环糊精在食品、医药等领域的应用越来越广,生产环糊精所必需的环糊精葡萄糖基转移酶(CGT酶)已经成为当今研究的热点。特别是近二十年来,国外对该酶进行了比较深入的研究。首先介绍了CGT酶的功能特性与结构特征。CGT酶是一种多功能型酶,能催化三种转糖基反应(歧化、环化和耦合反应)和水解反应,其中,能将淀粉转化为环糊精的环化反应是特征反应;作为α-淀粉酶家族的成员,CGT酶除了具有与α-淀粉酶相同的A、B、C结构域外,还存在D和E结构域。另外,对CGT酶的催化机理包括底物结合方式、转糖苷反应机理以及环化机理等进行了详细的讨论。

【英文摘要】With the applications of cyclodextrins expanding in the industries related to food,pharmaceuticals,etc,cyclodextrin glycosyltransferase(CGTase),the essential enzyme for the production of cyclodextrins,has become the focus of scientific research nowadays.Especially in recent twenty years,CGTase has been studied extensively,leading to increasing knowledge of its structure and function.Firstly the function and structural characteristics of CGTase were focused on.CGTase is a multifunctional enzyme.It can catalyze three transglycosylation reactions(disproportionation,cyclization,and coupling),and a hydrolysis reaction.The specific CGTase reaction is the cyclization reaction,which can result in the formation of a cyclodextrin.CGTase is a member of the α-amylase family of glycosyl hydrolases. α-Amylases generally consist of three structural domains,A,B,and C,while CGTases show a similar domain organization with two additional domains,D and E.In addition,substrate binding of CGTase and mechanisms of transglycosylation and cyclization reactions catalyzed by CGTase were discussed in detail.Domain B contributes to substrate binding by providing several amino acid side chains alongside a substrate binding groove on the surface of the CGTase protein.Maltose binding site assists in guiding the linear starch chains into the substrate binding groove containing at least nine subsites.After the glycosidic bond cleavage reaction has taken place between subsites +1 and-1,the non-reducing end of the oligosaccharide at the groove is transferred to the reducing end of the same oligosaccharide chain,leading to cyclic products

【题目】Calcium Leads to Further Increase in Glycine-Enhanced Extracellular Secretion of Recombinant γ -Cyclodextrin Glycosyltransferase in Escherichia coli
【中文关键词】无中文关键词
【英文关键词】Cyclodextrin glycosyltransferase, Paenibacillus macerans, extracellular secretion, glycine, Escherichia coli; Ca2+
【中文摘要】无中文摘要
【英文摘要】Overexpression of recombinant genes in Escherichia coli and targeting recombinant proteins to the culture medium are highly desirable for the production of industrial enzymes. However, a major barrier is inadequate secretion of recombinant protein across the two membranes of E. coli cells. In the present study, we have attempted to circumvent this secretion problem of the recombinant α -cyclodextrin glycosyltransferase (α -CGTase) from Paenibacillus macerans strain JFB05-01. It was found that glycine, as a medium supplement, could enhance the extracellular secretion of recombinant α -CGTase in E. coli. In the culture with glycine at the optimal concentration of 150 mM, the α -CGTase activity in the culture medium reached 23.5 U/mL at 40 h of culture, which was 11-fold higher than that of the culture in regular TB medium. A 2.3-fold increase in the maximum extracellular productivity of recombinant α -CGTase was also observed. However, further analysis indicated that glycine supplementation exerted impaired cell growth as demonstrated by reduced cell number and viability, increased cell lysis, and damaged cell morphology, which prevented further improvement in overall enzyme productivity. Significantly, Ca2+ could remedy cell growth inhibition induced by glycine, thereby leading to further increase in the glycine-enhanced extracellular secretion of recombinant α -CGTase. In the culture with 150 mM glycine and 20 mM Ca2+, both extracellular activity and maximum productivity of recombinant enzyme were 1.5-fold higher than those in the culture with glycine alone. To the best of our knowledge, this is the first article about the synergistic promoting effects of glycine and Ca2+ on the extracellular secretion of a recombinant protein in E. coli.

【题目】Delayed supplementation of glycine enhances extracellular secretion of the recombinant alpha-cyclodextrin glycosyltransferase in Escherichia coli
【中文关键词】无中文关键词
【英文关键词】Cyclodextrin glycosyltransferase. Paenibacillus macerans. Extracellular secretion. Glycine. Escherichia coli. Delayed supplementation
【中文摘要】无中文摘要
【英文摘要】The targeting of recombinant proteins for secretion to the culture medium of Escherichia coli presents significant advantages over cytoplasmic or periplasmic expression. However, a major barrier is inadequate secretion across two cell membranes. In the present study, we attempted to circumvent this secretion problem of the recombinant alpha-cyclodextrin glycosyltransferase (alpha-CGTase) from Paenibacillus macerans strain JFB05-01. It was found that glycine could promote extracellular secretion of the recombinant alpha-CGTase for which one potential mechanism might be the increase in membrane permeability. However, further analysis indicated that glycine supplementation resulted in impaired cell growth, which adversely affected overall recombinant protein production. Significantly, delayed supplementation of glycine could control cell growth impairment exerted by glycine. As a result, if

the supplementation of 1% glycine was optimally carried out at the middle of the exponential growth phase, the alpha-CGTase activity in the culture medium reached 28.5 U/ml at 44 h of culture, which was 11-fold higher than that of the culture in regular terrific broth medium and 1.2-fold higher than that of the culture supplemented with 1% glycine at the beginning of culture.

【题目】Enhanced secretion of recombinant α-cyclodextrin glucosyltransferase from E. coli by medium additives
【中文关键词】无中文关键词
【英文关键词】α-Cyclodextrin glucosyltransferase, Extracellular enzyme, Medium additives, Cell membrane permeability, Phosphatidylglycerol, Cell membrane fluidity
【中文摘要】无中文摘要
【英文摘要】The purpose of this study was to investigate the effect of medium additives on the secretion of recombinant α-cyclodextrin glucosyltransferase (α-CGTase) into the culture media of Escherichia coli. It is found that supplementation of the E. coli culture with SDS, glycine, Ca2+ or Na+, individually, facilitated the secretion of α-CGTase. Orthogonal experiment showed that the optimal condition to achieve maximal secretion of α-CGTase was the supplementation with 0.03% SDS, 400 mM Na+, 0.3% glycine and 10 mM Ca2+ together. Under this condition, extracellular enzyme activity reached 12.89 U/ml, which is 15 times higher than that of the culture without any additives. Further analysis showed that the permeability, fluidity and phosphatidylglycerol content of the E. coli cell membrane under the optimized condition were significantly increased in comparison to those under the control condition. These might be the potential mechanisms for the increased secretion of α-CGTase from the periplasmic compartment into the culture medium.

【题目】油菜沪油15中AP2/ERF-B3亚族转录因子的克隆和生物信息学分析
【中文关键词】转录因子AP2/ERF—B3亚族 生物信息学 进化树 油菜沪油15
【英文关键词】无
【中文摘要】AP2/ERF转录因子家族广泛存在于植物中,参与植物细胞周期、生长发育以及生物和非生物胁迫相关基因表达调控。本文利用油菜UniGene数据库,以拟南芥AP2/ERF—B3亚族转录因子保守序列为信息探针,分离得到2个油菜AP2/ERF—B3亚族的转录因子BnaERFB3—1和BnaERFB3—2。通过PCR和RT—PCR方法分别从双低甘蓝型油菜沪油15的DNA和cDNA中克隆了上述基因。序列分析显示,克隆的BnaERFB3—1-Hy15和BnaERFB3—2-Hy15转录因子与电子克隆的基因序列差异很小,均只有1个氨基酸位点不同,且都没有内含子。从氨基酸序列的相似性、组成成分、理化性质、疏水性/亲水性、序列比对、进化树、功能域、二级结构、三级结构、无序化特性等方面进行了预测和较为全面的分析。结果显示BnaERFB3—1-Hy15和BnaERFB3—2-Hy15是亲水性蛋白,在蛋白质的三级结构上与AtERF5相似,BnaERFB3—1-Hy15和BnaERFB3—2-Hv15蛋白无序化程度大于拟南芥AtERF5。通过分析EST丰度显示,BnaERFB3—1的表达集中在种子中,而BnaERFB3—2的表达则集中在根中。另外,将上述基因分别构建入酵母表达载体和植物双元表达载体,为深入研究该基因在油菜抗逆调控中的作用奠定了基础

【中文摘要】AP2/ERF转录因子家族是植物中广泛存在的一类转录因子,AP2/ERF这类转录因子主要参与植物的细胞周期、生长发育以及生物和非生物胁迫相关基因的表达调控.由于拟南芥和油菜同属于芸薹属,具有相似的基因信息,利用油菜UniGene数据库,以拟南芥ERF 转录因子保守序列为探针,通过电子克隆从一个UniGene Cluster中分离得到三个同类的AP2/ERF转录因子,从cDNA序列、氨基酸序列的相似性、组成成分、理化性质、疏水性/ 亲水性分析、序列比对、进化树、功能域、二级结构、三级结构、无序化特性进行了预测和较为全面的分析.结果显示油菜来源的BnaERF1、BnaERF2和BnaERF3属于AP2/ERF 转录因子的B-2亚族,是亲水性蛋白,在蛋白质的三级结构上与AtERF1相似.蛋白质无序化分析发现,油菜BnaERF1、BnaERF2和BnaERF3无序化程度小于拟南芥AtERF1.设计引物通过PCR和RT-PCR方法分别从甘蓝型双低油菜沪油15幼苗的DNA和cDNA中扩增了上述基因,初步分析BnaERF2没有内含子,BnaERF1和BnaERF3有内含子.另外,通过EST丰度分析显示,该类转录因子的表达最高峰在种子中,其次为花,在芽、茎和分生组织中没有检测出表达的存在.

【题目】Behavioral response of Norway rats (Rattus norvegicus) to odors of different mammalian species
【中文关键词】Rattus norvegicus , Predator odor aversion ,Behavioral responses , Captivity , Meles meles
【英文关键词】Rattus norvegicus , Predator odor aversion ,Behavioral responses , Captivity , Meles meles
【中文摘要】Behavioral responses to the odors of three predators of rodents (domestic cat (Felis catus), weasel (Mustela sibirica), Eurasian badger (Meles meles)), one non-predator mammal (rabbit (Lepus capensis)), and distilled water (control) were assessed in three types of Norway rats (Rattus norvegicus): wild (WNRs), domestic (DNRs), and albino laboratory Wistar (AWRs). Rats were taken individually to a testing apparatus consisting of a hide box and a testing arena. The behavioral activities, including concealing, heading out, approaching, and feeding behaviors in each trial were videotaped for 3 h. Results revealed that WNRs, DNRs, and AWRs all showed an aversion to the predator odors by spending more time concealing in the hide box: frequencies of approaching and feeding behaviors, as well as the amount of food intake were significantly lower than control group. Our results suggest that the response of DNRs and AWRs were ‘‘builtin’’ or innate in nature as they had never experienced the odors of the tested predators. Moreover, all three types of rats can distinguish between predator and non-predator odors, but the ability of WNRs was the highest, which can distinguish between sympatric and allopatric predators, while the ability of AWRs was the lowest, which spent most time in the hide box. The concealing and approaching behaviors were no significantly different among the five odor exposure groups. Also, the reactions of the three types of rats toward the control group(distilled water) significantly differ. This suggests that the duration of time spent in captivity plays an important role in shaping the response of rats to different predator odors.
【英文摘要】Behavioral responses to the odors of three predators of rodents (domestic cat (Felis catus), weasel (Mustela sibirica), Eurasian badger (Meles meles)), one non-predator mammal (rabbit (Lepus capensis)), and distilled water (control) were assessed in three types of Norway rats (Rattus norvegicus): wild (WNRs), domestic (DNRs), and albino laboratory Wistar (AWRs). 【题目】Biogeographical Study of Plateau Pikas Ochotona curzoniae (Lagomorpha,Ochotonidae)
【中文关键词】cob, D-loop, Ochotona curzoniae, phylogeography, pikas, population
【英文关键词】cob, D-loop, Ochotona curzoniae, phylogeography, pikas, population
【中文摘要】We reconstructed the demographic history of the plateau pika (Ochotona curzoniae) on the Qinghai-Tibetan plateau by using genetic variation data obtained from spatially distributed populations across much of the plateau. We obtained sequence data, including cob (1,140 bp) and D-loop sequences (732 bp), from 144 individuals at sites ranging from the high-altitude interior to the relatively low-altitude northeastern plateau, and identified 37 and 42 unique haplotypes, respectively.Phylgenetic analysis and haplotype networks based on the individual and the combined datasets of cob and D-loop sequences clustered all populations into four well-supported major groups, and the interaction between vicariance, dispersal, and habitat fragmentation resulted in the current geographical distribution and genetic diversity of O. curzoniae on the plateau. Analysis of molecular variance (AMOVA) and mismatch distribution suggested that the recent continuous uplifts of the plateau contributed to the radiation and diversification of the O. curzoniae populations occurring there.

【题目】Male reproductive success in plateau pikas(Ochotona curzoniae): A microsatellite analysis
【中文关键词】Male reproductive success; Microsatellites; Paternity analysis; Plateau pika
【英文关键词】Male reproductive success; Microsatellites; Paternity analysis; Plateau pika
【中文摘要】In many social species, competition and cooperation between group members may lead to a large variance in reproductive success among individuals, especially for adult male. From April to August 2002, we studied the adult male reproductive success of plateau pikas in Haibei Alpine Meadow Ecosystem Research Station, Chinese Academy of Science, using microsatellite analysis of paternity, mark-recapture and behavioral observations. Our result indicated that the reproductive success of adult males had a large variance. Its average was 6 individuals and range was from 0 to 13 individuals. One-third of males sired 63.22% offspring. There was a hierarchy system in polygynandrous families. Although the reproductive success of dominant males was higher than that of subordinate males, subordinate males still play an important role in the reproductive success of the population.

【题目】Prey selection and hunting behaviors of steppe polecat mustela eversmanni in laboratory studies
【中文关键词】Hunting behavior, Mustela eversmanni , prey activity, prey body mass, prey number, China
【英文关键词】Hunting behavior, Mustela eversmanni , prey activity, prey body mass, prey number, China
【中文摘要】Steppe polecat (Mustela eversmanni Lesson, 1827) is the dominant species of mustelids in the alpine meadow ecosystem of the Qinghai-Xizang (Tibetan) plateau in China. Using the live and dead rats as the experimental prey, we investigated the effects of prey body masses, numbers and activities on predatory behaviors of the polecat. Our results revealed that the prey activity was the most important factor that affected prey selection of the polecat during searching phase. The searching time used for live prey by polecat was significantly longer than that used for dead prey. Also, the prey numbers and body masses significantly affected prey selection of the polecat. When the activities of prey were the same, the polecat always preferred the group with more prey than the one with less prey. When the number and activity of prey were the same, the searching duration was significantly decreased from the lowest weight class to the highest one. In addition, the foraging profitability of polecat is prey-dependent, which was higher with smaller prey than with large ones. These results indicated that the polecat could adjust the hunting behaviors to achieve the optimal profitability according to the characteristics of prey.

【中文关键词】单宁酸;生殖激素;高原鼠兔;根田鼠;协同进化
【英文关键词】Coevolution;Gonad hormone;Plateau pikas (Ochotona curzoniae);Root voles (Microtus oeconomus);Tannic acid
【中文摘要】高原鼠兔和根田鼠是生存于青藏高原的小哺乳动物,它们所取食的高原植物含有多种次生化合物。为了证明食物中的次生化合物对高原鼠兔和根田鼠繁殖相关激素的影响,探讨它们与取食植物间的协同进化,分别对两种动物灌服0、5、10和20 mg/ kg BW剂量单宁酸1 d、3 d及5 d后,测定其下丘脑促性腺激素释放激素、血浆中睾酮和血浆雌二醇的含量。结果表明,单宁酸对高原鼠兔的LD50为112 ±27　72 mg/ kg BW,对根田鼠的LD50为117 ± 17　37 mg/ kg BW;单宁酸可以使高原鼠兔和根田鼠血浆睾酮和雌二醇水平升高,但对下丘脑促性腺激素释放激素水平没有明显的影响。说明单宁酸可能会促进这两种动物的性成熟,有利于它们的繁殖
【英文摘要】Plateau pikas (Ochotona curzoniae)and root voles (Microtus oeconomus)are herbivorous mammals inhabiting in the highest plateau of the world,the Qinghai-Tibet Plateau　They feed on plants that contain many kinds of secondary metabolites. Our study objectives were to verify that secondary metabolites in their diets have some effects on the hormones related to their reproductive behaviors,and to explore the co-evolution between the animals and their forage for both species. Gonadotropin-releasing hormone (GnRH),plasma androgen and estrogen for both species was assayed after subjects were administrated tannic acid at dosages of 0,5,10,20 mg /kg BW for 1,3,or 5 days. Tannic acid increased plasma androgen and estrogen in both of pikas and root voles. We observed no significant change of GnRH in either species. This suggests that tannic acid plays a role in sexual maturation and benefits reproductive behaviors.

【题目】京杭运河堤坝区域狗獾的栖息地特征
【中文关键词】狗獾; 栖息地选择; 人为干扰
【英文关键词】Mele meles; habitat selection; human disturbance
【中文摘要】2006年10-11月和2007年10-11月,在京杭运河邵伯—高邮段的西侧堤坝上,采用样方法测定了狗獾3个不同类型栖息地的特征变量和利用强度,结果表明: 狗獾主要生活在郁闭度较高的森林中,对泡桐、泡桐-杨树次生林的利用强度显著的高于杨树人工林(P < 0.05) ; 多元线性逐步回归分析表明: 洞口数主要受灌木密度、大树密度、草本植物盖度、土壤含水率和人为干扰强度的影响(P = 0.002) ,而粪堆数主要受灌木密度、大树密度和人为干扰强度的影响(P = 0.012) 。整体来看,影响狗獾栖息地选择的因素主要是郁闭度、人为干扰水平有关的因子。
【英文摘要】Habitat selection is one of the most poorly understood ecological processes,but its study has become a necessary tool in conservation biology and wildlife management. The basic assumption in habitat selection theory is that individuals select those types of habitat where the benefits are maximized and the harm is minimized. Many variables can influence the individual's decision of selecting between available habitats,from physiological limitations to ecological constrains (e. g.predation pressure,refuge) . The knowledge of these factors is basic for the correct understanding of habitat choice processes and for the implementation of effective strategies in conservation and /or management of species and landscapes.The Eurasian badger (Meles meles) is a medium sized carnivore distributed all over temperate Eurasia. In October-November 2006 and 2007,the habitat selection of Eurasian badger was investigated at Beijing-Hangzhou Grand Canalembankment (from Shaobo to Gaoyou) . Two indexes of activity intensities,setts number and feces

number were used to estimate the utilization intensities of badger on three types of habitats,Populus euphratica artificial forest,Populus euphratica-Paulownia fortunei artificial forest and Populus euphratica artificial forest. Meanwhile,the factors influencing the habitat selection of badger were analyzed by stepwise regression for determining the habitat characteristics of Eurasianbadger. Results indicated that,in Beijing-Hangzhou Grand Canal embankment area,badgers preferred Populus euphratica forest and Populus euphratica-Paulownia fortunei artificial forest attribute to dense plant canopy. Stepwise regression indicated that density of shrubs,density of big trees,herbaceous plants cover,soil moisture and human disturbance degree significantly influenced the number of setts (P = 0.002) . Furthermore,the number of fences were also affected by the density of shrubs and big trees,and human disturbance(P = 0.012) . Overall,the influences of most habitat variables onthe habitat selection of badger were directly or indirectly related to shelter cover and predation risk. It is concluded that badgers preferred to selecting forests with dense plant canopy and lower predation risk.

【题目】Every rose has its own thorns? A study on Trivers – Willard hypothesis in plateau pikas

【中文关键词】Sex ratio variation; litter size, Trivers – Willard hypothesis; Ochotona curzonia

【英文关键词】Sex ratio variation; litter size, Trivers – Willard hypothesis; Ochotona curzonia

【中文摘要】This study is considered the first dealt with Trivers – Willard hypothesis in china using a wildlife population of plateau pikas (Ochotona curzoniae) by which we have investigated the relationship between maternal quality, litter sex ratio and litter size in a polytocous mammal. Our results indicated that the reproductive time significantly affected the litter sex ratio. Although the concentration of female adult plasma immunoglobulin G (IgG) and Glucagon (Glu) at gestation, body weight, ear length, rear foot length, and body length of adult female after gestation did not affect the litter sex ratio, however, litter size has a significant negative impact on the litter sex ratio, and body weight of adult females have a significant effect on the litter size. These results might give some evidence for the Trivers – Willard hypothesis in polytocous mammals.

【题目】Apical thickening of epicarp is responsible for embryo protection in acorns of Quercus variabilis

【中文关键词】hull thickness,herbivory defense,weevil larvae,Quercus

【英文关键词】hull thickness,herbivory defense,weevil larvae,Quercus

【中文摘要】The present study explored the evolutionary role of epicarp thickness of Q. variabilis acorns as a defensive mechanism against length and fresh mass of insect-damaged acorns were not different from those of intact ones, but width did differ.About 2, 18, and 79% of oviposition sites are distributed at the apical end, middle part, and basal end of acorns, respectively. About 5, 49, and 55% of

eggs or larvae are infested at the apical end, middle part, and basal end, respectively. Similarly, about 10, 43, and 45% of emergence holes are found at the apical end, middle part, and basal end. Epicarp thickness varied among the three parts of acorns and was significantly negatively correlated with the appearance percentage of oviposition sites, infestation sites, and emergence sites, respectively. However, secondary metabolites and nutrition reserve showed no close correlation with the appearance percentage of ovi ¬ position sites, infestation sites, and emergence sites.Acorns with emergence holes at the apical end exhibited significantly lower seedling emergence and survival rates.Therefore,variation in epicarp thickness in individual acorns may be responsible for the weevil ' s preference for oviposition,infestation, and emergence, and acts as an alternative and important strategy protectingacorn embryos from pre-dispersal larval damage.

【题目】Extracellular expression and biochemical characterization of α-cyclodextrin glycosyltransferase from Paenibacillus macerans

【中文关键词】无中文关键词

【英文关键词】Expression, Cyclization activity, Characterization, Cyclodextrin glycosyltransferase, Paenibacillus macerans,Escherichia coli

【中文摘要】无中文摘要

【英文摘要】The cgt gene encoding α-cyclodextrin glycosyltransferase (α-CGTase) from Paenibacillus macerans strain JFB05-01 was expressed in Escherichia coli as a C-terminal His-tagged protein. After 90 h of induction, the activity of α-CGTase in the culture medium reached 22.5 U/mL, which was approximately 42-fold higher than that from the parent strain. The recombinant α-CGTase was purified to homogeneity through either nickel affinity chromatography or a combination of ion-exchange and hydrophobic interaction chromatography. Then, the purified enzyme was characterized in detail with respect to its cyclization activity. It is a monomer in solution. Its optimum reaction temperature is 45 ° C, and half-lives are approximately 8 h at 40 ° C, 1.25 h at 45 ° C and 0.5 h at 50 ° C. The recombinant α-CGTase has an optimum pH of 5.5 with broad pH stability between pH 6 and 9.5. It is activated by Ca2+, Ba2+, and Zn2+ in a concentration-dependent manner, while it is dramatically inhibited by Hg2+. The kinetics of the α-CGTase-catalyzed cyclization reaction could be fairly well described by the Hill equation.

【题目】Behavioral adaptation of Pallas ’ s squirrels to germination schedule and tannins in acorns
【中文关键词】behavioral decisions,germination schedule,long-term food supply,scatter hoarding,tannins,tree squirrels
【英文关键词】behavioral decisions,germination schedule,long-term food supply,scatter hoarding,tannins,tree squirrels
【中文摘要】Using acorns from Castanea henryi (CH) and Quercus variabilis (QV) with contrasting germination schedule (related to food perishability) and tannin levels, we conducted field experiments in a subtropical forest in Southwest China to investigate how free-ranging Pallas ’ s squirrels (Callosciurus erythraeus) utilize acorns as long-term storage based on the food perishability and hightannin hypotheses. Though QV acorns germinated much earlier than CH ones, we found that Pallas ’ s squirrels hoarded more high-tannin QV acorns over low-tannin CH ones, supporting the high-tannin hypothesis (but not the food perishability hypothesis). However, several other predictions derived from the food perishability hypothesis received sound support: nondormant QVacorns had their embryos removed with a highe r probability (68.5%) than dormant CH ones (8.8%) and embryo-removed acornshad a much lower germination success but had a higher probability surviving as long-term storage. During the caching-recoveryp rocess, hoarding animals actively detected acorn state (dormant or not) and removed acorn embryos with an increasing probability in subsequent hoarding events. In addition,embryo-removed acorns could serve as long-term storage because they had a very low probability being infested by fungi as intact acorns did during the time of storage. We conclude that tree squirrelscan differentially respond to acorn germination and remove the embryos of nondormant acorns more frequently as long-term storage, but tannin level is more important in determining whether a given acorn is hoarded or not. Combined with the studies from North America, our results suggest convergent evolution of acorn hoarding behavior in tree squirrels across different continents. Key words: behavioral decisions, germination schedule, long-term food supply, scatter hoarding, tannins,tree squirrels.

【题目】Mutations at subsite -3 in cyclodextrin glycosyltransferase from Paenibacillus macerans enhancing alpha-cyclodextrin specificity
【中文关键词】无中文关键词
【英文关键词】Cyclodextrin glycosyltransferase, Cyclodextrin, Product specificity, Paenibacillus macerans, Mutation, Subsite －3
【中文摘要】无中文摘要
【英文摘要】"A major disadvantage of cyclodextrin production is the limited cyclodextrin product specificity of cyclodextrin glycosyltransferase (CGTase). Here, we described mutations of Asp372 and Tyr89 at subsite -3 in the CGTase from Paenibacillus

macerans strain JFB05-01. The results showed that Asp372 and Tyr89 played important roles in cyclodextrin product specificity of CGTase. The replacement of Asp372 by lysine and Tyr89 by aspartic acid, asparagine, lysine, and arginine resulted in a shift in specificity towards the production of alpha-cyclodextrin, which was most apparent for the mutants D372K and Y89R. Furthermore, the changes in cyclodextrin product specificity for the single mutants D372K and Y89R could be combined in the double mutant D372K/Y89R, which displayed a 1.5-fold increase in the production of alpha-cyclodextrin, with a concomitant 43% decrease in the production of beta-cyclodextrin when compared to the wild-type CGTase. Thus, the D372K and Y89R single and double mutants were much more suitable for the industrial production of alpha-cyclodextrin than the wild-type enzyme. The enhanced alpha-cyclodextrin specificity of these mutants might be a result of stabilizing the bent conformation of the intermediate in the cyclization reaction. "

【题目】Behavioural responses of sympatric rodents to complete pilferage

【中文关键词】complete pilferage,food hoarding,hoarded intensity,pilferage avoidance , pilferage tolerance ,sex difference

【英文关键词】complete pilferage,food hoarding,hoarded intensity,pilferage avoidance , pilferage tolerance ,sex difference

【中文摘要】Food-hoarding animals employ a variety of tactics to minimize the loss of caches to pilferers. It remains unclear, however, how these responses are affected by complete pilferage events and if differences occur between species and between the sexes within a species that adopt different hoarding strategies. We studied the behavioural responses to complete pilferage in five species that scatter-hoard or larderhoard.Under natural conditions and within outdoor enclosures we simulated complete pilferage events by removing wild apricot, Prunus armeniaca, seeds hoarded by Pere David ’ s rock squirrels, Sciurotamias davidianus, Korean field mice, Apodemus peninsulae, striped field mice, Apodemus agrarius, Chinese white-bellied rats, Niviventer confucianus, and rat-like hamsters, Tscherskia triton. Following pilferage, all five species increased seed removal from the source and total hoarding intensity under both natural and captive conditions, but no effect of sex was found. Pere David ’ s rock squirrels, Korean field mice and striped field mice, which show both scatter and larder hoarding, increased scatter hoarding, but notlarder hoarding. Our pilferage manipulations in the field also increased the distance that seeds were buried from the source. These findings suggest that complete pilferage may increase seed-hoarding behaviour in rodents and that scatter hoarding might be better than larder hoarding in avoiding complete pilferage in rodents that already perform both of these

【题目】Scatter-hoarding rodents as secondary seed dispersers of a frugivore-dispersed tree Scleropyrum wallichianum in a defaunated Xishuangbanna tropical forest, China
【中文关键词】rugivorous vertebrate, scatter-hoarding rodents, Scleropyrum wallichianum, seed dispersal,seedling recruitment.
【英文关键词】rugivorous vertebrate, scatter-hoarding rodents, Scleropyrum wallichianum, seed dispersal,seedling recruitment.
【中文摘要】Local extinction or population decline of large frugivorous vertebrates as primary seed dispersers, caused by humandisturbance and habitat change, might lead to dispersal limitation of many large-seeded fruit trees. However,it is not known whether or not scatter-hoarding rodents as secondary seed dispersers can help maintain natural regeneration (e.g. seed dispersal) of these frugivore-dispersed trees in the face of the functional reduction or losses of primary seed dispersers. In the present study, we investigated how scatter-hoarding rodents affect the fate of tagged seeds of a large-seeded fruit tree (Scleropyrum wallichianum Arnott, 1838, Santalaceae) from seed fall to seedling establishment in a heavily defaunated tropical forest in the Xishuangbanna region of Yunnan Province, in south-west China, in 2007 and 2008. Our results show that: (i) rodents removed nearly all S. wallichianum seeds in both years; (ii) a large proportion (2007, 75%; 2008, 67.5%) of the tagged seeds were cached individually in the surface soil or under leaf litters; (iii) dispersal distance of primary caches was further in 2007 (19.6 ± 14.6 m) than that in 2008 (14.1 ± 11.6 m), and distance increased as rodents recovered and moved seeds from primary caches into subsequent caching sites; and (iv) part of the cached seeds (2007, 3.2%; 2008, 2%) survived to the seedling stage each year. Our study suggests that by taking roles of both primary and secondary seed dispersers, scatterhoarding rodents can play a significant role in maintaining seedling establishment of S. wallichianum, and are able to at least partly compensate for the loss of large frugivorous vertebrates in seed dispersal.

【题目】Effectiveness of koreanpine(Pinus koraiensis) seeds dispersing by small rodents in fragmented forests
【中文关键词】seed dispersal, rodents,Pinus koraiensis, tree regeneration, Lesser Xing ’an Mountain
【英文关键词】seed dispersal, rodents,Pinus koraiensis, tree regeneration, Lesser Xing ’an Mountain
【中文摘要】The effectiveness of dispersers on seeds of Korean pine (Pinus koraiensis Siebold et Zuccarini) was investigated in three fragmented stands and one primary stand. The proportion of Korean pine trees was less than 7% in the fragmented stands but more than 90% in primary stand. Five estimates related seed dispersal (proportion of removed seeds, scatter-hoarded seeds, cache dynamics, dispersal distance and microhabitat) were assessed to see the effect of forest fragmentation on the probability of seed dispersal of Korean pine seeds. Our results indicated fast seed harvest of Korean pine by small rodents at the seed stations and no difference among the four

stands. Scatter-hoarding rodents are potentially important in promoting natural regeneration of Korean pine as revealed by high proportion of seed removal (up 50%), short seed lifetime from the seed release locations and lower proportion of seeds remained on the ground surface. Although a proportion of seeds were scatter-hoarded in fragmented stands, no seedling was successfully emerged due to heavy predation. Dispersal distances were strongly left-skewed in fragmented stands, indicating that fragmentation is likely to be disadvantageous for longer distance dispersal. The effective dispersal suffered from a very heavy cost as accompanied by a great portion of seed predation and lower level of scatter-hoarded seeds. Failing to see seedling establishment in fragmented stands rather than in primary stand indicated that fragmentation and deforestation have negative effects on dispersal behavior and consequently seed destination. Artificial tree plantation and pinecone protection are highly recommend for Korean pine regeneration.

【题目】Frequency-dependent selection by tree squirrels: adaptive escape of nondormant white oaks

【中文关键词】behavioral preference, dispersal success, frequency-dependent selection, oak – squirrel system, predator – prey dynamics, seed Germination;dormancy.
【英文关键词】behavioral preference, dispersal success, frequency-dependent selection, oak – squirrel system, predator – prey dynamics, seed Germination;dormancy.

【中文摘要】Frequency-dependent selection is theoretically predicted to have an important impact on predator – prey dynamics, but little is understood about this process in nature. We investigated oak – squirrel interactions to test the hypothesis that tree squirrels predate/disperse white oak acorns based on the frequency of their germination phenotypes (dormancy, i.e., delayed germination vs. nondormancy, i.e., immediately germinating), which in turn influences dispersal and establishment of these oaks. In Central China, we manipulated the relative frequency of dormant and nondormant acorns available to Pe`re David ’ s Rock squirrel (Sciurotamias davidianus) with 2 white oaks (QAA, Quercus aliena var. acutesevata and QSB, Quercus serrata var. breviptiolata) that exhibit considerable variation in acorn germination between and within oak species throughout the fruiting season. We predicted that dispersal success (i.e., the probability of a viable acorn being hoarded) of each germination phenotype would vary with the phenotype frequency and hence show either positive or negative frequency-dependent selection. We found that acornembryo removal by squirrels may select for the dormant phenotype but is more likely to occur for early germinating acorns. We also found that both absolute and relative dispersal success of each germination phenotype increased with their frequency in the 2 white oaks, thus demonstrating positive frequency-dependent selection. Our results reveal that the frequency of germination phenotypes can account for as much as 40.5% and 21.4% of the observed dispersal success in QAA and QSB, respectively. We show that behavioral preferences of scatter-hoarding animals could result in frequency-dependent selection in nature, and such selection may help maintain variation in germination phenotypes in prey species.

【题目】High regeneration capacity helps tropical seeds to counter rodent predation
【中文关键词】Embryo removal ,Hoarding behavior ,Seed dispersal ,Seed germination ,Seed pruning
【英文关键词】Embryo removal ,Hoarding behavior ,Seed dispersal ,Seed germination ,Seed pruning
【中文摘要】Rapid germination of non-dormant seeds is one adaptation plants have evolved to counter seed predation by rodents. Some rodent species have evolved behaviors that prevent or slow the seed germination process through seed embryo removal or seed pruning; however, no plant species is known to have successfully escaped embryo removal or seed pruning by rodents. Here, we report that the non-dormant seeds of Pittosporopsis kerrii Craib in tropical rain forests in China have a high regeneration capacity to counter seed pruning by rodents. We found seed pruning, instead of embryo removal, was commonly used by rodents to increasefood storage time by slowing down the seed germination process, but that P. kerrii seeds have a high regeneration capacity to escape seed predation by rodents: all pruned seeds, pruned roots and embryo-removed seeds by rodents or people retain the ability to develop into seedlings. Seeds of P. kerrii also have other capacities (i.e. rapid seed decomposition and indigestible dormant taproots) to escape predation by reducing the plant ’s attractiveness to rodents.The association between seed pruning behavior in rodents and high regeneration capacity of pruned seeds or roots in P. kerrii seeds are likely novel adaptation strategies adopted by seeds and rodents, respectively.

【题目】Intra- and inter-specific effects of mast seeding on seed fates of two sympatric Corylus species
【中文关键词】Corylus ,Seed dispersal , Mast seeding ,Intra,specific interaction ,Inter-specific interaction ,Seed trait
【英文关键词】Corylus ,Seed dispersal , Mast seeding ,Intra,specific interaction ,Inter-specific interaction ,Seed trait
【中文摘要】We released seeds of two sympatric tree species, Corylus mandshurica (seed with thinner seed hull, higher nutrition) and C. heterophylla (seeds with thicker seed hull, lower nutrition) in the masting year of C. mandshurica in 2008, and C. heterophylla in 2009,respectively, to investigate how seed masting of the two sympatric Corylus species affects seed removal and dispersal fitness of the two species differently at both intra- and inter-specific levels. At intra-specific level, the authors found mast seeding of both C. mandshurica and C. heterophylla significantly reduced seed removal, seed consumption, but increased seed dispersal distance and seed dispersal fitness of the released seeds. Mast seeding of C. mandshurica increased seed caching of C. mandshurica.At inter-specific level, the authors found mast seeding of C. mandshurica reduced seed removal of C. heterophylla, but mast seeding of C. heterophylla did not significantly reduce seed removal of C. mandshurica. Mast seeding of C. mandshurica reduced seed consumption of C. heterophylla, while mast seeding of C. heterophylla reduced seed consumption of C. mandshurica. We found mast seeding of C.mandshurica significantly reduced seed dispersal distance of C. heterophylla, while mast seeding of C. heterophylla significantly increased seed dispersal distance of C. mandshurica. We found that mast seeding of C. mandshurica significantly increased seed dispersal fitness of C. heterophylla, while mast seeding of C. heterophylla did not significantly increase seed dispersal fitness of C. mandshurica. More studies are needed to reveal the ecological consequences of mast seeding at interspecific or community-level. Seed traits may attribute the differences of mast seeding at inter-specific level. Because seeds with thinner seed hull and higher nutrition were more harvested and eaten by rodents, mast seeding of C. mandshurica might have reduced seed removal and seed consumption, but increased dispersal fitness of C. heterophylla (seeds with thicker seed hull, lower nutrition). Therefore, synchrony among species is, or is not, selectively beneficial to the focus species depends on seed traits which determine gains from mast seeding at interspecific level.

【题目】Large acorns benefit seedling recruitment by satiating weevil larvae in Quercus aliena
【中文关键词】Acorn ,Defense traits ,Acorn infestation ,Acorn size/mass ,Seedling establishment
【英文关键词】Acorn ,Defense traits ,Acorn infestation ,Acorn size/mass ,Seedling establishment
【中文摘要】Plants can enhance their seed viability and survival through reducing the fitness costs of herbivory by satiating seed predators at either plant or seed level, or both. The former satiates with production of large crops while the latter with large-sized seeds, enhancing the probability of seed survival. We analyzed both types of satiat in the interaction between the Quercus aliena and the weevil Curculio spp in 2 years with different crop size and acorn size. Larger crop size seemed to satiate less effectively weevils due to higher proportions of the seeds were attacked in oaks producing more crops of smaller acorns. However, prematurely abscission of infested acorns in large crop year might compensate this ineffectiveness. Larger acorns in lean year well satiated weevil larvae, as a larger acorn size increased the likelihood of embryo survival and seedling establishment. Although effective satiation by largeracorns would be negated by smaller seed crops, the proportion of attacked acorns that survived increased with large acorn size in lean year. These results highlighted the importance of annual variation in acorn size of Quercus aliena in satiating and defending weevil larval predations, consequently in successful seedling recruitment and establishment.

【题目】OXYTOCIN AND VASOPRESSIN IMMUNOREACTIVE STAINING IN THE BRAINS OF BRANDT ’S VOLES (LASIOPODOMYS BRANDTII) AND GREATER LONG-TAILED HAMSTERS (TSCHERSKIA TRITON)
【中文关键词】medial preoptic area, anterior hypothalamus, medial
amygdala, solitary, social behavior
【英文关键词】medial preoptic area, anterior hypothalamus, medial
amygdala, solitary, social behavior
【中文摘要】Immunoreactive (ir) staining of the neuropeptides oxytocin (OT) and vasopressin (AVP) was performed in the brains of Brandt ’s voles (Lasiopodomys brandtii) and greater long-tailed hamsters (Tscherskia triton)—two species that differ remarkably in social behaviors. Social Brandt ’s voles had higher densities of OT-ir cells in the medial preoptic area (MPOA) and medial amygdala (MeA) as well as higher densities of AVP-ir cells in the lateral hypothalamus (LH) compared to solitary greater long-tailed hamsters. In contrast, the hamsters had higher densities of OT-ir cells in the anterior hypothalamus (AH) and LH and higher densities of AVP-ir cells in the MPOA than the voles. OT-ir and AVP-ir fibers were also found in many forebrain areas with subtle species differences. Given the roles of OT and AVP in the regulation of social behaviors in other rodent species, our data support the hypothesis that species specific patterns of central OT and AVP pathways may underlie species differences in social behaviors. However, despite a higher density of OT-ir cells in the paraventricular nucleus of the hypothalamus (PVN) in females than in males in both species, no other sex differences were found in OT-ir or AVP-ir staining. These data failed to support our prediction that a sexually dimorphic

pattern of neuropeptide staining in the brain is more apparent in Brandt ’ s voles than in greater long-tailed hamsters.

【题目】Repeated radicle pruning of Quercus mongolica acorns as a cache management tactic of Siberian chipmunks
【中文关键词】Siberian chipmunks ,Radicle pruning ,Acorn storage , Quercus mongolica
【英文关键词】Siberian chipmunks ,Radicle pruning ,Acorn storage , Quercus mongolica
【中文摘要】Many rodents hoard seeds as a means of ensuring food availability during scarcity. Siberian chipmunks (Tamias sibiricus) feed on acorns of white oak Quercus mongolica and hoard them for future use. Such caches may deteriorate due to the early germination of the acorns in autumn, which can be inhibited by radicle pruning or embryo excision. Siberian chipmunks are found to frequently prune the radicles of germinated acorns of Q. mongolica; however,whether this behavior is a kind of cache management tactic remains unclear. Here, we performed semi-natural enclosure and field experiments to test the role of radicle pruning in cache management of T. sibiricus. We found that T. sibiricus preferred non-germinated acorns and tended to prune radicles of germinating acorns when scatter-hoarding them, but did not perform the behavior of embryo excision by squirrels.Both semi-natural enclosure and field experiments showed that T. sibiricus not only pruned radicles repeatedly but removed radicles varied in length from acorns, which significantly postponed acorn germination and radicle growth. These observations suggest that radicle pruning would be an evolutionary tactic for cache management of Siberian chipmunks.

【题目】Scatterhoarding of Manchurian walnut Juglans mandshurica by small mammals: response to seed familiarity and seed size
【中文关键词】Seed dispersal ,Juglans mandshurica ,Caching experience , Seed size ,Apodemus penisulae
【英文关键词】Seed dispersal ,Juglans mandshurica ,Caching experience , Seed size ,Apodemus penisulae
【中文摘要】Dispersal patterns can be affected by seed familiarity and seed traits, including size, mass, and nutritional value, but these factors have not been intensively studied in the context of seed dispersal processes. Our aim was to study how small rodents respond to seed size and seed familiarity in their pattern of Manchurian walnut (Juglans mandshurica) seeds in two different habitats in temperate forests of northeast China. Our results demonstrated that Apodemus penisulae acts as the most important disperser for Manchurian walnut seeds. Inexperienced smallrodents did not reject seeds of the Manchurian walnut and show similar seed removal rates as compared with experienced rodents. Both experienced and na ï ve rodents actively participated in seed scatterhoarding of Manchurian walnut seeds. Consecutive survey showed that seeds with large size/mass were removed faster than those with small size/mass, indicating a preference for large seeds. However,small seeds scatter-hoarded by small rodents were transported farther than large ones, failing to support the traditional optimization models for various tree species.Small seeds of Manchurian walnut in caches were less likely to be recovered than large ones and showed greater cache survival rates, indicating that small seeds would be more advantageous for regeneration than large seeds in small rodent-dominated forests.

【题目】都江堰林区取食樱桃果实(种子)的鸟类及其种子扩散作用
【中文关键词】食果鸟; 鹎科鸟类; 樱桃; 种子扩散
【英文关键词】Frugivorous birds; Pycnonotidae; Wild Cherry (Prunus pseudocerasus); Seed dispersal
【中文摘要】樱桃(P runus p seudocerasu s)是广泛分布于我国亚热带常绿阔叶林内的一种重要核果植物。为了解食果鸟类在樱桃种群更新中的作用, 于2007年和2008年在四川都江堰亚热带常绿阔叶林内研究了取食樱桃果实(种子)的鸟类及其种子扩散作用。研究表明, 樱桃成熟果实的下落高峰发生在4 月下旬至5月上旬; 2007年的种子扩散率为4.0% ± 1.0%, 明显低于2008 年(27.7% ± 5.7%)。在研究地内, 发现至少有16种鸟取食樱桃果实或种子, 根据其对果实和种子的处理方式分为3个功能群: 白头鹎(Pycnontus sinensis)、领雀嘴鹎(Sp iz ix os sem itorques)、黑鹎(H yp isip etes leucocephalu s)、白颊噪鹛(Garru laxsnnio)、红嘴蓝鹊(Urocissa ery thorhyncha) 等10种鸟吞食樱桃果实, 而种子通过消化道末端排出并将种子携至远离母树的地方, 是重要的种子扩散者; 暗绿绣眼鸟(A lcipp e morr isonia) 和灰眶雀鹛(Z osterop siaponicus)等4种鸟主要啄食果肉而将种子丢弃在母树下, 为啄食果肉者; 而普通朱雀(Carp op acuserythrinus)和灰头鸦雀(Paradox orn is gularis)则主要取食种子, 为纯粹的种子捕食者。在吞食樱桃果实的 食果鸟中, 3种鹎科鸟类访问频次所占的比例达55. 3% (2007 年)和35. 3% (2008年) , 说明鹎科鸟类是都江堰林区樱桃种子的主要扩散者, 对樱桃种群的空间格局和自然更新可能有重要影响。

【英文摘要】As one important fruit plant, wild cherry (P runus pseudocerasus) is widely distributed in subtropical evergreen broad-leaved forests in China. In 2007 and 2008, fruit removal by frugivorous birds and its potential impacts on seed dispersal and natural regeneration of w ild cherry were investigated in a subtropical evergreen broad-leaved forest in the Dujiangyan City of Sichuan Province, Southwest China. The results showed that the falling peak of ripe fruits occurred from late April to early M ay, but the proportion of fruits removed by birds was significantly lower in 2007(4.0% ± 1. 0%) than in 2008(27. 7%± 5. 7%). In the study site, w e identified at least 16 bird species consuming cherry fru its or seeds, which belong to the following three functional groups based on their fruit/seed hand ling behaviors: legitimate seed dispersers, which swallowed whole fruits and defecated intact seeds aw ay from parent plants through the end o f gut, including Py cnontus sinens is, Spizix ossemitorques, Hypisipetes leucocephalus, Garrulax snnio and Urocissa erythorhyncha; pulp consumers, which on ly consumed fruit pulps but dropped seeds under parent plants, e. g. Alcippemorr isonia and Zosterop siaponicus; and pure seed consumers such as Carpopacus erythrinus and Paradoxorn is gularis. Among the legitimate seed dispersers, the total visiting frequency by three Pycnonotidae birds (P. sinensis, S. sem itorques and H.leucocep halus) w as very high in both years, up to 55.3% (2007) and 35. 3% (2008) , respectively. This suggests that the three Pycnonotidae birds are main seed dispersers to wild cherry and could have a substantial impact on spatial patterns and natural regeneration o f wild cherry in the Du jiangyan forest.

【题目】Agonistic encounters and brain activation in dominant and subordinate male greater long-tailed hamsters

【中文关键词】Aggression,Defense,c-fos,Medial preoptic area,Anterior hypothalamus,Amygdala

【英文关键词】Aggression,Defense,c-fos,Medial preoptic area,Anterior hypothalamus,Amygdala

【中文摘要】During an agonistic encounter test, dominant male greater long-tailed hamsters (Tscheskia triton) initiated attacks sooner and displayed higher levels of aggression and flank marking behavior than their subordinate counterparts. Accordingly, subordinate males exhibited more defensive behavior than dominant ones.Specific patterns of neuronal activation, measured by Fos-immunoreactive staining (Fos-ir), were found in the hamster brain following agonistic interactions. Increased Fos-ir was observed in the bed nucleus of the stria terminalis (BST), ventromedial hypothalamus (VMH), and medial (MeA) and anterior cortical (ACo) nuclei of the amygdala (AMYG) in both dominant and subordinate males. In contrast, dominant males had significantly higher Fos-ir densities in the medial preoptic area (MPOA) than subordinate males, whereas subordinate males expressed higher densities of Fos-ir in the anterior hypothalamus (AH) and central nucleus of the amygdala (CeA). Additionally, Fos-ir levels in the MPOA were significantly correlated with aggression and Fos-ir levels in the AH and CeA were correlated with defensive behavior. Together, our data indicate distinct patterns of neuronal activation associated with agonistic encounters in a behavior-specific manner in male greater long-tailed hamsters.

【题目】槲栎种子雨进程中昆虫的捕食特征
【中文关键词】槲栎; 种子雨; 昆虫捕食; 种子大小; 寄主选择偏好
【英文关键词】Quercus aliena; seed rain; insect predation; seed size; host preference
【中文摘要】为了了解昆虫捕食与槲栎Quercus aliena种子大小和产量的关系以及在栎林更新中的作用, 于2008和2009年秋季, 分别在暖温带伏牛山系天池山国家森林公园内研究了两个年度槲栎的种子雨过程及昆虫捕食特征。结果表明: (1)种子雨过程从8月中下旬到9月底约经历40 d, 存在高峰期且时段较明显, 高峰期下落种子量分别占全部种子雨量的78.13% (2008年)和75. 91% (2009 年); (2)槲栎的种子雨强度年间存在较大差异, 2008 年明显小于2009年(两年分别为31.75 ± 16.65粒/m2 和51.92 ± 29.26粒/m2), 但2009年的橡子明显比2008年小(两年分别为1. 94 ± 0.61 cm3 和2.46 ±0. 57 cm3); (3)种子雨构成比例在两个年份间存在差异, 完好种子的量分别为59.05%(2008年) 和36. 12% (2009年), 虫蛀率在大量结实的2009 年显著提高; (4)虫蛀橡子(2. 29 ±0. 42 cm3)显著大于完整橡子(1.59 ±0. 32 cm3), 且虫蛀种子中所含虫卵数与种子大小显著正相关, 昆虫有选择大种子产卵寄生的偏好。本研究的结果说明, 昆虫对槲栎大种子有寄生选择偏好; 大部分槲栎种子遭遇象甲虫蛀而降低生命活力, 这可能是影响槲栎林更新的主要因素之一。
【英文摘要】Insect seed predation and its relationships with seed rain o f Quercus aliena were investigated in Tianchi Mountain National Forest Park of Funiu Mountain in Luoyang, a warm temperate forest from August to September in 2008 and 2009. The results indicated that the duration of seed ra in of Q. aliena lasted from middle August to late September. The seed amount at the peak accounted for 78.13% and 75.91% of all seeds in 2008 and 2009, respectively. The seed rain density of Q.aliena was 31.75 ± 16.65 and 51.92 ± 29.26 nuts/m2 in 2008 and 2009, respectively. Seed size in 2009 (1.94 ± 0.61 cm3) was significantly smaller than that in 2008 (2.46 ± 0.57 cm3) . The proportion of intact seeds in 2008 and 2009 w as 59.05% and 36.12% respectively, and the proportion of the insect infested seeds w as increased significantly in 2009.We also found that the number of weevil eggs and larvae in each insect infested acorn was significantly correlated with acorn size, and the infested acorns (2.29± 0.42 cm3 in size) were much larger than the sound ones (1.59 ±0.32 cm3 in size), indicating the preference o f weevils to larger acorns for oviposition. The results suggest that weevils prefer larger acorns for oviposition, and the higher proportion o f weevil infested acorns may be one o f the main causes of decline in seedling establishment of Q. Aliena.

【题目】食物单宁和皂苷对小白鼠食物选择的影响
【中文关键词】小白鼠;单宁;皂苷;食物选择;取食经历
【英文关键词】Mice; Tannins; Saponins; Diet selection; Feeding experiences
【中文摘要】通过饲喂自然种子及人工饲料块等单宁和皂苷含量不同的食物,研究了食物中单宁或皂苷水平对小白鼠(Mus musculus domesticus) 食物选择的影响,以及取食经历在其食物选择中的作用。结果表明,(1) 无论有无取食经历,小白鼠均优先取食次生物质含量低的锥栗(或花生(Arachis hypogae Castanea henryi)a) ,而很少取食单宁含量高的栓皮栎(Quercus variabilis) 或皂苷含量高的油茶(Camelia oleifera) ;(2) 小白鼠的取食经历能增强其对种子中单宁或皂苷水平的识别,从而减少其摄入;(3) 小白鼠的食物摄入量随单宁或皂苷含量的增加而显著降低。本研究说明单宁或皂苷均可显著影响动物的食物选择,且取食经历能增强动物对食物的识别能力。
【英文摘要】We tested the effects of food tannin and saponin on diet selection of mice (Mus musculus domesticus) by using natural seeds and artificial food with different amount of tannin or saponin. We also investigated theeffects of feeding experiences on diet

selection. The results showed that: (1) regardless of feeding experiences,mice preferred to consume more seeds with lower tannin (i. e. Castanea henryi) or saponin (i. e. Arachishypogaea) over those with high tannin (i. e. Quercus variabilis) or saponin (i. e. Camelia oleifera) ; (2)feeding experiences for mice could enhance its ability to identify tannin or saponin levels in seeds,resulting in less food intake; and (3) food intake of mice significantly decreased with the increase of food tannin or saponin level. Our study indicates that food tannin or saponin can highly influence food selection by animals and feeding experiences can promote the animals to identify and use different kinds of food.

【题目】围栏条件下花鼠找寻种子的途径和方式
【中文关键词】花鼠;埋藏点;种子找回;红松;毛榛;平榛
【英文关键词】Eutamias sibiricus; Cache; Seed recovery; Pinus koraiensis; Corylus mandshurica; Corylus heterophylla.
【中文摘要】2009 年8 月和2010 年8 月,在黑龙江省带岭区东方红林场半天然围栏内研究了花鼠(Eutamias sibiricus) 对地表放置和埋藏种子的发现过程,摸清围栏条件下花鼠找寻种子信号的途径和方式。实验步骤如下:第1 天在花鼠巢区对角每释放点地表放置1 粒标记种子,共30 粒;第2 天在巢区对角每释放点埋藏1 粒标记种子,共30 粒,第3 天在巢区对角按1 粒、2 粒、3 粒次序循环重复埋藏标记种子,共60 粒;第4 天在巢区对角每释放点埋藏1 个塑料标签作为“ 伪种子 ”,共30 个;第5 天在巢区对角每释放点埋藏1 粒未标记种子,共30 粒,研究花鼠对3 种林木种子(红松Pinus koraiensis、平榛Corylus heterophylla 和毛榛C. mandshurica) 以及“ 伪种子 ”的发现率。结果表明,地表释放和埋藏对花鼠发现3 种林木种子无显著影响。种子类型和埋藏点大小对花鼠发现种子具有显著影响,埋藏点越大,发现率越高。花鼠对空标签的发掘率分别为3. 75% 、1. 67% 和42. 92% ,说明视觉在发现种子过程的作用。花鼠在寻找自身埋藏点与人工埋藏点的标记种子发现率间差异不显著,说明空间记忆的作用在短时间内较弱。围栏条件下花鼠可依靠嗅觉和视觉的共同作用寻找种子,视觉信号可在短时间内形成,但嗅觉的作用在发现种子的过程中还是主要的。
【英文摘要】Seed recovery processes were investigated with Eutamias sibiricus in the semi-natural enclosures in Dongfanghong Forest Dailing District of Heilongjiang Province in August 2009 and 2010. In the beginning ofexperiments,we constructed 16 semi-natural enclosures with one nest in each enclosure which is 10 m × 10 m ×2. 5 m in size and one E. sibiricus was released in it. All the enclosures with natural vegetation were covered by net to protect the animal from predator. In the first 3 days,we laid 30 seeds of Pinus koraiensis in the center of enclosure every day to check the discovery rate for each animal. Then,we choose 8 very active one as target animal to test the seed recovery process. In the formal experiment,we laid 30 tagged seeds evenly in the half enclosure area against the nest side in the first day; buried 30 tagged seeds 2 cm depth evenly in the same region in the second day; buried 60 marked seeds alternately with 1,2 and 3 seeds in each cache in the third day to see whether cache size influences seed recovery rate. In the fourth day,we buried 30 tags only unevenly to test whether animal can locate seeds by vision; fifth day,we buried 30 untagged seeds to see whether the animal can find seed by smell. We used three seed species (P. koraiensis,Corylus heterophylla and C. mandshurica) in this study. Our results showed no difference in seed discovery rates regardless ground surface releasing and burial. However,seed recovery rates varied significantly with seed species and cache sizes. The recovery rates of “ false seeds ” were 3. 75% (P. koraiensis) ,1. 67% (C. heterophylla) and 42. 92% (C. mandshurica) ,indicating the significance of vision. The recovery rates between handling caches and chipmunk ’ s own cacheswere not significantly different. These results showed that E. sibiricus rely on olfaction and vision to recover seeds under the semi-natural enclosures and olfaction might play an important role in finding seeds.

【题目】Estimation of the Homoplasmy Degree for Transplastomic Tobacco using Quantitative Real-time PCR
【中文关键词】烟草质体转化,实时定量PCR,同质化程度
【英文关键词】Transplastomic tobacco,Real-time quantitative PCR ,Homoplasmy degree
【中文摘要】在叶绿体转化过程中,转基因叶绿体的同质化程度检测是必须的关键步骤。以往利用Southern杂交的方法进行同质化检测,该方法耗时较长且需要大量的转基因植株材料。现发展了一项新型快速、灵敏且高效的检测方法——实时定量PCR法。本实验利用外源基因faeG设计探针,利用内源基因matK作为内参基因对17个转基因株系进行实时定量PCR检测,得到的结果与Southern blotting试验的相同,证明:省时、成本低的实时定量PCR更适合进行叶绿体转化的同质化程度检测。
【英文摘要】Estimation of the homoplasmy of transgene in chloroplast is a necessary step in chloroplast transformation. This task is usually achieved by Southern blot analysis, which is laborious, time-consuming, requires large amounts of plant materials and needs hazardous radioisotopes in some cases. To develop a fast, sensitive, stable and effective technique for determining the homoplasmy of transgene in chloroplast, one real-time PCR system based on TaqMan probe technique was developed for evaluating the homoplasmy degree. In the real-time PCR system, one assay targets the exogenous faeG gene, and another one the tobacco chloroplast reference gene, maturase gene within the trnK intron (matK). The homoplasmy of the transgene was determined by the comparison of copy number of faeG and matK. The analyzed results of 17 transplastomic tobacco lines using the developed real-time PCR system were consistent with those from Southern blot analysis, indicating that the real-time PCR method is suitable for estimating the homoplasmy degree of transplastomic plant with the advantages of high efficiency and throughput, low cost and saving time.

【题目】小泡巨鼠和社鼠对珍稀濒危植物红豆树种子的捕食和扩散作用
【中文关键词】Ormosia hosiei, Leopoldamys edwardsi, Niviventor confucianus, 分散贮藏, 种子扩散, 种子捕食, 自然更新
【英文关键词】Ormosia hosiei, Edward ’s long-tailed rat, Chinese white-bellied rat, scatter-hoarding, seed dis-persal, seed predation, natural regeneration
【中文摘要】红豆树(Ormosia hosiei)为我国特有的国家II级保护珍稀濒危植物, 有关动物对种子的捕食和扩散作用是否影响其种群更新目前尚无研究。2009年秋季, 我们在四川省都江堰地区利用大型实验围栏研究了小泡巨鼠(Leopoldamys edwardsi)和社鼠(Niviventor confucianus)对红豆树种子的捕食和贮藏格局, 以便了解鼠类在红豆树种子扩散中的潜在作用。结果表明小泡巨鼠和社鼠均取食红豆树种子, 但二者贮藏种子的方式不同: 社鼠主要集中贮藏种子, 对红豆树种子的扩散作用不大, 而小泡巨鼠则主要分散贮藏种子, 故对红豆树种子有一定的扩散作用。研究结果说明尽管鼠类可通过捕食而降低种子存活, 但分散贮藏的鼠种能促进红豆树种子的扩散, 从而有利于其种群维持。
【英文摘要】Ormosia hosiei (Papilionaceae) is a rare and endangered plant native to China. Currently, it is not understood how seed predation and dispersal by animals affect natural regeneration of the species. During the autumn of 2009, we investigated patterns of predation and hoarding by Edward ’s long-tailed rats (Leopolda-mys edwardsi) and Chinese white-bellied rats (Niviventor confucianus) of Ormosia hosiei seeds using large semi-natural enclosures in Dujiangyan City of Sichuan Province, southwest China. Both rodent species ate Ormosia hosiei seeds, but their hoarding patterns differed. Chinese white-bellied rats larder-hoarded more seeds in the nest and thus may have a negative impact on seed dispersal while Edward ’s long-tailed rats scat-ter-hoarded more seeds and thus may have a positive impact on seed dispersal. In conclusion, our study indi-cates that compared with other rodent species as seed predators, scatter-hoarding rodents as seed dispersers may play a significant role in seed dispersal and subsequent establishment of this endangered plant.

【题目】Acorn germination and seedling survival of Q. variabilis: effects of cotyledon excision
【中文关键词】Q. variabilis ,acorn damage ,cotyledon excision ,germination rate ,seedling survival
【英文关键词】Q. variabilis ,acorn damage ,cotyledon excision ,germination rate ,seedling survival
【中文摘要】We studied the effects of acorn cotyledon loss by insect damage and artificial excision on germination and seedling survival of Quercus variabilis, to determine whether insect infestation decreases acorn germination and seedling establishment; and to what extent cotyledon damage can affect acorn germination and seedling establishment. Artificial excision partially imitated the effect of insect damage on acorn germination and seedling survival, and indicated that insect damage did not significantly decrease germination rate and seedling survival of Q. variabilis acorns. The viability of infested but still viable acorns strongly depends on which sector weevil larvae feed on. The cotyledon reserves at the apex of acorns were more important than those at the base in supporting acorn viability and seedling establishment. The excision of apical cotyledon has the most detrimental effects on acorn germination activity. The relatively low effect of larval infestation on acorn viability was likely related to the high frequency of feeding and escaping at the base, which was closely correlated with differentiation in pericarp thickness in Q. variabilis acorns. These could explain the low decrease in acorn germination and seedling survival experienced by infested acorns.

【题目】The effects of kernel mass and nutrition reward on seed dispersal of three tree species by small rodents
【中文关键词】Seed dispersal ,Seed fate, Kernel mass, Caloric reward ,Seed size, Seed mass ,Colored tag marking
【英文关键词】Seed dispersal ,Seed fate, Kernel mass, Caloric reward ,Seed size, Seed mass ,Colored tag marking
【中文摘要】In the present study, colored tags were fastened to individual seeds to investigate seed dispersal and seed fates of Pinus koraiensis, Corylus mandshurica, and Corylus heterophylla with different seed traits. Our aim was to determine the role of the proportion of kernel mass, caloric reward per seed, and tag color in affecting seed removal rates and seed fates. We predicted that higher proportion of kernel mass and caloric reward will favor seed removal and caching, while lower ones will facilitate seed consumption either in situ or after removal. Our results showed that the proportion of kernel mass, rather than seed size, played an important role in determining seed removal rates and seed fates. Seeds of C. heterophylla with the lowest proportion of kernel mass, regardless of their largest size and/or mass, had lower removal rates, lower level of caching but higher proportion of consumption in situcompared with P. koraiensis and C. mandshurica seeds. Seeds with higher caloric reward exhibited greater dispersal distances. Seed kernel proportion was closely correlated to seed removal rates and caching rates, while seed size and hull thickness seemed to play less important role in affecting seed dispersal, probably because the higher seed handling ability of small rodents in the experimental areas. Our investigation revealed no significant effect of tag color on seed removal rates and seed fates of the three seed species.
【英文摘要】In the present study, colored tags were fastened to individual seeds to investigate seed dispersal and seed fates of Pinus koraiensis, Corylus mandshurica, and Corylus heterophylla with different seed traits. 【题目】Effect Of Establishment of a Gene Expression System in Rice Chloroplast and Obtainment of PPT-Resistant Rice Plants
【中文关键词】水稻,叶绿体转化,bar 基因,同源片段
【英文关键词】Oryza sativa L.,chloroplast transformation,bargene,homologous fragments
【中文摘要】核转化中外源基因的整合随机性大,而叶绿体转化可以通过同源重组将外源基因定点的引入到叶绿体基因组中。本实验选择水稻叶绿体内源基因ndhF and trnL 位点区域作为外源除草剂基因bar的整合靶位点,来建立一个水稻叶绿体外源基因表达体系。本研究选择叶绿体内源的16s rRNA基因的启动子和psbA基因的3‘终止子作为外源基因表达载体的启动子和终止子。利用基因枪轰击法获得转基因植株。分子检测结果显示bar基因已成功的整合到水稻叶绿体基因组中,且转基因植株获得了PPT抗性。本研究成功建立了叶绿体转化技术。
【英文摘要】In contrast to the situation of random integration of foreign genes in nuclear transformation, the introduction of genes via chloroplast genetic engineering is characterized by site-specific pattern via homologous recombination. To establish an expressionsystem for alien genes in ricechloroplast, the intergenic region of ndhF and trnL was selected as target for site-specific integration of PPT-resistantbargene in this study. Two DNA fragments suitable for homologous recombination were cloned from ricechloroplast genome DNA using PCR technique, and the chloroplast-specific expression vector pRB was constructed by fusing a modified 16S rRNA gene promoter to bargene together with terminator of psbAgene 3 ′ sequence. Chloroplast transformation was carried out by biolistic bombardment of sterile rice calli with the pRB construct. Subsequently, the regenerated plantlets and seeds of progeny arising from reciprocal cross to the wild-type lines were obtained. Molecular analysis suggested that the bargene has been integrated into ricechloroplast genome. Genetic analysis revealed that bargene could be transmitted and expressed normally in chloroplast genome. Thus, the bargene conferred not only selection pressure for the transformation of ricechloroplast genome, but PPT-resistant trait for riceplants as well. It is suggested that an efficient geneexpressionsystem in the ricechloroplast has been established by chloroplast transformation technique.

【题目】Cinnamic Acid Inhibits Growth but Stimulates Production of Pathogenesis Factors by in Vitro Cultures of Fusarium oxysporum f.sp. niveum
【中文关键词】无
【英文关键词】Biomass; cinnamic acid; Fusarium oxysporum f.sp. niveum (FON); mycotoxin production; pathogenic enzymes
【中文摘要】无
【英文摘要】Long-term monoculture of watermelon leads to frequent occurrence of watermelon fusarium wilt caused by Fusarium oxysporum f.sp. niveum (FON). Some allelochemicals contained in watermelon root exudates and decaying residues are possibly responsible for promoting the wilt disease. The purpose of this study was to evaluate the allelopathic effect of artificially applied cinnamic acid on FON. Results demonstrated that hyphal growth of FON was strongly inhibited by cinnamic acid. At the highest concentration of cinnamic acid, the biomass in liquid culture was decreased by 63.3%, while colony diameter, conidial germination on plates, and conidial production in liquid culture were completely inhibited. However, mycotoxin production and activity of phytopathogenic enzymes were greatly stimulated. Mycotoxin yield, pectinase activity, proteinase activity, cellulase activity, and amylase activity were increased by 490, 590, 760, 2006, and 27.0%, respectively. It was concluded thatcinnamic acid dramatically stimulated mycotoxin production and activities of hydrolytic enzymes by FON but inhibited growth and germination of FON. The findings presented here indicate that cinnamic acid is involved in promoting watermelon fusarium wilt.

【题目】Immunogenicity of recombinant F4 (K88) fimbrial adhesin FaeG expressed in tobacco chloroplast.
【中文关键词】F4ac enterotoxigenic Escherichia coli,FaeG,质体转基因烟草,免疫原性
【英文关键词】F4ac enterotoxigenic Escherichia coli,FaeG,adhesin,transplastomic tobacco,immunogenicity
【中文摘要】本研究将FaeG基因构建在叶绿体表达载体上转化烟草,分子检测显示FaeG已整合到叶绿体基因组中。该基因在烟草叶绿体中得到表达。本研究证明;可以利用叶绿体表达系统生产ETEC疫苗。
【英文摘要】To test the possibility of producing the novel vaccine in plants against diarrhea normally found in neonatal and newly weaned piglets, the faeG gene, encoding a major F4ac fimbrial subunit protein, was introduced into the tobacco chloroplast genome. After two rounds of selection under spectinomycin, we obtained the transgenic plants nearly homoplasmic. RNA gel blot analysis indicated that faeG and the antibiotic selective gene aminoglycoside 3 ′ adenylyltransferase (aadA) were highly transcribed as a dicistron, while the translational level of recombinant FaeG in transplastomic tobacco was about 0.15% of total soluble protein. The immunogenicity of recombinant FaeG produced in tobacco chloroplasts was confirmed by the observation that FaeG-specific antibodies were elicited in mice immunized with total soluble protein of transgenic plants, as well as the result that mouse sera stimulated by chloroplast-derived recombinant FaeG could neutralize F4ac enterotoxigenic Escherichia coli (ETEC) in vivo. This study provides a new alternative for producing the ETEC vaccine using the chloroplast expression system.

【中文摘要】本研究的目的是使脱脂牛奶获得抗氧化、免疫调节及抗体功能。
【英文摘要】The aim of this study was to evaluate the antioxidant, antihypertensive and immunomodulatorycharacteristics of skim milk fermented with Lactobacillus delbrueckii ssp. bulgaricus LB340.Supernatants obtained from the ferments after centrifugation were subjected to ultrafiltration and yielded four peptidic fractions of 10 – 5kDa,5 – 3 kDa, 3 – 1 kDa, and <1・0 kDa. Peptides in 5 – 3 kDa range exhibited a good antioxidant activity. The peptides (<1・0 k) was applied to Superdex-30 G column fractionation and produced six fractions (F1 – 6).Fraction F2 presented the highest angiotensin I-converting enzyme inhibition activity with IC50 of 67・71±7・62mg/ml. Moreover, fraction F6,which displayed a good immunomodulatory activity, had a positive effect on murine spleen lymphocyte proliferation with Stimulation Index of 0・729±0・123. The present data showed the potential of the milk fermented with Lactobacillus delbrueckii ssp. bulgaricus LB340 as a functional food, however, further research is needed to evaluate the biofunctional activity of this fermentation product in vivo using model animal

【题目】Mutations of Lysine 47 in Cyclodextrin Glycosyltransferase from Paenibacillus macerans Enhance β-Cyclodextrin Specificity
【中文关键词】无中文关键词
【英文关键词】Cyclodextrin glycosyltransferase, cyclodextrin, product specificity, Paenibacillus macerans, residue 47, mutation
【中文摘要】无中文摘要
【英文摘要】"The nature of amino acid residue 47 shows a clear discrimination between the different groups of cyclodextrin glycosyltransferase (CGTase). The effects of amino acid side chain at position 47 on cyclodextrin product specificity were investigated by replacing Lys47 in the CGTase from Paenibacillus macerans strain JFB05-01 with arginine, histidine, threonine, serine, or leucine. All of the mutations reduced α-cyclodextrin-forming activity, whereas significant increases in β-cyclodextrin-forming activity were achieved. Especially, the mutations of Lys47 into threonine, serine, or leucine converted P. macerans CGTase from α-type to β/α-type. As a result, all of the mutants displayed a shift in product specificity toward the production of β-cyclodextrin. Thus, they were more suitable for the industrial production of β-cyclodextrin than the wild-type enzyme. The enhancement of β-cyclodextrin specificity might be due to weakening or removal of hydrogen-bonding interactions between the side chain of residue 47 and the bent intermediate specific for α-cyclodextrin formation.

【题目】γ-Cyclodextrin: a review on enzymatic production and applications
【中文关键词】无中文关键词
【英文关键词】Gamma-Cyclodextrin, Cyclodextrin glycosyltransferase, Enzymatic production, Application, Property
【中文摘要】无中文摘要
【英文摘要】Cyclodextrins are cyclic α-1,4-glucans that are produced from starch or starch derivates using cyclodextrin glycosyltransferase (CGTase). The most common forms are α-, β-, and γ-cyclodextrins. This mini-review focuses on the enzymatic production, unique properties, and applications of γ-cyclodextrin as well as its difference with α- and β-cyclodextrins. As all known wild-type CGTases produce a mixture of α-, β-, and γ-cyclodextrins, the obtaining of a CGTase predominantly producing γ-cyclodextrin is discussed. Recently, more economic production processes for γ-cyclodextrin have been developed using improved γ-CGTases and appropriate complexing agents. Compared with α- and β-cyclodextrins, γ-cyclodextrin has a larger internal cavity, higher water solubility, and more bioavailability, so it has wider applications in many industries, especially in the food and pharmaceutical industries.

【题目】麦芽糊精摩尔质量分布对β-环糊精合成的影响

【中文关键词】环糊精;环糊精葡萄糖基转移酶;麦芽糊精;分子摩尔质量分布

【英文关键词】cyclodextrin;cyclodextrin glucanotransferase;maltodextrin;molecular weight distribution

【中文摘要】环糊精是一类广泛应用于食品、医药、化工、农业等领域的环状低聚糖。本实验研究了以麦芽糊精为底物,其摩尔质量分布对β-环糊精(β-CD)合成的影响。通过GPC分析,运用Sephacryl 200-HR和Sephacryl 400-HR两种凝胶分析麦芽糊精的摩尔质量分布,通过高效液相色谱法(HPLC)分析其小分子糖组成。结果表明,不同葡萄糖值(DE值)的麦芽糊精具有明显不同的分子组成,随着DE值升高,麦芽糊精分子的分支化程度逐步升高,分子链长减小,小分子糖含量呈上升趋势;生产工艺不同可引起DE值相近的麦芽糊精出现摩尔质量分布的较大差异;麦芽糊精分子组成可影响β-CD的合成,应用适当链长的底物在一定程度上可促进环化反应,链长过长易引起歧化反应,而链长过短则会导致β-CD因耦合反应而降解;β-CD的转化率随麦芽糊精分子分支化程度的升高而降低,重均摩尔质量约在(MW)43,053-18,793 g·mol-1左右且分支较少的线性麦芽糊精分子可认为是环化反应的最适底物。

【英文摘要】The molecular weight distribution of maltodextrins and its relation to the synthesis of cyclodextrinsCyclodextrins(CDs) are cyclic oligosaccharides with a wide range of application in food,pharmaceutical,cosmetic and agricultural industries.In this work,we studied the influence of molecular weight distribution of starch degradations on the synthesis of β-CD.The molecular weight distribution of starch degradations were analyzed by GPC on both Sephacryl 200-HR and Sephacryl 400-HR column.The oligosaccharides in starch degradation were analyzed by HPLC.With the increasing of DE,the contents of low weight polysaccharides with higher multiple branching degree increased.Maltodextrins,which were prepared by different methods,had significantly different molecular weight distribution even if they had similar dextrose equivalent value(DE).In general,the conversion rate of β-CD decreased with DE increasing.The best condition for the substrate is the average molecular weight between 43 053~18 793 g/mol and less branch Maltodextrains.Similar DE with different processing methods can shift molecular weight distribution greatly.The different component of Maltodextrains can affect β-CD production.Starch degradations with appropriate molecular weight and higher linear degree are better for the synthesis of β-CD.

【题目】乙醇对环糊精葡萄糖基转移酶催化作用影响的研究
【中文关键词】乙醇 环糊精葡萄糖基转移酶 环化作用 偶合作用
【英文关键词】ethanol,cyclodextrin glycosyltransferase, cyclization ,coupling
【中文摘要】采用紫外吸收光谱法测定了乙醇、环已烷与β-环糊精包合反应稳定常数及自由能变化,确定乙醇与β-环糊精的包合反应稳定常数Ks为4.71L/mol,ΔG=-3.84KJ·mol-1;环已烷与 β-环糊精Ks为19.56L/mol,ΔG=-7.37 KJ·mol-1。环已烷与β-环糊精的结合能力大大高于乙醇,故乙醇提高其产率的机理不同于传统工艺中所添加的环已烷。通过测定乙醇对环糊精葡萄糖基转移酶催化作用的影响来进一步探究其作用机理。结果表明:乙醇不仅能提高环糊精葡萄糖基转移酶环化作用的活力,并能在一定程度上减少对转化环糊精有抑制作用的小分子糖的形成,还可以减轻环糊精葡萄糖基转移酶对环糊精的水解及偶合作用,从而提高环糊精的产率。
【英文摘要】UV absorption spectroscopy was used to study the stability constant (Ks) and free energy change (ΔG)of the inclusion reaction of ethanol or cyclohexane with β-cyclodextrin. The Ks and ΔG of ethanol with β-cyclodextrin was 4.71L/mo and-3.84KJ·mol-1;the Ks and ΔG of cyclohexane with β-cyclodextrin was 19.56L/mo and-7.37KJ·mol-1. The binding ability of cyclohexane with β-cyclodextrin is higher than that of ethanol. The effect of ethanol added is shown not to be related to the product inhibition of CGTase, the way of action is different than cyclohexane. Ethanol can not only increase the activities of CGTase, but also inhibit the effect of the coupling reaction and hydrolysis reaction, resulting in an increase in cyclodextrins yield.

【题目】基于LEAP的居民生活能源与环境情景分析
【中文关键词】居民生活用能;LEAP;情景分析;环境影响
【英文关键词】residential energy;LEAP;scenario analysis;environmental impact
【中文摘要】:应用LEAP软件建立河南省居民生活能源与环境模型.利用该模型模拟3个不同情景下河南省居民生活在2005--2030年间能源需求和环境影响.模拟结果表明,政策执行力度及技术推广程度对能源需求量及用能结构有较大影响,3个不同情景下的能源需求量的最大差异量达到9.8 Mtce,而且终端直接消费能源所产生的C02排放量在3个情景下呈不同的下降趋势.
【英文摘要】To assess the energy demand and environment effect for household sector,a bottom—upLEAP Henan model was developed to simulate three different scenarios from 2005 to 2030.In this paper,taking Henan Province as an example,simulation results show that:the implementation of poli · cies and technologies to promote the degree of intensity of energy demand and use can produce a grea—ter impact on the structure.The three different scenarios of the greatest differences in energy demandhave reached 9.8 Mtce,and the direct consumption of energy by the end of the C02 produced emissionsin three different scenarios was a downward trend.

【题目】镁锰锌金属离子对γ-CGT酶生产和能量代谢的促进影响
【中文关键词】γ-CGT酶; Bacillus macorous WSH02-06; 二价金属离子; 组合添加; ATP; ATP/ADP
【英文关键词】γ-CGTase, Bacillus macorous WSH02-06, divalent metal ion, combined addition, ATP, ATP/ADP
【中文摘要】研究了添加镁、锰、锌二价金属离子对Bacillus macorousWSH02-06生产γ-CGT酶的影响。结果表明,在培养基中组合添加镁、锰、锌等二价金属离子能提高酶产量近两倍。这些金属离子的添加同样能促进细胞生长。锰、锌金属

离子的存在能促进细胞消耗镁离子的量。γ-CGT酶产量、细胞干重随着镁离子消耗量的增加而增加。镁、锰、锌二价金属离子提高了胞内ATP含量和ATP/ADP比例,从而为产酶提供了更大的能量支持。

【英文摘要】The effects of divalent metal ions addition such as magnesium,manganese and zinc on the yield of γ-CGTase by Bacillus macorous WSH 02-06 were studied.The γ-CGTase yield was increased maximally almost three folds by the combined addition of magnesium,manganese and zinc ions.The addition of these metal ions also stimulated cell growth.The consumption of Mg2+ was promoted in the cultures with the co-existance of manganese ion and zinc ion.The γ-CGTase yield and dry cell weight increased with the consumption of magnesium ion.The increased intracellular content of ATP and ATP-to-ADP ratio by the addition of these metal ions could generate more energy for better cell growth and higher γ-CGTase yield。

【题目】水温对香港巨牡蛎摄食和代谢的影响

【中文关键词】香港巨牡蛎;水温;滤水率;摄食率;吸收率;耗氧率;排氨率

【英文关键词】Crassostrea hongkongensis;water temperature;filtration rate;ingestion rate;absorption efficiency;oxygen consumptionrate;ammonia excretion rate

【中文摘要】为了探明香港巨牡蛎(Crassostrea hongkongensis)的摄食和代谢生理与水温的关系,在实验室条件下采用流水系统研究了不同水温条件下香港巨牡蛎的滤水率、摄食率、吸收率、耗氧率和排氨率的变化规律,结果显示:(1)在13℃—33℃范围内,水温对香港巨牡蛎的滤水率、摄食率和吸收率的影响都极显著,滤水率、摄食率和吸收率与水温之间的关系方程分别为:FR=-0.027T2+1.1967T-7.8537(R2=0.8902);IR=-0.147T2+6.5202T-42.845(R2=0.9009);AE=-0.1783T2+8.1846T-12.304(R2=0.9757)。(2)在13℃—33℃范围内,水温对香港巨牡蛎的耗氧率和排氨率的影响极显著,耗氧率和排氨率与水温之间的关系方程分别为:OR=1.283Ln(T)-2.332(R2=0.9599);NR=0.1022Ln(T)-0.2136(R2=0.9743)。根据研究结果可以判断:香港巨牡蛎生长的最适水温为22℃,其摄食和代谢在水温18~28℃之间处于较适宜水平。

【英文摘要】In order to make clear the relationship between water temperature and the feeding and metabolic physiology of Crassostrea hongkongensis, the variation of filtration rate (FR), ingestion rate (IR), absorption efficiency (AE), oxygen consumption rate (OR) and ammonia excretion rate (NR) under different water temperatures (T) were studied at laboratory conditions using a running water system. The results showed that, (1) Within the range of 13~33℃, the temperature had a very significant effect on filtration rate, ingestion rate and absorption efficiency of Crassostrea hongkongensis (P<0.01), and the relations between water temperature and filtration rate, ingestion rate and absorption efficiency were as follows: FR =-0.027T2+1.1967T-7.8537 (R2=0.8902), IR=-0.147T2+6.5202T-42.845 (R2=0.9009), AE=-0.1783T2+8.1846T-12.304 (R2=0.9757). (2) Within 13~33益, the temperature had a very significant effect on oxygen consumption rate and ammonia excretion rate of Crassostrea hongkongensis, the relations between water temperature and oxygen consumption rate and ammonia excretion rate were as follows: OR=1.283Ln(T)-2.332 (R2=0.9599); NR=0.1022Ln(T)-0.2136 (R2=0.9743). This study indicated that the optimal temperature for the growth of Crassostrea hongkongensis was 22℃, its feeding and metabolism were at a appropriate level between temperature 18℃and 28℃.

【题目】体规格对香港巨牡蛎摄食和代谢的影响

【中文关键词】香港巨牡蛎;个体规格;滤水率;摄食率;吸收率;耗氧率;排氨率
【英文关键词】Crassostrea hongkongensis; sizes; filtration rate; ingestion rate; absorption efficiency; oxygen consumption rate; ammonia excretion rate
【中文摘要】为了查明香港巨牡蛎(Crassostrea hongkongensis)的摄食和代谢与个体规格的关系,本研究在实验室条件下采用流水系统研究了不同规格香港巨牡蛎的滤水率(FR)、摄食率(IR)、吸收率(AE)、耗氧率(OR)和排氨率(NR)的变化规律。结果显示:1)个体规格对香港巨牡蛎的滤水率、摄食率的影响都极显著(P<0.01)。滤水率和摄食率与干组织质量之间的关系方程分别为:FR = 3.568 5W-0.590 1,(R2=0.956 4);IR = 20.396W-0.539 2,(R2=0.967 9)。个体规格对吸收率的影响不显著(P>0.05)。2)个体规格对香港巨牡蛎的耗氧率和排氨率的影响极显著(P<0.01),耗氧率和排氨率与干组织质量之间的关系方程分别为:OR=1.220 8W-0.444 8,(R2= 0.948 1);NR= 0.074 3W-0.469 1,(R2=0.922 4)。个体规格对O:N的影响不显著(P>0.05),不同个体规格下O:N平均值为18.09,表明在本实验条件下香港巨牡蛎代谢所需要的能量主要由脂肪和碳水化合物提供。
【英文摘要】In order to make clear the relationship between sizes and the feeding and metabolic physiology of Crassostrea hongkongensis, the variation of filtration rate (FR), ingestion rate (IR), absorption efficiency (AE), oxygen consumption rate (OR) and ammonia excretion rate (NR) under different sizes were studied at laboratory conditions using a running water system. The results showed that: (1) Sizes had a very significant effect on filtration rate and ingestion rate of Crassostrea hongkongensis (P<0.01). The relations between dry tissue weight and filtration rate and ingestion rate were as follows: FR = 3.5685W-0.5901, (R2=0.9564); IR = 20.396W-0.5392, (R2=0.9679). Sizes had no significant impacts on absorption efficiency of Crassostrea hongkongensis (P>0.05). (2) Sizes had a very significant effect on oxygen consumption rate and ammonia excretion rate of Crassostrea hongkongensis (P<0.01). The relations between dry tissue weight and oxygen consumption rate and ammonia excretion rate were as follows: OR=1.2208W-0.4448, (R2= 0.9481); NR= 0.0743W-0.4691, (R2=0.9224). The sizes had no significant impacts on the ratio of O:N (P>0.05). The values of O:N ratios were 18.09, which indicated that the Crassostrea hongkongensis in the experiment mainly utilized carbohydrate and lipid as their energy sources.

【题目】盐度对香港巨牡蛎摄食和代谢的影响
【中文关键词】香港巨牡蛎;盐度;滤水率;摄食率;吸收率;耗氧率;排氨率
【英文关键词】Key words: Crassostrea hongkongensis;salinity;filtration rate;ingestion rate;absorption efficiency;oxygen consumption rate;ammonia excretion rate
【中文摘要】为了探明香港巨牡蛎(Crassostrea hongkongensis)的摄食和代谢与盐度的关系,本研究在实验室条件下采用流水系统研究了不同盐度(S)条件下香港巨牡蛎的滤水率(FR)、摄食率(IR)、吸收率(AE)、耗氧率(OR)和排氨率(NR)的变化规律。结果显示:(1)在盐度6~27范围内,盐度对香港巨牡蛎的滤水率、摄食率的影响都极显著(P<0.01),随着盐度的升高,滤水率与摄食率先增大后减小,盐度13时最大,分别为5.93 L · g-1 · h-1和38.26×106 cell · g-1 · h-1;盐度对吸收率的影响不显著(P>0.05),吸收率为74.77 %~78.41 %。 (2)在盐度6~27范围内,盐度对香港巨牡蛎的耗氧率和排氨率的影响极显著(P<0.01),随着盐度的升高,耗氧率与排氨率先增大后减小,盐度20时最大,分别为1.76 mg · g-1 · h-1和0.11 mg · g-1 · h-1;盐度对O:N比的影响不显著(P>0.05),不同盐度下O:N平均值为17.89,表明在本实验条件下香港巨牡蛎代谢所需要的能量主要由脂肪和碳水化合物提供。根据研究结果可以判断:香港巨牡蛎的摄食和代谢活动在盐度13到20之间处于较适宜水平。
【英文摘要】In order to make clear the relationship between salinity and the feeding and metabolic physiology of Crassostrea hongkongensis, the variation of filtration rate (FR), ingestion rate (IR), absorption efficiency (AE), oxygen consumption rate (OR) and ammonia excretion rate (NR) under different salinity (S) were studied at laboratory conditions using a running water system. The results showed that: (1) In the context of salinity 6-27, the salinity had a very significant effect on filtration rate and ingestion rate (P<0.01). The filtration rate and ingestion rate were the highest at the salinity of 13, respectively 5.93 L · g-1 · h-1 and 38.26×106 cell · g-1 · h-1, and decreased at the higher and lower salinity. The salinity had no significant impacts on absorption efficiency of Crassostrea hongkongensis (P>0.05), witch was between 74.77~78.41 %. (2) In the context of salinity 6-27, the salinity had a very significant effect on oxygen consumption rate and ammonia excretion rate of Crassostrea hongkongensis (P<0.01). The oxygen consumption rate and ammonia excretion rate were the highest at the salinity of 20, respectively 1.76 mg · g-1 · h-1 and 0.11 mg · g-

1・h-1, and decreased at the higher and lower salinity. The salinity had no significant impacts on the ratio of O:N(P>0.05). The values of O:N ratios were 17.89±1.05(mean±SD), which indicated that the Crassostrea hongkongensis in the experiment mainly utilized carbohydrate and lipid as their energy sources. It could be judged based on the results that the feeding and metabolism of Crassostrea hongkongensis were at a appropriate level between salinity 13 to 20.

【题目】酶法制备α-环糊精反应体系中癸醇的分离
【中文关键词】液液萃取,α-环糊精,癸醇,分离,水蒸气蒸馏
【英文关键词】extraction, α-cyclodextrin, 1-decanol, separation, steam distillation
【中文摘要】建立了利用液液萃取技术分离酶法制备α-环糊精反应体系中复合剂———癸醇的方法。首先,在α-环糊精溶液中加入癸醇形成α-环糊精-癸醇复合物沉淀后,以该混合体系为研究对象,考察了萃取剂种类及其用量、萃取温度和萃取时间等因素对萃取法分离癸醇的影响,确定了萃取条件: 以15 倍于癸醇体积的乙醚作为萃取剂,在30℃下萃取30 min。其次,以酶法制备α-环糊精的反应体系为研究对象,在最佳萃取条件下分离癸醇后,所测得的α-、β-、γ-环糊精收率与采用传统方法———水蒸气蒸馏法所得收率相当,进一步验证了萃取法能够将α-环糊精-癸醇复合物中的癸醇有效分离出来。
【英文摘要】An extraction method was developed to separate the complex reagent 1-decanol in enzymatic reactionsystem for α-cyclodextrin production. Firstly,a certain amount of 1-decanol was added to α-cyclodextrin solution toform α-cyclodextrin-1-decanol complexes for the parameter study of extraction separation. Effects of type and volumeof extraction solvent,extraction time,and extraction temperature on extraction separation of 1-decanol were investigated.The results showed that the optimum conditions were that ethyl ether,15 times as many as the volume of 1-decanol,was used as extraction solvent to extract 1-decanol at 30℃for 30 min. Secondly,under above optimum conditions,1-decanol in enzymatic reaction system for α-cyclodextrin production was extracted. The results showed that,after extraction separation of 1-decanol, α, β and γ-cyclodextrin yields determined were almost the same as those bythe traditional separation method--steam distillation,which further verified that 1-decanol in the α-cyclodextrin-1-decanol complexes could be effectively separated using extraction method. Furthermore,compared with steam distillation,the proposed extraction method was simple,energy-saving and efficient.

【题目】OsAREB1, an ABRE-binding protein responding to ABA and glucose, has multiple functions in Arabidopsis
【中文关键词】无
【英文关键词】ABA, ABRE, Dehydration, Flowering, Heat
【中文摘要】无
【英文摘要】Expression patterns of OsAREB1 revealed that expression ofOsAREB1 gene can be induced by ABA, PEG and heat. Yeastone-hybrid assay demonstrated it can bind to ABA-responsiveelement (ABRE), which was found in most stress-induced genes.Transgenic Arabidopsis over-expressing OsAREB1 had differentresponses to ABA and glucose compared to wild-type plants,which suggest OsAREB1 might have a crucial role in these twosignaling pathways. Further analysis indicate that OsAREB1have multiple functions in Arabidopsis. First, OsAREB1 transgenicplants had higher resistance to drought and heat, andOsAREB1 up-regulated the ABA/stress related gene such asRD29A and RD29B. Second, it delayed plant flowering time bydown-regulating the expression of flowering-related genes, suchas FT, SOC1, LFY and AP1. Due to the dates, OsAREB1 mayfunction as a positive regulator in drought/heat stresses response,but a negative regulator in flowering time in Arabidopsis

【题目】DGTF: A Database of Grape Transcription Factors
【中文关键词】无
【英文关键词】Vitis vinifera L., family, domain, transcriptional regulator
【中文摘要】无
【英文摘要】ABSTRACT. The database of grape transcription factors (DGTF) is a plant transcription factor (TF) databasecomprehensively collecting and annotating grape (Vitis L.) TF. The DGTF contains 1423 putative grape TF in 57families. These TF were identified from the predicted wine grape (Vitis vinifera L.) proteins from the grape genomesequencing project by means of a domain search. The DGTF provides detailed annotations for individual members ofeach TF family, including sequence feature, domain architecture, expression information, and orthologs in otherplants. Cross-links to other public databases make its annotations more extensive. In addition, some othertranscriptional regulators were also included in the DGTF. It contains 202 transcriptional regulators in 10 families

【题目】Isolation and Identification of Lactic Acid Bacteria from Tarag in Eastern Inner Mongolia of China by 16S rRNA Sequences and DGGE analysis
【中文关键词】乳酸菌
【英文关键词】Tarag Lactic acid bacteria 16S rRNA gene DGGE Biodiversity
【中文摘要】lactic acid bacteria fermentation
【英文摘要】Tarag is a characteristic fermented dairy product with rich microflora (especially lactic acid bacteria), developed by the people of Mongolian nationality in Inner Mongolia of China and Mongolia throughout history. One hundred and ninety-eight samples of Tarag were collected from scattered households in Eastern Inner Mongolia, and total of 790 isolates of lactic acid bacteria (LAB) were isolated by traditional pure culture method. To identify these isolates and analyze their biodiversity, 165 rRNA gene sequences analysis and PCR-DGGE were performed respectively. The results showed that 790 isolates could be classified as 31 species and Subspecies. Among these isolates. Lactobacillus helveticus (153 strains, about 19.4%), Lactococcus lactis subsp. lactis (132 strains, about 16.7%) and Lactobacillus casei (106 strains, about 11.0%) were considered as the predominated species in the traditional fermented dairy products (Tarag) in Eastern Inner Mongolia. It was shown that the biodiversity of LAB in Tarag in Inner Mongolia was very abundant, and this traditional fermented dairy product could be considered as valuable resources for LAB isolation and probiotic selection. 【题目】Phenotypic and genotypic characteristics of Lactic acid bacteria isolated from Fermented Congee in Inner Mongolia of China
【中文关键词】乳酸菌
【英文关键词】congee lactic acid bacteria 16S rRNA gene
【中文摘要】lactic acid bacteria fermented milk
【英文摘要】Sour congee is a popular food in the western regions of Inner Mongolia in China. It has a complex microbial population, which contributes to its unique flavor and functional properties. In this study, we chose 28 sour congee samples that were collected from different areas in Inner Mongolia for analysis of the microbial community of lactic acid bacteria (LAB) by classical biochemical tests, 16S rRNA gene sequencing, multiplex PCR assay of recA gene and restriction fragment length polymorphism (RFLP) analysis of the tuf gene (encoding elongation factor Tu). The results revealed that all the isolates were identified as Lactobacillus (L.) paracasei (38 strains), L. fermentum (28 strains), L. plantarum (7 strains), L brevis (4 strains), L. reuteri (2 strains), L. amylolyticus (1 strain), Enterococcus (E.) faecalis (3 strains), E. italicus (2 strains) or Lactococcus lactis subsp. lactis (1 strain). The predominant LAB were L. casei and L. fermentum in sour congee samples. The diversity of LAB derived from sour congee could offer useful information for further research on sour congee, and the results demonstrated that the combination of tuf gene and RFLP patterns can be considered as a useful tool for differentiation of the L. casei group

【题目】Diversity of lactic acid bacteria associated with traditional fermented dairy products in Mongolia
【中文关键词】乳酸菌
【英文关键词】lactic acid bacteria
【中文摘要】lactic acid bacteria dairy
【英文摘要】Spontaneous milk fermentation has a long history in Mongolia, and beneficial microorganisms have been handed down from one generation to the next for use in fermented dairy products. The objective of this study was to investigate the diversity of lactic acid bacteria (LAB) communities in fermented yak, mare, goat, and cow milk products by analyzing 189 samples collected from 13 different regions in Mongolia. The LAB counts in these samples varied from 3.41 to 9.03 log cfu/mL. Fermented yak and mare milks had almost identical mean numbers of LAB, which were significantly higher than those in fermented goat milk but slightly lower than those in fermented cow milk. In total, 668 isolates were obtained from these samples using de Man, Rogosa, and Sharpe agar and M17 agar. Each isolate was considered to be presumptive LAB based on gram-positive and catalase-negative properties, and was identified at the species level by 16S rRNA gene sequencing, multiplex PCR assay, and restriction fragment length polymorphism analysis. All isolates from Mongolian dairy products were accurately identified as Enterococcus faecalis (1 strain), Enterococcus durans (3 strains), Lactobacillus brevis (3 strains), Lactobacillus buchneri (2 strains), Lactobacillus casei (16 strains), Lactobacillus delbrueckii ssp. bulgaricus (142 strains), Lactobacillus diolivorans (17 strains), Lactobacillus fermentum (42 strains), Lactobacillus helveticus (183 strains), Lactobacillus kefiri (6 strains), Lactobacillus plantarum ssp. plantarum (7 strains), Lactococcus lactis ssp. lactis (7 strains), Leuconostoc lactis (22 strains), Leuconostoc mesenteroides (21 strains), Streptococcus thermophilus (195 strains), and Weissella cibaria (1 strain). The predominant LAB were Strep. thermophilus and Lb. helveticus, which were isolated from all sampling sites. The results demonstrate that traditional fermented dairy products from different regions of Mongolia have complex compositions of LAB species. Such diversity of LAB provides useful information for further studies of probiotic strain selection and starter culture design, with regard to the industrial production of traditional fermented milk.

【题目】In fl uence of consumption of probiotics on the plasma lipid pro fi le: A meta-analysis of randomised controlled trials.
【中文关键词】乳酸菌
【英文关键词】Probiotics; Meta-analysis; Total cholesterol; HDL cholesterol; LDL cholesterol; Triglycerides
【中文摘要】lactic acid bacteria
【英文摘要】Aims: Human clinical studies have yielded mixed results on the effects of consumption of probiotics on the plasma lipid profile. We conducted a meta-analysis of randomised controlled trials that evaluated the effects of probiotics consumption on blood lipids. Data Synthesis: A systematic literature search of Embase, Web of Science, PubMed and Cochrane Controlled Trials Registry was conducted for studies that investigated the efficacy of probiotics on the plasma lipid profile of subjects. With the help of Review Manager 4.2, data from 13 trials, which included 485 participants with high, borderline high and normal cholesterol levels, were examined. The pooled mean net change in total cholesterol for those treated with probiotics compared to controls was -6.40 mg dl(-1) (95% confidence interval (CI), -9.93 to -2.87), mean net change in low-density lipoprotein (LDL) cholesterol was -4.90 mg dl(-1) (95% CI, -7.91 to -1.90), mean net change in high-density lipoprotein (HDL) cholesterol was -0.11 mg dl(-1) (95% CI, -1.90-1.69) and mean net change in triglycerides was -3.95 mg dl(-1) (95% CI, -10.32-2.42). Conclusion: These results indicate that a diet rich in probiotics decreases total cholesterol and LDL cholesterol concentration in plasma for participants with high, borderline high and normal cholesterol levels. 【题目】Proteomic analysis of responses of a new probiotic bacterium Lactobacillus casei Zhang to low acid stress
【中文关键词】乳酸菌
【英文关键词】Lactobacillus casei Zhang; Proteomics; Acid stress
【中文摘要】lactic acid bacteria 蛋白质组学
【英文摘要】erance to acid is an important feature for probiotic bacteria during transition through the gastrointestinal tract. Proteomics analysis of a new probiotic bacterium. Lactobacillus casei Zhang, was performed upon 30-min exposure to low acid stress (pH 2.5 vs. pH 6.4) using two-dimensional electrophoresis. Out of 33 protein spots that showed changes of expression between the two pHs, 22 showed 1.5-fold higher expression at pH 2.5 than at pH 6.4, whereas five spots had expression decreased by 1.5-fold at pH 2.5. There were also six protein spots that were exclusively present on different pH maps. Further analysis showed that eight of the enhanced

proteins, NagA, NagB, PGM, GlmM, LacC, TOP, GALM and Ptsl, were involved in carbohydrate catabolism. Moreover, quantitative RT-PCR showed that the mRNA expression levels of dnaK, nagB, galm, estC, tuf and luxS were consistent with changes in protein expression. We postulate that there might be some relationship between differentially expressed proteins and acid tolerance in L casei Zhang. (C) 2011 Elsevier B.V. All rights reserved.

【题目】Validation of reference genes for real-time quantitative PCR studies in gene expression levels of Lactobacillus casei Zhang.
【中文关键词】乳酸菌
【英文关键词】Lactobacillus casei Zhang; Reference genes; Real-time quantitative PCR
【中文摘要】lactic acid bacteria
【英文摘要】Lactobacillus casei Zhang, a potential probiotic strain isolated from homemade koumiss in Inner Mongolia of China, has been sequenced and deposited in GenBank. Real-time quantitative PCR is one of the most widely used methods to study related gene expression levels of Lactobacillus casei Zhang. For accurate and reliable gene expression analysis, normalization of gene expression data using one or more appropriate reference genes is essential. We used three statistical methods (geNorm, NormFinder, and BestKeeper) to evaluate the expression levels of five candidate reference genes (GAPD, gyrB, LDH, 16s rRNA, and recA) under different culture conditions and different growth phases to find a suitable housekeeping gene which can be used as internal standard. The results showed that the best reference gene was GAPD, and a set of two genes, GAPD and gyrB (which were the most stable reference genes), is recommended for normalization of real-time quantitative PCR experiments under all the different experimental conditions tested. The systematic validation of candidate reference genes is important for obtaining reliable analysis results of real-time quantitative PCR studies in gene expression levels of Lactobacillus casei Zhang.

【题目】A survey of bacterial composition in kurut from Tibet of China using a culture-independent approach
【中文关键词】乳酸菌
【英文关键词】Tarag Lactic acid bacteria 16S rRNA gene DGGE Biodiversity
【中文摘要】lactic acid bacteria fermentation
【英文摘要】Kurut (fermented yak milk) made by natural fermentation is a very important dairy food for the local people in Tibet (China). It is important to fully understand the bacterial composition of kurut for quality improvement and industrial production. Because more than 99% of prokaryotes cannot be cultured and identified by methods currently used in taxonomy, we applied a culture-independent approach to explore the microbial biodiversity of this traditional food. In this study, a bacterial 16S rIINA gene clone library, including 460 clones, was constructed using total DNA extracted from 30 samples of kurut. After screening by restriction fragment length polymorphism (RFLP) analysis, 56 operational taxonomic units (OTU) with unique RFLP patterns were obtained. Then, 1 representative sequence of every OTU was sequenced and phy-logenetically analyzed. The representative phylotypes were affiliated with 5 groups, including Lactococcus lactis ssp. laths, Lactobacillus helveticus, Streptococcus thermophilus, Lactobacillus delbrueckii ssp. bulgaricus, and Acetobacter. In addition, nearly one-third of the representative clones (132 clones) had low similarity to species in GenBank (<97%), and these phylotypes were regarded as unknown bacteria. The characteristics of kurut are determined not only by lactic acid bacteria well known by the culture-dependent approach but also by bacteria that have not yet been identified.

【题目】Lactobacillus casei Zhang stimulates lipid metabolism in hypercholesterolemic rats by affecting gene expression in the liver.
【中文关键词】乳酸菌
【英文关键词】DNA microarray Gene expression Hypocholesterolemic effect Lactobacillus casei Liver
【中文摘要】lactic acid bacteria
【英文摘要】In this study, we show that administration of Lactobacillus casei Zhang evokes a significant reduction in the levels of cholesterol, triglycerides (TGs), and low-density lipoprotein cholesterol (LDL-C) from the serum and liver of hypercholesterolemic rats. After administration of L. casei Zhang, there was 31.5 and 30.8% reduction in the levels of serum TG and LDL-C. DNA microarray results revealed that 755 genes, mainly involved in biological regulation, and cellular and metabolic processes, were differentially expressed in the liver from rats treated with probiotic bacteria, wherein, 324 genes were up-regulated and 431 were down-regulated, respectively. In the up-regulated group, we characterized genes including Acsl1, Hadh, Acaa2, Acads, and gcdH, which are involved in beta-oxidation of fatty acids and encodes enzymes catalyzing critical steps for CoA synthesis and dehydrogenation. It is possible that Lactobacillus could accelerate the fatty acid catabolism by enhancing beta-oxidation step, thus reducing the level of free fatty acid and TG in the serum and liver. Subsequently, it may trigger lipid homeostasis that converts TGs, which are the main storage form of fatty acids, into free fatty acids, and lower TG concentrations both in the serum and liver.

【题目】Effect of Lactobacillus plantarum P-8 on lipid metabolism in hyperlipidemic rat model.
【中文关键词】乳酸菌
【英文关键词】Intestinal microflora Lactobacillus plantarum P-8 Lipid metabolism Probiotics
【中文摘要】lactic acid bacteria
【英文摘要】Probiotics have been reported to play an important role in the prevention of metabolic disorders. Werecently identified a novel probiotic strain Lactobacillus plantarum (L. plantarum) P-8. The objective ofthis study was to determine the effects of L. plantarum P-8 on lipid metabolism of rats fed with high fatdiet. All experimental rats were divided into three groups: control group, model group, and L. plantarumP-8 group. Changes in serum lipid levels, hepatic lipid deposition, serum oxidative stress-relatedparameters, activities of liver function marker enzymes, organ indices, gut microflora, and fecal lipidswere assessed. Compared with model group, L. plantarum P-8 exhibited hypolipidemic effects bylowering serum total cholesterol (TC), triglyceride (TG), and low-density lipoprotein cholesterollevels, accompanied with elevation of high-density lipoprotein cholesterol level. L. plantarum P-8 alsoexerted beneficial effects against high-fat diet-induced oxidative stress, curtailed the accumulation of liverlipids and protected healthy liver function. Moreover, L. plantarum P-8 was able to regulate intestinalbacteria and enhance the fecal excretion of TC, TG, and bile acid. These findings indicate thatL. plantarum P-8 may represent a potential therapeutic agent for controlling hyperlipidemia.

【题目】OsHSF7 gene in rice, Oryza sativa L., encodes a transcription factor that functions as a high temperature receptive and
【中文关键词】无
【英文关键词】Heat-shock factor, Heat tolerance, OsHSF7, Rice, Yeast
one-hybrid
【中文摘要】无
【英文摘要】Three novel Class A genes that encode heat shock transcriptionfactor (HSF) were cloned from Oryza Sativa L using a yeast hybridmethod. The OsHSF7 gene was found to be rapidly expressed inhigh levels in response to temperature, which indicates that it maybe involved in heat stress reception and response. Over-expressionof OsHSF7 in transgenic Arabidopsis could not inducedover the expression of most target heat stress-inducible genes ofHSFs; however, the transcription of some HSF target genes wasmore abundant in transgenic plants following two hours of heatstress treatment. In addition, those transgenic plants also had ahigher basal thermotolerance, but not acquired thermotolerance.Collectively, the results of this study indicate that OsHSF7 mightplay an important role in the response to high temperature.Specifically, these findings indicate that OsHSF7 may be usefulin the production of transgenic monocots that can over-expressprotective genes such as HSPs in response to heat stress, whichwill enable such plants to tolerate high temperatures.

【题目】OsNAC52, a rice NAC transcription factor, potentially responds to ABA and
【中文关键词】无
【英文关键词】Abiotic stress ; OsNAC52 ;Transcription factor ; ABA ; Drought toleranc
【中文摘要】无
【英文摘要】Abstract A novel NAC (NAM, ATAF1/2, CUC2)homologous gene, OsNAC52, was isolated from Oryzasativa L using RACE (rapid amplification of cDNA ends).Analysis of the amino acid sequence of OsNAC52 revealeda highly conserved NAC domain and a potential nuclearlocalization sequence in its N-terminus, and the transcriptionalactivation motif in the C-terminal region. Transgenicplants over-expressing OsNAC52 were highly sensitive toABA (Abscisic acid), and the growth of the 35S-OsNAC52transgenic seedlings was significantly more restrained byABA treatment than those of the wild-type seedlings.Furthermore, over-expression of OsNAC52 activated theexpression of downstream genes in transgenic Arabidopsis,resulting in enhanced tolerance to drought stresses but notgrowth retardation. The results from this study indicate thatthis novel rice OsNAC52 gene functions as an importanttranscriptional activator in ABA-inducible gene expressionand may be useful in improving plant tolerance to abioticstress.

Yeast one-hybrid system
【中文摘要】无
【英文摘要】In this study, we cloned the ERF-B3 subfamily transcriptionfactor gene BnaERF-B3-hy15 from Brassica napus L. Huyou15.This 600 bp gene encodes a 199 amino acid classic ethyleneresponsive factor (ERF), which shown no binding or very weakbinding GCC box-binding activity by the yeast one-hybridassay. We used gene shuffling and the yeast one-hybrid systemto obtain three mutated sequences that can bind to the GCCbox. Sequence analysis indicated that two residues, Gly156 inthe AP2 domain and Phe62 at the N-terminal domain weremutated to arginine and serine, respectively. Changes ofGly156 to arginine and Phe62 to serine increased the GCCbindingactivity of BnaERF-B3-hy15 and the alter of Gly156 toarginine changed the AP2-domain structure of BnaERF-B3-hy15.

【题目】Expression of a rice DREB1 gene, OsDREB1D, enhances cold
【中文关键词】无
【英文关键词】Abiotic stress, Arabidopsis, DREB-type transcription
factors, Rice, Transgenic plants
【中文摘要】无
【英文摘要】OsDREB1D, a special DREB (dehydration responsive elementbinding protein) homologous gene, whose transcripts cannotbe detected in rice (Oryza sativa L), either with or withoutstress treatments, was amplified from the rice genome DNA.The yeast one-hybrid assay revealed that OsDREB1D was ableto form a complex with the dehydration responsive element/C-repeat motif. It can also bind with a sequence of LTRE (lowtemperature responsive element). To analyze the function ofOsDREB1D, the gene was transformed and over-expressed inArabidopsis thaliana cv. Columbia. Results indicated that theover-expression of OsDREB1D conferred cold and high-salttolerance in transgenic plants, and that transgenic plants werealso insensitive to ABA (abscisic acid). From these data, we deducedthat this OsDREB1D gene functions similarly as otherDREB transcription factors. The expression of OsDREB1D inrice may be controlled by a special mechanism for the redundancyof function

【题目】Isolation and characterization of a novel AP2/EREBP-type transcription factor OsAP211 in Oryza sativa
【中文关键词】无
【英文关键词】low temperature, rice, yeast one-hybrid system
【中文摘要】无
【英文摘要】AP2 (APETALA2)/EREBPs (ethylene responsive element binding proteins) are the primary members of a family oftranscription factors and OsAP211 was isolated from Oryza sativa L using the yeast one-hybrid system. It can specificallybind to the promoter containing three tandem repeats of DRE core sequence: TACCGACAT and activate the transcriptionof the downstream lacZ gene in the yeast one-hybrid system. OsAP211 contained a single open reading frame of225 amino acids and encoded a protein containing a conserved AP2/EREBP domain featuring the DREB family. Thesemi-quantitative RT-PCR (s-Q RT-PCR) analysis indicated OsAP211 was strongly induced by low temperatures but notby NaCl and drought. It accumulates primarily in shoot tips during the tillering stage and young spikes during the bootingstage. OsAP211 might function as a DRE-binding transcription factor in stress signal transduction pathways in rice.

【题目】Genome-wide analysis of the AP2/ERF gene family in Populus trichocarpa
【中文关键词】无
【英文关键词】Populus;Arabidopsis thaliana;AP2/ERF;Transcriptional factor;In silico cloning;Bioinformatics

【中文摘要】无
【英文摘要】Populus is a model system for investigating the wood development, crown formation, and disease resistancein perennial plants. AR2/ERF is a large family of transcription factors in plant, encoding transcriptionalregulators with a variety of functions involved in the developmental and physiological processes.Here, starting from database of Populus genome, we identified 200 AP2/ERF genes by in silico cloningmethod using the AP2/ERF conserved domain amino acid sequence of Arabidopsis thaliana as probe. Basedon the number of AP2/ERF domains and the function of the genes, those AP2/ERF genes from Populus wereclassified into four subfamilies named the AP2, DREB, ERF, RAV, and a soloist. Among these genes, thenumber genes of total AP2/ERF family genes, DREB subfamily, and ERF subfamily from Populus trichocarpawere about 1.4 – 1.6-fold than those from A. thaliana. The rates were very similar for the putative homologsbetween Populus and Arabidopsis.

【题目】卡介菌多糖核酸(BCG-PSN)对感染IBDV鸡的免疫活性研究
【中文关键词】卡介菌多糖核酸; 细胞免疫; 体液免疫; 传染性法氏囊病; 鸡
【英文关键词】polysaccharide nucleic acid fraction of Bacillus Calmette Guerin (BCG-PSN) ; cellular immunity; humoral immunity; infections bursal disease (IBD) ; chicken
【中文摘要】为了评价卡介菌多糖核酸(BCG-PSN) 在畜禽病毒性疾病中的作用及其诱导机体免疫的能力,建立了人工感染传染性法氏囊病(IBD) 动物模型,通过检测免疫器官指数、IBDV 抗体、外周淋巴细胞亚群、诱导干扰素和白介素水平等特异性和非特异性免疫指标,评估不同剂量BCG-PSN 对IBDV 感染鸡免疫功能的影响。结果显示: 免疫器官脾脏指数和胸腺指数在注射BCG-PSN 的初期出现上升趋势,而在注射BCG-PSN 后期(15 d) 受试鸡外周血液CD4+/CD8+ 值显著提升; 各BCG-PSN 注射组的IBDV 抗体滴度在试验初期明显提高; 从注射开始,BCG-PSN 就显示出其对IFN- γ、IFN- α 和IL-2 的显著提升效果。上述结果说明: BCG-PSN 既能调节IBDV 感染鸡的细胞免疫功能,又能调节机体的体液免疫功能,激活组织细胞释放包括IFN- γ、IFN- α 和IL-2 等多种细胞因子,以0. 3 mg · kg - 1的注射剂量可获得良好的免疫效果。
【英文摘要】To evaluate the protective effects and immune activities induced by polysaccharide nucleic acid fraction of Bacillus Calmette Guerin (BCG-PSN) in the livestock,the animal model of IBD (infectious bursal disease) on chicken was established.The specific and nonspecific immune response parameters such as the titer of IBDV antibody,the periphery lymphocyte subsets, the levels of IFN- α ,IFN- β ,and IL-2 were used to evaluate the effects of clinicaltherapy and its immune activities in IBDV vaccinated chickens which were injected with different doses of BCG-PSN. The results showed that immune organ index such as spleenindex and thymus index had the induction tendency at the beginning of BCG-PSN injection. During later period (15 d) ,the ratio of CD4+/CD8+ T lymphocytes in peripheral blood of chickens increased significantly. The titers of IBDV antibody from the beginning stage after BCG-PSN injection increased obviously in IBDV vaccinated chickens. The levels of serum IFN- γ ,IFN- α and IL-2 increased significantly from the beginning of BCG-PSN injection. The results suggested that BCG-PSN could not only increase and regulate cellular immunity including IFN- γ ,IFN- α and IL-2 but also humoral immunity. The middle dosage of BCG-PSN(0. 3 mg · kg - 1) used in chickens could produce upstanding immune and protective effects

【题目】Heat stress protection in Aspen sp1 transgenic Arabidopsis
【中文关键词】无
【英文关键词】ChlorophyII, ChlorophyII fluorescence, High temperature stress, Malondialdehyde, Proline, Stable protein 1, Water content
【中文摘要】无
【英文摘要】It is known that the stable protein 1 (SP1) detected in aspenplants remains soluble upon boiling and that sp1 expression intransgenic aspen is resistant to salt stress. Presently, we analyzedthe effect of expression of SP1 in Arabidopsis thalianaplants and their response to high temperature stress. After 45oCfor 16 h, relative to wild type plants, sp1 transgenic plants exhibitedstronger growth and were better in several physiologicalproperties including chlorophyII, chlorophyII fluorescence, watercontent, , proline content, and malondialdehyde content.These preliminarily results suggest that the over-expression ofSP1 may notably enhance heat-tolerant level of transgenic A.thaliana plants

【题目】Over-expression of ThpI from Choristoneura fumiferana enhances tolerance to cold
【中文关键词】无
【英文关键词】Thermal hysteresis protein I ;Low temperature stress; Electrolyte leakage ;Malondialdehyde ; Proline

【中文摘要】无
【英文摘要】Abstract Thermal hysteresis proteins (Thps) known asantifreeze proteins for their antifreeze activity, depress thefreezing point of water below the melting point in manypolar marine fishes, terrestrial arthropods and plants. Forthe purpose of breeding cold-resistant plants, we designedto introduce the Thp gene into the plants. The physiologicaland biochemical effect of high-lever expression of themodified Choristoneura fumiferana Thp (ThpI) in Arabidopsisthaliana plants was analyzed. Under low temperaturestress, the ThpI transgenic plants exhibited stronger growththan wild-type plants. The elevated cold tolerance of theThpI over-expressing plants was confirmed by the changesof electrolyte leakage activity, malonyldialdehyde andproline contents. These results preliminarily showed thatthe Thp possibly be used to enhance the low temperaturetolerantability of plants.

【题目】Forced expression of Mdmyb10, a myb transcription factor gene from apple,enhances tolerance to osmotic stress in transgenic plants
【中文关键词】无
【英文关键词】Mdmyb10 ; Transgenic Arabidopsis ;
Osmotic stress
【中文摘要】无
【英文摘要】Abstract In plants, anthocyanins often appear at specificdevelopmental stages, but are also induced by a number ofenvironmental factors. The coordinated expression ofgenes encoding the anthocyanin biosynthetic pathwayenzymes is controlled at the transcriptional level usually byan R2R3Myb transcription factor. However, little is knownabout the effects of R2R3-Myb on plant resistance toenvironmental stresses. In this study, we introduced anR2R3Myb transcription factor gene Mdmyb10, a regulatorygene of anthocyanin biosynthesis in apple fruit, into Arabidopsisand analyzed its function to osmotic stress intransgenic plants. Under high osmotic stress, the Mdmyb10over-expressing plants exhibited growth better than wildtypeplants. The elevated tolerance of the transgenic plantsto osmotic stress was confirmed by the changes of flavonoids,chlorophyll, malondialdehyde and proline contents.These results preliminarily showed that the Mdmyb10 canpossibly be used to enhance the high osmotic-tolerantability of plants.

【题目】Discovery and expression profile analysis of AP2/ERF family genes from Triticum aestivum

【中文关键词】无

【英文关键词】Transcription factor ; AP2/ERF ;Expression profile ; Arabidopsis thaliana ; Triticum aestivum

【中文摘要】无

【英文摘要】Abstract Throughout its development, common wheat,Triticum aestivum responds to different kinds of adverseabiotic and biotic stress by expressing specific genes thatallow it to adapt to these stresses. In this process, genes inthe AP2/ERF family encode transcriptional regulatorsinvolved in diverse developmental and physiological processesplay critical roles. Here, we established an extensivepicture of the AP2/ERF family genes in wheat. From 960,174 ESTs of T. aestivum, 117 putative AP2/ERF familygenes were identified by in silico analysis based on thepresence of the conserved AP2/ERF domain amino acidsequence of Arabidopsis thaliana. Based on the modelspecies A. thaliana, the AP2/ERF TFs from T. aestivumwere classified into five subfamilies with the followingnumber of members: DREB (57), ERF (47), AP2 (9), RAV(3) and Soloist (1). Using the available EST information asa source of expression data, the putative AP2/ERF familygenes from T. aestivum were detected in nine kinds oftissues. Transcripts of the genes were shown to be mostabundant in leaves, followed by roots and seeds, and theleast abundant in stem. Most of the T. aestivum AP2/ERFfamily genes showed some tissue specificity

【题目】Genome-wide analysis of the putative AP2/ERF family genes in Vitis vinifera
【中文关键词】无
【英文关键词】Vitis vinifera;AP2/ERF;Transcription factor;In silico Mapping;Gene duplication
【中文摘要】无
【英文摘要】The nucleotide sequence of the entire grapevine genome has been obtained and its draft sequence hasserved as the model for fruit crops. Many transcription factors involved in stress-resistance pathwayshave been identified, among which the AP2/ERF is a large, and one of the most important families oftranscription factors in plants. In this study, 132 putative transcription factor genes in the AP2/ERFfamily were identified from the database of the Vitis vinifera (grapevine) genome, and were comparedwith those from three other completely sequenced genomes, Arabidopsis thaliana, Populus trichocarpa(poplar), and Oryza sativa (rice). The grapevine AP2/ERF genes were classified into four subfamilies, AP2,DREB, ERF, RAV, and a soloist, and there were considerable variations among the subfamily memberscomparing with those in other species. The amino acid sequence, composition, physical and chemicalcharacterization, phylogenetic tree, conserved domain sequences, function domain, and locations onchromosomes were predicted and analyzed. In silico mapping of the gene loci showed that AP2/ERFfamily genes of grapevine were localized on 19 linkage groups. The extant AP2/ERF gene family ingrapevine apparently resulted from whole genome, segmental and tandem duplications. Severalgrapevine AP2/ERF genes have been identified which are orthologous to those characterized inArabidopsis with known functions.

【题目】Analysis of Brassica rapa ESTs: gene discovery and expression patterns of AP2/ERF family genes
【中文关键词】无

【英文关键词】AP2/ERF　Transcription factor
Expression pattern　Brassica rapa　Arabidopsis thaliana
【中文摘要】无
【英文摘要】Abstract Chinese cabbage (Brassica rapa subsp. pekinensis)is among the most important vegetables and iswidely cultivated in world. Genes in the AP2/ERF familyencode transcriptional regulators that serve a variety offunctions in the plants. Expressed sequence tags (ESTs) arecreated by partially sequencing randomly isolated genetranscripts and have proved valuable in molecular biology.Starting from the database with 142 947 ESTs of B. rapa,62 putative AP2/ERF family genes were identified by insilico cloning using the conserved AP2/ERF domain aminoacid sequence of Arabidopsis thaliana as a probe. Based onthe number of AP2/ERF domains and functions of thegenes, the AP2/ERF transcription factors from B. rapawere classified into four subfamilies (DREB, ERF, AP2and RAV). Using large-scale available EST information asa source of expression data for digital expression profiling,differentially detected genes were identified among diverseplant tissues. Roots contained the largest number of transcriptsof the AP2/ERF family genes, followed by leavesand seeds. Only a few of the 62 AP2/ERF family geneswere detected in all tissues: most were detected only insome tissues but not in others. The maximum detected wasthat of BraERF-B2-5, and it was recorded from seed tissue.

【英文关键词】polyinosinic:polycytidylic acid copolymer, Newcastle disease virus,
anti-virus activity, IFN, toxicity
【中文摘要】研究PolyLc的杭病毒效果及其机理,选择鸡新城疫病毒(Lasota株)和水疤口炎病毒(VSv)对离体培养的鸡胚成纤维(cEF)细胞进行病毒感染,分别研究 PolyI:C对离体培养鸡胚CEF细胞的病习印制和干扰素测定试验。试验结果表明, PolyLc能显著抑制NDv在cEF细胞上生长,但 PolyLC对NDv的抑制作用并非随着其剂量的增加和作用时间的延长而增强,60林留mL的 PolyLc在cEF细胞上作用12h后,产生的杭病毒活性最强;PolyI:c抑制水疤口炎病毒在CEF细胞上生长的结果表明, PolyI:C具有免疫刺激活性,PolyLc能诱导吓争吞am刃则和万W节舰刃则转录水平升高,说明 PolyLc的杭病毒作用和其诱导产生的干扰素有关;而且井W渭脚刃叼转录水平是刀刁瞬a阴R入只表达量的数倍,说明正N一p在抗病毒活性中起主要作用;然而, PolyLC也同时能抑制CEF细胞的生长,且与 PolyI:c剂量和作用时间成正比,说明 PolyLc具有一定的毒副作用,在临床使用时,应注意使用剂量和使用频度。
【英文摘要】The effect of a polyinosinic:polycytidylic acid copolymer (Poly I:C) on chickembryo fibroblast (CEF) cell viability, anti-Newcastle disease virus (NDV) activityand on IFN-α and IFN-β levels were determined in vitro. Poly I:C inhibited NDVgrowth in CEF cells in the range of 30 – 500 μg/mL and over 0.75 – 12 h of treat-ment. The anti-NDV activity was maximal for 60 μg/mL of Poly I:C treatment at12 h, after which it declined. The result of VSV protection assay which was usedto determine IFN-activity showed that Poly I:C inhibited VSV growing on CEF cells,indicating that Poly I:C had immune-stimulating activities. The amount of IFN-β in cell supernatant and the transcription levels of IFN-α mRNA and IFN-β mRNAincreased after Poly I:C treatment, indicating that the anti-viral activity related tothe production of type I IFN. However Poly I:C also showed a toxic effect by inhib-iting CEF cell proliferation in a dose-dependent and time-dependent manner. Theresults of this study indicate that the dosage level of Poly I:C must be carefullyconsidered when used in a clinical setting.

【题目】氮肥不同比例分期施用对超高产玉米叶片
【中文关键词】超高产玉米; 氮肥; 保护酶活性; 丙二醛(MDA) 含量; 叶绿素含量
【英文关键词】super hig h yield maize; nit rog en fert ilizer; protect ive enzymes act ivity; MDA content ; Chl content
【中文摘要】目的:研究不同氮肥施用方式对超高产玉米叶片保护酶活性变化规律的影响, 为玉米超高产模式研究提供理论依据。方法:以超高产玉米品种先玉335 为试验材料, 在氮肥总量一定的条件下, 按分配比例不同设6个处理: N1. 底肥100%; N2. 底肥80%, 拔节期追施20%; N3. 底肥80%, 拔节期追施10%, 吐丝期追施10%; N4. 底肥60%, 拔节期追施40%; N5. 底肥60%, 拔节期追施30%, 吐丝期追施10%; N6. 底肥60%, 拔节期和吐丝期均追施20%, 研究氮肥不同比例分期施用对玉米产量、叶片保护酶(超氧化物歧化酶(SOD) 、过氧化物酶(POD) 、过氧化氢酶(CAT)) 活性及丙二醛(MDA) 、叶绿素(Chl) 和可溶性蛋白含量的影响。 结果 N6 处理玉米产量最高, N2 处理玉米产量最低, N6 处理比N4、N1、N2 处理分别增产7. 3%, 10. 2%, 11. 1%。在灌浆期以前, 各处理叶片叶绿素及可溶性蛋白含量差异不显著; 灌浆期以后, N6、N5 处理叶片叶绿素及可溶性蛋白含量显著高于N4、N1、N2 处理。在吐丝期以前, 各处理叶片保护酶SOD、POD、CAT 活性及MDA 含量差异不显著, 吐丝期以后N6、N5 处理的叶片保护酶SOD、POD、CAT 活性显著高于N4、N1、N2 处理, 而MDA 含量则显著低于N4、N1、N2 处理。 结论 氮肥不同比例分期追施使玉米叶片生育后期保护酶活性增强, 延

缓了玉米叶片的衰老速度,提高了产量。氮肥最佳施用模式为60%作底肥,拔节期和吐丝期均追施20%,玉米产量最高可达14 852. 2 kg / hm2 。

【英文摘要】Objective:The effect of nit ro gen fert ilizer applied in dif ferent w ays on the change regularity of pro tective enzymes act iv ity in leaves o f super hig h yield maize was studied to pro vide a scientif ic theor y for the super hig h yield pro duct ion mo del. Method Six t reatments w ere desig ned in differ ent distr ibution proport ions under the condit io n o f a certain total nitr ogen fert ilizer using the super hig h y ield maizehy br id Xianyu 335 as the exper imental material: N 1. Base fert ilizer 100% ; N2. Base fert ilizer 80%, top dressed in jointing stage 20%; N 3. Base fert ilizer 80%, topdressed in jo int ing stag e 10%, to pdressed in an thesis stage 10%; N4. Base fert ilizer 60% , topdressed in joint ing stage 40% ; N 5. Base fer tilizer 60%, top dressed in jo int ing stage 30%, topdressed in anthesis stag e 10% ; N6. Base fer tilizer 60% , topdressed in bothjoint ing stage and anthesis stag e with 20% . T he ef fects of nitr ogen fert ilizer applicat ion at stages in differ ent pr opo rt io ns o n the o utcome of maize, the protect iv e enzyme act ivity(sperox ide dismutase(SOD) , prox i dase(POD) , ctalase(CAT)) , the content o f malo ndialdehy de(MDA) , the content of chloro phyll (Chl) andsoluble protein in leaves were studied. Result The result s show ed that the y ield of N6 treatment w as thehig hest, the y ield of N2 t reatment w as the low est , and N6 tr eatment increased pro duct ion by 7. 3%, 10. 2%and 11. 1% than N4, N1 and N2 t reatmemt respectively. The difference of Chl content and soluble pr oteinin leaves of all dif ferent tr eatment s w ere not sig nif icant before f illing stage. A fter that , the content o f Chland so luble protein of N6 and N5 in leaves w ere significant ly hig her than that of N4, N1 and N2. T he pro tect ive enzyme act ivity and MDA co ntent of each t reatment w ere not signif icant befor e anthesis stag e, butpro tective enzyme act ivit ies of N6 and N5 w ere significant ly higher than that of N4, N1 and N2 af ter f illingstage, and the MDA co ntent w as signif icant ly low er than that of N 4, N 1 and N2 t reatment . Conclusio n The study show ed that nit ro gen fert il izer applicat ion at stag es in different pro por tions can r einfo rce pr otec t ive enzyme act ivity and slow dow n the aging of leaves in late grow th stage, thereby enhancing the y ield.The best nit rog en applicat ion model is the base fer tilizer applied by 60% , both the joint ing stag e and anthesis stage sho uld be topdressed by 20% . The highest yield o f maize can be up to 14 852. 2 kg/ hm2 .

【题目】Preparation and evaluation of polyinosinic:polycytidylic acid copolymer microcapsules

【中文关键词】聚肌胞;乙基纤维;微囊;缓释;液中干燥法

【英文关键词】Polyinosinic:polycytidylic acid copolymer; ethylcellulose; microencapsulation; sustained release; intra-liquid desiccation method

【中文摘要】PolyLC微囊的制备与体外评价,以乙基纤维(EC)为囊材,采用液中干燥法制备 PolyLc缓释微囊。通过正交实验对成囊试验条件进行优化,试验结果表明,700rpm转速、0.49硬脂酸镁、2%司盘一80、囊材占丙酮质量2.5%、丙酮和石蜡体积比30:30为最佳制备条件。对最佳条件制备的微囊进行体外试验评价,微囊大小均一,平均粒径93.56卜m,载药率为0.64%,包封率为74%,体外释放度随着聚乙二醇一2000(pEG一2000)的含量增加而增大

【英文摘要】The purpose of this research is to prepare polyinosinic : polycytidylic acid (poly I : C) microcapsules by intra-liquid desiccation with ethylcellulose (EC) as the polymer coating material. An orthogonal test was used to develop an optimal combination. The optimal combination of encapsulating factors for poly I : C microcapsules was found to be as follows: a rotation speed of 700 rpm, 0.4 g magnesium stearate, 2 % Span-80 in acetone, 2.5 % EC in acetone, and an acetone/paraffin ratio of 30:30 (v/v). The pharmaceutical characteristics of size, morphological characterization, drug loading efficiency, encapsulation yield, and in vitro release rate were evaluated. The in vitro release rate was directly proportional to the amount of PEG-2000, i.e., with an increase in the amount of PEG-2000, poly I : C release from the microcapsules was more rapid

【题目】Apoptosis induced by Polyinosinic : polycytidylic acid copolymer on chicken embryo fibroblast cells in vitro
【中文关键词】聚肌胞,鸡胚成纤维细胞,毒性,凋亡,caspase活性,死亡受体途径
【英文关键词】Polyinosinic:polycytidylic acid copolymer; Chicken embryo fibroblast cell; Cytotoxicity; Apoptosis; Caspase activation; Death receptor-mediated pathway
【中文摘要】为研究Poly I:C对CEF细胞的毒性及其机理,将Poly I:C与CEF细胞共孵育后,对CEF细胞活性、形态变化、磷脂酰丝氨酸外翻、DNA片段形成、caspase-3, caspase-8, caspase-9活性变化及RIPK1 mRNA和TNFRSF8 mRNA转录水平等进行检测。试验结果显示,随着Poly I:C药物浓度和作用时间的延长,CEF细胞活性降低,成剂量和时间正相关,表明Poly I:C对CEF细胞具有一定的毒性作用;磷脂酰丝氨酸外翻和DNA片段形成显示,Poly I:C可诱导CEF细胞的凋亡;随着作用时间的延长,caspase-3活性升高,说明Poly I:C引起的凋亡和caspapse激活途径相关;caspase-8活性升高,而caspase-9活性没有显著变化的结果说明Poly I:C诱导凋亡和死亡受体途径相关;TNFRSF8 mRNA转录水平增加说明凋亡和TNFRSF8上调有关。
【英文摘要】In this study apoptosis induced by the toxic effects of the Polyinosinic:polycytidylic acid copolymer (Poly I:C) was investigated on CEF cells. Along with cell viability and morphological changes, other indicators including phosphatidylserine translocation, the formation of DNA fragments, activity of caspase-3, caspase-8 and caspase-9, and the expression levels of RIPK1 mRNA and TNRSF8 mRNA, were measured in vitro, after incubation of the cells with Poly I:C. An inhibition of proliferation was found with increased levels of Poly I:C, showing that the Poly I:C was toxic to the cells. The finding of phosphatidylserine translocation and formation of DNA fragmentation suggested that Poly I:C induced apoptosis. With increased incubation time, the activities of caspase-3 and caspase-8 increased, while there was no significant change in caspase-9 activity. Accordingly it is concluded that the apoptosis induced by Poly I:C involves a cell death receptor-mediated pathway. The transcription level of RIPK1 mRNA decreased, while that of TNFRSF8 mRNA increased, indicating that Poly I:C-induced apoptosis was related to an upregulation of TNFRSF8. These observations provide insight into the potential mechanism of Poly I:C-induced toxicity.

【题目】盐渍化水田秸秆还田对水稻生长及产量的影响
【中文关键词】水稻; 秸秆还田; 产量; 盐渍化水田
【英文关键词】Rice; Straw application; Grain yield; Soda-salinization paddy
【中文摘要】选择盐渍化水田进行水稻秸秆30%、50% 和70% 还田处理,研究水稻秸秆还田对水稻生长及产量的影响。结果表明,与CK 相比,30%、50% 和70% 秸秆还田对拔节期水稻生长及地上部干物质积累没有显著影响,对灌浆成熟期影响显著。50% 秸秆还田可提高灌浆期水稻有效叶片数和有效叶片面积,增加地上部干物重; 30%秸秆还田的水稻产量比对照提高4. 0% ,差异不显著(P > 0. 05) ; 50% 秸秆还田的水稻产量比对照提高9. 4% ,差异显著(P < 0. 05) ; 70% 秸秆还田水稻产量比对照降低1. 2% ,差异不显著(P >0.05) 。说明在盐渍化水田秸秆还田时,秸秆还田量不能过多,控制在50% 左右最佳,还田量过高不利于水稻生长发育,产量降低。
【英文摘要】The soda-salinization paddy soil was treated with 30%, 50% and 70% of rice straw, the effects of rice straw application to soda-salinization paddy soil on rice growth and grain yield were studied. The results showed that, in the soda-salinization paddy soil with 30%, 50% and 70% of rice straw application, the rice growth and the aerial part dry matter had no significant differences with the control at jointing stage; but there were significantdifferences with the control at grain filling stage. In the soda-salinization paddy soil with 50% rice straw application,efficient leaf numbers,efficient leaf area and aerial part dry matter of rice were significantly higher than those in the control at grain filling stage. In the soda-salinization paddy soil with 30% rice straw application, the grainyield was increased by 4. 0% compared with the control(P > 0. 05) . In the soda-salinization paddy soil with 50% straw application, the grain yield was increased by 9. 4% compared with the control(P < 0. 05) . In the soda-salinization paddy soil with 70% straw application, the grain yield was reduced by 1. 2% compared with the control(P >0. 05) . These results showed that 50% rice straw application was optimum for grain yield; it was not beneficial to rice growth and grain yield when rice straw application was higher than 50%.

【题目】杀菌剂对苏打盐碱地水稻秆腐菌核病防治
【中文关键词】杀菌剂;水稻秆腐菌核病;毒力作用;防治
【英文关键词】fungicide; sclerotiniose blight of rice stem rot; virulent effect; control
【中文摘要】[目的]水稻秆腐菌核病是苏打盐碱地水稻重要病害,为了筛选防治水稻秆腐菌核病有效杀菌剂对17种杀菌剂进行试验。 [方法]利用生长速率法,对供试药剂建立毒力回归线,进行EC值分析。 计算病情指数和防效并进行差异显著性分析。 [结果]50%异菌脲WP、25%咪鲜胺(德国)EC和25%咪鲜胺EW防治效果明显,达到了80%以上;25%丙环唑EC达到70%。 [结论]防治苏打盐碱地水稻秆腐菌核病首选50%异菌脲WP、25%咪鲜胺(德国)EC和25%咪鲜胺EW,25%丙环唑EC可以作为备选药剂。
【英文摘要】[Aims] Sclerotiniose blight of rice stem rot is an important plant disease in the sodium bicarbonate soil of the Songnen plain. Effective fungicides to the disease were screened in this study. [Methods] Probit regression lines were established by using plate mycelium growth rate method, and EC values were analyzed. Then, disease indexes and control effects were calculated, and difference signifi cances were analyzed by DPS software. [Results] Control effects of iprodione, prochloraz (made in Germany) and prochloraz (made in China) exceeded 80%, and that of propiconazole was 70%. [Conclusions] First, fungicide iprodione, prochloraz (made in Germany) and prochloraz (made in China) were used to control sclerotiniose blight of rice stem rot in the sodium bicarbonate soil. Then, fungicide propiconazole could be a candidate.

【题目】等距开槽结合施用石膏改良苏打盐碱土
【中文关键词】等距开槽; 石膏; 苏打盐碱土; 理化性质
【英文关键词】equidistance slotting; gypsum; soda saline-alkali soil; physical and chemical properties
【中文摘要】采用田间小区试验,研究了等距开槽结合施用石膏对东北松嫩平原西部苏打盐碱土的改良效果。结果表明:等距开槽(20 ~ 40 cm 心土层开槽,槽间距1 m) 能有效降低开槽点的土壤紧实度,对槽间土壤紧实度也有一定的降低作用,且与对照(不开槽) 紧实度的差异达到极显著水平; 等距开槽必须结合石膏才能改善土壤的化学性质,加石膏与未加石膏处理的pH 和碱化度达到差异显著水平,而电导率值在处理前后差异不显著,开槽松土处理对槽内土壤化学性质改善效果不明显; 磷石膏与脱硫石膏在改土效果上差异不显著,石膏配合开槽能有效改善土壤理化性质和植物生长状况,且对槽间土壤改良和植物生长均有一定的促进作用。
【英文摘要】A field plot experiment was conducted to examine the effectiveness of equidistant slottingin combining with gypsum application on the amelioration of soda saline-alkali soil in thewest Songnen Plain of Northeast China. Equidistant slotting at the soil depth 20 - 40 cm and 1 mapart could significantly decrease the degree of soil compaction within the slotted area,as comparedwith the control (un-slotting) ,and also,had definite effect in decreasing the soil compactnessbetween the slotted areas. Slotting combined with gypsum application improved the soilchemical properties,with significant difference in soil pH and exchangeable sodium percentagebut little difference in soil electrical conductivity between gypsum and no-gypsum treatments.Slotting and subsoiling had little effects on soil chemical properties within the slotted areas. Phosphogypsumand desulfurized gypsum had little difference in ameliorating the soda saline-alkalisoil. This study showed that slotting in combining with gypsum application could effectively improvethe physical and chemical properties of soda saline-alkali soil and the plant growth withinthe slotted area,and had definite effect in ameliorating soil properties and in promoting plantgrowth between the slotted areas.

【题目】水稻耐盐碱鉴定标准评价及建议与展望
【中文关键词】水稻; 盐碱; 评价标准; 改进
【英文关键词】Rice; Saline-alkalinity; Evaluation standard; Improvement
【中文摘要】对国内外水稻耐盐碱鉴定评价标准进行了评述,指出目前采用的评价标准存在着对盐碱害判断不够全面、准确的问题,只适用对水稻进行生物耐盐力的鉴定,而不适合对水稻的农业耐盐力进行鉴定; 提出了对水稻耐盐碱鉴定的标准品种、方法、鉴定胁迫浓度等进行改进的建议,强调对水稻进行全生育期的耐盐碱性鉴定。
【英文摘要】The identification standards of saline-alkali tolerance in rice were evaluated according to the researches in both China and abroad. This study pointed out that the present adopted evaluation standards was inaccurate in distinguishing harms of salinity and alkalinity and they could only be used for the biological salt tolerance and could not be used for agricultural salt tolerance. Some suggestions on identification standards of rice saline-alkali tolerance in varieties,methods and stress concentrations were also provided in this paper. The saline-alkali tolerance abilities in the whole life cycle of rice should be emphasized in the future.

【题目】苏打盐碱胁迫下粳稻子粒灌浆动态研究*
【中文关键词】北方粳稻; 苏打盐碱胁迫; 干物质积累; 灌浆速率; 子粒含水量
【英文关键词】Northern Japonica rice; saline-sodic stress; dry matter accumulation; milking rate; water content of grain
【中文摘要】选用粳稻品种/ 东稻4 号0 (DD4) 、粳稻品系/ G190 作为试验材料, 分别种植在pH 值为81 01 和9103 的苏打盐碱地中。在栽培条件相同的情况下, 分析2 个供试材料在不同苏打盐碱胁迫下水稻灌浆期干物质积累、子粒灌浆速率和含水量的动态变化。结果表明: 重度苏打盐碱胁迫下水稻起始灌浆期都延迟5 d; 强势粒干物质积累都明显高于弱势粒, 强势粒前期的灌浆速率高于弱势粒, 后期呈明显的下降趋势; / DD40 先于/ G190 达到干物质积累的高峰, / G190 强势粒灌浆高峰次数多于/ DD40 ; 灌浆期/ DD40 无论强势粒还是弱势粒均失水较快, 而/ G190 强势粒失水快, 弱势粒相对平缓。
【英文摘要】The Japonica rice cultivar DD4 and strain G19 were grown under saline-sodic stress on ricepaddy with pH 8101 and 9103, respectively. The effects of saline-sodic stress on the dynamic changes of grain dry matter accumulation, milking rate and water content during rice milking stage were studied under the same conditions. The results showed that starting of the rice filling delays 5 days under severe saline-sodic stress; The superior grains are superior on dry matter accumulation to inferior grains, strong milking rate during former stage and downtrend later; The peak of dry matter accumulation DD4 is earlier than G19, and the times of milking peak of G19 superior grains are more than DD4. Water loss of DD4is faster to both superior and inferior grains, and in this respect, G19 superior grains are the same whereas inferior grains exhibit slower water loss comparat ively.

【题目】苏打盐碱胁迫对水稻品种长白9号穗部性状及产量构成的影响
【中文关键词】水稻; 盐碱; 穗部性状; 产量
【英文关键词】Rice; Salinity and sod ic ity; Panicle traits; Yield
【中文摘要】研究了盆栽条件下苏打盐碱胁迫对水稻品种长白9号穗部性状及产量构成的影响。结果表明: 盐碱胁迫对稻穗2次枝梗数、2次枝梗上的颖花数、2次枝梗上的实粒数的影响达显著水平(P < 0 05), 随盐碱胁迫程度的增加, 2次枝梗数、2次枝梗上的颖花数和2次枝梗上的实粒数呈明显降低趋势; 相关分析表明, 盐碱胁迫下穗上的2次枝梗数是对单穗产量贡献的最大因子; 方差分析结果表明, 盐碱胁迫使长白9 号产量显著降低, 其降低的主要原因是盐碱胁迫使穗的总颖花数、穗粒数减少。因此, 盐碱地种植长白9号在孕穗期要加强水肥调控, 尽量增加水稻的颖花数, 减少2次枝梗退化。
【英文摘要】Studied on panicle traits and y ield components o f rice variety Changba i9 in pot fo llow ing soda saline sodic stress. The resu lts show ed that w ith soda saline sodic stress increased amount o f secondary branches, grains of secondary branches, ripened g rains of secondary branches w ere significant ly decreased. Amount of secondary branches on panicle w as considered as themost important effecting factor for sing le panicle y ield. Y ield of Changba i9 w ere sign if icantly reduced due to tota l amount of spike decreased under saline sodic stress. Therefore, w ater and fertilizer regulation w asmore important to increase number of florets on pan icle and decrease degradation of secondary branches atChangba i9 boo ting stage under sa line sod ic env ironments.

【题目】收获时间对玉米单交种种子质量和萌发过程中贮藏物质运转的影响
【中文关键词】玉米单交种;收获时间;种子质量;物质运转
【英文关键词】maize single-cross hybrid; harvest time; seed quality; matter transportation
【中文摘要】以授粉后不同时间收获的玉米单交种郑单958为试验材料,研究了不同收获时间对种子发芽率、百粒重以及种子萌发过程中可溶性糖、淀粉含量和贮藏物质运转的影响。结果表明,授粉后40 d收获的玉米种子其发芽率最低,未达到国家玉米良种发芽率85%的标准,而授粉后55 d收获的玉米种子其发芽率最高,为97.3%。授粉后60 d收获的玉米种子其百粒重最高,为33.22 g。玉米种子在萌发过程中,淀粉含量表现为下降变化。授粉后55、60 d收获的单交种在其种子萌发过程中淀粉含量都显著地高于40、45、50 d收获的单交种。在萌发过程中,不同时间收获的玉米单交种贮藏物质的运转率和消耗率均随授粉天数的增加而呈上升趋势,且运转率和消耗率的比值在1.3~1.5之间,其中,授粉后55 d收获的玉米单交种萌发过程中运转率与消耗率的比值最大为1.43。
【英文摘要】Using single-cross Zhengdan958 hybrid maize harvested at different time after pollination asexperimental material, studied how different harvest time affected germination rate of maize seeds, 100-seed weight and soluble sugar content during seed germination, starch content and reserve transportation. The results showed that maize seeds harvested after 40 d of pollination, with had the lowest germination rate failed to meet the national standard rate, which was 85%; and seeds harvested after 55 d had the highest germination rate whichwas 97.3%. Seeds harvested after 60 d had the highest 100-seed weight, which was 33.22 g. During the process of germination, starch content had a trend of falling. During the process of germination, maize seeds harvested after 55, 60 d of pollination, its starch content was outstanding higher than maize seeds harvested after 40, 45, 50 d.During the process of germination, the reserve translocation rate and consumption rate had a trend of increasing with days after pollination, and ratio of the reserve translocation and consumption were from 1.3 to 1.5. Seeds harvested after 55 d pollination had the biggest ratio which was 1.43.

【题目】植物光合生物增效剂对玉米产量及干物质积累的影响
【中文关键词】玉米;光合生物增效剂;产量;干物质积累
【英文关键词】Maize; Photosynthesis biological synergist; Yield; Drymatter accumulation
【中文摘要】以玉米和植物光合生物增效剂为试验材料,研究叶面喷施植物光合生物增效剂对玉米产量及干物质积累的影响。结果表明,喷施150 g/hm2 和300 g/hm2 植物光合生物增效剂对玉米子粒产量增加不显著;喷施450~750 g/hm2 植物光合生物增效剂能够显著增加玉米子粒产量,比对照产量提高8.3%~12.0%,主要表现在穗粒数和百粒重显著增加;还能显著提高地上部干物质积累速度和叶片叶绿素含量。以喷施600 g/hm2 植物光合生物增效剂增产效果最佳。
【英文摘要】Maize and plant photosynthesis biological synergist were used as test materials, the effect of plant photosynthesis biological synergist on yield and dry matter accumulation of maize were studied. The results showed that the effect of spraying 150 and 300 g/ha of plant photosynthesis biological synergist on grain yield ofmaize was not significant. The maize yield with spraying 450, 600 and 750 g/ha of plant photosynthesis biological synergist were significantly increased. Compared with CK, spraying 450, 600 and 750 g/ha of plant photosynthesis biological synergist could significantly increase the kernel number per ear and 100- kernel weight and the chlorophyll content in leave of maize. Increase the grain maize effect was the best with spraying 600 g/ha plant photosynthesis biological synergist.

【题目】水分、pH 值、光照对蓝蓟生长性状及产量的影响研究
【中文关键词】蓝蓟; 环境因子; 性状; 品质; 产量
【英文关键词】Echium v ulgar e L. ; environmental factor s; characters; quality ; y ield
【中文摘要】在温室内进行土壤pH 值、水分、光照的梯度处理, 通过对性状指标及产量指标的测定与分析, 了解各项环境因子对蓝蓟生长及产量的影响。在pH 值6. 5、湿润条件下最先出苗, 其次为pH 值6~ 8, 再次是80%光照处理出苗, 最后为干旱和60%光照处理出苗。植株生长到第9 天开始测定植株苗期性状指标为: pH 值6. 0、湿润、光照正常情况, 叶长、叶宽和株高值最大。考种结果为: 在pH 值6. 5 千粒质量出现最大值4. 43(为CK 的115%) , 干旱条件出现最小值3. 34; 在pH 值6. 0 条件下单株粒数出现最大值1 635 粒, 在干旱条件下出现最小值913 粒; 粗脂肪含量在pH 值8. 0 最大值24. 60%, 在80%光照下出现在最小值18. 60%。充足的光照和湿润的土壤对蓝蓟性状生长起重要作用, 偏酸促进良好性状和产量, 但偏碱对蓝蓟的品质有利。
【英文摘要】It w as used the g radient t reatment o f soil pH value, moisture and illuminat ion inside the green house. It w as understoo d the ef fect of any env ir onmental factors o n gr ow th and y ield v ia determining and anly zing on the character and yield index s. T he results show ed that it w as first ly seeding emerg enc under the condit io n of pH v alue equaled to 6. 5 and moist . pH v alue betw een 6 to 8 w as follow ed, then w er e the 80% illumination t reatments, the last one was dry and 60% illumination t reatment s. When plants grew onthe ninth day, it w as began to measure the character index s of seeding. It show ed that leaf length, width and hight w ere max ium w hen pH value equaled to 6. 0, moist and no rmal illumination conditions. Testing seed results indicated that the max ium value of the thousand g rain w eig ht w as 4. 43 w hen the pH v alue was 6. 5 (115% of the contr ol) . , and the minium w as 3. 34 on dry co ndit ion. 【题目】Cyanobacteria MT gene SmtA enhance zinc tolerance
【中文关键词】无
【英文关键词】Metallothionein ; Zinc tolerance;Transgenic plants ; Arabidopsis ; Cyanobacteria
【中文摘要】无
【英文摘要】Abstract Zinc is essential but toxic in excess. A bacterialmetallothionein, SmtA from Synechococcus PCC 7942, hashigh affinity for Zn2? and the intracellular exclusivelyhandling of Zn2?. In this study, we report a functionalanalysis of SmtA in Arabidopsis thaliana and its responseto zinc stress. After high zinc stress, the transgenic plantsover-expressing SmtA showed higher survival rate than thewild type. We also found that over-expression of SmtA inArabidopsis increased the activities of SOD and POD, andenhanced the tolerance to zinc stress. Together, our resultsindicate that SmtA may play an important role in theresponse to zinc stress in Arabidopsis.

【题目】Expression and characterization of a cold-active and xylose-stimulated b-glucosidase from Marinomonas
【中文关键词】无
【英文关键词】b-Glucosidase; Glycoside hydrolase family 1 ;Marinomonas MWYL1 ; Cold-active ; Xylose-stimulated
【中文摘要】无
【英文摘要】Abstract The gene encoding a cold-active and xylosestimulatedb-glucosidase of Marinomonas MWYL1 wassynthesized and expressed in Escherichia coli. Therecombinant enzyme (reBglM1) was purified and characterized.The molecular mass of the

purified reBglM1determined by SDS-PAGE agree with the calculated values(50.6 Da). Optima of temperature and pH for enzymeactivity were 40 C and 7.0, respectively. The enzymeexhibited about 20% activity at 5 C and was stable over therange of pH 5.5 – 10.0. The presence of xylose significantlyenhanced enzyme activity even at higher concentrations upto 600 mM, with maximal stimulatory effect (about 1.45-fold) around 300 mM. The enzyme is active with bothglucosides and galactosides and showed high catalyticefficiency (kcat = 500.5 s-1) for oNPGlc. These characterizationsenable the enzyme to be a promising candidatefor industrial applications.

【题目】Gene duplication, transfer and evolution in the chloroplast genome
【中文关键词】无
【英文关键词】Gene duplication;Transfer;Evolution;Chloroplast
【中文摘要】无
【英文摘要】In addition to the nuclear genome, organisms have organelle genomes. Most of the DNA present in eukaryoticorganisms is located in the cell nucleus. Chloroplasts have independent genomes which are inherited fromthe mother. Duplicated genes are common in the genomes of all organisms. It is believed that geneduplication is the most important step for the origin of genetic variation, leading to the creation of new genesand new gene functions. Despite the fact that extensive gene duplications are rare among the chloroplastgenome, gene duplication in the chloroplast genome is an essential source of new genetic functions and amechanism of neo-evolution. The events of gene transfer between the chloroplast genome and nucleargenome via duplication and subsequent recombination are important processes in evolution. The duplicatedgene or genome in the nucleus has been the subject of several recent reviews. In this review, we will brieflysummarize gene duplication and evolution in the chloroplast genome. Also, we will provide an overview ofgene transfer events between chloroplast and nuclear genomes.

【题目】Genetic mapping of size-related quantitative trait loci (QTL) in the bay scallop (Argopecten irradians) using AFLP and microsatellite markers
【中文关键词】海湾扇贝;年龄大小;遗传连锁图;
【英文关键词】Argopecten irradians; Bay scallop; Linkage map; Size-at-age; QTL
【中文摘要】我们使用AFLP和微卫星标记技术构建了海湾扇贝遗传连锁图谱,进行了个体大小相关性状的复合区间作图(CIM)。317个AFLP和10微卫星标记被用于图谱构建。母本地图包含15个连锁群的120个标记,跨越479.6厘米,平均间隔7厘米。父本地图有17个连锁群的190个标记,覆盖883.8厘米,每个标记7.2厘米。观察母本地图覆盖率为70.4%,父本地图覆盖率为81.1%。偏向同一方向的标记在遗传图谱上是密切相联的,表明存在生存相关的重要基因。测量了壳长,壳高,壳宽,总重量,软组织重量,和壳重六个大小相关性状用于QTL作图。尺寸数据之间显著相关。我们对得到的数据log转化后进行了主要成分分析,利用第一主成分为进行QTL作图。用CIM分析在母本地图的连锁群3发现一个重要的数量性状位点(LOD=2.69,1000序列,Pb0.05)。在本研究中,测绘大小相关QTL提供了通过标记辅助选择促进海湾扇贝的生长的可能性。
【英文摘要】We constructed genetic linkage maps for the bay scallop Argopecten irradians using AFLP and microsatellite markers and conducted composite interval mapping (CIM) of body-size-related traits. Three hundred seventeen AFLP and 10 microsatellite markers were used for map construction. The female parent map contained 120 markers in 15 linkage groups, spanning 479.6 cM with an average interval of 7.0 cM. The male parent map had 190 markers in 17 linkage groups, covering 883.8 cM at 7.2 cM per marker. The observed coverage was 70.4% for the female and 81.1% for the male map. Markers that were distorted toward the same direction were closely linked to each other on the genetic maps, suggesting the presence of genes important for survival. Six size-related traits, shell length, shell height, shell width, total weight, soft tissue weight, and shell weight, were measured for QTL mapping. The size data were significantly correlated with each other. We subjected the data, log transformed firstly, to a principle component analysis and use the first principle component for QTL mapping. CIM analysis revealed one significant QTL (LOD=2.69, 1000 permutation, Pb0.05) in linkage group 3 on the female parent map. The mapping of size-related QTL in this study raises the possibility of improving the growth of bay scallops through marker-assisted selection.

【题目】A novel Heart Cell Line from Brown-marbled Grouper, Epinephelus fuscoguttatus (Forsskal), and Its Viral Susceptibility to Iridovirus

【中文关键词】对细胞的影响;褐点石斑鱼;heart-cell线;虹彩病毒的易感性。
【英文关键词】brown-marbled grouper; cytopathic effects; Epinephelus fuscoguttatus; heart-cell line; iridovirus; viral susceptibility.
【中文摘要】一种新的细胞系(bmgh)成立于心棕色大理石棕点石斑鱼和病毒的敏感性评价。bmgh已传代至65代,培养液使用DMEM/F12,是进一步补充胎牛血清,羧甲基壳聚糖,碱性成纤维细胞生长因子(生长因子)和胰岛素样生长因子(IGF - I)在24。角的心细胞具有成纤维细胞形态和增殖的汇合后14天。细胞生长在一个稳定的速度在随后的亚文化,群体倍增时间40.3小时。核型分析表明,这些细胞表现出染色体非整倍体与模式染色体数目48。结果病毒易感性表征表明,细胞病变效应(终端)的bmgh细胞出现感染后2虹彩病毒,大菱鲆红体病虹彩病毒(trbiv)和淋巴囊肿病毒(淋巴囊肿病毒)。大量trbiv和淋巴囊肿病毒颗粒也观察到感染的bmgh细胞的电子显微镜检查。所有这些事实表明,bmgh系建立在这里可以作为一个宝贵的工具,为研究细胞病毒相互作用,具有潜在的应用在鱼类病毒分离,繁殖和疫苗开发。
【英文摘要】A novel cell line (bmGH) was established from the heart of brown marbled grouper Epinephelus fuscoguttatus and its viral susceptibility was evaluated. The bmGH cells have been subcultured to passage 65 in Dulbecco ’s modified eagle medium:Ham ’s nutrient mixture F-12 (1:1) medium (DMEM/F12) which was further supplemented with foetal bovine serum (FBS), carboxymethylchitosan, basic fibroblast growth factor (bFGF) and insulin-like growth factor-I (IGF-I) at 24 。 C. The heart cells have a fibroblastic morphology and proliferated to confluence 14 days later. The cells grew at a steady rate during subsequent subculture and had a population doubling time of 40 · 3 h at passage 60. Karyotype analysis showed that these cells exhibited chromosomal aneuploidy with a modal chromosome number of 48. The results of viral susceptibility characterization revealed that cytopathic effects (CPE) of bmGH cells appeared after infection by two iridoviruses, turbot reddish body iridovirus (TRBIV) and lymphocystis disease virus (LCDV). A large number of TRBIV and LCDV particles were also observed in the infected bmGH cells by electron microscope examination. All of these facts indicate that the bmGH cell line established here may serve as a valuable tool for studies of cell-virus interactions and has potential applications in fish virus isolation, propagation and vaccine development.

【题目】Establishment of a turbot fin cell line and its susceptibility to turbot reddish body iridovirus
【中文关键词】大菱鲆鳍细胞;细胞系;病毒易感性;大菱鲆红体大菱鲆虹彩病毒;
【英文关键词】Turbot fin cells ; Cell line; Viral susceptibility ;Turbot reddish body iridovirus;Scophthalmus maximus
【中文摘要】一种比目鱼,大菱鲆,鳍(因子)细胞系的建立和易感性的大菱鲆红体病虹彩病毒(trbiv)决心在本研究。原代启动,细胞开始从鳍组织块部分消化与胰蛋白酶,胶原酶和透明质酸酶。消化组织块培养在24摄氏度 leibovitz-15培养液,辅以20%胎牛血清,羧甲基壳聚糖,乙酰氨基葡萄糖盐酸盐,碱性成纤维细胞生长因子和表皮生长因子。培养的细胞,成纤维细胞形态,增殖到100%汇合后50天。细胞系群体倍增时间为45.6小时,已经建立至133代。染色体分析表明,如果表现出细胞染色体非整倍体与模式染色体数目44表现出正常的二倍体核型的S .鲆至少通过80。trbiv敏感性试验表明,细胞病变效应和传播病毒粒子观察组细胞后,trbiv感染。总之,连续trbiv敏感因子的细胞系已成功建立,并系可作为一个有价值的工具,为研究细胞病毒相互作用和应用各种不同的cytotechnological研究以及。
【英文摘要】A turbot, Scophthalmus maximus, fin (TF) cell line was established and susceptibility to turbot reddish body iridovirus (TRBIV) was determined in this study. Primary culture of TF cells was initiated from fin tissue pieces partially digested with trypsin, collagenase II and hyaluronidase. Digested tissue pieces were cultured at 24 C in Leibovitz-15 medium (pH 7.2), supplemented with 20% fetal bovine serum, carboxymethyl chitosan, N-acetylglucosamine hydrochloride, basic fibroblast growth factor and epidermal growth factor. The cultured TF cells, in fibroblast shape, proliferated to 100% confluency 50 days later. A TF cell line, with a population doubling time of 45.6 h at passage 80, has been established and subcultured to passage 133. Chromosome analyses indicated that the TF cells exhibited chromosomal aneuploidy with a modal chromosome number of 44 which displayed the normal diploid karyotype of S. maximus at least up to passage 80. TRBIV susceptibility testing demonstrated that cytopathic effect and propagated viral particles were observed in TF cells after TRBIV infection. In conclusion, a continuous TRBIV susceptible TF cell line has been established successfully, and the cell line may serve as a valuable tool for studies of cell-virus interactions and has applications for different kinds of cytotechnological studies as well.

【题目】Development and characterization of a new marine fish cell line from turbot (Scophthalmus maximus)
【中文关键词】大菱鲆;大菱鲆;肾细胞系;TK;核型;病毒的易感性
【英文关键词】Turbot ;Scophthalmus maximus;Kidney cell line ;TK ;Karyotype ;Virus susceptibility
【中文摘要】一个新的海洋鱼类细胞系,传统知识,从大菱鲆(大菱鲆)肾脏,确定了方法胰酶消化,传代50个以上的通道在300天的时间。传统知识的细胞保持在最低必需培养基的MEM,抗生素,胎牛血清(胎牛血清),2 -巯基乙醇(ME),和碱性成纤维细胞生长因子(因子)。适宜生长温度为24摄氏度,和显微镜下,传统知识的细胞组成的成纤维细胞样细胞。染色体分析表明,传统知识的细胞具有正常的二倍体核型与2n = 44。2种鱼类病毒lcdv-c(淋巴囊肿病毒从中国)和trbiv(大菱鲆红体病虹彩病毒)被用来确定病毒易感性的细胞系。传统知识的细胞被发现是容易trbiv,并被证实感染细胞病变(病变)和透射电子显微镜,发现病毒颗粒在细胞质中的病毒感染的细胞。最后,重要的绿色荧光信号,观察时,tkcells转染pegfp-n3矢量,表明其潜在的效用鱼类病毒的研究和基因操纵。
【英文摘要】A new marine fish cell line, TK, derived from turbot (Scophthalmus maximus) kidney, was established by the method of trypsin digestion and subcultured for more than 50 passages over a period of 300 days. The TK cells were maintained in Minimum Essential Medium Eagle (MEM) supplemented with HEPES, antibiotics, fetal bovine serum (FBS), 2-Mercaptoethanol (2-Me), and basic fibroblast growth factor (bFGF). The suitable growth temperature for TK cells was 24 C, and microscopically, TK cells were composed of fibroblast-like cells. Chromosome analysis revealed that the TK cell line has a normal diploid karyotype with 2n = 44. Two fish viruses LCDV-C (lymphocystis disease virus from China) and TRBIV (turbot reddish body iridovirus) were used to determine the virus susceptibility of TK cell line. The TK cell line was found to be susceptible to TRBIV, and the infection was confirmed by cytopathic effect (CPE) and transmission electron microscopy, which detected the viral particles in the cytoplasm of virus-infected cells. Finally, significant green fluorescent signals were observed when the TKcells were transfected with pEGFP-N3 vector, indicating its potential utility for fish virus study and genetic manipulation.

【题目】Inbreeding depression for various traits in two cultured populations of the American bay scallop, Argopecten irradians irradians Lamarck (1819) introduced into China
【中文关键词】海湾扇贝养殖群体近交衰退;近亲繁殖的水平;mass-mating;自体受精
【英文关键词】Argopecten irradians irradians; Cultured population; Inbreeding depression; Inbreeding level; Mass-mating; Self-fertilization
【中文摘要】本文探讨的影响,近亲繁殖的水平人口的规模inbreedingdepression通过比较它们之间的twoculturedpopulations(一和二)在雌雄同体动物的bayscallopargopectenirradiansirradians。人口预计将有更少的遗传变异和近交水平由于长期培养的历史(20代)和“祖先”的个人(26人)比人口由于历史较短的培养(4代)和更多的“祖先”的个人(406人)。2组在每个人口的生产,一个使用自体受精和一个使用mass-mating在同一人口。自交后代(a和b)从twopopulations都有较低的健身组件比他们的mass-mated同行(和骨髓)和展出inbreedingdepression所有检查特征,如较低的孵化,少活力和增长放缓,表明inbreedingdepression的一个共同特点是在这种动物。健身组件在所有性状的后代人口显着不同的人口和规模inbreedingdepression所有性状的人口具有较高的近亲繁殖水平明显小于在人口与较低的近亲繁殖的水平,表明这两个健身组件和规模inbreedingdepression均显着影响的近亲繁殖水平的人口和遗传负荷窝藏在人口可能是部分通过清除近亲繁殖。此外,规模inbreedingdepression在twopopulations都各不相同的特征和生活的历史阶段。本研究结果支持这一假设inbreedingdepression partial-dominance
【英文摘要】This paper examines the effect of inbreeding level of population on the magnitude of inbreedingdepression expressed by comparing them between twoculturedpopulations (A and B) in the hermaphroditic animal of the bayscallopArgopectenirradiansirradians. Population A is expected to have less genetic variations and higher inbreeding level due to longer cultured history (20 generations) and less “ancestral” individuals (26 individuals) than population B due to shorter cultured history (4 generations) and more “ancestral” individuals (406 individuals). Two groups within each population were produced, one using self-fertilization and one using mass-mating within the same population. Selfed offspring (AS and BS) from twopopulations both had lower fitness components than their mass-mated counterparts (AM and BM) and exhibited inbreedingdepression for all examined traits, e.g. lower hatching, less viability and slower growth, indicating that inbreedingdepression is a common feature in this animal. Fitness components in all traits of offspring from population A significantly differed those from population B and the magnitude of inbreedingdepression for all traits in population A with higher inbreeding level was significantly smaller than that in population B with lower inbreeding level, indicating that both fitness components and magnitude of inbreedingdepression were significantly affected by inbreeding level of populations and genetic load harbored in population A may be partially purged through inbreeding. Moreover, the magnitude of inbreedingdepression in the twopopulations both varied among traits and life history stages. The present results support the partial-dominance hypothesis of inbreedingdepression

【题目】Growth and survival of reciprocal crosses between two bay scallops, Argopecten irradians concentricus Say and A. irradians irradians Lamarck
【中文关键词】海湾扇贝;海湾扇贝;双列杂交;杂种优势;母体效应;生存;发展
【英文关键词】Bay scallop; Argopecten irradians; Diallel cross; Heterosis; Maternal effect; Survival; Growth
【中文摘要】一个完全双列杂交两国之间的海湾扇贝说,墨西哥湾扇贝(米)和扇贝扇贝拉马克(丙),进行了。生长和存活的比较混合动力和纯人口。无显着差异的壳长被发现四组间在第一天的d-larvae。10天,壳长度的相互交叉(厘米,三菱商事)(♀×♂)显着高于消委会(141.97μ米)和毫米(146.20μ米)组,与增长率的三菱商事(156.14μ米)交叉高于厘米(155.35μ米)交叉。此外,杂种优势的生存显着较大的比生长。产妇起源和交配策略有显着影响生长和存活在整个幼虫期。杂种优势

也观察后吐和成年阶段。170天,平均壳长,壳高和总重量的厘米交叉均显着高于其他组合(< 0.05)。从本研究结果表明,杂交墨西哥湾扇贝生殖腺和扇贝扇贝可能是一个有希望的方式为遗传改良现有的海湾扇贝孵化股票中国。

【英文摘要】A complete diallel cross between two bay scallop populations, Argopecten irradians concentricus Say (M) and A. irradians irradians Lamarck (C), was carried out. Growth and survival were compared among hybrids and pure populations. No significant difference in the shell length was found among the four groups on the first day of D-larvae. On day 10, shell lengths of the two reciprocal crosses (CM, MC)(♀ × ♂) were significantly greater than those of the CC (141.97 μm) and MM (146.20 μm) groups, with the growth rate of the MC (156.14 μm) cross greater than that of the CM (155.35 μm) cross. Also, heterosis for survival was significantly larger than that for growth. Both maternal origin and mating strategy had significant effects on growth and survival throughout the whole larval stage. Heterosis was also observed in later spat and adult stages. On day 170, the mean shell length, shell height and total weight of the CM cross were significantly larger than those of the other crosses (P < 0.05). The results from this study indicate that hybridization between A. irradians concentricus and A. irradians irradians may be a promising way for genetic improvement of existing bayscallop brood stocks in China.

【题目】Molecular cloning and expression analysis of the myostatin gene in sea perch (Lateolabrax japonicus)

【中文关键词】胚胎干细胞;基因;基因表达;鲈鱼;肌肉;海鲈鱼

【英文关键词】embryonic stem cell; gene; gene expression;Lateolabrax japonicus;myostatin;sea perch

【中文摘要】肌肉生长抑制素(抑制素)是一个成员的转化生长因子(因子)家族的功能作为一个负调控骨骼肌的发展和增长的哺乳动物。然而,一些报告提供的结构和功能研究中的鱼类。在这里,该抑制素基因克隆鲈(鲈)的同源性克隆和基因组步行。在4873-bp基因组序列,外显子内含子三,2,和50和30个侧翼序列被确定。海鲈鱼肌肉生长抑制素基因编码一个374-amino酸性蛋白,包括信号肽,保守的半胱氨酸残基,并rxxr蛋白裂解域。表达分析研究表明,抑制素的高度表达的眼睛,大脑,肌肉;中等在小肠;和弱的鳃,肝,脾,心。结果表明,抑制素基因高表达在胚胎干细胞(ljes1),但它是不可在几种类型的体细胞系由海鲈鱼,包括成纤维细胞样细胞,上皮细胞,与淋巴细胞样细胞。此外,它表明,50个侧翼地区的肌肉生长抑制素基因可以表达绿色荧光蛋白(绿色荧光蛋白)基因在ljes1细胞和转基因斑马鱼(斑马鱼)。这是第一次报告的表达谱研究基因在不同类型的细胞培养。

【英文摘要】Myostatin (MSTN) is a member of the transforming growth factor-b (TGF-b) superfamily that functions as a negative regulator of skeletal muscle development and growth in mammals. However, few reports are available about the structure and function of MSTN in teleost. Here, the MSTN gene was cloned from sea perch (Lateolabrax japonicus) by homology cloning and genomic walking. In the 4873-bp genomic sequence, three exons, two introns, and 50 and 30 flanking sequences were identified. The sea perch MSTN gene encodes a 374-amino acid protein, including a signal peptide, conserved cysteine residues, and a RXXR proteolytic cleavage domain. Expression analysis of MSTN revealed that MSTN was highly expressed in eyes, brain, and muscle; intermediately in intestine; and weakly in gill, spleen, liver, and heart. It was demonstrated that MSTN mRNA was highly expressed in embryonic stem cell line (LJES1), but it was undetectable in several types of somatic cell lines from sea perch, including fibroblast-like cell, epithelioid cell, and lymphocyte-like cell. Further, it was demonstrated that the 50 flanking region of the MSTN gene can drive the expression of green fluorescent protein (GFP) reporter gene in LJES1 cells and transgenic zebrafish (Danio rerio). This is the first report on the expression profile of MSTN gene in various types of cell cultures.

【题目】Pluripotency and chimera competence of an embryonic stem cell line from the sea perch (Lateolabrax japonicus)
【中文关键词】细胞移植;嵌合体;胚胎干细胞;全能;鲈鱼;斑马鱼
【英文关键词】Cell transplantation;chimera;embryonic stem cells;pluripotency;sea perch;zebrafish
【中文摘要】一个稳定的绿色荧光蛋白(绿色荧光蛋白+ ljes1)细胞株是从ljes1细胞获得鲈(鲈胚胎,)。绿色荧光蛋白+ ljes1细胞进行体外诱导维甲酸分化成各种细胞类型,也有能力形成胚体结构在悬浮培养。确定分化潜能的ljes1体内细胞,绿色荧光蛋白+ ljes1细胞被移植到海鲈鱼和斑马鱼的胚胎在囊胚阶段。二十出478移植鲈鱼胚胎含有绿色荧光蛋白表达ljes1细胞24小时后注射。十五嵌合体胚胎发育成苗。在这些怪物,绿色荧光蛋白+ ljes1细胞有助于各种组织包括头部和躯干。在斑马鱼胚胎显微注射的绿色荧光蛋白,221 + ljes1细胞和22嵌合体胚胎表达绿色荧光蛋白获得了炸薯条。供体基因+ ljes1细胞有助于各种组织中的头部和躯干的斑马鱼胚胎和孵化的鱼苗。
【英文摘要】A stable GFP-expressing (GFP+LJES1) cell strain was developed from the LJES1 cells obtained from sea perch (Lateolabrax japonicus,) embryos. GFP+LJES1 cells were induced in vitro by RA to differentiate into a variety of cell types and also had the ability to form embryoid body-like structures in suspension culture. To determine the differentiation potential of LJES1 cells in vivo, GFP+LJES1 cells were transplanted into sea perch and zebrafish embryos at mid-blastula stage. Twenty out of 478 transplanted sea perch embryos contained GFP-expressing LJES1 cells 24 h after microinjection. Fifteen chimera embryos developed into fry. In these chimeras, the GFP+LJES1 cells contributed to a variety of tissues including the head and trunk. In zebrafish, 221 embryos were microinjected with GFP+LJES1 cells and 22 chimera embryos and fries expressing GFP were obtained. Donor GFP+LJES1 cells contributed to various tissues in head and trunk of zebrafish embryos and hatched fry.

【题目】Development and characterization of a cell line from the embryos of half smooth tongue sole(Cynoglossus semilaevis)
【中文关键词】胚胎细胞系;半滑舌鳎;核型;绿色荧光蛋白;淋巴囊肿病毒生长
【英文关键词】embryonic cell line; half smooth tongue sole; karyotype; GFP; LCDV; CSEC
【中文摘要】一个新的细胞系,生长,已成功建立了从原肠期胚胎在一个海洋养殖鱼类,半滑舌鳎(半滑舌鳎)。我细胞积极发展和稳定50多通道超过200天在培养液中添加15%胎牛血清(胎牛血清),碱性成纤维细胞生长因子(2.5毫微克/毫升,碱性成纤维细胞生长因子),1纳克/立方厘米荧光(白血病抑制因子)和50浓度/循环箱(2-mecaptoethanol)。细胞生长良好,在温度范围为24 – 30 ° °C,最佳生长温度为24摄氏 ° 胎牛血清和生长因子的浓度是其中的关键组成部分的商业性剥削细胞增殖。染色体分析表明,生长细胞具有正常的二倍体核型与2 = 42t。重要的荧光信号,观察我转染后绿色荧光蛋白报告基因,这表明生长细胞系可以作为一个有用的工具,转基因和基因操纵研究。我细胞病变效应(终端)后感染淋巴囊肿病病毒(淋巴囊肿

病毒)2 d。此外,该淋巴囊肿病毒粒子可以看到在细胞质中的病毒感染细胞的电子显微镜。这表明,我可能是潜在的用于研究水生病毒。

【英文摘要】A new cell line, CSEC, has been successfully established from embryos at gastrula stage of a cultured marine fish, half smooth tongue sole (Cynoglossus semilaevis). CSEC cells grow actively and stably more than 50 passages for over 200 d in DMEM medium supplemented with 15% FBS (fetal bovine serum), 2.5 ng/cm3 bFGF (basic fibroblast growth factor), 1 ng/cm3 LIF (leukemia inhibitory factor) and 50 mmol/dm3 2-ME (2-mecaptoethanol). The cells grew well in the temperature range of 24 – 30 ° C and the optimal growth temperature was 24 ° C. FBS and bFGF concentrations are the two key components for CSEC cells proliferation. Chromosome analysis reveals that CSEC cells have a normal diploid karyotype with 2n=42t. The significant fluorescent signals were observed in CSEC after transfection with the GFP reporter gene, suggesting that the CSEC cell line can be used as a useful tool for transgenic and genetic manipulation studies. CSEC cells showed the cytopathic effect (CPE) after infection with lymphosystis disease virus (LCDV) in 2 d. Moreover, the LCDV particles can be observed in the cytoplasm of virus-infected cells by electron microscopy. It suggests that CSEC could be potentially used for the study of aquatic virus.

【中文摘要】一个新的细胞系的建立从心的海洋养殖鱼类,半滑舌鳎(半滑舌鳎),指定为肽(半滑舌鳎心脏细胞系)。该肽细胞生长超过400天的最低基本培养基(液)辅以10%胎牛血清(胎牛血清)和2毫微克/毫升,碱性成纤维细胞生长因子(因子)。适宜的温度对细胞的生长是24 – 30 ° 与最佳生长在24 ° 和降低经济增长在12和30摄氏 ° 胎牛血清和碱性成纤维细胞生长因子浓度的重要组成部分,肽细胞增殖。百分之二十胎牛血清中被发现的最佳浓度和碱性成纤维细胞生长因子促进细胞生长肽。双时间的细胞在24摄氏 ° 确定73.39小时染色体分析显示,44%的细胞保持正常的二倍体染色体数(2 = 42)在肽细胞通道58。荧光信号,观察肽后的细胞转染绿色荧光蛋白(绿色荧光蛋白)记者质粒。肽的细胞病变效应(终端)后感染淋巴囊肿病病毒(淋巴囊肿病毒)。此外,该淋巴囊肿病毒粒子可以看到在细胞质中的病毒感染细胞的电子显微镜,和一段基因的主要衣壳蛋白的淋巴囊肿病毒被发现的聚合酶链反应扩增核酸的病毒感染的细胞

【英文摘要】A new cell line was established from the heart of a cultured marine fish, half smooth tongue sole (Cynoglossus semilaevis), designated as CSH (Cynoglossus semilaevis heart cell line). The CSH cells grow over 400 days in minimum essential medium (MEM) supplemented with 10% fetal bovine serum (FBS) and 2 ng/ml basic fibroblast growth factor (bFGF). The suitable temperature for the cell growth was 24 – 30 ° C with the optimum growth at 24 ° C and a reduced growth at 12 and 30 ° C. FBS and bFGF concentration were the two important components for CSH cells proliferation. Twenty percent FBS in the medium was found to be the optimum concentration and bFGF promoted the growth of CSH cells. The double time of the cells at 24 ° C was determined to 73.39 h. Chromosome analysis revealed that 44% of the cells maintained a normal diploid chromosome number (2n = 42) in the CSH cells at Passage 58. The fluorescent signals were observed in CSH after the cells were transfected with green fluorescent protein (GFP) reporter plasmids. CSH cells showed the cytopathic effect (CPE) after infection with lymphosystis disease virus (LCDV). Moreover, the LCDV particles can be observed in the cytoplasm of virus-infected cells by electron microscopy, and a segment of MCP gene for major capsid protein of LCDV was found by PCR amplification DNA of virus-infected cells

【题目】Production of a base population and its responses to F1 selection in the bay scallop, Argopecten irradians irradians Lamarck (1819)

【中文关键词】海湾扇贝、海湾扇贝;人口;基础;遗传改良选择性育种;遗传增益;

【英文关键词】bay scallop;Argopecten irradians irradians;base population;genetic improvement;genetic gain;selective breeding

【中文摘要】人口基数海湾扇贝,海湾扇贝拉马克,是由跨越2养殖海湾扇贝种群。经过1年的培育,顶部10%截断选择前10%(= 1.755)进行了在基地人口约1300人。一个家长控制组具有相同数目的选择亲本组随机选择从整个人口在孤立的选择父母组。结果表明,在幼虫期,幼虫的生长速度在选定的路线是明显高于对照组(< 0.05),而且遗传增益为6.78%。由于低密度控制在吐阶段,平均壳长的控制线是大于该选择线在100天。在相同的密度进行了调整,线与线之间的过渡阶段中(从100日至160),每日生长率的选线明显高于控制线(< 0.05)。生存的选择线明显大于控制线在成长阶段。最后,得出的结果,这个实验表明,选择性育种基地人口具有较高的遗传多样性建立了大规模产卵不同人群之间似乎是一个有希望的方法遗传改良的海湾扇贝,扇贝扇贝拉马克。

【英文摘要】A base population of the bay scallop, Argopecten irradians irradians Lamarck, was produced by crossing two cultured bay scallop populations. After 1 year of rearing, the top 10% truncation selection of the top 10% (i=1.755) was carried out in the base population of about 1300 adults. A control parental group with a an identical number to the select parental group was randomly selected from the entire population before isolation of the select parental group. The result showed that, at the larval stage, the growth rate of larvae in the selected line was significantly higher than that of the control (P<0.05), and that the genetic gain was 6.78%. Owing to the lower density of control at the spat stage, the mean shell length of the control line was larger than that of the select line at day 100. When the same density was adjusted between two lines in the grow-out stage (from day 100 to 160), the daily growth rate of the selected

line was significantly higher than that of the control line (P<0.05). Survival of the select line was significantly larger than that of the control line in the grow-out stage. In conclusion, the results obtained from this experiment indicate that selective breeding from a base population with a high genetic diversity established by mass spawning between different populations appears to be a promising method of genetic improvement in bay scallop, A. irradians irradians Lamarck.

【题目】Sustained response to selection in an introduced population of the hermaphroditic bay scallop Argopecten irradians irradians Lamarck (1819)

【中文关键词】响应选择;遗传;遗传增益;雌雄同体;近亲繁殖;海湾扇贝、海湾扇贝;

【英文关键词】Response to selection; Heritability; Genetic gains; Hermaphrodite; Inbreeding; Bay scallop; Argopecten irradians irradians

【中文摘要】引进的物种往往开始与有限的遗传变异,这是问题的选择性繁殖。近亲繁殖的问题可以被激怒的雌雄同体。该海湾扇贝、海湾扇贝是雌雄同体物种已被引入到现在支持的一个主要的水产养殖产业在中国。积极响应选择的快速增长是观察一个少交股在先前的研究。在这项研究中,我们评估选择二代确定选择反应可以持续在这人口雌雄同体物种介绍。选择反应,实现了遗传的二代,累积(2代),电流(为二代)和剩余(第一代)的遗传增益估计比较三种不同类型的线:党卫军(选择2代),资深大律师(选定的第一代只)和消委会(选2代)。不锈钢线增长明显快(< 0.05)比其他2线,表明二代选择更快的增长仍然是有效的。反应选择和实现遗传的二代0.612±0.101和0.349±0.057,分别,这是类似于观察到的第一代。累积,目前,和剩余收益17.56±5.30%,10.63和6.25±±2.46%,3.13%,分别为。持续反应选择二代在这里观察表明,相当多的遗传变异存在于这个人口和选择性育种今后的努力可能会取得丰硕成果

【英文摘要】Introduced species often start with limited genetic variability, which is problematic for selective breeding. The problem of inbreeding can be exasperated by hermaphroditism. The bay scallop Argopecten irradians irradians is a hermaphroditic species that has been introduced to and now supports a major aquaculture industry in China. Positive response to selection for fast growth was observed in one of the less inbred stocks in a previous study. In this study, we evaluated selection for the second generation to determine if response to selection can be sustained in this introduced population of a hermaphroditic species. Response to selection, realized heritability for the second generation, cumulative (over two generations), current (for the second generation) and residual (from the first generation) genetic gains were estimated by comparing three different types of lines: SS (selected for two generation), SC (selected for the first generation only) and CC (unselected for two generations). The SS line grew significantly faster (P < 0.05) than the other two lines, indicating that the second generation selection for faster growth is still effective. Response to selection and realized heritability for the second generation were 0.612 ± 0.101 and 0.349 ± 0.057, respectively, which are similar to those observed for the first generation. The cumulative, current, and residual gains were 17.56 ± 5.30%, 10.63 ± 2.46%, and 6.25 ± 3.13%, respectively. The sustained response to selection for the second generation observed here suggests that considerable genetic variability exists in this population and that future efforts on selective breeding are likely to be fruitful

【题目】玉蜀黍赤霉有性重组体的诱导及其生物学特性

【中文关键词】玉蜀黍赤霉; nit突变体; 有性重组体; 生物学特性; 遗传进化;
【英文关键词】Gibberella zeae; nit mutants; sexual recombinants; biological properties; genetic evolution;
【中文摘要】本研究以硝酸盐营养缺陷型突变体(nit)和多菌灵抗性为遗传标记,在5个所选菌株中设计了3个玉蜀黍赤霉病菌Gibberella zeae的杂交组合,使各菌株之间进行杂交,从而诱导有性重组体。从各杂交组合的后代中任意挑选出3个有性重组体,比较了这些有性重组体与其亲本在无性和有性阶段的主要生物学性状。结果表明,玉蜀黍赤霉中的nit基因及对杀菌剂多菌灵的抗药性基因可以通过有性杂交的方式重组,即发生了有性重组。有性重组体与其亲本在菌落生长、培养性状和致病性方面没有显著差异;但某些有性重组体中,产孢量和产子囊壳能力方面存在一定差异。总体看来,有性重组体仍然保持了较高的适合度。因此,可以认为有性重组在玉蜀黍赤霉群体对多菌灵抗药性发生发展以及群体遗传进化中可能起着重要的作用。
【英文摘要】In order to induce sexual recombinants of Gibberella zeae,five selected isolates were adopted as parents and crossed in three designed pairs by using nitrate non-utilizing(nit) mutants and carbendazim-resis-tance as genetic markers.Three sexual recombinants from each of the three combinations were randomly selec-ted to compare the major biological properties with their parental isolates.The results showed that the nit gene and carbendazim-resistance gene could be recombined by sexual crosses.There were no significant differences in mycelial growth,traits of culture and pathogenicity between the sexual recombinants and their parental isolates.Sporulation and perithecigerous capacities,however,changed more or less in some sexual recombinants.The fitness of the sexual recombinants was comparable to the parents in general.Therefore,it is concluded that sexual recombination may play an important role in carbendazim resistance development and genetic evolution of G.zeae populations.

【题目】禾谷镰孢菌微管相关蛋白基因(map)克隆及其与多菌灵抗药性关系分析
【中文关键词】禾谷镰孢菌; 微管相关蛋白基因(map); 多菌灵; 抗药性;
【英文关键词】Fusarium graminearum; microtubule-associated proteins gene(map); carbendazim(MBC); resistance;
【中文摘要】根据禾谷镰孢菌(Fusarium graminearum)测序菌株NRRL31084(PH-1)的微管相关蛋白基因(map)核苷酸序列设计4对引物,采用PCR方法测定了禾谷镰孢菌对多菌灵(MBC)不同敏感性表型的6个中国菌株的map全序列。DNA序列比对表明,中国的3个敏感菌株和3个抗药菌株的map核苷酸序列相似性没有差异,表明多菌灵抗药性与微管相关蛋白无关。该基因全长1 793 bp,含有6个内含子,编码199个氨基酸;与NRRL31084的map核苷酸序列相似性为99.39%,存在10个差异核苷酸,与其所编码的氨基酸序列相似性为100%
【英文摘要】The full-length nucleotide sequence of microtubule-associated proteins gene(map)from each of 6 Fusarium graminearum strains from China which had different carbendazim(MBC)sensitivity phenotypes were cloned using PCR with 4 primer pairs designed in accordance with nucleotide sequence of map from the genome-sequenced isolate,NRRL31084(PH-1).The DNA sequence comparison showed that there was no difference in the nucleotide sequence of map among 3 sensitive and 3 resistant strains from China.This result demonstrated that there was no relationship between MBC-resistance and map gene.The full-length of the gene spans 1 793 bp,including 6 introns,encoding 199 amino acids.With 99.39% homology,there were 10 nucleotide differences in map gene between PH-1 isolate and the 6 strains from China.The homology of the deduced amino acid sequence of the gene was 100% between the 6 strains and PH-1 isolate.

【题目】Establishment of a novel fin cell line from Brown marbled grouper
【中文关键词】鳍细胞;细胞的影响;病毒易感性;褐点石斑鱼
【英文关键词】brown-marbled grouper;fin cell line;cytopathic effects;viral susceptibility;Epinephelus fuscoguttatus
【中文摘要】奠定坚实基础的体外调查鱼类病毒病,病理科和细胞毒性,一个新的细胞系来自对,褐点石斑鱼,成立和病毒的敏感性评价。鳍组织,消化酶和胶原酶Ⅱ,用于原代启动24摄氏度的20%胎牛血清DMEM/F12,这是进一步补充 – 羧甲基壳寡糖,碱性成纤维细胞生长因子和胰岛素样生长因子的成纤维细胞生长在一个稳定的鳍在随后的亚文化有一个人口倍增时间为50.6小时60。模态的二倍体染色体数目为48。一对鳍细胞系(bmgf-1)已经成立,由现在的75代,通道。病毒的敏感性表明,典型的细胞病变的影响bmgf-1细胞出现感染后大菱鲆虹彩病毒(reddish-body trbiv)或淋巴囊肿病毒(淋巴囊肿病毒)。然而,大量trbiv和淋巴囊肿病毒颗粒也发现在受感染的bmgf-1细胞。所有这些表明,bmgf-1细胞具有良好的敏感性trbiv和淋巴囊肿病毒,它可以作为一个宝贵的工具,为研究细胞 – 病毒的相互作用,具有潜在的应用在鱼类病毒的传播和疫苗的发展。
【英文摘要】To lay a solid foundation of in vitro investigations of fish viral diseases, cytotechnology and cytotoxicology, a novel fin cell line from brown-marbled grouper, Epinephelus fuscoguttatus, was established and its viral susceptibility was evaluated. The fin tissues, digested with hyaluronidase and collagenase II, were used to initiate primary culture at 24 ° C by using 20% foetal bovine serum-Dulbecco's modified Eagle medium/F12 medium, which was further supplemented with carboxymethyl – chitooligosaccharide, basic fibroblast growth factor and insulin-like growth factor-I. The fibroblastic fin cells grew at a steady rate during subsequent subculture and had a population doubling time of 50.6 h at passage 60. The modal diploid chromosome number was 48. A brown-marbled grouper fin cell line (bmGF-1) has been established and subcultured to passage 75 by now. Viral susceptibilities revealed that typical cytopathic effects of bmGF-1 cells emerged after being infected by turbot reddish-body iridovirus (TRBIV) or lymphocystis disease virus (LCDV). However, a large number of TRBIV and LCDV particles were also found in infected bmGF-1 cells. All these indicate that the bmGF-1 cell line has good susceptibility to TRBIV and LCDV, which may serve as a valuable tool for studies of cell – virus interactions and have potential applications in fish virus propagation and vaccine development.

【题目】cDNA cloning, characterization and expression analysis of the DEAD box family genes
【中文关键词】DEAD盒;对虾;营养;pl10系
【英文关键词】DEAD-box; Fenneropenaeus chinensis;germ-line ;vasa ; PL10
【中文摘要】核糖核酸解旋酶的死盒和相关的家庭都参与了各种细胞过程,包括复制,修复,和加工。然而,功能的死盒蛋白在水产养殖物种是了解甚少在分子水平上。我们获得的基因全长序列的2基因编码的蛋白质helicase-related,fc-vasa和fc-pl10a从睾丸,中国对虾,对虾。2预测的氨基酸序列包含所有保守的图案特征的死盒家庭和几个基本重复的N -末端区域。同源性和系统发育分析表明,它们属于“ 瓦萨 ”号和pl10亚科。三维结构的蛋白质进行了预测,同源性建模方法。核心蛋白组成的串联recA样域相似的死盒解旋酶。采用逆转录聚合酶链反应(RT - PCR)和实时聚合酶链反应,我们发现,fc-vasa是表示特别是在成年性腺。转录减少,但增加的卵巢在睾丸性腺发育过程中。fc-pl10a表达是广泛分布于组织,我们审查。采用原位杂交,我们表明,fc-vasa转录是位于细胞质的精原细胞和卵母细胞。因此,我们的结果表明,fc-vasa起着重要的作用,在生殖系的发展,并已成为一种生殖细胞谱系标记将有助于产生新的见解的起源和分化的生殖细胞以及调节复制在中国对虾。
【英文摘要】RNA helicases of the DEAD-box and related families are involved in various cellular processes including DNA replication, DNA repair, and RNA processing. However, the function of DEAD-box proteins in aquaculture species is poorly understood at molecular level. We obtained the full-length cDNA sequences of two genes encoding helicase-related proteins, Fc-vasa and Fc-PL10a, from the testes of Chinese shrimp, Fenneropenaeus chinensis. The two predicted amino acid sequences contain all the conserved motifs characterized by the DEAD-box family and several RGG repeats in the N-terminal regions. Homology and phylogenetic analyses indicate that they belong to the vasa and PL10 subfamilies. The three-dimensional structures of the two proteins were predicted with a homology modeling approach. Both core proteins consist of two tandem RecA-like domains similar to those of the DEAD-box RNA helicase. Using reverse transcription-polymerase chain reaction (RT-PCR) and real-time PCR we found that Fc-

vasa was expressed specifically in the adult gonads. Transcription decreased in the ovary but increased in the testis during gonadal development. Fc-PL10a expression was widely distributed in the tissues we examined. Using in situ hybridization, we demonstrated that the Fc-vasa transcript is localized to the cytoplasm of the spermatogonia and oocytes. Thus, our results suggest that Fc-vasa plays an important role in germ-line development, and has utility as a germ cell lineage marker which will help to generate new insight into the origin and differentiation of germ cells as well as the regulation of reproduction in F. chinensis.

【题目】The manganese superoxide dismutase gene in bay scallop Argopecte irradians
【中文关键词】锰超氧化物歧化酶(酶);克隆;海湾扇贝;三维建模;qrt-pcr;基因表达;免疫反应

【英文关键词】Manganese superoxide dismutase (MnSOD); Cloning; Argopecten irradians; 3D modelling; qRT-PCR; mRNA expression; Immune response
【中文摘要】一种新型的manganesesuperoxidedismutase(歧化酶)是克隆的′bayscallopargopecten 3和5′末端快速扩增聚合酶链反应(种族)。全长基因的锰超氧化物歧化酶1207与678开放阅读框编码226个氨基酸。推导的氨基酸序列包含一个假定的信号肽26个氨基酸。序列比较表明,锰超氧化物歧化酶的扇贝共享高身份与锰超氧化物歧化酶在无脊椎动物和脊椎动物,如锰超氧化物歧化酶从鲍鱼盘鲍(abg88843)和青蛙爪蟾(aaq63483)。此外,三维结构bayscallop锰超氧化物歧化酶的预测蛋白质模型的网络服务器和比较与其他mnsods。整体结构bayscallop锰超氧化物歧化酶类似斑马鱼斑马鱼,果蝇果蝇,中国明对虾,人类智人,并有最高的相似性scallopmizuhopecten扇贝、鲍鱼H铁饼铁饼。定量实时聚合酶链反应(qrt-pcr)法是检测的mrnaexpression锰超氧化物歧化酶在不同的组织和时间表达血以下的挑战与细菌鳗弧菌。更高一级的mrnaexpression锰超氧化物歧化酶检测在鳃,地幔。表达的锰超氧化物歧化酶所达到的最高水平在3小时后注射鳗弧菌和稍微恢复从6至48小时结果表明,bayscallop锰超氧化物歧化酶是一个构和诱导蛋白,因此可以发挥重要作用的免疫反应对鳗弧菌感染。
【英文摘要】A novel manganesesuperoxidedismutase (MnSOD) was cloned from bayscallopArgopecten irradians by 3′ and 5′ rapid amplification of cDNA ends (RACE) PCR. The full-length cDNA of MnSOD was of 1207 bp with a 678 bp open reading frame encoding 226 amino acids. The deduced amino acid sequence contained a putative signal peptide of 26 amino acids. Sequence comparison showed that the MnSOD of A. irradians shared high identity with MnSOD in invertebrates and vertebrates, such as MnSOD from abalone Haliotis discus discus (ABG88843) and frog Xenopus laevis (AAQ63483). Furthermore, the 3D structure of bayscallop MnSOD was predicted by SWISS-MODEL Protein Modelling Server and compared with those of other MnSODs. The overall structure of bayscallop MnSOD was similar to those of zebrafish Danio rerio, fruit fly Drosophila melanogaster, Chinese shrimp Fenneropenaeus chinensis, human Homo sapiens, and had the highest similarity to scallopMizuhopecten yessoensis and abalone H. discus discus. A quantitative real-time PCR (qRT-PCR) assay was developed to detect the mRNAexpression of MnSOD in different tissues and the temporal expression in haemocytes following challenge with the bacterium Vibrio anguillarum. A higher-level of mRNAexpression of MnSOD was detected in gill and mantle. The expression of MnSOD reached the highest level at 3 h post-injection with V. anguillarum and then slightly recovered from 6 to 48 h. The results indicated that bayscallop MnSOD was a constitutive and inducible protein and thus could play an important role in the immune responses against V. anguillarum infection.

Oilseed rape
Carboxamides
【中文摘要】Between 2006 and 2008, 120 isolates of Sclerotinia sclerotiorum from the Jiangsu Province of China werecharacterized for the baseline sensitivity to boscalid, a new active ingredient that interferes withsuccinate ubiquinone reductase in the electron transport chain of fungi. The isolates collected between2006 and 2008 all showed similar sensitivity to boscalid. Baseline sensitivities were distributed asunimodal curves with mean EC50 values of 0.17 0.09 mg ml 1 for inhibition of mycelial growth. Inhibitionof mycelial growth of isolates whether they had resistance to carbendazim or, dimethachlon ordual resistance to both carbendazim and dimethachlon was similar, suggesting that there was no crossresistancebetween boscalid and MBC/dimethachlon already in commercial

use. In field trials, thetreatments boscalid (50% WG), at 125, 187.5 and 250 g ai ha 1 provided higher control efficacies of 65.2,69.0 and 75.1%, respectively, than the treatments carbendazim (50% WP), at 750 g ai ha 1 and dimethachlon(46% WP), at 690 g ai ha 1 with control efficacies of 18.9 and 44.6%, respectively

【题目】Mutations in a beta-Tubulin Confer Resistance of Gibberella zeae to Benzimidazole Fungicide

【中文关键词】gene-deletion and -complementation mutants.

【英文关键词】gene-deletion and -complementation mutants.

【中文摘要】Wheat head blight caused by Gibberella zeae (anamorph: Fusariumgraminearum) is a threat to food safety in China because of mycotoxincontamination of the harvested grain, the frequent occurrence of thedisease, and the failure of chemical control in some areas due tobenzimidazole resistance in the pathogen population. The molecularresistance mechanism, however, of G. zeae to benzimidazole fungicides(especially carbendazim; active ingredient: methyl benzimidazol-2-ylcarbamate [MBC]) is poorly understood. DNA sequences of a β-tubulingene (β2tub) (GenBank access number FG06611.1) in G. zeae wereanalyzed. Mutations in β2tub in moderately resistant strains (MBCMR)included TTT (Phe)→TAT (Tyr) at codon 167 or TTC (Phe)→TAC (Tyr)at codon 200. A highly resistant strain (MBCHR) had two point mutations,one at codon 73, CAG (Gln)→CGG (Arg), and the other at codon 198,GAG (Glu)→CTG (Leu). To confirm that mutations in the β2tub conferresistance to benzimidazole fungicides, the entire β2Tub locus was deletedfrom MBCMR and MBCHR strains of G. zeae. The resulting Δ β2tubmutants from both MBCMR and

MBCHR strains grew normally on MBCfreepotato dextrose agar medium and were supersensitive to MBC. Complementationof the Δβ2tub mutants by transformation with a copy of theintact β2Tub locus from their parent strains exhibited less resistance thanthe original strains, and complementation of the Δβ2tub mutants bytransformation with a copy of the intact β2Tub locus from sensitive strainsrestored MBC sensitivity. The results indicated that the mutations in the β2tub gene conferred resistance of G. zeae to benzimida

【题目】Establishment of a spleen cell line from large yellow croaker Pseudosciaena crocea and its primitive application in foreign gene

【中文关键词】大黄鱼脾脏细胞,细胞系,转基因易感性,绿色荧光蛋白,大黄鱼
【英文关键词】large yellow croaker spleen cells; cell line; transgenic feasibility; green fluorescence protein (GFP); Pseudosciaena crocea

【中文摘要】本文建立了大黄鱼脾(LYCS)细胞系并评估了用该细胞系进行外源基因转染的可行性。LYCS细胞的原代培养用脾组织块,用DMEM/F12培养液(DMEM/F12,1∶1)(ph7.2)在25℃培养,添加20%胎牛血清,羧甲基壳聚糖,硫酸软骨素,碱性成纤维细胞生长因子(bFGF)和胰岛素样生长因子(IGF - I)。培养的LYCS细胞为成纤维细胞形态,20天后长满培养瓶底部。染色体分析表明,LYCS细胞表现出染色体非整倍体,特征性染色体数目为48,表现出正常的大黄鱼二倍体核型(6m + 6sm +36t,NF= 60)。LYCS细胞系第60代细胞的群体倍增时间48.7小时,表明已经建立了LYCS细胞系并传至70代。转基因的可行性试验表明,LYCS 细胞在pcDNA3.1-GFP质粒转染后能够观察到阳性绿色荧光蛋白的表达。总之,具有外源基因转染易感性的LYCS连续细胞系已经建立成功。该细胞系可以作为研究转基因育种的评价工具,并且有可能应用于各种不同的细胞技术研究

【英文摘要】A large yellow croaker, Pseudosciaena crocea, spleen (LYCS) cell line was established and the feasibility of using it for foreign gene transfection was evaluaed in this study. Primary culture of LYCS cells was initiated from spleen tissue pieces, which were cultured at 25°C in Dulbecco ’s modiced Eagle medium/F12 medium (DMEM/F12, 1:1) (pH7.2), supplemented with 20% fetal bovine serum, carboxymethyl chitosan, chondroitin sulfate, basic fibroblast growth factor (bFGF) and insulin-like growth factor-I (IGF-I). The cultured LYCS cells, in fibroblast shape, proliferated to 100% confluency 20 days later. Chromosome analyses indicated that the LYCS cells exhibited chromosomal aneuploidy with a modal chromosome number of 48 which displayed the normal diploid karyotype of P. crocea (6m+6sm+36t, NF=60). A LYCS cell line, with a population doubling time of 48.7 h at passage 60, has been established and subcultured to passage 70. Transgenic feasibility test demonstrated that positive green fluorescence protein (GFP) expression was observed in LYCS cells after pcDNA3.1-GFP plasmid transfection. In conclusion, a continuous foreign gene transfection feasible LYCS cell line has been established successfully. The cell line might serve as a valuable tool for studies of transgenic breeding and has potential applications for different kinds of cytotechnological studies.

【题目】漠斑牙鲆胚胎细胞系的建立与鉴定
【中文关键词】胚胎细胞系;漠斑牙鲆;核型; GFP 报告基因
【英文关键词】embryonic cell line ;southern flounder ; Paralichthys lethostigma ;karyotype ;reporter gene
【中文摘要】漠斑牙鲆(Paralichthys lethostigma) 是中国近年新开发的重要海水养殖鱼类,本研究以漠斑牙鲆囊胚期胚胎为材 料,探索了鱼类胚胎细胞分离和培养的条件,建立了漠斑牙鲆胚胎细胞培养技术。建立的漠斑牙鲆胚胎细胞系(SFEC) 至今已经培养了240 多天,传至80 多代。SFEC 的完全培养基采用添加抗生素、胎牛血清(FBS) 、花鲈血清(SPS) 、成纤 维生长因子(bFGF) 的DMEM。SFEC 形态小而呈圆形、多边形,在培养基中生长迅速。本实验检测了温度、胎牛血清浓 度、成纤维生长因子对SFEC 生长的影响。在24~30 ℃之间SFEC 生长良好,但当温度低于18 ℃时细胞生长速度明显 减慢。在含15 % FBS 的培养基中,SFEC 生长速度明显比在含715 % FBS 的培养基中快,在培养基中添加bFGF 可以使 细胞生长速度显著提高。SFEC 的二倍体核型为2n = 6st + 42t 。将GFP 报告基因通过脂质体介导的方法转入SFEC 中 并成功地获得了表达,转化率为20 %
【英文摘要】A continuous cell line ,SFEC (southern flounder embryonic cell line) ,was established f rom embryos at gast rula stage of a marine cultured fish ,southern flounder (Paralichthys lethostigma) and was cultured for more than 240 d with more than 80 generation. The SFEC cells were cultured in DMEM medium supplemented with antibiotics ,fetal bovine serum (FBS) , sea perch serum (SPS) ,basic fibroblast growth factor (bFGF) . The cells were small and round in shape and grew actively and stably in medium. Effect s of temperature ,FBS and bFGF concent ration on the growth of SFEC cells were evaluated. The cells grew well in the temperature range of 24 - 30 ℃, but had a reduced growth rate at temperature below 18 ℃. The growth of SFEC cells in medium containing 15 % FBS was higher than that in medium containing 715 % FBS. Addition of bFGF to the medium significantly increased growth rate of SFEC cells. Chromosome anal ysis revealed that SFEC cells have a normal diploid karyotype with 2n = 6st + 42t . GFP reporter gene was successfully t ransferred into SFEC cells and expressed

【题目】High-throughput detection of highly benzimidazole-resistant allele E198A with mismatch primers in allele-specific real-time polymerase chain reaction
【中文关键词】allele-specific quantitative real-time PCR; mismatch primers; genotyping; carbendazim-resistance; Sclerotinia sclerotiorum
【英文关键词】allele-specific quantitative real-time PCR; mismatch primers; genotyping; carbendazim-resistance; Sclerotinia sclerotiorum
【中文摘要】BACKGROUND: A point mutation often confers resistance of organisms against medical drugs and agricultural pesticides.Allele-specific nucleotide polymerase chain reaction (ASPCR) and allele-specific quantitative real-time PCR using SYBR Green(ASQPCR) arewidely and effectively applied to detect and monitor this type of resistance. However, the former is unsuitable forhigh-throughput detection, and the latter often reduces the accuracy of detection.RESULTS: In order to decrease background amplification, a rapid and high-throughput genotyping method with mismatchprimers was developed (ASQPCR-MP) and applied specifically to survey the frequency of the highly benzimidazole-resistantMBCHR mutation (E198A) in the β-tubulin gene of

Sclerotinia sclerotiorum (Lib.) de Bary populations. Genomic DNA from 223sclerotiawas analysed. Similar genotype results were also obtained using ASPCR with mismatch primers and amycelial growthinhibition assay. It was found that ASQPCR-MP clearly differentiated MBCHR and benzimidazole-sensitive MBCS phenotypes.Moreover, ASQPCR-MP took less than 6 h to complete.CONCLUSION: ASQPCR-MP appears suitable for large epidemiological studies involving resistant genotypes and requiringhigh-throughout formats.

【题目】Monogenic resistance to a new fungicide, JS399-19, in Gibberella zeae

【中文关键词】cyanoacrylate fungicide,
Fusarium graminearum
,
Triticum aestivum
, wheat head blight
【英文关键词】cyanoacrylate fungicide,
Fusarium graminearum
,
Triticum aestivum
, wheat head blight

【中文摘要】The fungicide JS399-19 is a novel cyanoacrylate fungicide active againstGibberella zeae, and has been marketed in Chinafor control of fusarium head blight (FHB) on wheat. Forty-three isolates sensitive to fungicide JS399-19 were collectedfrom three commercial wheat fields in China. Forty-five isolates resistant to JS399-19, obtained from five sensitiveisolates by selection for resistance to JS399-19, were selected. Three sensitivity levels were identified: sensitive (S),moderately resistant (MR) and highly resistant (HR) to JS399-19, based on a previous study. Eight isolates representingthe three sensitivity-level phenotypes were randomly selected for a study on the inheritance of JS399-19 resistance byanalysing the sensitivity of hybrid F1progeny. A nitrate-non-utilizing mutant (nit) was used as a genetic marker toconfirm that individual perithecia were the result of outcrossing. Five crosses were assessed: S×S, S×HR, MR×HR,HR×HR and MR×S. In crosses between parents with different sensitivity levels, such as S×HR, MR×HR andMR×S, the progeny fitted a 1:1 segregation ratio of the two parental phenotypes. No segregation was observed in thecrosses S×S and HR×HR. It was concluded that the MR and HR phenotypes inG. zeaewere conferred by differentallelic mutations within the same locus. In these isolates, resistance to JS399-19 was not affected by modifying genes orcytoplasmic components.

【题目】Effect of Carbendazim Resistance on Trichothecene Production and Aggressiveness of Fusarium graminearum.
【中文关键词】Effect ;Carbendazim Resistance
; Trichothecene Production and Aggressiveness
;Fusarium graminearum
【英文关键词】Effect ;Carbendazim Resistance
; Trichothecene Production and Aggressiveness
;Fusarium graminearum
【中文摘要】Fusarium graminearum (teleomorph, Gibberella zeae)causes head blight of cereals and contaminates grains withtrichothecene mycotoxins that are harmful to humans anddomesticated animals. Control of Fusarium head blightrelies on carbendazim (MBC) in China, but resistance toMBC in F. graminearum is now widespread. Sixty-sevenstrains were evaluated for trichothecene production inshake culture or in the field. The strains included 60 wildtypestrains (30 MBC-resistant and 30 MBC-sensitive),three MBC-resistant site-directed mutants at codon 167 in β 2-tubulin, three MBC-sensitive site-directed mutants atcodon 240 in β 2-tubulin, and their MBC-sensitive wild-typeprogenitor strain ZF21. The incidence of infected spikeletsand the amount of F. graminearum DNA in field grain(AFgDNA) also were evaluated for all strains. MBC resistanceincreased trichothecene production in shake cultureor in the field. Although MBC resistance did not changethe incidence of infected spikelets, it did increase AFgDNA.Tri5 gene expression increased in MBC-resistant strainsgrown in shake culture. We found a significant exponentialrelationship between trichothecene production and Tri5gene expression in shake culture and a linear relationshipbetween the incidence of infected spikelets or AFgDNAand trichothecene production in field grain.

【题目】大菱鲆红体病虹彩病毒体外增殖条件的研究
【中文关键词】大菱鲆红体病虹彩病毒(TRBIV) ; 细胞病变效应(CPE) ; 牙鲆鳃细胞; 增殖
【英文关键词】turbot reddish body iridovirus (TRBIV) ; cytopathic effect (CPE) ; flounder gill (FG) cells ; propagation
【中文摘要】探讨大菱鲆病毒疫苗的研制,以牙鲆鳃细胞(FG细胞) 为增殖体系,利用细胞病变效应(CPE) 为判断指标,对大菱鲆红体病虹彩病毒(Turbot reddish body iridovirus , TRBIV) 的体外最适增殖条件等进行了研究。结果表明,病毒接种量、病毒吸附时间、细胞培养条件对TRBIV 的体外增殖均有明显的影响,以0. 2 mL 病毒液接种FG细胞、吸附2 h、用含10 %胎牛血清的MEM 培养液于22 ℃培养时,病毒的增殖速度最快。研究还发现,病毒的收获时间和病毒液冻融次数对所得病毒的感染力均有显著影响,在最佳增殖条件下,病毒在FG细胞中增殖至第4 天时进行收获,且只冻融1 次,其感染活性最强,反复冻融后病毒的感染活性会显著降低。
【英文摘要】By using the cytopathic effect (CPE) as a criterion index , the optimal propagation condition of Turbot reddish body iridovirus (TRBIV) in culturing flounder gill (FG) cells was studied in this study. The result s show that the amount of inoculated virus , adsorption time of virus and FG cell culture condition all had great effect s on the i n vit ro propagation of TRBIV. And TRBIV propagated very fast when 0. 2 mL virus solu2 tion was inoculated , adsorpted for 2 h , and virus inoculated FG cells were cultured in 10 % bovine calf serum supplemented MEM medium at 22 ℃. It was found that the harvest time of propagated viruses and the times of f reeze2thaw of the harvested virus solution had enormous effect s on the infective ability of TRBIV. It was also found that the propagated TRBIV had the highest infective ability when they were harvested 4 days after inocu2 lation and f reeze2thawed only once. The determination of the optimal propagation condition of TRBIV will lay a solid foundation for exploiture of turbot virus vaccine.

【题目】大菱鲆鳍细胞系的建立
【中文关键词】大菱鲆; 鳍细胞; 原代培养; 传代培养; 细胞系
【英文关键词】turbot ; fin cells ; primary culture ; subculture ; cell line
【中文摘要】建立大菱鲆(Scophthalus maximus) 鳍细胞系,文中采用胰蛋白酶、透明质酸酶和Ⅱ型胶原酶消化法启动大菱鲆鳍组织的原 代培养,并通过培养液配方和培养条件的优化成功进行大菱鲆鳍细胞的继代培养。研究结果显示,在pH = 7. 0~7. 4 、温度20~24 ℃ 的培养条件下,培养于含有表皮细胞生长因子、碱性成纤维细胞生长因子、羧甲基壳多糖、N2乙酰葡萄糖盐酸盐的Leibovitz215 培养液 (20 %胎牛血清) 中的大菱鲆鳍细胞,其生长分裂状况最好,细胞形态为成纤维细胞样。经继代培养后,细胞生长分裂依然十分旺盛, 第60 代大菱鲆鳍细胞系的群体倍增时间为62. 4 h ,虽然出现了染色体的非整倍性,但其特征性染色体仍为44 条。该细胞系细胞经 液氮冻存后仍保持有原有形态和较高存活率。现已成功建立了连续性大菱鲆鳍细胞系,目前已传至第65 代。该细胞系的建立对于 查清病毒对大菱鲆细胞的感染途径与感染机理等具有重要的理论意义,对于病毒疫苗研制具有重要应用价值。
【英文摘要】turbot reddish body iridovirus (TRBIV) ; cytopathic effect (CPE) ; flounder gill (FG) cells ; propagation To establish a cell line of turbot Scophthal us maximus , primary culture of turbot fin cells was ini2 tiated by t rypsin , hyaluronidase and type II callagenase digestion methods , and the cells were successfully sub2 cultured after optimization of the culture medium and culture conditions. The result s showed that the optimal culture medium for turbot fin cells was Leibovitz215 medium supplemented with 20 %fetal bovine serum , basic fibroblast growth factor (bFGF) , epidermal growth factor (EGF) , N2Acetyl2D2glucosamine , and car2 boxymethyl2chitosan. And the optimal culture conditions for turbot fin cells were 20224 ℃and pH = 7. 027. 4. The turbot fin cells were in fibroblast2like shape and grew actively under the optimal medium and culture condi2 tions. The population2doubling time of the cell line established is 62. 4 hours at passage 60. And chromosome analysis showed that the cells exhibited chromosomal aneuploidy with a modal chromosome number of 44. The cells maintained their original shape and high viability after cryopreserved and

resuscitated. A continuous turbot fin cell line has been established which has been subcultured to passage 65. The established turbot fin cell line will provide an ideal research system for studying the pathways and mechanisms of infective viruses , and will lay solid foundations for viral vaccine development .

【题目】褐点石斑鱼三种组织细胞系的建立
【中文关键词】褐点石斑鱼; 鳍细胞; 心脏细胞; 鳔细胞; 细胞系
【英文关键词】Ep inep helus f uscogut tatus ; f in cells; heart cells; sw im bladder cells; cell line
【中文摘要】为建立褐点石斑鱼鳍、心脏和鳔组织细胞系, 本文利用不同培养液和培养温度对褐点石斑鱼鳍、心脏和鳔组织 细胞进行了原代培养和传代培养。实验结果显示, 在24 培养于含有羧甲基壳寡糖、碱性成纤维样生长因子、I 型胰岛素 样生长因子及20%胎牛血清的DMEM/ F12 培养液(pH= 7. 2) 中的3 种细胞, 均为成纤维样细胞, 其生长分裂状态最佳, 可 以持续稳定传代。第60 代褐点石斑鱼鳍、心脏和鳔细胞的群体倍增时间分别为50. 6 h、40. 3 h 和43. 3 h, 其特征性染色体 数目均为48 条。目前鳍、心脏和鳔细胞已分别传至第90 代、第70 代和第75 代, 已成功建立了3 种细胞的连续性细胞系, 为鱼类病毒与宿主细胞相互作用机制等鱼类病毒学基础研究, 以及鱼类病毒的分离、鉴定、繁殖及病毒疫苗研制等奠定了 基础。
【英文摘要】To establish novel cell lines from brow n marbled g rouper, Epinep helus f uscogut tatus , primary cultures of f in, heart and sw im bladder t issues w ere init iated in this study. These cells w ere successfully culturedat 24 by using 20% FBS DMEM/ F12 medium (pH = 7. 2) , which w as further supplemented w ith carbox ymethy l chitooligosaccharide, basic f ibroblast g row th factor and insulin like growth factor I. The fin, heart and sw im bladder cells all show ed fibroblast ic morphology. These cells grew at a steady rate during subsequent subculture with populat ion doubling t imes of 50. 6 h, 40. 3 h and 43. 3 h at passage 60, respect ively. Chromo some analyses show that these cells exhibited chromosomal aneuploidy, but st ill had a modal chromosome num ber of 48. To date, three novel brow n marbled grouper cell lines have been established and subcultured to morethan 70 passages. These continuous cell lines may serve as valuable tools for studies of cell virus interact ions and have potential applications in f ish virus isolat ion, propagat ion and vaccine development.

【题目】大黄鱼鳍细胞系的建立及久效磷对其毒性作用的研究
【中文关键词】大黄鱼; 鳍细胞; 细胞系; 久效磷; 毒性作用
【英文关键词】lar ge yellow cr oaker; fin cells; cell line; monocrotophos; cyto to xic effect
【中文摘要】为了建立大黄鱼(Pseudosciaena crocea) 鳍细胞系, 为其细胞毒理学、病毒学与细胞工程等研究奠定基础, 本文采用酶消化法使用含有20%胎牛血清(FBS) 的DMEM/ F12、Leibo vitz L 15 和DM EM 培养液(pH 7. 2) 在22~ 28 分别启动了大黄鱼鳍组织的体外培养, 通过添加促细胞贴壁和分裂的物质在最适培养条件下对大黄鱼鳍细胞进行了原代培养和继代培养, 并研究了久效磷对大黄鱼细胞系鳍细胞的毒性作用。体外培养结果显示, 大黄鱼鳍细胞的最适培养液为20%FBS DM EM/ F12, 最适培养温度为25 , 体外培养鳍细胞的形态主要为成纤维细胞样, 22 d 后便可形成汇合细胞

单层, 经过连续继代培养成功建立了大黄鱼的连续性鳍细胞系, 目前已传至第112 代; 对第60 代大黄鱼鳍细胞系细胞的鉴定结果显示, 其群体倍增时间为50. 96 h, 分裂状态十分旺盛, 虽然出现了染色体的非整倍性, 但其特征性染色体数目仍为48 条,并具有正常的6m+ 6sm+ 36t 二倍体核型, 证明所建立的细胞系确为大黄鱼鳍细胞系。不同浓度久效磷处理的检测结果显示, 大黄鱼鳍细胞对久效磷敏感, 20~ 160 g/ mL 久效磷可引起鳍细胞乙酰胆碱酯酶活性的持续性显著降低, 引起超氧化物歧化酶和谷胱甘肽 S 转移酶活性的显著升高并随着浓度的升高而逐渐降低, 久效磷对该细胞系细胞的48 h 半抑制浓度(IC50) 为43. 05 g / mL, 证实久效磷对大黄鱼鳍细胞具有显著的毒性作用

【英文摘要】For laying a solid foundat ion fo r cellular tox icolog y, v ir olog y and cell eng ineering studies, this ar ticle is about establishment and ident ification o f large y ellow croaker fin cell line and study of cytotox ic ef fects o f monocrotopho s to the f in cells. T he fin t issues, digested w ith hyaluro nidase and co llag enase II, were cultured in three kinds o f media (pH7. 2) at different temperatures supplemented w ith 20% fetal bov ine serum, carbox ymethyl chito oligosaccharide, cho ndroit insulfate, basic f ibro blast g row th factor and insulin like gr ow th factor I to init iate the primary culture and subculture. T he cultur e in vit ro show ed that the opt imum medium and temperature w ere Dulbecco % s modified Eag le medium/ F12 medium(DMEM/ F12) and 25 respect iv ely , and the fibroblast ic f in cells grew steadily and fo rmed mo no lay er 22 days later. T he large y el low croaker fin cell line has been sucessfully established and subcultur ed to passage 112 now . The f in cells at passage 60 had a populat ion doubling t ime o f 50. 96 h, indicating that the cells still proliferated act ively. Karyo ty pe analysis show ed that the cells exhibited chr omosomal aneuploidy but had a modal diploid chr omosome number of 48 w ith 3 pairs of metacent rics, 3 pairs of submeta cent rics and 18 pairs of telocent rics. In the monocrotopho s t reated cells f rom 20 to 160 g / mL, result s show ed that the act ivit ies o f acetylcho linesterase (AChE) reduced sustaining ly and significant ly, the act ivit ies o f superox ide dismutase (SOD) and g lutathione S t ransferase (GST) increased sig nif icant ly but later reduced alo ng w ith increased concent rat io n of monocrotophos and the 48 h IC50 v alues of monocr otophos to yellow croaker f in cel ls w er e 43. 05 g / mL. Result s show ed that monocrotopho s have significant ly cytotox ic effect to lar ge y ellow cr oaker fin cel ls. The established cont inuous large yellow cr oaker fin cell line has theoret ical significance and pract ical v alue for lay ing a fo undat ion to detect the org anophospho rus pest icide and set ing up a rapid ef fect ive bioassay system, and studing of cellular tox icolog y, virolo gy and cell engineering as an ideal in vit ro research system.

【题目】圆斑星鲽连续性鳃细胞系的建立

【中文关键词】圆斑星鲽; 鳃; 原代培养; 继代培养; 细胞系

【英文关键词】Spo tted halibut (Ver asp er var i egatus) ; g ill; primary culture; subculture; cell line

【中文摘要】为建立圆斑星鲽(Ver asp er v ar iegatus) 鳃细胞系, 本文采用胰蛋白酶消化法启动了圆斑星鲽鳃组织的体外培养, 并通过对培养液配方和培养条件的优化成功地进行了圆斑星鲽鳃细胞的原代培养和继代培养。结果显示, 圆斑星鲽鳃细胞的最适培养液为含有20% 胎牛血清(FBS) 的DMEM/ F12 培养液, 培养液最适pH 值为7. 2, 最适培养温度为22 ; 通过向20% FBSDMEM/ F12 培养液(pH = 7. 2) 中添加N 乙酰葡萄糖盐酸盐、羧甲基壳寡糖、碱性成纤维细胞生长因子(bFGF) 及I 型胰岛素样生长因子(IGFI) , 在22 成功启动了圆斑星鲽鳃细胞的原代培养, 细胞的贴壁、生长和分裂状态良好, 为典型的成纤维样细胞形态, 30 d 即可形成汇合的细胞单层; 经连续继代培养后, 已成功建立了连续性圆斑星鲽鳃细胞系, 现已继代培养至第76 代; 该细胞系细胞经液氮冻存复苏后仍保持其原有的成纤维样细胞形态, 其贴壁生长状态和增殖速度也与冻存前无差异; 生长特性鉴定结果显示, 第60 代圆斑星鲽鳃细胞系细胞的群体倍增时间为43. 6 h,表明细胞的生长分裂依然十分旺盛。染色体分析结果显示, 圆斑星鲽鳃细胞系细胞虽然出现了染色体的非整倍性, 但其特征性染色体数目仍为46 条, 并具有其典型的二倍体核型特征(46 t) , 表明所建立的细胞系确为圆斑星鲽鳃细胞系。该细胞系的建立对于病毒与宿主相互作用机理的研究及病毒疫苗的开发具有重要的理论和应用价值。

【英文摘要】To establish a novel cell line f rom spot ted halibut , Ver asp er var i egatus, primar y culture ofspot ted halibut g ill t issue w as init iated w ith metho ds of t rypsin digest ion, and the cells w ere successfully subcultured thro ug h optimizing the medium formulat ion and culture condit ions. T he gill cel ls grew w ellat 22 in DMEM/ F12 medium (pH7. 2) w hich contained 20% fetal bovine serum (FBS) , NAcetylDg lucosamine, carbo xymethy lchitoolig osaccharide, basic f ibroblast grow th factor (bFGF) and insulinlike g row th facto rI (IGFI) . The cells show ed f ibro blastic shape, g rew r apidly and formed a co nf luent monolayer after 30

days o f cultivat ion. The gill cel ls could be subcultured subsequent ly and maintained their original gr ow th rate af ter cr yopreservat io n and resuscitat ion. The populat io n doubling t ime of the cel l line w as 43. 6 hours at passage 60. Chromo some analysis show ed that some cells w ere chromo somal aneuploidybut most of them had a modal chromosome number o f 46, w hich had a normal diploid kar yotype of 23pairs o f telo cent ric chromosomes at passage 60. A co nt inuous spot ted halibut g ill cell line has been established w hich is being subcultured to passage 76 now . T he establishment of this cell line w ill make greatcont ribut ion to the study of mechanisms of cellv ir us interact ions and the development of viral vaccine forf ish viral disease cont rol.

【题目】太平洋牡蛎人工培育群体的繁殖习性初探
【中文关键词】太平洋牡蛎(Crassostrea gigas);人工培育群体;繁殖习性
【英文关键词】Pacific oyster, Crassostrea gigas;cultivated groups;reproductive characteristics
【中文摘要】作者对太平洋牡蛎(Crassostrea gigas)人工培育群体的繁殖习性进行了初步探讨。经室内升温人工育苗培育的牡蛎性成熟年龄缩短,受精135 d 后性腺发育成熟;雌雄性比随着年龄而变化,4.5 月龄的牡蛎群体中,雄性占优势(68.93%),雌雄性比为1∶2.73;1 龄群体中,雌雄两性比例接近,性比为1∶1.07;2 龄群体中雌性(63.69%)明显多于雄性,雌雄性比为1∶0.599。群体中存在雌雄同体现象,雌雄同体率随着年龄的增长而降低, 4.5月龄的牡蛎群体中,雌雄同体高达1.94%,1 龄群体中雌雄同体比例降低为0.35%,而2 龄牡蛎群体中,雌雄同体率仅为0.12%;雌雄同体者能够自体受精。怀卵量随年龄的增长而增大,1 龄牡蛎的平均怀卵量在800 万粒~856.8 万粒,而2 龄牡蛎的平均怀卵量在2 333.80万粒~2 900 万粒之间,明显多于1 龄群体;怀卵量的多少也与亲贝的营养条件和性腺的发育程度有关。雌体的壳高、壳宽、体质量和软体部质量都明显大于雄体(P<0.05),但雌雄两性在壳长方面差异不显著。
【英文摘要】The reproductive characteristics of cultured Pacific oysters (Crassostrea gigas) were discussed in this study. The time for sex maturation shortened in oysters that were artificially breeded inside the door by promoting the sea water temperature. The gonad matured only 135 days after fertilization in these oysters. Sex ratio of female to male varied greatly with ages, was 1:2.73 in a 4.5-month-old group, 1:1.07 in 1-year-old group and 1:0.599 in 2-year-old group. Hermaphrodites exist in oyster groups and the rate of hermaphrodites reduced with the increase of ages. The proportion of hermaphrodites was up to 1.94% in 4.5-month-old group and lowed to 0.35% in 1-year-old oyster, only 0.12% of hermaphrodites were observed in 2-year-old group. Self-fertilization was realizable in hermaphrodites. The fecundity increases with the increase of ages, the mean amount of eggs in each femle ranges from 23.338~290.0 million in 2-year-old oyster which were significantly more than that in 1-year-old group (ranged from 80.0~85.68million). Beside ages, fecundity also depended on nutrition and extent of gonad development. The females were larger than males in shell height, shell width, whole weight and tissue weight(P<0.05), but no significant differences were noticed in shell length between males and females.

【题目】中国明对虾caspase基因的克隆与表达分析
【中文关键词】中国明对虾(Fenneropenaeus chinensis) 基因克隆 Caspase WSSV攻毒 实时定量PCR分析
【英文关键词】Fenneropenaeus chinensis,caspase gene cloning,WSSV challenge,real-time PCR,RNAi
【中文摘要】利用细胞凋亡来清除多细胞器官受损伤或有害的细胞,为动物发育过程中保持机体平衡起到关键作用。为了研究细胞凋亡在甲壳类动物应对病毒感染后所起到的作用,作者利用同源克隆技术获得了中国明对虾(Fenneropenaeus chinensis)caspase基因(FcCasp)的cDNA序列,并分析了该基因在对虾受到白斑综合症病毒(white spot syndrome virus,简称WSSV)刺激后的表达变化规律。结果表明,该基因的cDNA含有954个核苷酸,编码317个氨基酸,具有caspase家族典型的QACRG五肽蛋白酶活性位点(190-194氨基酸)。对注射了WSSV的中国明对虾FcCasp的表达进行分析,在5个时间点取其肝胰脏样本,经real-time PCR检测发现,WSSV刺激3 h后,对虾肝胰脏中FcCasp的表达呈现显著性上调,说明FcCasp的表达与WSSV感染密切相关,提示FcCasp基因与细胞凋亡相关。
【英文摘要】Apoptosis eliminates unwanted cells, from an organism including damaged and virus-infected cells, being a fundamental cellular process that plays a critical role in normal development and tissue homeostasis. Here we studied a caspase homolog from Chinese shrimp Fenneropenaeus chinensis, designated FcCasp. An open reading frame of 954 nucleotides encoding 317 amino acids (aa) contained a conserved motif, QACRG, of known caspases- 3, and was located at aa 190 – 194. FcCasp expressions were measured in normal shrimp and in shrimp infected by white spot syndrome virus (WSSV) at five time-points post-injection (p.i.)

with real-time PCR, revealing different expression profiles of FcCasp gene in hepatopancreas of shrimps after they were challenged by WSSV. The transcription of FcCasp in hepatopancreas showed up-regulation 12 h post-challenge, indicating the expression of FcCasp was closely related to WSSV challenge. Therefore, FcCasp might be involved in the apoptosis.

【题目】Occurrence and characterization of dimethachlon insensitivity in Sclerotinia sclerotiorum in Jiangsu Province of China
【中文关键词】Occurrence and Characterization;dimethachlon Insensitivity
;Sclerotinia sclerotiorum ; Jiangsu Province of China
【英文关键词】Occurrence and Characterization;dimethachlon Insensitivity
;Sclerotinia sclerotiorum ; Jiangsu Province of China
【中文摘要】Sclerotinia stem rot, caused by Sclerotinia sclerotiorum, is the main fungal disease of oilseedrape (Brassica napus) in China. Numerous fungicide applications are required for control. Dimethachlon,one of the dicarboximide fungicides, has been the major fungicide for disease controlafter benzimidazole resistance became widespread. Fungal populations were collectedthroughout Jiangsu Province between 2006 and 2007 in order to determine their sensitivity todimethachlon. A total of 1,066 single-sclerotium isolates of S. sclerotiorum were collected, andmost of the isolates were considered sensitive to dimethachlon. Five isolates collected inYancheng and Changzhou showed normal growth at 5 μg/ml dimethachlon with the resistancefactor ≈ 10 (resistance factor was estimated as ratios between the EC50 values of resistant isolatesand the average EC50 values of sensitive ones) compared to the sensitive isolates (EC50 isthe concentration of fungicide causing 50% reduction in growth). Through in vitro selection forresistance to the fungicide, 25 dimethachlon-resistant mutants were derived from 10 wild-typeisolates of S. sclerotiorum. The resistance factors for the isolates ranged from 198 to 484, andthe isolates were considered highly resistant to dimethachlon. Therefore, at least two differentmechanisms of resistance seem to be involved: one that may provide a moderate resistance (insensitivity)and a second that may give a high resistance level under laboratory conditions. Therewas positive cross-resistance between dimethachlon and other dicarboximide fungicides, such asiprodione and procymidone, in these S. sclerotiorum isolates. The field dimethachlon-insensitiveand the laboratory-induced dimethachlon-resistant isolates appeared to have mycelial growth,sclerotial production, and pathogenicity comparable to their wild-type parental isolates. Also,results of osmotic tests showed that there were no significant difference in mycelial radialgrowth between the field dimethachlon-sensitive and field dimethachlon-insensitive isolates onpotato dextrose agar plates amended with 2, 4, 6, or 8% (wt/vol) NaCl, but the laboratoryinduceddimethachlon-resistant isolates grew significantly more slowly than their wild-typesensitive parents under all concentrations of NaCl. Because these studies yielded a high frequencyof laboratory resistance in S. sclerotiorum, together with the occurrence of field insensitivity,appropriate precautions against resistance development in natural populations should betaken.

【题目】PIRA-PCR for detection of Fusarium graminearum genotypes with moderate resistance to carbendazim

【中文关键词】Gibberella zeae, methyl benzimidazole carbamates (MBC), molecular detection, single nucleotide mutation, wheat scab, b2-tubulin

【英文关键词】Gibberella zeae, methyl benzimidazole carbamates (MBC), molecular detection, single nucleotide mutation, wheat scab, b2-tubulin

【中文摘要】PIRA-PCR (primer-introduced restriction analysis PCR) was developed to detect isolates of Fusarium graminearum withmoderate resistance to carbendazim, a methyl benzimidazole carbamate (MBC)-group fungicide. Two primer pairs weredesigned and synthesized according to the nucleotide sequence of the b2-tubulin gene from F. graminearum. Fragmentsof 164 bp were amplified by nested PCR from isolates differing in carbendazim sensitivity. A HindIII restriction enzymerecognition site was introduced artificially by inner primers to detect a mutation at codon 167, and TaaI (Tsp4CI) restrictionenzyme was used to detect a mutation at codon 200. The sensitivity of isolates to carbendazim was determined byanalyzing electrophoresis patterns of the resulting PCR products after simultaneous digestion with both HindIII andTaaI. Results from PIRA-PCR and a conventional method (mycelial growth on agar) were identical but PIRA-PCRrequired only 7 – 8 h while the conventional method required 5 – 7 days. This study demonstrates that PIRA-PCR not onlymonitors the appearance of moderately resistant isolates, but can be useful for detecting genotypes of F. graminearumwith moderate resistance to carbendazim.

【题目】Sexual recombination of carbendazim-resistance in Fusarium graminearum under field conditions
【中文关键词】Gibberella zeae; carbendazim resistance; disease management; sexual recombination; epidemiology; population biology
【英文关键词】Gibberella zeae; carbendazim resistance; disease management; sexual recombination; epidemiology; population biology
【中文摘要】BACKGROUND: Carbendazim has been the major fungicide for control of Fusarium head blight (FHB) caused by Fusariumgraminearum Schwade in China.However, the effectiveness of carbendazim has been threatened by the emergence of resistantpathogen populations in the field.RESULTS: Five isolates, representing three phenotypes of different carbendazim sensitivity levels (S,MRandHR),were randomlyselected to study the inheritance of carbendazim resistance by three genetic crosses under field conditions. Each parent in allcrosseswas marked with a different class of nitrate non-utilizing (nit)mutation. The presence of sexual recombinants indicatedthat outcrossing had occurred in the crosses. Over 100 putative self-crossing or outcrossing perithecia for each cross wererandomly sampled on the surface of the haulms of dead rice for each pair of parents. Results showed that 5.7 – 20.9% outcrossingfrequency occurred in the three crosses and confirmed sexual recombination under field conditions. There were no significantdifferences inmycelial linear growth and pathogenicity between the selected recombinants and their parents, but they differedin sporulation ability and capacity to produce perithecia. Nevertheless, most of the sexual recombinants possessed fitnesslevels comparable with those of their parents.CONCLUSION: Outcrossing between carbendazim-sensitive and -resistant isolates did occur under field conditions, and sexualrecombinationmust play a role in the development of carbendazim resistance in the field.

【题目】γ - Polyglutamic acid (γ - PGA) produced by Bacillus amyloliquefaciens C06 promoting its colonization on fruit surface
【中文关键词】无
【英文关键词】Bacillus amyloliquefaciens C06、γ -Polyglutamic acid (PGA)、Surface colonization Biofilm、Surface adhesion、Swarming motility
【中文摘要】无
【英文摘要】Bacillus amyloliquefaciens C06, an effective biological agent in controlling brown rot of stone fruit caused by Monilinia fructicola, was also found to produce extra-cellular mucilage and form mucoid colonies on semisolid surfaces. This study aimed to characterize the extra-cellular mucilage produced by B. amyloliquefaciens C06 using transposon mutagenesis and biochemical and physical analyses. The mucilage production in B. amyloliquefaciens C06 was demonstrated to be associated with ywsC gene expression and characterized to be of high molecular weight, consisted of only glutamic acid and linked with non-peptide bonds, thus identified as γ -polyglutamic acid (γ -PGA). Compared with wild type B. amyloliquefaciens C06, its mutants deficient in producing γ -PGA, e.g. M106 and C06 Δ ywsC showed less efficiency in biofilm formation, surface adhesion and swarming ability. It was also demonstrated that γ -PGA was not essential for C06 to form colony on semi-solid surfaces, but was able to improve its colony structure. In vivo

evaluation showed that disruption of γ-PGA production in C06ΔywsC impaired its efficiency of colonizing apple surfaces.

【题目】Depressed biofilm production in Bacillus amyloliquefaciens C06 causes γ-polyglutamic acid (γ-PGA) overproduction
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】Bacillus amyloliquefaciens C06, a potential agent in biological preservation of post-harvest fruit, was found to secrete extra-cellular gamma-polyglutamic acid (gamma-PGA) in liquid culture. In this work, M306, a transposon mutant of B. amyloliquefaciens C06, defective in forming structured colony and displaying enhanced ability of producing gamma-PGA, was obtained. Inverse PCR and quantitative reverse transcription PCR (qRT-PCR) analysis demonstrated that the defective phenotype in M306 was associated with an ORF showing high similarity to RBAM_034550 from B. amyloliquefaciens FZB42. In this paper, the ORF was designated pbrA, standing for gamma-PGA production and biofilm formation regulatory factor. qRT-PCR analysis also indicated that pbrA down-regulated mRNA expression of epsD and yqxM, the crucial genes involved in biofilm formation, but affected little on expression of ywtB, the gene directing gamma-PGA synthesis. Evaluations in gamma-PGA productivity of wild-type C06 and its mutants C06 Delta epsA and C06 Delta tasA, respectively, deficient in producing exopolysaccharides (EPS) and TasA, revealed that gamma-PGA overproduction in M306 was probably due to the redistributed metabolic flux caused by defective production of EPS.

【题目】Identification and Analysis of Polychlorinated Biphenyls (PCBs)-Biodegrading Bacterial Strains in Shanghai
【中文关键词】无
【英文关键词】Identification ;Polychlorinated Biphenyls ; Biodegrading ;Bacterial Strains;Shanghai
【中文摘要】无
【英文摘要】Abstract As one of China ’s great metropolises, Shanghaiis vulnerable to various forms of industrial and agriculturalcontamination associated with its development. Polychlorinatedbiphenyls (PCBs) are man-made chemicals thatnever existed in nature until the 1900s when they started tobe released into the environment. PCBs are hazardousenvironmental contaminants that bind strongly to soil. Inthis study, four soil samples were screened for the presenceof PCB-degrading bacteria. The 16 S rDNAs were amplifiedfrom those genomes and the products (*1.5 kb) werepurified and sequenced for the isolation and identificationof bacterial species. Four Pseudomonas strains (strain1-212 from sample 1; strain 2-241 from sample 2; strain3-318 from sample 3; and strain 4-150 from sample 4) wereselected for analysis by HPLC. Setting the content of thebiphenyl in CK as 100%, the biphenyl contents was 2.32%in 1-212, 73.11% in 2-241, 69.83% in 3-318, and 86.16%in 4-150. The results of this study suggest directions forfuture research, including genetic screening, cloning andrestructuring, and provide guidance for the cultivation ofPCBs-degrading bacteria.

【题目】Identification of Up-regulated Genes of Bacillus amyloliquefaciens B55 During the Early Stage of Direct Surface Contact with Rice R109 Root
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】The early stage of plant-rhizobacteria interaction, affected by plant root exudates and plant-rhizobacteria surface contact, is considered to be critical for plant growth-promoting rhizobacteria colonizing plant roots and initiating the beneficial effects on plant growth. However, little is known about the mechanisms of plant-rhizobacteria surface contact involved in early stage of plant-rhizobacteria interaction. In order to reveal the molecular mechanisms of the surface contact, a rhizobacterium Bacillus amyloliquefaciens B55 was interacted with plant roots of rice R109 and used to perform a cDNA-based suppression-subtractive hybridization. Seven differentially expressed DNA fragments were identified. Except for the two fragments showing no matches to any known sequences in the Genbank, the other five fragments were found to have high homologies with the genes encoding 2-oxoglutarate dehydrogenase E1 component OdhA, aspartate ammonia-lyase AnsB, and hypothetical protein proposed to be involved in surface adhesion, acetolactate decarboxylase AlsD, and DNA mismatch repair protein MutL, respectively. The induced RNA expression levels of two putative genes ansB and odhA and an unmatched DNA fragment BD33 were verified by RT-PCR analysis.

【题目】Identification of candidate genes involved in responses of Arabidopsis to polychlorinated biphenyls based on microarray analysis
【中文关键词】无
【英文关键词】Polychlorinated biphenyls Microarray
Gene expression Arabidopsis Phytoremediation
【中文摘要】无
【英文摘要】Abstract Polychlorinated biphenyls (PCBs) are consideredas persistent organic pollutants. Their long termaccumulation in soils and progressive bioaccumulation inthe food chain makes PCBs a risk for human health. Phytoremediation,or the use of plants to enhance pollutantdissipation, is an efficient technique for the removal oforganic compounds, including PCBs. However, themolecular basis of plant responses to PCBs has not beenclearly elucidated. Here we studied the effects on growthand the transcriptional profile of Arabidopsis thaliana afterexposure to 2,20,3,30-tetrachlorobiphenyl, a representativePCB. A comprehensive survey of global gene expressionresponse to this PCB was done by using Arabidopsis (V4)gene expression microarray (4 9 44 K) to quantify thespatio-temporal variations in transcript abundance of42,000 genes. The results revealed a coordinated inductionor suppression of 146 or 148 genes, respectively. Of these,expression of 40 genes was validated by RT-PCR analysis.The functional classification of these PCB-responsivegenes indicated their involvement in various metabolicpathways, such as ion transport, signal transduction, transcriptionalregulation, and other processes related togrowth and development.

【题目】Expression, purification and functional characterization of a recombinant 2,3-dihydroxybiphenyl-1,2-dioxygenase from Rhodococcus rhodochrous
【中文关键词】无
【英文关键词】Bphc gene 2,3-Dihydroxybiphenyl dioxygenase Pseudomonas 2,3-Dihydroxybiphenyl HPLC
【中文摘要】无
【英文摘要】Abstract A 2,3-dihydroxybiphenyl (2,3-DHBP) dioxygenasegene from a Rhodococcus sp. strain, namedRrbphCI and involved in the degradation of polychlorinatedbiphenyls (PCBs), was synthesized. RrbphCI wasexpressed in Escherichia coli and its encoded enzyme waspurified. SDS – PAGE analysis indicated that the size of theprotein encoded by RrbphCI was about 32 kDa. Theactivity of the 2,3-DHBP dioxygenase was 82.8 U/mgwhen the substrate was 2,3-DHBP, with optimum pH 8.0 at30 C, and optimum temperature was 40 C at pH 8.0. TheRrbphCI gene was transformed into Pseudomonas putidastrain EG11, to determine the ability of the enzyme todegrade 2,3-DHBP. The wild type EG11 degraded 61.86%of supplied 2,3-DHBP and the transformed EG11 (hostingthe RrbphCI gene) utilized 52.68% after 2 min of treatmentat 30 C. The overexpressed and purified enzyme was ableto degrade 2,3-DHBP. The 2,3-DHBP dioxygenase is a keyenzyme in the PCB degradation pathway. RrbphCI and itsencoded 2,3-DHBP dioxygenase may have transgenicapplications in bioremediation of PCBs.

【题目】Assessment of Inheritance Pattern and Agronomic Performance of Transgenic Rapeseed having HarpinXooc-Encoding hrf2 Gene
【中文关键词】无
【英文关键词】Transgenic rapeseed,hrf2 gene,Inheritance , Resistance,Agronomic performance
【中文摘要】无
【英文摘要】hrf2 gene is a member of the harpin-encoding gene family of rice-pathogenic bacterium Xanthomonas oryzae pv. oryzicola. In our previous studies, we observed that harpin(Xooc) could elicit hypersensitive cell death in non-host plants, induce disease and insect resistance in plants, and enhance plant growth. In this study, the rapeseed cultivar, Yangyou 4, was genetically engineered via Agrobacterium-mediated transformation to express the hrf2 gene. Polymerase chain reaction (PCR) and southern blot analyses of T-1 generation of transgenic rapeseed revealed stable integration and expression of the inserted gene hrf2. In addition, the resistance to Sclerotinia sclerotiorum was greatly enhanced. A comparison between agronomic characters of transgenic and control lines displayed significant differences in terms of plant height, stem width, number of pods per plant, number of seeds per pod, 1,000-seed weight, and seed yield per plant. Among lines with resistance to S. sclerotiorum, T(1)1 had improved agronomic traits compared with controls with a 22.7% seed yield increase. These results suggest that the introduction of the hrf2 gene into rapeseed can be an effective strategy for enhancing resistance to S. sclerotiorum

【题目】Molecular Mechanism of Plant Growth Promotion and Induced Systemic Resistance to Tobacco Mosaic Virus by Bacillus spp
【中文关键词】无
【英文关键词】Bacillus spp, PGPR, induced systemic resistance,
tobacco mosaic virus, growth promotion

【中文摘要】无
【英文摘要】Bacillus spp., as a type of plant growth-promoting rhizobacteria (PGPR), were studied with regards promoting plant growth and inducing plant systemic resistance. The results of greenhouse experiments with tobacco plants demonstrated that treatment with the Bacillus spp. significantly enhanced the plant height and fresh weight, while clearly lowering the disease severity rating of the tobacco mosaic virus (TMV) at 28 days post-inoculation (dpi). The TMV accumulation in the young non-inoculated leaves was remarkably lower for all the plants treated with the Bacillus spp. An RT-PCR analysis of the signaling regulatory genes Coil and NPR1, and defense genes PR-1a and PR-1b, in the tobacco treated with the Bacillus spp. revealed an association with enhancing the systemic resistance of tobacco to TMV. A further analysis of two expansin genes that regulate plant cell growth, NtEXP2 and NtEXP6, also verified a concomitant growth promotion in the roots and leaves of the tobacco responding to the Bacillus spp.

【题目】Over-expression of ThpI from Choristoneura fumiferana enhances tolerance to cold in plants
【中文关键词】无
【英文关键词】Thermal hysteresis protein I ;Low temperature stress; Electrolyte leakage ;Malondialdehyde ; Proline
【中文摘要】无
【英文摘要】Abstract Thermal hysteresis proteins (Thps) known asantifreeze proteins for their antifreeze activity, depress thefreezing point of water below the melting point in manypolar marine fishes, terrestrial arthropods and plants. Forthe purpose of breeding cold-resistant plants, we designedto introduce the Thp gene into the plants. The physiologicaland biochemical effect of high-lever expression of themodified Choristoneura fumiferana Thp (ThpI) in Arabidopsisthaliana plants was analyzed. Under low temperaturestress, the ThpI transgenic plants exhibited stronger growththan wild-type plants. The elevated cold tolerance of theThpI over-expressing plants was confirmed by the changesof electrolyte leakage activity, malonyldialdehyde andproline contents. These results preliminarily showed thatthe Thp possibly be used to enhance the low temperaturetolerantability of plants.

【题目】Expression of HpaG(Xooc) Protein in Bacillus subtilis and its Biological Functions
【中文关键词】无
【英文关键词】HpaGXooc, Bacillus subtilis, biological function
【中文摘要】无
【英文摘要】HpaG(Xooc), from rice pathogenic bacterium Xanthomonas oryzae pv. oryzicola, is a member of the harpin group of proteins, eliciting hypersensitive cell death in non-host plants, inducing disease and insect resistance in plants, and enhancing plant growth. To express and secret the HpaG(Xooc) protein in Bacillus subtilis, we constructed a recombinant expression vector pM43HF with stronger promoter P43 and signal peptide element nprB. The SDS-PAGE and Western blot analysis demonstrated the expression of the protein HpaG(Xooc) in B. subtilis. The ELISA analysis determined the optimum condition for HpaG(Xooc) expression in B. subtilis WBHF. The biological function analysis indicated that the protein HpaG(Xooc) from B. subtilis WBHF elicits hypersensitive response (HR) and enhances the growth of tobacco. The results of RT-PCR analysis revealed that HpaG(Xooc) induces expression of the pathogenesis-related genes PR-1a and PR-1b in plant defense response

【题目】Molecular and biochemical detection of fengycin- and bacillomycin D-producing Bacillus spp., antagonistic to fungal pathogens of canola and wheat
【中文关键词】无
【英文关键词】Bacillus spp.; bacillomycin D; fengycin; PCR detection; MALDI-TOF-MS
【中文摘要】无
【英文摘要】Bacillus species are well known for their ability to control plant diseases through various mechanisms, including the production of secondary metabolites. Bacillus subtilis DFH08, an antagonist of Fusarium graminearum, and other Bacillus spp. that are antagonists of common fungal pathogens of canola were screened for peptide synthetase biosynthetic genes of fengycin and bacillomycin D. Specific polymerase chain reaction (PCR) primers identified B. subtilis strains DFH08 and 49 for the presence of the fenD gene of the fengycin operon. Bacillus cereus DFE4, Bacillus amyloliquefaciens strains DFE16 and BS6, and B. subtilis 49 were identified for the presence of the bamC gene of the bacillomycin D synthetase biosynthetic operon. Both fengycin and bacillomycin D were detected in the culture extract of strain Bs49, characterized through MALDI-TOF-MS (matrix-assisted laser desorption ionization - time of flight - mass spectrometry), and their antifungal activities demonstrated against F. graminearum and Sclerotinia sclerotiorum. This study designed and used specific PCR primers for the detection of potential fengycin- and bacillomycin D-producing bacteria antagonists and confirmed the molecular detection with the biochemical detection of the corresponding antibiotic produced. This is also the first report of a B. cereus strain (DFE4) to have bacillomycin D biosynthetic genes. Bacteria that synthesize these lipopeptides could act as natural genetic sources for genetic engineering of the peptide synthetases for production of novel peptides.

【题目】Cloning, expression and characterization of a new aspartate aminotransferase from Bacillus subtilis B3
【中文关键词】无
【英文关键词】aspartate aminotransferase; Bacillus subtilis;
conserved active residues; kinetic
parameters; protein sequence analysis
【中文摘要】无
【英文摘要】In the present study, we report the identification of a new gene from theBacillus subtilis B3 strain (aatB3), which comprises 1308 bp encoding a 436amino acid protein with a monomer molecular weight of 49.1 kDa. Phylogeneticanalyses suggested that this enzyme is a member of the Ib subgroupof aspartate aminotransferases (AATs; EC 2.6.1.1), although it also hasconserved active residues and thermostability characteristic of Ia-typeAATs. The Asp232, Lys270 and Arg403 residues of AATB3 play a key rolein transamination. The enzyme showed maximal activity at pH 8.0 and45 C, had relatively high activity over an alkaline pH range (pH 7.0 – 9.0)and was stable up to 50 C. AATB3 catalyzed the transamination of fiveamino acids, with L-aspartate being the optimal substrate. The Km valueswere determined to be 6.7 mM for L-aspartate, 0.3 mM for a-ketoglutarate,8.0 mM for L-glutamate and 0.6 mM for oxaloacetate. A 32-residue N-terminalamino acid sequence of this enzyme has 53% identity with that ofBacillus circulans AAT, although it is absent in all other AATs from differentorganisms. Further studies on AATB3 may confirm that it is potentiallybeneficial in basic research as well as various industrial applications.

【题目】The purL gene of Bacillus subtilis is associated with nematicidal activity
【中文关键词】无

【英文关键词】biocontrol; Bacillus; plant-parasitic nematodes; nematicidal-related genes; purL
【中文摘要】无
【英文摘要】Parasitic nematodes of plants are important plant pathogens that represent a significant financial burden on agriculture. This study evaluated the efficacy of Bacillus spp. as nematode biocontrol agents and identified Bacillus genes associated with nematicidal activity. Culture by products of Bacillus subtilis strains OKB105 and 69 and Bacillus amyloliquefaciens strains FZB42 and B3 were used to treat Aphelenchoides besseyi, Ditylenchus destructor, Bursaphelenchus xylophilus and Meloidogyne javanica, respectively. The highest mortality rates were observed at 12 h when combinations of either A. besseyi/B3, D. destructor/OKB105, B. xylophilus/69 or M. javanica/OKB105 resulted in 10.6%, 27.6%, 35.6% and 100% mortality rates, respectively. Supernatant analysis demonstrated that the nematicidal active ingredients of strain OKB105, with a molecular weight of < 1000 Da, were nonproteinaceous, heat and cold resistant, highly polar and could be evaporated but not extracted by some organic solvents. To identify nematicidal-related genes, 2000 OKB105 mutants were generated using the TnYLB-1 transposon. Mutant M1 lost nematicidal activity by 72 h and inverse PCR results demonstrated disruption of the purL gene. Nematicidal activity was restored when M1 mutant was complemented with either plasmid pMA5-purL or pUC18-purL, demonstrating a role for purL in mediating nematicidal activity

【题目】Functional analysis and application of the cryptic plasmid pBSG3 harboring the RapQ-PhrQ system in Bacillus amyloliquefaciens B3
【中文关键词】无
【英文关键词】Bacillus amyloliquefaciens; Rolling-circle replication plasmid; RapQ-PhrQ system; Shuttle vector; HpaG(xooc) protein
【中文摘要】无
【英文摘要】This work sequenced and characterized a cryptic plasmid called pBSG3 from wild-type Bacillus amyloliquefaciens B3 - a powerful agent for suppression of plant pathogenic organisms. It is an 8439 bp circular molecule, with G + C content of 40.3%. We provide evidence that pBSG3 replicates via the rolling-circle (RC) mechanism and, sequence comparisons place it in the pC194 family of rolling-circle-replicons. The plasmid contains seven putative open reading frames (ORFs), including genes repB3, mobB3. rapQ, phrQ, pgsR, and two unknown ORFs (orf1c and orf2). Our observations reveal that the RapQ-PhrQ (response regulator aspartate phosphatase-phosphatase regulator) system is involved in sporulation and RapQ can delay the onset of sporulation. Two Escherichia coli and Bacillus potential shuttle vectors, pTRD (containing the minimal replicon) and pTRDS (containing the minimal replicon and the single-strand origin) were developed from pBSG3 and tested the stability. Moreover, HpaG(xooc) protein, which can induce disease and insect resistance in plants, was tried to express with the stable vector pTRDS in Bacillus subtilis. In summary, the pBSG3 plasmid containing various genes is not only a candidate tool for vector development in Bacillus genus research but also a potential vehicle for the exchange of genetic elements among Bacillus populations that contributes to the survival of bacilli in natural environments. 【题目】Molecular characterization of two important antifungal proteins isolated by downy mildew infection in non-heading Chinese cabbage
【中文关键词】略
【英文关键词】Downy mildew; Non-heading Chinese cabbage (Brassica rapa ssp. chinensis L.) ;Plant chitinase;Plant defensin;Real-time quantitative PCR;Systemic acquired resistance
【中文摘要】略
【英文摘要】Two cDNA clones for a pathogen inducedgenes in non-heading Chinese cabbage (Brassica rapa ssp.chinensis L. cv. Suzhouqing) were isolated and character-ized. The two full-length cDNA clones, designated Bcchiand BcAF were isolated during the resistance response toPeronospora parasitica. Sequence analysis of corre-sponding cDNA clones con fi rmed the translation productsof both genes showed high degree of homology to otherplant chitinases and plant defensins, respectively. GenomicDNA Southern blot analysis indicated that each gene rep-resented a small multi-gene family. Upon inoculation withP. parasitica, both genes transcripts were rapid accumu-lated in the infected leaves. Tissue-speci fi c expression ofboth genes showed that 24 h post-inoculation the highestexpression tissue of Bcchi mRNA was leaves, and 12 hpost-inoculation the highest expression tissue of BcAFmRNA was leaves. These data revealed that both genesmay be involved in plant resistance against fungal patho-gen infection.

【题目】The construction of a genetic linkage map of non-heading Chinese cabbage (Brassica campestris ssp. chinensis Makino)
【中文关键词】略
【英文关键词】non-heading Chinese cabbage; genetic linkage map; SRAP; SSR; RAPD
【中文摘要】略
【英文摘要】Non-heading Chinese cabbage (Brassica campestris ssp. chinensis Makino) is one of the most important vegetables in eastern China. A genetic linkage map was constructed using 127 doubled haploid (DH) lines, and the DH population was derived from a commercial hybrid “ Hanxiao ” (lines SW-13 × L-118). Out of the 614 polymorphic markers, 43.49% were not assigned to any of the linkage groups (LGs). Chi-square tests showed that 42.67% markers were distorted from expected Mendelian segregation ratios, and the direction of distorted segregation was mainly toward the paternal parent L-118. After sequentially removing the

markers that had an interval distance smaller than 1 cM from the upper marker, the overall quality of the linkage map was increased. Two hundred and sixty-eight molecular markers were mapped into 10 LGs, which were anchored to the corresponding chromosome of the B. rapa reference map based on com-mon simple sequence repeat (SSR) markers. The map covers 973.38 cM of the genome and the average interval distance between markers was 3.63 cM. The number of markers on each LG ranged from 18 (R08) to 64 (R07), with an average interval distance within a single LG from 1.70 cM (R07) to 6.71 cM (R06). Among these mapped markers, 169 were sequence-related amplified polymorphism (SRAP) mo-lecular markers, 50 were SSR markers and 49 were random amplification polymorphic DNA (RAPD) markers. With further saturation to the LG, the current map offers a genetic tool for loci analysis for important agronomic traits.

【题目】Linkage map construction and QTL analysis for bolting trait based on a DH population of Brassica rapa

【中文关键词】略

【英文关键词】bolting index; Chinese cabbage; doubled haploid population; genetic map; quantitative trait loci.

【中文摘要】略

【英文摘要】Early bolting of Chinese cabbage (Brassica rapa L.) during spring cultivation often has detrimental effects on theyield and quality of the harvested products. Breeding late bolting varieties is a major objective of Chinese cabbagebreeding programs. In order to analyze the genetic basis of bolting traits, a genetic map of B. rapa was constructedbased on amplified fragment-length polymorphism (AFLP), sequence-related amplified polymorphism (SRAP), simplesequence repeat (SSR), random amplification of polymorphic DNA (RAPD), and isozyme markers. Marker analysiswas carried out on 81 double haploid (DH) lines obtained by microspore culture from F1 progeny of two homozygousparents: B. rapa L. ssp. pekinensis (BY) (an extra-early bolting Chinese cabbage line) and B. rapa L. ssp. rapifera(MM) (an extra-late bolting European turnip line). A total of 326 markers including 130 AFLPs, 123 SRAPs, 16 SSRs, 43RAPDs and 14 isozymes were used to construct a linkage map with 10 linkage groups covering 882 cM with anaverage distance of 2.71 cM between loci. The bolting trait of each DH line was evaluated by the bolting index undercontrolled conditions. Quantitative trait loci (QTL) analysis was conducted using multiple QTL model mapping withMapQTL5.0 software. Eight QTLs controlling bolting resistance were identified. These QTLs, accounting for 14.1% to25.2% of the phenotypic variation with positive additive effects, were distributed into three linkage groups. Theseresults provide useful information for molecular marker-assisted selection of late bolting traits in Chinese cab-bage breeding programs.

【题目】Unconditional and Conditional Quantitative Trait Loci Mapping for Plant Height in Nonheading Chinese Cabbage.

【中文关键词】略

【英文关键词】nonheading Chinese cabbage, plant height, unconditional QTL mapping, conditional QTL mapping

【中文摘要】略

【英文摘要】Quantitative trait loci (QTLs) identi fi ed so far in Brassica were mainly generatedin the fi nal stage of plant development, which did not apply to the exploitation of geneticeffects that were expressed during a speci fi c developmental stage.

Thus, the objective of thisstudy was to simultaneously identify unconditional and conditional QTL associated withplant height at various stages of nonheading Chinese cabbage. One hundred twelve doubledhaploid (DH) lines developed from the cross between nonheading Chinese cabbage lines ‘ SW-13 ’ and ‘ SU-124 ’ were used for QTL analysis of plant height by the composite intervalmapping method combined with mixed genetic model. The map we used for QTL analysiswas an updated version of the first genetic map of nonheading Chinese cabbage with 48additional markers to the same DH population. With data from 2 years, a total of 11unconditional QTLs in six linkage groups and 23 conditional QTLs in eight linkage groupswere identified for plant height. The results indicated that the number and type of QTLsand their genetic effects for plant height were different in a series of measuring stages. EachQTL can explain 7.92% to 28.25% of the total phenotypic variation. Two QTLs (ph8-4 andph8-5) were identified to be associated with plant height using both unconditional andconditional mapping methods simultaneously in 2 years. These results demonstrated that itis highly effective for mapping QTL of developmental traits using the unconditional andconditional analysis methodology.

【题目】IdentiWcation of SCAR markers linked to or, a gene inducing beta-carotene accumulation in Chinese cabbage

【中文关键词】略

【英文关键词】Chinese cabbage (Brassica rapa L. ssp. pekinensis) · Orange head leaf gene (or) · SCAR markers · Gene mapping · Marker-assisted selection

【中文摘要】略

【英文摘要】The or mutation in Chinese cabbage(Brassica rapa L. ssp. pekinensis) is a recessive, sin-gle-locus mutation that causes the head leaves of theplant to accumulate carotenoids and turn orange. InChina, considerable attention has been focused inrecent years on breeding the variety with orange headleaves. In this study, sequence-characterized ampliWedregion (SCAR) markers linked to the or gene wereidentiWed based on random ampliWed polymorphicDNA (RAPD) and ampliWed fragment length poly-morphism (AFLP) by performing a bulked segregantanalysis (BSA) using a doubled haploid (DH) popula-tion derived from the F1 cross between 91-112 (whitehead leaves) and T12-19 (orange head leaves) viamicrospore culture. Two RAPD markers—OPB01-845 and OPAX18-656—and 1 AFLP marker, namely,P67M54-172, were identiWed to be linked to the orgene, and they were successfully converted into theSCAR markers SCR-845, SCOR204, and SCOR127,respectively. In a linkage analysis, these 3 SCARmarkers and 2 previously published simple sequencerepeat markers, namely, BRMS-51 and Ni4D09(located on R9 linkage group), were mapped to thesame linkage group with the or gene at a LOD score of6.0, indicating that the or gene should be located onthe linkage group R9 of the A genome. In addition,accuracies of 92%, 90%, and 89.1% were obtainedwhen 110 diVerent inbred breeding lines of Chinesecabbage were used for investigation with these 3SCAR markers, indicating that these makers could beused in marker-assisted selection in orange head leafbreeding programs for Chinese cabbage.

【题目】A Genetic Linkage Map of Nonheading Chinese Cabbage
【中文关键词】略
【英文关键词】Brassica rapa ssp. chinensis, doubled haploid population, SSR, RAPD, SRAP, ISSR, segregation distortion
【中文摘要】略
【英文摘要】Brassica rapa L. ssp. chinensis (L.) Hanelt, known as nonheading chinese cabbage in China, is an importantvegetable in eastern Asia and its genetic improvement requires a genetic linkage map. The first genetic linkage map ofnonheading chinese cabbage using 112 doubled haploid lines derived from a released F1hybrid cultivar Shulu ¨ between two lines SW-3 and Su-124 was constructed in this paper. One hundred thirty-eight molecular markers weremapped into 14 linkage groups. Among these markers, there were 77 sequence-related amplified polymorphism markers,27 simple sequence repeat markers, 21 random amplification polymorphic DNA markers, and 13 intersimplesequence repeat markers. Chi-square tests showed that 54 markers are distorted from Mendelian segregation ratios,and the direction of the distortion is mainly toward the maternal parent SW-3. The distortion affects not only theestimation of genetic distance, but also the order of distorted markers on a same linkage group. Given a specific marker order, the authors proposed a multipoint approach to correct the linkage map in an unbiased manner in anF2population while considering distorted, dominant, and missing markers. A new method was used to correct thelinkage map in the doubled haploid population mentioned earlier considering new, distorted, and missing markers.The total length of the corrected linkage map was 1923.75 cM, with an average marker spacing of 15.52 cM. The mapwill facilitate selective breeding and mapping of quantitative trait loci.

【题目】Genetic mapping and localization of a major QTL for seedling resistance to downy mildew in Chinese cabbage (Brassica rapa ssp. pekinensis)
【中文关键词】略
【英文关键词】Brassica rapa ssp. pekinensis;Seedling resistance to downy mildew;Doubled haploid (DH) ;Genetic mapping ;QTL (quantitative trait loci)
【中文摘要】略
【英文摘要】Downy mildew caused by the fungusPeronospora parisitica is a serious threat to membersof the Brassicaceae family. Annually, a substantialloss of yield is caused by the widespread presence ofthis disease in warm and humid climates. The aim ofthis study was to localize the genetic factors affectingdowny mildew resistance in Chinese cabbage (Bras-sica rapa ssp. pekinensis). To achieve this goal, weimproved a preexisting genetic map of a doubled-haploid population derived from a cross between twodiverse Chinese cabbage lines, 91-112 and T12-19,via microspore culture. Microsatellite simplesequence repeat (SSR) markers, isozyme markers,sequence-related amplified polymorphism markers,sequence-characterized amplified region markers andsequence-tagged-site markers were integrated into thepreviously published map to construct a compositeChinese cabbage map. In this way, the identities oflinkage groups corresponding to the Brassica Agenome reference map were established. The newmap contains 519 markers and covers a total length of1,070 cM, with an average distance between markersof 2.06 cM. All markers were designated as A1 – A10through alignment and orientation using 55 markersanchored to previously published B. rapa or B. napusreference maps. Of the 89 SSR markers mapped, 15were newly developed from express sequence tags inGenbank. The phenotypic assay indicated that asingle major gene controls seedling resistance todowny mildew, and that a major QTL was detectedon linkage group A8 by both interval and MQMmapping methods. The RAPD marker K14-1030 andisozyme marker PGM flanked this major QTL in aregion spanning 2.9 cM, and the SSR markerOl12G04 was linked to this QTL by a distance of4.36 cM. This study identified a potential chromo-somal segment and tightly linked markers for use inmarker-assisted selection to improve downy mildewresistance in Chinese cabbage.

【题目】油菜菌核病生防芽孢杆菌的分离鉴定及其脂肽化合物分析
【中文关键词】油菜菌核病; 芽孢杆菌; 16S rDNA; BOX PCR 指纹图谱; 脂肽化合物
【英文关键词】无
【中文摘要】采用平板拮抗筛选, 分别从西藏日喀则地区和拉萨地区杂草根围土壤中筛选到2个对油菜菌核病菌有显著拮抗活性的芽孢杆菌菌株RJGP16和YBWC43。通过生理生化鉴定、16S rDNA 序列分析和BOX PCR 指纹图谱分析, 鉴定菌株RJGP16 为萎缩芽孢杆菌Bacillus atrophaeus, 菌株YBWC43为解淀粉芽孢杆菌B acillus amyloliquefaciens。离体叶片试验结果显示, 菌株RJGP16 和YBWC43对油菜菌核病菌防治效果分别为50. 24% 和100. 00% 。脂肽化合物种类分析显示, 菌株RJGP16产生脂肽化合物表面活性素和芬枯草菌素, 菌株YBWC43产生杆菌霉素D和芬枯草菌素。表明菌株R JGP16和YBWC43对油菜菌核病的防治效果与其产生的脂肽化合物有关。

【题目】大白菜SSR锚定标记分子遗传图谱的构建
【中文关键词】大白菜；遗传图谱；SSR；锚定标记
【英文关键词】Chinese cabbage; genetic map; SSR; anchor markers
【中文摘要】为了将已有的大白菜分子遗传图谱和国际上A 基因组参考图谱对应起来，利用国际上发表的大白菜和甘蓝型油菜 A 基因组特异 SSR 标记作为锚定标记，以 100个 DH 株系组成的群体为作图群体进行了分子遗传图谱的构建研究。利用双亲和F1对 230个SSR 标记和 8个STS 标记进行了筛选，共获得67个多态性分子标记。在此基础上整合了已有的 263 个 AFLP 标记、150 个 RA PD 标记、17 个 SSR 标记、3个SCAR 标记、14个同工酶标记和 1个形态标记，最终构建了一张由 10个连锁群组成，包含了 497个标记的大白菜高密度分子遗传图谱。该图谱覆盖基因组长度 1 08617 cM，标记间平均图距 21 19 cM。此图谱上包含了已在A 基因组参考图谱上定位的 34个 SSR 标记和2个 ST S标记，分布于 10 个连锁群上，由此可将该图谱按A 基因组参考图谱的连锁群进行命名，即A 1~ A 10，并与 10 条染色体对应起来，A 1~ A 10 分别对应 3、6、2、8、5、4、7、9、1、10号染色体。
【英文摘要】In th is paper, a DH population inc lud ing 100 lines w as used to construct a detailed geneticm ap to estab lish the identity of linkage g roups corresponding to reference m ap ofB rassica A genom e. A se t o fSSR and STS m arkers prov ided anchors to prev iously pub lished linkage m aps forB. rapa and B. napus, andw as used to designate linkage groups. Ou t o f 230 SSR m arkers and 8 STS m arkers, 67 m arkers show ed po ly-m orph ism betw een 2 parents and w ere analyzed in DH popu lation. In add ition, 448 prev iously m apped m o lec-u lar m arkers, including 263 AFLP m arkers, 150 RAPD m arkers, 17 SSR m arkers, 3 SCAR m arkers, 14isozym e m arkers and a m orpho log ica lm arker w ere integrated to a genetic m ap. This m ap contains 497 loc,iand covered 1 08617 cM w ith an average d istance 2119 cM. In th ism ap, 36 m arkers prev iously pub lished inre ference m ap, including 34 SSR m arkers and 2 STS m arkers, w ere distributed in 10 linkage g roups. A ccord-ing ly, these linkage g roupsw ere nam ed fo llow ing the A1 to A10 o f reference m ap, and w ere assigned to corre-spond ing chrom osom es.

【题目】Over-expression of mitochondrial heat shock protein 70 suppresses programmed cell death in rice
【中文关键词】线粒体热激蛋白70;线粒体膜电势;细胞程序性死亡;活性氧;水稻
【英文关键词】Mitochondrial heat shock protein 70; Mitochondrial membrane potential; Programmed cell death; Reactive oxygen species; Oryza sativa
【中文摘要】本文鉴定并验证了线粒体热激蛋白70的生物学功能。在水稻原生质体中过表达该基因可以有效抑制热激和过氧化氢诱导的程序性死亡,部分原因在于线粒体热激蛋白70 可以稳定并维持线粒体内膜完整性及跨膜电势,并部分阻止了细胞色素C的外漏。同时,该蛋白的过表达也抑制了程序性死亡早期的活性氧爆发。
【英文摘要】In this study, we identified and functionally characterized the mitochondrial heat shock protein 70 (mtHsp70). Over-expression of mtHsp70 suppressed heat- and H2O2-induced programmed cell death (PCD) in rice protoplasts, as reflected by higher cell viability, decreased DNA laddering and chromatin condensation. Mitochondrial membrane potential (Dwm) after heat shock was destroyed gradually in protoplasts, but mtHsp70 over-expression showed higher Dwm relative to the vector control cells, and partially inhibited cytochrome c release from mitochondria to cytosol. Heat treatment also significantly increased reactive oxygen species (ROS) generation, a phenomenon not observed in protoplasts over-expressing mtHsp70. Together, these results suggest that mtHsp70 may suppress PCD in rice protoplasts by maintaining mitochondrial Dwm and inhibiting the amplification of ROS.

【题目】西藏低温适生芽孢杆菌的分离鉴定及其抗菌和促生作用
【中文关键词】低温适生芽孢杆菌; ERIC-PCR 指纹图谱; 16S rRNA 系统发育; gyrB 基因;抑菌作用; 促生作用
【英文关键词】无
【中文摘要】从西藏拉萨色拉寺杂草根围土壤中分离到1 株低温适生芽孢杆菌LSSC3, 对该菌株进行了形态学、生理生化和分子生物学鉴定及抗菌和促生作用研究。菌株LSSC3 细胞短杆状, 芽孢圆形, 10 度条件下生长良好。生理生化特征显示, 该菌株与巨大芽孢杆菌Bacillus megaterium特征一致, 但ERIC-PCR 指纹图谱分析表明其与B .megaterium 模式菌株存在显著差异。16SrRNA 基因序列分析结果显示, 菌株LSSC3 与B. subtilis 和B. atrophaeus 的系统发育相似性均很高。进一步通过gyrB 基因测序和比对, 其同源性与B. atrophaeus 达到100%, 没有找到与B . subtilis 的同源性关系。据此, 将其鉴定为B. atrophaeus 。菌株LSSC3 对植物病原真菌和细菌均具有很强的抑制作用, 同时对拟南芥有良好的促生长作用。该菌具有耐低温和生防的双重特点, 具有在农业生产上应用的潜力。

【题目】大白菜抗 TuMV-C3 的 QTL 分析
【中文关键词】大白菜;TuMV-C3
;SRAP;数量性状位点(QTL)
【英文关键词】Chinese cabbage; TuMV-C3; SRAP; QTL
【中文摘要】本研究以大白菜高抗 TuMV-C3 株系的自交系 A52-2 和感病自交系 P9805 杂交的 F2 代 202 个单株作为构建遗传图谱的作图群体,采用 SRAP 标记方法构建包含 8 个连锁群,由 95 个 SRAP 遗传标记组成的大白菜分子遗传图谱,该图谱覆盖长度为 1 151.1 cM,平均图距 12.1 cM 。运用软件 Windows QTL Cartographer V2.5 和复合区间作图法共检测到 4 个抗 TuMV-C3 的 QTL 位点。这一研究成果为开展大白菜 TuMV 抗性分子标记辅助育种提供了理论基础。
【英文摘要】A population of Chinese cabbage F2 generation including 202 individual plants was derivedfrom the cross between resistance line A52-2 and susceptible line P9805. A molecular genetic map ofChinese cabbage was constructed with Mapmaker 3.0 software. A total of 95 SRAP markers were mapped to8 linkage groups, covering 1 151.1 cM with an average distance of 12.1 cM between loci. Four QTLscontrolling TuMV-C3 resistance at artificial inoculation were identified with Windows QTL Cartographer V2.5software and Composite Interval Mapping method. It provides theoretical base for improvement of Mar-ker-assisted Selection (MAS) for breeding ofTurnip Mosaic Virus (TuMV) resistance in Chinese cabbage.

【题目】Mitochondrial proteome during salt stress-induced programmed cell death in rice
【中文关键词】细胞程序性死亡;蛋白质组学;线粒体;盐胁迫;热激蛋白70
【英文关键词】Programmed cell death; Proteomics; Mitochondria; Salt stress; Heat shock protein 70
【中文摘要】前期研究在水稻根尖细胞中建立了盐诱导细胞程序性死亡模型,包括DNA片段化、细胞色素C释放、TUNEL阳性反应。本研究进一步分析线粒体在PCD早期发挥的作用。盐诱导2小时后,线粒体完整度轻微下降,伴随少量细胞色素C释放,电子传递部分受抑,导致活性氧爆发,但ATP的产量未受影响。分析了该PCD条件下的线粒体蛋白质组,并鉴定了8个PCD相关蛋白。其中4个蛋白表达上调,包括葡糖苷水解酶、线粒体热激蛋白70、20S蛋白酶体、SOD。4个蛋白下调,包括ATP合酶亚基、细胞色素C氧化酶亚基、SAM和转录起始因子。结果表明ATP合酶可能不是PCD早期线粒体ATP的主要生产者,葡糖苷水解酶参与ETC伤害及活性氧爆发,热激蛋白70是PCD的调节因子。
【英文摘要】It has been shown that mitochondria play a pivotal role in plant programmed cell death (PCD). Previous study established a salt stress-induced PCD model in rice (Oryza sativa L. cv. WYJ 8th) root tip cells, demonstrated by DNA laddering, cytochrome c release, and TUNEL positive reaction. In this study, the role of mitochondria during the early phase of PCD (2h-PCD) was analyzed in rice roots. After 2h-PCD induction, the integrity of mitochondria decreased slightly, consistent with a small release of cytochrome c. 2h-PCD partially inhibited electron transport, resulting in oxidative burst in mitochondria. However, ATP production maintained constant. Mitochondria proteome were analyzed by two-dimensional IEF/SDS-PAGE before and after 2h-PCD induction, and eight PCD-related proteins were identified. Amongthem, four proteins were up-regulated after PCD induction, which included glycoside hydrolase, mitochondrial heat shock protein 70, 20S proteasome subunit, and Cu/Zn-superoxide dismutase, and four were down-regulated, namely ATP synthase beta subunit, cytochrome c oxidase subunit 6b, S-adenosylmethionine synthetase 2, and transcription initiation factor eIF-3 epsilon. These results suggested that ATP synthase may not be the major producer of ATP in mitochondria during the early stage of PCD in rice. Glycoside hydrolase may be involved in ETC impairment and ROS burst, and

mitochondrial HSP70 is a potential candidate for PCD regulation. The possible roles of other proteins on PCD initiation were also discussed。

【题目】蓝色温和凝胶双向电泳用于分析嗜盐菌质膜蛋白复合物
【中文关键词】嗜盐芽孢杆菌,相容性溶质,质膜,蛋白质复合物,蓝色温和凝胶电泳
【英文关键词】halophilic Bacillus; compatible solute; plasma membrane; protein complex; blue native gel electrophoresis
【中文摘要】为了揭示细胞对盐胁迫渗透适应的分子机制,以新鉴定的中度嗜盐芽孢杆菌Bacillus sp. I121 为实验材料,分析了该嗜盐菌质膜上的盐胁迫响应蛋白.为此,通过蓝色温和凝胶双向电泳(BN/SDS-PAGE)对纯化的质膜组分进行了差异蛋白质组学研究.经MALDI-TOF/TOF质谱分析,鉴定了8 个盐胁迫响应蛋白.盐胁迫诱导上调表达的蛋白质包括ABC 型转运蛋白、3- 磷酸甘油透性酶、嘧啶核苷转运蛋白和甲酸脱氢酶,下调表达的蛋白质包括琥珀酸脱氢酶(succinate dehydrogenase)铁硫亚基、黄素蛋白亚基、细胞色素b556 亚基以及分子伴侣DnaJ 的同源蛋白;酶活力测定结果表明胁迫条件下上述蛋白质的活性变化与表达量变化相一致.这些蛋白质中绝大多数属于高度疏水的跨膜蛋白,主要负责物质跨膜运输及能量代谢.上述结果表明,中度嗜盐菌Bacillus sp. I121 可通过加快跨膜物质运输,同时抑制TCA 循环完成盐胁迫条件下相容性溶质脯氨酸和四氢嘧啶的合成与积累.也进一步证明,蓝色温和凝胶双向电泳不仅可用于线粒体、叶绿体中蛋白质复合物的分析,也同样适用于细胞质膜上高度疏水蛋白复合物的比较研究.
【英文摘要】In order to reveal the mechanisms of cell osmo-adaptation to salt stress, a newly identified moderately halophilic Bacillus sp. I121 was used to study the salt-stress responding proteins. Differential proteomic analysis of the purified plasma membrane fractions were performed by two dimensional Blue-Native/SDS-PAGE. Eight proteins corresponding to NaCl were identified by MALDI-TOF/TOF. Up-regulated proteins under salt stress include an ABC transporter permease, glycerol-3-phosphate permease, pyrimidine nucleotide transporter, formate dehydrogenase, and down-regulated proteins include succinate dehydrogenase iron-sulfur subunit, flavoprotein subunit, cytochrome b-556 subunit, and a hypothetical membrane protein similar to charperone DnaJ. Some of these changes were further verified by enzyme activity assay. Most of these proteins are highly hydrophobic trans-membrane protein, and responsible for material transport across membrane and energy metabolism. These results indicated that in halophilic Bacillus sp. I121,

higher salt stress activated material transport across plasma membrane, and compatible solutes, such as proline and ectoine, could be synthesized through suppressed TCA cycle. The research further demonstrated that besides the protein complexes in mitochondria and chloroplast, BN/SDS-PAGE is also a powerful tool for the protein complexes in plasma membrane.

【题目】定植期和定植密度对温室单头切花菊外观品质的影响
【中文关键词】单头切花菊 定植密度 定植期 外观品质
【英文关键词】single-flower cut chrysanthemum; transplanting density; transplanting date; appearance quality
【中文摘要】定植期和种植密度是影响切花菊外观品质的重要栽培措施. 本文以单头切花菊-神马. (Chrysanthemum morifolium cv . Shenma)为材料, 研究定植期和密度对温室单头菊外观品质的影响.结果表明,在试验的定植期和密度范围内,随着定植期的延迟、 密度的增加, 单头菊株高增加,单株叶数、 茎直径减小,单株鲜质量降低, 花颈长度增加, 花朵直径减小,但密度对株高的影响不大.在上海地区非加温温室单头切花菊生产中, 以生产 A级产品为目标的适宜定植期为 8月中旬, 适宜种植密度为 64株 m-2; 以生产 B级产品为目标的适宜定植期为 8月中旬至9月初,适宜种植密度为 72~ 80株 m-2.本研究为建立基于光、 温和密度的温室单头切花菊外观品质预测模型提供了参考.
【英文摘要】Transplanting date and density are the important factors affecting the appearance qualityof chrysanthemum. The study on the greenhouse single-flower cut chrysanthemum (Chrysanthemummorifolium cv. Shenma) showed that within the ranges of test transplanting date and density, the plant height and neck length increased, while the leaf number per plant, stem diameter, plant fresh mass and flower diameter decreased with the delay of transplanting date and the increase of transplanting density. No effect of transplanting density was observed on plant height. For the production of single-flower cut chrysanthemum in non-heated greenhouse in Shanghai, the optimal transplanting date and density to achieve the top rank of quality (rank A) were the middle ten days of August and 64 plants m-2, and those to achieve the second rank of quality (rank B) were from mid August to early September and 72-80 plants m-2, respectively . The results obtained in this study offered references in establishing the prediction model of greenhouse single-flower

cut chrysanthemum appearance quality based on light, temperature, and transplanting date and density.

【题目】Zn2+对高盐和紫外线胁迫条件下水稻根尖细胞程序性死亡的影响
【中文关键词】盐胁迫; 紫外线辐射; Zn2+; 细胞程序性死亡; 活性氧;
【英文关键词】salt stress; UV radiation; Zn2+; PCD; reactive oxygen species;
【中文摘要】前期研究表明:500mmol.L-1NaCl处理能诱导水稻武运粳8号根尖细胞发生细胞程序性死亡(programmed celldeath,PCD)。为了研究Zn2+对盐胁迫诱导的水稻根尖细胞PCD的影响,采用不同浓度Zn2+进行试验,结果表明:10μmol.L-1Zn2+能够在一定程度上缓解PCD现象。对这一过程中抗氧化酶(CAT、APX、POD和SOD)活性进行检测,发现抗氧化酶活性短期迅速升高,随后降低,10μmol.L-1Zn2+试验组的抗氧化酶活性高于对照组与单独NaCl处理组。而对H2O2在根尖细胞积累的观测结果显示Zn2+的添加能减少H2O2的积累,证明低水平Zn2+(10μmol.L-1)能够诱导抗氧化酶活性上升,并抑制活性氧产生。Zn2+同样可以缓解紫外线诱导的水稻根尖细胞原生质体PCD,而添加特异性的锌离子螯合剂TPEN(NNN′,N′-tetrakis-(2-pyridylmethyl)ethylenediamine)则会促进PCD的发生。据此推测:一定水平Zn2+对不同胁迫模式下发生的PCD进程的缓解作用具有普遍性。
【英文摘要】Previous study indicated that,the root tip cells of Oryza sativa L.Wuyunjing 8 could be induced to programmed cell death(PCD)by 500 mmol · L-1 NaCl treatment.To investigate the effects of Zn2+ on the PCD of rice root tip cells which was induced by salt stress,tested cells were added with Zn2+ solutions of different concentrations.The results showed that 10 μmol · L-1 Zn2+ could partially inhibit the PCD.The activity of antioxidant enzymes(CAT,APX,POD and SOD)increased rapidly,and then decreased

during salt-induced PCD.The addition of Zn2+ increased the activity of antioxidant enzymes,compared with NaCl treatment alone.The observation of H2O2 accumulation in root tip cells showed that the addition of Zn2+ could reduce the H2O2 level and increased the activity of antioxidant enzymes.Zn2+ also inhibited UV-induced PCD in rice root tip cell protoplast.TPEN,a specific chelator of zinc ions,accelerated the PCD process.The results indicated that certain level of Zn2+ inhibits the PCD induced by various stresses in plant cell.

【题目】Quantifying the effects of nitrogen on fruit growth and yield of cucumber crop in greenhouses
【中文关键词】无
【英文关键词】Cucumber,Nitrogen,Source/sink ratio,Fruit growth,Yield
【中文摘要】无
【英文摘要】Nitrogen supply can improve crop growth and yield. An over-use of nitrogen fertilizer in greenhouse crop productions, however, causes many environmental problems. The aim of this study was to quantify the effects of nitrogen on fruit growth and yield so as to facilitate the optimization of nitrogen management for cucumber (Cucumis sativus) crop in greenhouses. Four experiments with different levels of nitrogen treatments, substrates and planting dates on cucumber (cv. Deltastar) were conducted in greenhouses located at Shanghai during 2005 and 2007. Using data of one experiment, seasonal time courses of leaf nitrogen content (NL), leaf area per plant (LA), and the number of fruits growing per plant (nFG), aswell as time course of the length of individual fruit growing on the plant (LF(i)) under different levels of nitrogen supply conditionswere, respectively, determined as functions of a photo-thermal index (PTI). The impact of NL on LA was determined by curve fi tting to the experimental data. The source/sink ratio (LA/nFG), an indicative of the source size per fruit, was then derived fromthe seasonal time courses of LA and nFG. The impact of NL on LF(i)was indirectly quanti fi ed by the relationship between source/sink ratio (LA/nFG) and the elongation rate of individual fruit (RFL(i)). Both the harvest date and freshweight (WF(i)) of individualfruit growing at different node, and number of harvested fruits (nFH) were then calculated as functions of the fruit length. These quantitative relationships were assembled to form a model for predicting the effects of nitrogen on fruit growth and yield (fruit fresh weight per plant). Independent data from other experiments were used to validate the model. Our model gives satisfactory predictions of cucumber fruit growth and yield under different levels of nitrogen supply and growing season conditions. The coef fi cient of determination (r2) and the relative rootmean squared error (rRMSE) between the predicted and measured values are, respectively, 0.92 and 0.22 (r2, rRMSE) for leaf area per plant, 0.90 and 0.24 forthe number of fruits growing on the plant, 0.91 and 0.22, 0.90 and 0.23, and 0.92 and 0.21, respectively, for the length, harvest date and fresh weight of individual fruit growing on the plant, 0.94 and 0.20 for yield. The model may be used for the optimization of nitrogen management for cucumber production in greenhouses. Further model calibration and test would be needed when applying this model to a wider range of conditions.

【题目】温室标准切花菊发育模拟与收获期预测模型研究
【中文关键词】菊花;生理辐热积;发育;模拟;收获期

【英文关键词】Chrysanthemum morifolium; Physiological product of thermal effectiveness and PAR;Development; Simulation; Harvest date

【中文摘要】【目的】建立一个可以预测温室标准切花菊现蕾和收获期的模拟模型,为温室切花菊温光调控提供决策支持。【方法】根据菊花(Chrysanthemum morifolium Ramat.)发育对光温反应的特性,提出了生理辐热积(physiological product of thermal effectiveness and PAR,PTEP)的概念,通过不同扦插期和不同品种的试验,建立了以生理辐热积(PTEP)为尺度的温室标准切花菊发育模型,并用独立的试验数据对模型进行了检验。【结果】模型对从扦插到定植、短日处理、现蕾和收获期的模拟预测值与实测值的符合度较好,预测值与实测值间1:1线的回归估计标准误差RMSE分别为 2.3、2.9、1.2和3.2 d,预测精度明显高于以有效积温为尺度的发育模型(RMSE分别为3.0、12.5、12.5和15.6 d)。【结论】本研究建立的模型能较准确地预测标准切花菊各个发育阶段出现的时间与收获期,可以为中国温室标准切花菊周年生产的光温调控提供理论依据和决策支持。

【英文摘要】【Objective】In order to optimize the climate control for standard cut chrysanthemum production in greenhouse, a simulation model for predicting standard, cut chrysanthemum development and harvesting date was developed. 【Method】Based on the effects of photo-thermal conditions on chrysanthemum development, the concept of physiological product of thermal effectiveness and PAR (PTEP) and its calculation method were proposed and used to predict cut chrysanthemum development stages. Experiments with different varieties and cutting dates were carried out in greenhouses to collect data to develop and to validate the model. 【Result】The results show that the simulated results agree well with the observed ones. Based on the 1:1 line, the root mean squared error (RMSE) from cutting to planting, beginning of the short-day length treatment, bud break and harvesting date were, respectively, 2.3, 2.9, 1.2 and 3.2 days. The prediction accuracy of the model developed in this study is significantly higher than that of the growth degree days (GDD) base model (RMSE is 3.0, 12.5, 12.5 and 15.6 days, respectively, from cutting to planting, beginning of the short-day length treatment, bud break and harvesting date). 【Conclusion】It can be concluded that the model developed in this study can give satisfactory prediction of standard cut chrysanthemum development and harvesting date and can be used for decision making for the optimization of the climate control for standard cut chrysanthemum production in greenhouse.

【题目】温室标准切花菊干物质生产和分配模型

【中文关键词】菊花;生理辐热积;干物质生产;干物质分配

【英文关键词】Chrysanthemum morifolium; Physiological product of thermal effectiveness and PAR; Dry matter production; Dry matter partitioning

【中文摘要】【目的】干物质生产与分配是菊花(Chrysanthemum morifolium Ramat.)外观品质形成的基础。本研究建立一个预测温室标准切花菊各器官干重和植株地上部分鲜重的模型,为温室标准切花菊外观品质的调控提供决策支持。【方法】根据光温对菊花生长的影响,通过不同定植期和不同品种的试验,建立以生理辐热积(Physiological product of thermal effectiveness and PAR,PTEP)为尺度的温室标准切花菊干物质生产和分配模型,并用独立的试验数据对模型进行检验。【结果】模型对温室标准切花菊的植株总干重、叶干重、茎干重、花干重和单株地上部分鲜重的模拟值与实测值的符合度较好,模拟值与实测值间 1:1 线的决定系数(R2)和回归估计标准误差(RMSE)分别为:0.97、0.97、0.97、0.83、0.99;67.5 g · m-2、22.4 g · m-2、28.2 g · m-2、15.4 g · m-2、3.73 g/株。本模型对菊花植株干物质生产的预测精度明显高于基于光合作用驱动的生长模型(R 2和 RMSE 分别为0.82 和 274.68 g · m-2)。【结论】本研究建立的模型能较准确地预测温室标准切花菊的干物质生产和各个器官的干重,模型的实用性较强,可以为温室标准切花菊生产中的光温调控提供理论依据和决策支持。

【英文摘要】【Objective】 Dry matter production and partitioning is the base of external quality formation of cut chrysanthemum. A simulation model was developed to predict the biomass production, dry weight of organs and shoots. This model was developed to look at the optimization of crop and climate management for greenhouse production of standard cut chrysanthemum.【Method】A model of dry matter production and partitioning of standard cut chrysanthemum in greenhouse was developed based on the effects of temperature and radiation on chrysanthemum growth using physiological product of thermal effectiveness and PAR (PTEP) as prediction index. Experiments with different varieties and planting dates were carried out in greenhouses to collect data to develop and

validate the model. 【Result】The results show that the simulated values agreed well with the observed ones. The determination coefficient (R2) and root mean squared error (RMSE) between the simulated and the measured value based on the 1:1 line for biomass production, dry weight of leaf, stem and flower, and fresh weight of shoot per plant were, respectively, 0.97, 0.97, 0.97, 0.83, 0.99; 67.5 g · m-2, 22.4 g · m-2, 28.2 g · m-2, 15.4 g · m-2 and 3.73 g/plant. For the prediction of biomass production, the prediction accuracy of the PTEP based model is significantly higher than that of the photosynthesis driven crop growth model (R2 and RMSE were 0.82 and 274.68 g · m-2, respectively). 【Conclusion】 Based on the results obtained in this study, it can be concluded that the model developed can give a satisfactory prediction of standard cut chrysanthemum biomass production and partitioning. The model developed in this study is more applicable than the photosynthesis driven crop growth model for the optimization of climate and crop management for standard cut chrysanthemum production in greenhouses.

【题目】温室甜椒叶面积指数形成模拟模型
【中文关键词】温室, 甜椒, 辐热积, 叶面积指数, 模型
【英文关键词】greenhouse ; sweet pepper ; product of thermal effectiveness and PAR; leaf area index ; model.
【中文摘要】叶面积指数是光合作用驱动的作物生长模型以及冠层蒸腾模型所需的重要作物参数, 温度和辐射是影响叶片生长的重要环境因子.通过不同定植期、 不同品种、 不同地点的试验, 定量分析了温室甜椒出叶数、 叶片长度和叶面积指数与温度和辐射的关系, 构建了温室甜椒叶面积模型,并利用独立的试验资料对模型进行了检验. 结果表明: 甜椒出叶数与出苗后累积辐热积呈指数函数关系;叶片长度与出叶后累积辐热积呈负指数函数关系;甜椒出叶数、 叶片长度和叶面积指数的模拟结果与实测值之间的决定系数 R2分别为 0　94、0　89、0　93 ,其回归估计标准误 RMSE分别为 3　4、2　15 cm、 0　15 . 该模型能够利用气温、 辐射、种植密度和出苗日期准确地预测温室甜椒叶面积指数动态,且模型参数少、实用性强, 可以为温室甜椒生长模型和蒸腾模型提供必需的叶面积指数动态信息.
【英文摘要】Leaf area index (LAI) is one of the most important crop parameters in photosynthesis -driving crop growth simulation model and canopy evapotranspiration simulation model, while air temperature and radiation are the important climate factors affecting crop leaf growth. In this paper, experiments with different sweet pepper (Capsicum annuum L .) cultivars and sowing dates were conducted in greenhouse to quantitatively analyze the relationships of the number of unfolding leaves per plant, the number of old leaves removed per plant, and the length of each leaf with air temperature and radiation. Based on these quantitative relationships, a leaf area simulation model for greenhouse sweet pepper was developed, and the independent experimental data were used to validate the model. The results showed that the number of unfolding leaves per plant was a positive exponential function of the product of thermal effectiveness and PAR (TEP) accumulated after emergence, and the length of each leaf was a negative exponential function of the TEP accumulated after emergence. The coefficient of determination (R2) and the root mean squared error (RMSE) between simulatedand measured leaf number, leaf length, and LAI were 0.94, 0.89, and 0.93, and 3.4, 2.15, and0.15, respectively. The model could use air temperature, radiation, planting density, and emergence date to satisfactorily predict the LAI of greenhouse sweet pepper, and supply required LAI information for the sweet pepper growth and canopy evapotranspiration simulation models.

【中文关键词】菊花, 杆数, 密度, 模型, 品质
【英文关键词】Chrysanthemum morifolium; stem number; planting density; model; quali ty .
【中文摘要】通过对切花菊不同品种、 不同单株主杆数、 不同定植密度和不同定植日期的试验, 定量分析了单位面积杆数对标准切花菊叶面积指数动态变化规律和各外观品质指标的影响, 在此基础上,构建了以冠层吸收的生理辐热积为指标的可定量预测单位面积不同杆数对温室标准切花菊品质影响的预测模型,并用与建模相独立的试验数据对模型进行了检验. 结果表明:随单位面积杆数的增加,切花菊的叶面积指数增加,其植株的平均株高、 茎粗、 出叶数、 花径均降低.所建模型对多杆栽培和不同密度单杆栽培的标准切花菊单杆地上部分鲜质量、 株高、 茎粗、 出叶数、 花径和单位面积出花枝数的预测值与实测值的决定系数 (R2)分别为 0.95、0.96、0.94、0.91、0.81和 0.97, 预测相对误差分别为 16.1%、10.1%、12.8%、13.4%、15.9% 和16.1% ,模型模拟精度较高.该模型可为温室标准切花菊栽培密度和栽培杆数的优化以及品质的光温调控提供理论依据和决策支持.
【英文摘要】In order to understand the effects of stem numbers per ground area on the quality ofstandard cut Chrysanthemum morifolium, an experiment with different cultivars, different stem numbers per plant, different planting densities, and different planting dates was conducted in a greenhouse in Shanghai in 2005 and 2006. The effects of stem numbers per ground area on the canopy leaf area index and external quality of standard cut C. morifolium were quantified using the experimental data. Based on the physiological product of thermal effectiveness and PAR (PETP) the canopy absorbed, a model for predicting the effects of stem numbers per ground area on the quality of standard cut C. morifolium was developed, and validated with independent experimental data. The results showed that with the increase of stem numbers per ground area, the leaf area index increased, whereas plant height, stem diameter, leaf number, and flower diameter decreased. The model gave satisfactory predictions of the quality of standard cut C. morifolium cultivated

with different stem numbers and planting density. The coefficient of determination (R2) and relative prediction error (RSE) based on the 1:1 line for fresh mass per stem, plant height, stem diameter,leaf number, flower diameter, and the number of qualified stem harvested per ground area were 0.95, 0.96, 0.94, 0.91, 0.81 and 0.97,and 16.1%, 10.1%, 12.8%, 13.4%, 15.9 %, 16.1%, respectively. The model developed in this study could be used for the optimization of light and temperature management for standard cut C. morifolium cultivated with different stem numbers and planting densities in greenhouse.

【题目】叶片氮浓度对温室黄瓜花后叶片最大总光合速率影响的模拟
【中文关键词】叶片最大总光合速率;叶片氮浓度;光合有效辐射;温度
【英文关键词】maximum leaf gross photosynthesis rate; leaf nitrogen concentration; PAR; temperature
【中文摘要】光合作用是作物产量和品质形成的基础, 直接受到叶片含氮量的影响。 该文通过不同定植期不同氮素处理试验,建立了不同光温条件下温室黄瓜叶片适宜氮浓度的求算方程,并定量分析了不同光温条件下黄瓜叶片最大总光合速率与叶片氮浓度的关系。在此基础上,进一步建立了适合不同光温条件的温室黄瓜花后叶片最大总光合速率与叶片氮浓度关系的通用模型,并用与建模相独立的试验数据对模型进行了检验。结果表明,建立的模型能较好地预测不同定植期黄瓜叶片氮浓度对叶片最大总光合速率的影响。模型对温室黄瓜叶片最大总光合速率的预测结果与实测结果之间基于1∶1直线的决定系数和均方根差分别为0.83和1.56 μmol·m-2·s-1。建立的模型可以为温室黄瓜周年生产的氮素精确管理提供理论依据与决策支持。
【英文摘要】Leaf photosynthesis rate, as one of the most important physiological processes affecting crop yield and product quality, is strongly affected by leaf nitrogen concentration.Experiments with four nitrogen treatments and sowing dates were conducted in greenhouses in Shanghai during 2003 to 2005. The seasonal time course of the optimal leaf nitrogen concentration(N%opt) for photosynthesis was found to be an exponential function of the physiological development time after transplanting(PDT). The relationship between the ratio of the maximum leaf gross photosynthesis rate with nitrogen deficiency (Pgmaxi) to that without nitrogen deficiency(Pgmax0) (PR= Pgmaxi / Pgmax0) and the ratio of the actual leaf nitrogen concentration(N%) to the optimal leaf nitrogen concentration(N%opt) (NR= N%/ N%opt) was also found to be an exponential function. Based on these quantitative relationships, a general model was developed to estimate the effects of leaf nitrogen concentration on the maximum leaf gross photosynthesis rate of greenhouse cucumber under different radiation and temperature conditions. Independent experimental data were used to validate the model. The coefficient of determination(R2) and the root mean squared error(RMSE) between the estimated and the measured maximum leaf gross photosynthesis rate based on the 1∶1 line were 0.83 and 1.56 μmol CO2·m-2·s-1, respectively. The model developed in this study gives satisfactory estimation of the maximum leaf gross photosynthesis rate of greenhouse cucumber growing during different seasons, hence it can be used to optimize nitrogen management for greenhouse cucumber production under different PAR and temperature conditions.

【题目】氮素对温室黄瓜开花后干物质分配和产量影响的模拟研究
【中文关键词】温室黄瓜 叶片氮浓度 干物质分配 产量

【英文关键词】greenhouse cucumber; leaf nitrogen concentration; dry matter partitioning; yield

【中文摘要】了解氮素对干物质分配和产量的定量影响是实现温室黄瓜氮肥优化管理的前提。该研究通过黄瓜雌性无限生长型品种“戴多星”(Cucumis sativas.‘Deltastar’)不同定植期和开花后不同氮素处理试验,定量分析了氮素施用水平对该类型黄瓜开花后干物质分配和产量的影响,并建立了开花后分配指数和采收指数与盛果期叶片氮浓度的关系方程。在此基础上,建立了氮素对黄瓜开花后干物质分配和产量影响的预测模型,并用独立的试验数据对模型进行了检验。结果表明,模型对茎干物质量、叶干物质量和果实干物质量及黄瓜产量(鲜质量)预测值与实测值之间基于1∶1直线之间的决定系数R2分别为0.945、0.943、0.990、0.955;相对预测误差RE分别为13.0%、12.3%、9.2%、16.8%。本模型可预测不同氮素水平下温室黄瓜地上部各器官干物质量和产量,可以为中国温室黄瓜生产的氮肥优化管理决策提供参考。

【英文摘要】Quantifying the effects of nitrogen (N) on dry matter partitioning and yield of greenhouse cucumber is essential for the optimization of nitrogen management in greenhouse cucumber production. For this purpose, experiments with different planting dates and levels of nitrogen application rate after anthesis for greenhouse cucumber (Cucumis sativus) were conducted in a greenhouse in Shanghai during 2005. First, the seasonal time course of the partitioning indices of shoot dry matter to stem, leaf and fruit were derived using the experimental data. The relative decreasing rate of leaf partitioning index and the relative increasing rate of fruit partitioning index after anthesis were found, respectively, to be an exponential function of leaf nitrogen concentration at middle fruit harvest stage (NL). The seasonal time course of the harvest index, defined as the ratio of the accumulated dry weight of the harvested fruit to the accumulated total fruit dry weight, was also derived from the experimental data. The relative increasing rate of harvest index was also found to be an exponential function of NL. Based on these quantitative relationships, a model was developed to predict the effects of nitrogen on after anthesis dry matter partitioning and yield of greenhouse cucumber. Independent experimental data were used to validate the model. The coefficient of determination (R2) between the predicted and the measured dry weight of stem, leaf, fruit and the yield (fresh weight) based on the 1:1 line were 0.945, 0.943, 0.990, 0.955, respectively, and the relative prediction error (RE) were 13.0%, 12.3%, 9.2%, 16.8%, respectively. The results showed that the model developed in this study can give satisfactory prediction of dry matter partitioning and yield of greenhouse cucumber under different nitrogen application level, hence, can be used to support decision-making for nitrogen management in greenhouse cucumber production.

【题目】温室黄瓜生育期模拟模型的研究

【中文关键词】黄瓜;生理发育时间;生育期;模拟模型

【英文关键词】cucumber; physiological development time; development stages; simulation model

【中文摘要】根据黄瓜(Cucumis sativus)发育的光温反应过程,建立了基于生理发育时间的黄瓜生育期模拟模型,并利用不同品种的试验资料对模型进行了检验。结果表明,黄瓜从播种到第一批瓜成熟需积累生理发育时间30 d,播种 幼苗、幼苗 伸蔓、伸蔓 开花、开花 结瓜、结瓜 成熟所需的生理发育时间分别为3、11、9、5、2 d。发芽期、幼苗期、伸蔓期、开花期、结瓜期等各生育期持续时间的模拟值与实际观测值的回归估计标准误差(root mean squared error; RMSE)分别为0、2.6、1.7、0.8、2.1 d,从播种到第一次采收的模拟值与观测值的RMSE为1.4 d。而用有效积温法对发芽期、幼苗期、伸蔓期、开花期、结瓜期等各生育期持续时间的模拟值与实际观测值的RMSE分别为0.7、10.0、5.7、2.4、2.5 d,从播种到第一次采收的模拟值与观测值的RMSE为22.0 d。本模型比用有效积温法能更准确地预测黄瓜各个生育期的起止日期和黄瓜的收获期。

【英文摘要】A simulation model of development stages of greenhouse cucumber (Cucumis sativus) was developed based on photo-thermal reactions of crop development rate. The concept of physiological development time(PDT) was used as the scale to measure the greenhouse cucumber development stages. Experimental data of different varieties were used to validate the model. The results show that the PDT value for the duration from sowing date to the first harvest date was 30 days, with 3, 11, 9, 5, 2 days, respectively, for the duration from sowing to germination, germination to tendril elongation, tendril elongation to flowering, flowering to fruit setting, and fruit setting to first harvest. The root mean squared error(RMSE) between the simulated and observed results for duration of germination, five leaf stage, tendril elongation, flowering, fruit setting, and from sowing to first harvest, respectively, was 0, 2.6, 1.7, 0.8, 2.1, 1.4 days, which was lower than the prediction errors using the growing degree days(GDD) (0.7, 10.0, 5.7, 2.4, 2.5, 22.0 days,

respectively).

【题目】Effects of combined nitrogen fertilizer and nano-carbon application on yield and nitrogen use of rice grown on saline-alkali soil
【中文关键词】盐碱土,纳米碳,水稻,氮,产量
【英文关键词】Saline-alkali soil, nano-carbon, rice, nitrogen, yield.
【中文摘要】在盐碱地大田试验条件下,以水稻长白10号为材料,研究氮肥与纳米碳结合施肥和单一氮肥对土壤氮素利用和水稻产量的影响,分别设100%、70%和50%三个施肥水平,相当于公顷施氮量214kg、150kg和107kg。结果表明:在水稻成熟期,水稻氮素累积吸收量A1比B1、A2比B2、A3比B3分别高13.23%、9.57%和38.14%;水稻收获后,土壤中全氮的残留量A1比B1、A2比B2、A3比B3分别降低6.95%、8.48%和9.65%;生物量分别高8.58%、15.70%和19.30%;增产18.36%、8.51%和10.19%。氮肥与纳米碳结合施用土壤养分的供应能力、植株对氮素的累积吸收量、干物质积累量及产量均显著高于不加纳米碳的氮肥处理。
【英文摘要】To investigate the effects of combined application of nitrogen fertilizer and nano-carbon on nitrogen use of soil and rice yield, six treatments were applied as a randomized complete block design with three replications including A1 (N 215 kg hm-2 + nano-carbon 1.194 kg hm-2), B1 (N 215 kg hm-2), A2 (N 150.5 kg hm-2 + nano-carbon 0.836 kg hm-2), B2 (N 150.5 kg hm-2), A3 (N 107.5 kg hm-2 + nano-carbon 0.597 kg hm-2) and B3 (N 107.5 kg hm-2), respectively, to a rice cv. Changbai 10. The soil total and available N, the N accumulation, dry matter accumulation of aerial part and the yield components such as spike number, filled spike number, 1000-grain weight and yield of O. sativa were studied. The result indicated that significant differences in nitrogen use of saline-alkali soil and yield were observed among the treatments and the deliverability of soil nutrition, the nitrogen uptake of plant, dry matter accumulation and yield significantly increased after combined application of nitrogen fertilizer and nano-carbon. The nitrogen accumulation of rice of A1, A2 and A3 treatments were 13.23%, 9.57% and 38.14% higher than B1, B2 and B3 treatments, respectively; total nitrogen residues of soil of A1, A2 and A3 treatments were 6.95%, 8.48% and 9.65% lower than B1, B2 and B3 treatments, respectively; dry biomass of aerial part of A1, A2 and A3 treatments were 58%, 15.7% and 19.3% higher than B1, B2 and B3 treatments, respectively. The yield of all treatments combined application of N and nano-carbon were higher than those in treatments that only applied nitrogenous fertilizer was applied, compared to B1, B2 and B3 treatments, the yield of A1, A2 and A3 treatments were 18.36%, 8.51% and 10.19% higher, respectively. There was no significant difference between the yield of A2 and B1, which indicated that the yield of combined application of 70% conventional fertilizer and nano-carbon (N 150.5 kg hm-2 and nano-carbon 0.836 kg hm-2) was equal to that with supplied 100% conventional fertilizer (N 215 kg hm-2). This indicated that the utilization rate of nitrogen fertilizer increased after combined application of nano-carbon, which can save the N fertilizer in production practice. Therefore, combined treatment is suitable to application and dissemination in soda saline-alkali soil in the agriculture.

【题目】Estimating Exchangeable Sodium Percentage from Sodium Adsorption
【中文关键词】ESP,SAR,饱和膏提取液,土壤盐渍度,土壤碱度

【英文关键词】ESP, SAR, saturated paste extract, soil salinity, soil sodicity
【中文摘要】土壤碱化度(ESP)和钠吸附比(SAR)通常被用来评价土壤的碱化程度。土壤饱和浸提液的SAR与土水或1:5浸提液SAR与土壤ESP的相关关系被用来估算土壤的ESP。但是到目前为止,对中国东北松嫩平原盐渍土尚缺乏用SAR估算ESP的模型。本研究选择117个土壤样品,研究了松嫩平原西部盐渍土用SAR估算ESP的方法。研究结果表明,土壤饱和浸提液的SAR与土水和1:5浸提液SAR与土壤ESP高度相关(r2 > 0.76, P <0.001)。松嫩平原盐渍土的ESP可以通过一个对数回归方程进行估算。
【英文摘要】Soil exchangeable sodium percentage (ESP) and sodium adsorption ratio (SAR) are commonly used to assess soil sodicity. Corre-lation between ESP and SAR of saturated pasted extract (SARe) or of 1:5 (m:m) mixture soil to water (SAR1:5) has been documentedto predict ESP from SAR. However limited studies have been undertaken to model soil ESP based on soil SAR in the Songnen Plain,Northeast China. In this study, 117 soil samples were used to predict ESP from SARe and SAR1:5 of salt-a ® ected soils in western Song-nen Plain. Soil ESP was highly related (r2 > 0:76, P < 0:001) with SARe and SAR1:5. ESP of salt-a ® ected soils in the Songnen Plaincould be predicted using a logarithmic regression equations of ESP = 10.72 ¢ ln(SARe) ¡ 15:36 and ESP = 11.44 ¢ ln(SAR1:5) + 5:48.Key Words: ESP, SAR, saturated paste extract, soil salinity, soil sodicity

【题目】Effect of irrigation water depth on rice growth and yield in a saline-sodic soil in
【中文关键词】发展关键期,灌溉水深度,水稻,盐碱土,松嫩平原
【英文关键词】Critical development period, irrigation water depth, rice, saline-sodic soil, Songnen plain.
【中文摘要】通过调节灌溉水深度可降低盐碱胁迫对水稻产量的影响。然而,不同灌溉水深度对以碳酸盐和碳酸氢盐为主的盐碱土的水稻生长发育和产量的影响有待进一步研究。为此在松嫩平原西部未改良的盐碱土上开展田间试验,设置三种灌溉水深度(1,4,7cm)。研究表明,水稻每单位面积穗数和叶面积指数随灌溉水深度增加而增加。三种灌溉水深度的水稻产量分别为0.62,1.38和2.62 t/ha。1,4cm灌溉水深处理的水稻每穗粒重对产量的贡献率大于单位面积穗数,而7cm灌溉水深度处理的水稻每穗粒重对产量的贡献率小于单位面积穗数,且7cm灌溉水深度处理的水稻每穗粒数最大。三种灌溉水深处理的水稻结实率对每穗粒重的变异贡献率最大,这可能受较低的气温和盐碱度的综合作用影响。综上,7cm灌溉水深增加了水稻的产量,主要由于水稻每穗粒数以及结实率增加与分蘖抑制减轻的结果。
【英文摘要】It was hypothesized that reductions in rice yield under salinity stress can be ameliorated by adjusting the water depth. However, the effect ofdifferent irrigation water depths on rice growth and yield in a saline-sodic soil dominated by carbonate and bicarbonate salts is not yet wellunderstood. A field experiment consisting of three levels of 1, 4 and 7 cm irrigation water depth was conducted in an unameliorated saline-sodic soilin western of Songnen plain. The trends were found that tiller number per hill and LAI increased as the irrigation water depth increased. The yieldsof 1, 4 and 7 cm irrigation water depth treatments were 0.62, 1.38 and 2.62 t ha-1, respectively. Panicle density (PD) of 1 cm and 4 cm irrigation waterdepth treatments both contributed more to yield compared to seed weight per panicle (SWP) while SWP at the 7 cm irrigation water depth treatmentcontributed over PD. Spikelets per panicle (SP) was maximum in 7 cm irrigation water depth treatment. Percent filled spikelet accounted for the mostvariation for SWP at each treatment probably owing to low air temperature and salinity and sodicity. We conclude that increasing water depth up to7 cm increased rice grain yield mainly by increasing rice SP and PFS and alleviating the tillering inhibition.

【题目】Characterizing Salt-Affected Soils of Songnen Plain Using Saturated Paste
【中文关键词】电导率,钠离子浓度,钠吸附比,总离子浓度
【英文关键词】electrical conductivity (EC), Na+ concentration, sodium adsorption ratio (SAR), total cation concentration (TCC)
【中文摘要】在松嫩平原西部,盐渍土化学性质测定主要是利用土水比1:5的方法制备土壤浸提液,而对于土壤饱和浸提液方法测定土壤化学性质应用较少。本试验利用两种浸提液方法来分析121个盐渍化土壤样品的化学性质,具体测量指标为EC、pH、土壤四种盐离子(Na+、Ca2+、Mg2+和K+)。试验结果表明,土壤阳离子中以Na+为主。土壤样品中SAR较高,最大值为4042.57(mmolcL-1)1/2,其中22个土壤样品SAR超过1000(mmolcL-1)1/2。通过回归分析,两种方法浸提液的阳离子浓度与EC呈显著性相关,斜率分别为10.3(饱和土壤浸提液方法)和9.8(土水比1:5浸提液方法)。EC、Na+和SAR在两种浸提液方法均呈显著性相关(r2>0.81,P<0.0001),而Ca2+、Mg2+在两种方法无显著性相关。
【英文摘要】In the Songnen Plain, Northeast China, chemical parameters of salt-affected soilswere previously obtained from 1:5 soil-to-water (1:5) extracts so that there isno information available for soil salinity and sodicity from the saturated paste(SP) extracts. The work reported here characterized soil salinity and sodicity ofSP extracts and compared salinity and sodicity measurements using SP and 1:5extraction methods from 121 soil samples from various sites of salt-affected soilareas in the Songnen Plain. Electrical conductivity (EC), major cations Na+, K+,Mg2+, Ca2+ , sodium adsorption ratio (SAR), and pH were determined and analyzedusing SP extracts and 1:5 extracts.The sodium ion was the predominant cation so that Na+ concentration was close to total cation concentration (TCC). The SAR in the 121 samples wasremarkably high; 22 soils had a SAR > 1000 mmolc L − 1 1/2 with a maximum SARvalue of 4042.57 mmolc L − 1 1/2 for SP extract. The SAR was highly correlated withEC r2 > 0 86 P < 0 0001 . The salt-affected soils are predominantly saline-sodicbased on the classification of the USDA (1954). Through a regression analysis, totalcation concentration was strongly related to EC with slopes of 10.3 and 9.8 withouty intercept in SP and 1:5 extracts, respectively.Significant relationships r2 > 0 81 P < 0 0001 existed between EC, Na+,and SAR in SP and 1:5 extracts. However, K+, Ca2+, and Mg2+ of SP extracts was not related to those of 1:5 extracts.

【题目】鸡源抗菌肽Fowlicidin-3表达条件的优化及生物学特性和体内治疗研究
【中文关键词】Fowlicidin - 3; 表达优化; 生物学特性; X - 33; 体内疗效
【英文关键词】Fowlicidin-3; optimize expression; biological characteristics; X-33; therapeutic test
【中文摘要】对重组X - 33 毕赤酵母菌株表达的鸡源Fowlicidin - 3 抗菌肽的条件进行优化,并研究了表达产物的生物学活性。结果表明: 当含有重组酵母菌的BMGY 培养基A600值达到5 ~ 6 时,转接pH 6.0 的BMMY 培养基,每24 h 补加2%甲醇, 29 °C条件下培养72 h,重组鸡源Fowlicidin - 3 抗菌肽获得高效表达,含量达到170 mg · L - 1。采用琼脂孔扩散法对该抗菌肽的热稳定性、酸碱稳定性等特性进行分析,结果表明: 鸡源Fowlicidin - 3 抗菌肽具有较强的热、酸稳定性; 对致病性大肠杆菌K99、鸡白痢沙门氏菌和金黄色葡萄球菌Cowan Ⅰ的最小抑菌浓度分别为3. 12、1. 56 和1. 56 μg · mL - 1。在对大肠杆菌感染雏鸡的体内疗效试验中,鸡源Fowlicidin - 3 显示出了较好的预防和治疗效果。
【英文摘要】The requirement for the flask-shaking culture fermentation of the recombinant antibacterial peptide Pichia pastoris was optimized.Fowlicidin-3 would be expressed with high level and the concentration of the secreted peptides was 170 mg · L- 1 while thedensity of the yeast amounted to A600 value 5-6,the pH of the culturing BMMY medium was 6. 0, the yeast was cultured under 29 °Cfor 72 hours and 2% methanol was supplemented into the medium. According to Agarose Diffusion Assay, the pH-stable assay indicatedthat the peptide dispalyed the best activities while the pH was between 5. 0 - 10. 0. The heat-stable assay indicated that the peptide could remain its inhibition activity after 2 h treated in boiled water. The minimal inhibitory concentration (MIC) of antibacterialpeptide Fowlicidin-3 against E. coli K99,Salmonella typhimurium and Staphylococcus aureus Cowan Ⅰ were 3.12,1.56 and 1.56 μg · mL- 1,respectively. The results of therapeutic tests showed that the mortality rate decreased significantly (P<0.01) in both antimicrobial peptide Fowlicidin-3 group and ciprofloxacin group compared to the E. coli O1 infection control group, and the

prevention effectives from antibacterial peptide Fowlicidin-3 group reached the high level as ciprofloxacin group did.Recombinant antibacterial peptide Fowlicidin-3 displayed preferable curative effect and protection.

【题目】我国棉花耕作栽培技术研究和应用
【中文关键词】棉花; 栽培; 耕作; 技术; 应用;
【英文关键词】Cotton;Cultivation;Tillage;Technology;application
【中文摘要】耕作栽培学科紧密围绕棉花高产优质高效,面向全国开展棉花栽培试验研究、经验总结和生产服务,在棉花生产区域划分、麦棉两熟种植、棉花需水和棉田灌溉、棉花营养和施肥、盐碱地植棉、育苗移栽、地膜覆盖、化学和农艺调控、合理密植、模拟决策支持和监测预警信息等方面取得新进展,在科技兴棉中发挥积极作用,促进棉花增产,棉农增效,品质改良,丰富和发展了棉花栽培理论,取得一批技术成果和专利,其中一些领域居国内外同类研究的领先水平。近10年,又从产中科学化向产前信息化和产后市场化延伸,棉花生产现代化技术也初见端倪,促进棉花产量、质量和效益再上新台阶。
【英文摘要】The discipline of cot ton culture and tillage was one preeminent subject. It w as generally approved in practices that the cultural technology shared 35 percents in the yield increasing. In the past half century, cotton culture and tillage carried on experiment and research, practices summing up and service of cotton culture in the whole country, closely around high yield, good quality, and high efficiency of cotton producing. It achieved new progress in geographic division of cotton producing, wheat cotton doubling cropping, water absorption and field irrigation, nutrition and fertilization, cotton planting in alkali land, seedling raising and transplanting, film-mulching, chemical control and agronomic regulation, rational density, simulation and decision making support, monitoring and early warning information, and so on. These progress worked a positive role in prospering cotton by science and technology , helped increasing cot ton production, adding income of cotton farmers, improving fiber quality, enriching and developing cotton culture theory, and obtained a mass of technological achievements and patent s, in which some w ere in the highest flight of the same researches in the world. In the late 10 years, the study of information service before producing and market service after harvest was put forward and extended from the study of science and technology service in producing. The modern cotton production technology also came out initially, promoted the product ion, quality and benefits o f cotton stepping into a new stage.

【题目】裸苗移栽棉花根系形态特征的初步观察
【中文关键词】棉花; 根系; 植物生长调节; 剖面;
【英文关键词】root system; plant growth regulator; complete distribution at soil profile;
【中文摘要】对收获期裸苗移栽、营养钵育苗移栽和直播棉花的成熟棉株根系形态特征进行了剖面观察,发现裸苗移栽棉株的侧根向四周呈伞面放射状生长,可见粗而健壮的优势侧根6~8条.株-1;营养钵移栽棉株的侧根多向一侧呈鸡爪状极性伸展,可见优势侧根1~2条或2~3条;直播棉花为典型的直根系。经测定,裸苗移栽棉花一级侧根条数44条.株-1,分别比营养钵移栽和直播棉的多15.8%和37.5%;根直径0.31cm,分别比营养钵移栽和直播棉的粗20.5%和88%;根干重31.9g.株-1,分别比营养钵移栽和直播棉的重22.2%和75.3%。
【英文摘要】The morphological parameters of the adult plant root system of the root-naked transplanting cotton(RNTC)was compared in the fields with the soil-cubes transplanting cotton(SCTC)and the direct seeding cotton(DSC)by observing the distribution of root system at each soil profile in layer 0~170 cm. Results showed that lateral roots of RNTC grew actinomorphicly, there about 6 to 8 dominant thick and strong lateral roots. Lateral roots of SCTC spread anisomerously to one side like the paw of a chicken, with about one to two or two to three dominant lateral roots. The root system of DSC was typical taproot system. T he survey indicated that mean numbers of primary lateral roots of RN TC w as 44/plant , more than SCT C and DSC by 15. 8% and 37.5% each (F= 33. 24> F0. 01=5. 49) . Mean diameter width of the primary lateral roots of RNTC was 0.31 cm, wider than SCTC and DSC by 20. 5% and 88% each (F= 249. 01> F0. 01 = 5. 49) ; Mean dry weight o f w hole root system of RNTC was 31.9 g · plant-1 , heavier than SCT C and

DSC by 22.2% and 75.3% each.

【题目】麦后裸苗移栽短季棉连作模式关键栽培措施效应研究
【中文关键词】棉花;连作;裸苗移栽
【英文关键词】null
【中文摘要】我国人口增长,耕地减少,粮棉争地矛盾不断加剧。而发展麦后移栽短季棉连作模式,是充分利用耕地和光热资源,提高复种指数,实现粮、棉双高产,改善品质,提高农业效益,增加农民收入的有效途径。本文主要研究麦后裸苗移栽短季棉连作模式下适宜移栽期、移栽苗龄、移栽密度和移栽棉花化学调控等栽培措施对棉花产量、产量构成因子、早熟性和成铃进程、株高、果枝数和果枝始节等指标的影响,为本技术的推广提供技术支撑。

【题目】南疆棉区地面灌溉棉田高效节水灌溉方式研究
【中文关键词】南疆棉区; 地面灌溉; 灌溉方式;
【英文关键词】Cotton region of south Xinjiang; Surface irrigation; Irrigation regime;
【中文摘要】研究了南疆地面灌溉条件下棉花生育期不同灌溉定额的土壤水分动态、棉株叶片水势动态、棉花耗水规律以及对棉花生长发育、产量和水分利用效率的影响。结果表明, 棉花全生育期灌溉定额345 mm, 每次灌水量60~ 75 mm, 土壤供水明显不足, 叶片水势下降较快, 棉株生育受到抑制, 减产严重; 灌溉定额480mm, 每次灌水量90~ 105 mm, 在15 d 左右的灌水周期内, 土壤供水适宜, 棉株生长稳健, 产量与充分灌溉相当, 水分生产效率显著高于低量灌溉和充分灌溉; 灌溉定额615 mm, 每次灌水量105~ 135 mm, 土壤水分偏多, 棉株生长过旺, 与适量灌溉相比并没有增产效果, 且耗水量加大、水分生产效率下降。在试验结果的基础上提出了南疆棉区合理的灌溉制度。
【英文摘要】Effects of the irrigation schedules of surface irrigation during cotton growing season on change of soil moisture and leaf water potential,water consumption,growth,yield and water use efficiency in cotton field were studied.The results showed:(a) by irrigating 345 mm during the whole season and 60~75 mm each application,the soil moisture supplying ability was obviously deficient,the drop of leaf water potential was faster,the cotton growth was inhibited,the yield sharply decreased;(b) by irrigating 480 mm during whole season and 90~ 105 mm each, the soil supplied sufficient water in 15 days alternation, the cotton grew steadily and vigorously, the yield equal to w h full irrigate, and the water use efficiency w ere higher than that of insufficient and full irrigation; (c)by irrigating 615 mm during whole season and 105~ 135 mm each, the soil supplied too much water, the growth was too strong, the yield did no t increased comparing with common irrigation schedule while the water consumption increased, and the water use efficiency w as reduced. An rational irrigation regime for cot ton production in south Xin-Jiang was proposed based on the studies.

【题目】裸苗移栽棉花缓苗期抗氧化酶活性和叶绿素含量的变化特点
【中文关键词】棉花; 裸苗移栽; 缓苗期; 抗氧化酶活性; 叶绿素;
【英文关键词】cotton; naked-seedling transplanting; recovering stage; anti-oxidant enzyme activity; chlorophyll;
【中文摘要】2007年在一熟棉田设裸苗移栽、钵苗移栽和直播3个处理,在麦棉两熟裸苗移栽棉田设置地膜覆盖和不覆盖两个处理,在移栽后40d内分次取样测定棉花功能叶片的超氧化物歧化酶(SOD)、过氧化物酶(POD)、过氧化氢酶(CAT)活性和叶绿素含量。结果表明,移栽棉花由于移栽时根系受损,存在明显的缓苗期,缓苗期内功能叶片三种酶活性和叶绿素含量变化规律均表现为先升高而后下降或趋于平稳变化;CAT、POD较SOD对逆境的反应敏感,其活性当处于逆境时快速升高,逆境解除时就迅速下降;地膜覆盖有利于缩短移栽缓苗期,促进棉苗早发。
【英文摘要】The purpose of experiment was to study the antioxidant enzyme activity and chlorophyll contents in naked-seedling transplanting cotton on recovering stage.Three treatments were designed in single cropping field including directly sowed cotton,seedling raised with nutritive soil cube and transplanted cotton,seedling raised with soilless-substrante and root-naked transplanted cotton.Two treatments including film-mulched,or no film-mulched were designed in double cropping system of wheat-cotton.SOD,POD and CATactivity, chlorophyll content in functional leaves were measured in 40 days after cot ton w as transplanted. The results show ed that: transplanting cotton had distinct recovering stage because o f the damaged root s during transplanting. During the recovering stage, SOD,POD and CAT activity , chlorophyll content in functional leaves w ere all going up at first , then descending or in a steady situation. CA T、 POD were more sensitive to the negative environment than SOD, the activity went up quickly in the negative environment and went down quickly when the negative environment w as relieved; film-mulched is beneficial to shorting the recovering stag e and promoting the cot ton seedling delivery early.

【题目】脱氧雪腐镰刀菌烯醇(DON)人工抗原及多克隆抗体的研制
【中文关键词】脱氧雪腐镰刀菌烯醇、结构修饰、琥珀酸酐法、碳化二亚胺法
【英文关键词】deoxynivalenol、structuremodification、succinyloxide、carbodiimide reaction
【中文摘要】脱氧雪腐镰刀菌烯醇(Deoxynivalenol,DON)是一种半抗原,没有免疫原性。为了制备抗DON的抗体,必须对其进行结构修饰,加大DON的分子量。本研究采用保护-去保护策略使DON的C3上的羟基与琥珀酸酐反应,使DON衍生后获得1个羧基。利用薄层色谱法跟踪反应进程,反应产物采用薄层色谱法纯化,高效液相色谱和电喷雾离子化质谱(ESI-MS)分析,得出[M+H]+为397.2,确认为3-半琥珀酰-脱氧雪腐镰刀菌烯醇(3-HS-DON)。3-HS-DON与载体蛋白采用碳化二亚胺法进行偶联,偶联物经SDS-聚丙烯酰胺凝胶电泳鉴定,推断偶联成功,并研制出多克隆抗体。
【英文摘要】Deoxynivalenol (DON) is a toxin produced by Fusarium graminearum, which causes ear blight of wheat,barley, corn and other cereal crops worldwide. Consumption of cereal grains containing DON can result in diseases in animals and human beings. It is very necessary to detect DON in food. However,DON is notan antigen, it is essential tomodify the structure and design an semi-antigen. The conversion of DON to 3-HS-DON was facilitated by protecting two of the three available hydroxyls with a cyclic boronate ester and making DON react with the C3 hydroxyl. The derived product was purified with TLC and analyzed by HPLC and ESI-MS.The mass spectrum of derived DON, 3-HS-DON, had the expected [M+H]+ peak at 397.2 m/z. 3-HS-DON-BSA and 3-HS-DON-OVA were prepared by the carbodiimide reaction, and the conjugates were confirmed by SDS-PAGE.

【题目】脱氧雪腐镰刀菌烯醇(DON)抗原化分子设计及其检测
【中文关键词】脱氧雪腐镰刀菌烯醇、人工抗原、鉴定

【英文关键词】deoxynivalenol (DON)、artificial antigen、identification
【中文摘要】利用琥珀酸酐法对DON分子进行结构修饰,采用高效液相色谱法和薄层层析法进行检测,并将衍生物与载体蛋白牛血清白蛋白进行偶联,设计人工抗原,通过紫外分光光度法、SDS-PAGE和ELISA试剂盒分析偶联结果。结果显示,成功得到了DON-BSA,偶联物中DON浓度为0.797μg/μL。
【英文摘要】Deoxynivalenol(DON) molecular structure was modified with succinic anhydride(SA) method in this study. HPLC and TLC were used to determine the product. The derivative and carrier protein BSA were coupled to develop artificial antigen. The conjugate was analyzed with ultraviolet spectrophotometry, SDS-PAGE and ELISA kit for DON. The result showed that DON artificial antigen was obtained and the content ofDON in DON-BSA was 0.797 μg/μL.

【题目】玉米中伏马毒素FB1液相色谱-电喷雾串联质谱测定方法的建立
【中文关键词】液相色谱-电喷雾串联质谱、玉米、伏马毒素、多离子反应监测
【英文关键词】HPLC/MS/MS、maize、fumonisin、multiple responsemonitor
【中文摘要】为建立简单、快速、同时测定玉米中伏马菌素的超高效液相色谱三重四极杆质谱确证方法,利用液相色谱-电喷雾串联质谱法(HPLC-MS/MS)测定FB1,采用固相萃取富集,以含有0·1%甲酸的甲醇/水(75+25)为流动相,流速0.4 ml/min,以多反应监测(MRM)方式进行检测,利用ESI/MS/MS对FB1质谱解析,分别选择特征离子峰m/z334和m/z352作为准确定性的依据。结果表明,在最佳色谱条件下,碰撞能量50 eV,传输区电压100 V时,FB1的保留时间为1.0 min,检出限为75 pg,平均回收率为80.5%,相对标准偏差≤7.47%。以上数据表明该方法具有预处理简单、检测速度快、灵敏度高的优点,可用于玉米样品中伏马菌毒素的确认和准确定量检测,并满足对伏马菌毒素的最低检出要求。
【英文摘要】A new approach for simple, rapid and simultaneous determination of fumonisin B1contaminants inmaize by high-performance liquid chromatography-tandem mass spectrometry was established. High performance liquid chromatography-electrospray ionization tandem mass spectrometry (HPLC-MS/MS) combining with solid phase extraction had been developed for the determination of FB1 inmaize. Mobile phases were methanol-water (75+25), both containing 0.1% formic acid. Flow rate was maintained at 0.4 ml/min. Ionization was performed in an electrospray-positive ion source (+) and quantitative detection was carried out using multiple reaction monitor (MRM) mode.Using the proposed ESI/MS/MS, FB1 could be identified with both retention time and the typical ion peaks at m/z 352 and m/z 334, respectively. When the electrospray ionization source valueswere as follows: collision energy, 50 eV, and cone voltage, 100 V, the retention time of FB1 was 1.0 min, the limit of detection was 75 pg, and the linear rangewas from 0 ng/ml to 300 ng/ml with recovery of 80.5% and theRSD≤7.47%. It comes to a nclusion that the quantitative method has many advantages including simple pretreatment, rapid determination and high sensitivity, which could be applied to the determination and quantification of fumonisin contaminants inmaize.

【题目】抗脱氧雪腐镰刀菌烯醇单克隆抗体的制备
【中文关键词】脱氧雪腐镰刀菌烯醇、单克隆抗体、酶联免疫吸附测定
【英文关键词】deoxynivalenol、monoclonal antibody、enzyme-linked immunosorbent assay
【中文摘要】【目的】小麦赤霉病菌产生的毒素不仅在病害发展过程中具有加重赤霉病的作用,而且污染谷物导致严重的食用安全性问题。由于赤霉病的普遍发生,有必要建立快速、灵敏、有效的毒素检测方法,本试验旨在制备可用于检测被脱氧雪腐镰刀菌烯醇污染的粮谷类特异性单克隆抗体。【方法】本实验首先将脱氧雪腐镰刀菌烯醇(DON)的衍生物3-半琥珀酰 -脱氧雪腐镰刀菌烯醇(3-HS-DON-OVA)与卵清蛋白(OVA)采用碳化二亚胺法进行偶联得到人工抗原,以此人工抗原免疫 BAL B/C 小鼠,取该鼠脾细胞与 SP2/O 鼠骨髓瘤细胞融合,经筛选和克隆,得到了1株能稳定分泌 DON 抗体的单克隆

细胞株(3B2),并制备单克隆抗体腹水。【结果】经检测3B2的抗体类型及亚类均为IgG1,其轻链为κ链。腹水通过间接酶联免疫吸附测定效价在1×107以上。该单克隆抗体与脱氧雪腐镰刀菌烯醇特异性结合反应的50%抑制质量浓度为29μg/L,除与3-acetyldeoxynivalenol(3-Ac-DON)的交叉反应率为78.38%,与其他脱氧雪腐镰刀菌烯醇结构类似物无交叉反应。【结论】本实验所制备的单克隆抗体有较高的灵敏度和特异性,具有较好的应用价值。

【英文摘要】[Objective] Deoxynivalenol (DON) is a trichothecene mycotoxin produced by Fusarium graminearum, a pathogen causing Fusarium Head Blight of wheat. It is necessary to establish a rapid and simple assay to detect DON. [Methods] High affinity monoclonal antibodies (Mab) against DON were produced by cell fusion with 500 mg/mL Poly-ethylene Glycol 400, and cell sub-cloning in HAT (H: hypoxanthine, A: aminopterin; T: thymidine) culture medium for screening and limiting dilution. Hybridoma lines were screened for specificity to DON by Enzyme-linked Immunosorbent Assay (ELISA). One hybridoma cell line (3B2) secreting monoclonal antibody (MAb) against DON was produced by fusing mouse myeloma cells (SP 2/0) with spleen cells from BAL B/C mice which were immunized by the artificial antigen conjugated with Ovalbumin (OVA). [Results] The MAb obtained in this experiment could specifically react with DON without cross-reactivity to DON related compounds except 3-acetyldeoxynivalenol (3-Ac-DON), with the titres of ascitic fluids up to 1×l07 by indirect ELISA. Isotype and subclass of the monoclonal cell line (3B2) showed that it belonged to IgG1. The light chain of the MAb was identified to be κ. Ascites antibodies generated by hybridoma of 3B2 cells were purified. Inhibition rate studies showed that the detection limit of the ELISA was 8 μg/L, with the regression equation of indirect ELISA Y=0.733lg(x) 0.572, R2=0.9652, IC50 value being 29ug/L. [Conclusion] The MAb can be used to prepare the reagents for analyzing DON residue.

【题目】薄层色谱和高效液相色谱联合检测玉米赤霉烯酮的方法研究

【中文关键词】玉米赤霉烯酮;检测;TLC;HPLC

【英文关键词】zearalenone、detection、TLC、HPLC

【中文摘要】建立了薄层色谱法(TLC)定性检测和高效液相色谱法(HPLC)定量检测相结合的检测玉米粉中玉米赤霉烯酮(ZON)的方法。以石油醚：乙醚：冰醋酸(70：28：2)为展开剂, TCL定性检测ZON, ZON的比移值(Rf值)约为0.26。HPLC对ZON进行定量分析,ZON在0.25~5μg/mL范围内线性关系良好,回收率高,检测限为3μg/kg。试验表明: TLC快速、简便,可作为大批量、快速检测ZON的有效方法;HPLC精确、灵敏度高可作为定量检测ZON的有效手段。

【英文摘要】Thin layer chromatography (TLC) combined with high performance liquid chromatography (HPLC) were used for the detection of zearalenone (ZON) in corn flour. Rfvalue of ZON for TLC with ligarine-ethylether-glacial acetic acid (70：28：2, V/V) as expanded materialwas determined as 0.26. Quantitation of ZON was carried out by HPLC. The linear correlation was well between 0.25~5 μg/mL. The coefficient of recovery was high and detection limit was 3 μg/kg. It suggested that TLC is fastand convenient, and suitable for quick detection in a large batch, while HPLC is precise and sensitive, and suitable for quantitation of ZON.

【题目】Optimization of the isolation and cultivation of Cyprinus carpio primary hepatocytes

【中文关键词】Hepatocytes; Primary culture; Cell viability; Cyprimus carpio

【英文关键词】Hepatocytes; Primary culture; Cell viability; Cyprimus carpio

【中文摘要】The aquatic environment is affected by numerous chemical contaminants. There is an increasing need to identify these chemicals and to evaluate their potential toxicity towards aquatic life. In this research we optimized techniques for primary cell culture of Cyprinus carpio hepatocytes as one adjunct model for ecotoxicological evaluation of the potential hazards of xenobiotics in the aquatic environment. In this study, Cyprinus carpio hepatocytes were isolated by mechanical separation, two-step collagenase perfusion, and pancreatin digestion. The hepatocytes or parenchymal cells could be separated from cell debris and from non-parenchymal cells by low-speed centrifugation (Percoll gradient centrifugation). The harvested hepatocytes were suspended in DMEM, M199 (cultured in 5% CO2), or L-15 (cultured without 5% CO2) medium then cultured at 17, 27, or 37°C. Cell yield was counted by use of a hemocytometer, and the viability of the cells was assessed by use of the Trypan blue exclusion test. Results from these studies showed that the best method of isolation was pancreatin digestion (the cell yield was 2.7*108 per g (liver weight) and the viability was 98.4%) and the best medium was M199 (cultured in 5% CO2) or L-15 (cultured without 5% CO2). The optimum culture temperature was 27 °C. The primary hepatocytes culture of Cyprimus carpio grew well and satisfied requirements for most toxicological experiments in this condition.

【题目】Development of a sensitive competitive indirect ELISA method for determination of ochratoxin A levels in cereals originating from Nanjing, China

【中文关键词】Ochratoxin A; Monoclonal antibody; ELISA; Cereals

【英文关键词】Ochratoxin A; Monoclonal antibody; ELISA; Cereals

【中文摘要】A monoclonal antibody against ochratoxin A (OTA) was produced and a simple, rapid and reliable competitive indirect ELISA (ci-ELISA) for detection of OTA was developed. The 50% inhibitory concentration (IC50) was 1.70 ng/mL, with a detectable range of 0.55-6.75 ng/mL, and a limit of determination (LOD) at 0.15 ng/mL. The cross-reactivity of the antibody against ochratoxin B was 17%, and <10% against deoxynivalenol, fumonisin B1 or aflatoxin B1. A survey of 65 cereal samples was carried out in Nanjing, the capital of Jiangsu Province, China. The frequencies of OTA contamination were 36.36%, 26.08% and 15.00%, and the mean concentrations of positive samples were 4.248 ng/g, 7.360 ng/g and 3.382 ng/g for wheat, corn and rice, respectively. The results of this study suggest that the ci-ELISA developed can be used to determine OTA in agricultural commodities such as cereals, and a survey might be needed to investigate OTA contamination in food and feed to prevent their harmful health effects.

【题目】A mitochondria-mediated apoptotic pathway induced by deoxynivalenol in human colon cancer cells
【中文关键词】Deoxynivalenol; HT-29; Apoptosis; Mitochondria-mediated pathway
【英文关键词】Deoxynivalenol; HT-29; Apoptosis; Mitochondria-mediated pathway
【中文摘要】Deoxynivalenol (DON), known colloquially as "vomitoxin", is a pathogenic mycotoxin produced by Fusarium fungi. Human food poisoning outbreaks, with nausea, diarrhea, and vomiting as primary symptoms, have been associated with Fusarium-infected cereals. Therefore, this study was designed to determine the molecular aspects of DON in human colon cancer cells (HT-29). To this aim, we have monitored the effects of DON on (i) cellular morphological changes via optical and transmission electron microscopy, especially in regards to cell viability and mitochondria changes, and (ii) its effects on key regulators of cell apoptosis, including cytochrome c, caspase-9, caspase-3, Bcl-2, Bax, and Bid. Our results showed that DON treatment inhibited cell proliferation, induced significant morphological changes, and promoted the activation of cytochrome c and caspases. Furthermore, changes in Bcl-2, Bax, and Bid expression were detected. The relative expression profile of Bcl-2 was contrary to that of Bax and Bid, as Bcl-2 expression decreased as the concentrations DON increased, reaching a minimum at the highest concentration of DON. We concluded that DON-induced apoptosis was caused by mitochondrial dysfunction and subsequent release of cytochrome c into the cytoplasm and successive activation of caspases, and this was likely regulated by Bcl-2 family proteins.

【题目】不同灌溉定额对设施茄子光合特性和产量的影响
【中文关键词】设施茄子; 灌水量; 光合特性; 水分利用效率;
【英文关键词】greenhouse eggplant; irrigation amount; photosynthesis characteristics; water use efficiency;
【中文摘要】为研究不同灌溉定额对设施茄子叶片光合特性及产量的影响,在宁夏盐池县进行小区栽培试验。结果表明:灌溉定额675、900 mm的处理叶片净光合速率影响显著高于灌溉113 mm的处理。随着灌水量的增加,叶片蒸腾速率、气孔导度、胞间CO2浓度先减少后增加,Fo有着先减少后增加的趋势,Fm和Fv随着灌水量的增加有先增加后减少的趋势。反映了水分亏缺和水分过量都会影响光化学效率、潜在活性、捕获激发能的效率、光和电子的传递。水分利用效率随着灌水量的增加而逐渐的减少,根据不同灌水处理下茄子的生理性状、经济效益和土壤水分的可持续利用原则,最佳的灌溉量为550~700 mm。
【英文摘要】The effects of different irrigation amount on leaf photosynthesis characteristics and yield of greenhouse eggplant are studied in Yanchi county of Ningxia.The result shows that Pn of the treatments with 675 mm and 900 mm irrigation quota are significant more than that of 113 mm treatment.At the same time,with the increase of the irrigation amount,the values of stomatal conductance(Ci),intercellular CO-2 concentration(Gs)and transpiratory rate(Tr) are gradually decrease first then increased,the trend of Fo is reduced firstly then increases,while the Fm,Fv increases firstly then reduces.This reflects that both the water deficit and water surplus have effects on the primary light energy conversion of PSⅡ,the potential activities of PSⅡ,the potential photosynthetic activities and photosynthetic electron transport.The water use efficiency(WUE) is gradually decreased with the increase of irrigation amount.According to the analysis result of yield and growth status of eggplant under different irrigation amount,economic benefit and sustainable use of soil water,it is concluded that the optimum irrigation amount is 550 to 700 mm.

【题目】不同灌水量对日光温室番茄产量_品质和水分利用效率的影响
【中文关键词】灌水量; 日光温室番茄; 产量; 品质; 水分利用率;
【英文关键词】irrigation quantity; solar greenhouse tomato; yield; quality; WUE;
【中文摘要】通过温室膜下滴灌试验,研究了不同灌水量对番茄产量、品质和水分利用率的影响。结果表明:灌水量对番茄产量和果实品质有显著的影响。灌水量为375mm的处理产量达到138108kg/hm2,比对照增产74.96%,达到极显著水平,水分利用率为1.60kg/m3;降低灌水量可提高果实中硝酸盐、可溶性糖和维生素C等可溶物的含量。
【英文摘要】The experiment was carried on drip irrigation under film in solar greenhouse to study the effect of irrigation quantity on yield and quality and water use efficiency.The results showed that irrigation quantity affected the yield of tomato and fruit quality significantly.The yield of tomato dealt with 375 mm irrigation treatment achieved 138 108 kg/hm~2,it was higher by 74.96%than check and achieved significance level,WUE of this treatment achieved 1.60 kg/m~3;The content of nitrate and solubility sugar and vitamin C in fruit were raised through reducing irrigation quantity.

【题目】不同灌水次数对日光温室番茄土壤水分动态变化规律的影响
【中文关键词】灌水次数;日光温室;番茄;土壤水分动态变化

【英文关键词】irrigation frequency; greenhouse; tomato; soil water dynamics
【中文摘要】根据番茄在整个生育期内土壤水分变化特点,充分利用有限水资源,调节土壤水分状况。在相同灌水量条件下,利用时域反射仪研究不同灌水次数对土壤含水量的变化的影响。结果表明:各处理土壤贮水量变化的深度一般在0~100 cm内,尤其在0~60 cm变化最为激烈,100~180 cm范围内土壤水分变化不明显。按土壤水分运移规律进行划分,将土壤水分的垂直变化分为4层,即活跃层(0~30 cm)、次活跃层(30~60 cm)、缓变层(60~100 cm)和均稳层(100~180 cm)。灌水次数越少对土壤水分消耗的越多,易造成活跃层和次活跃层土壤水分亏缺;反之,则土壤水分消耗较少。
【英文摘要】In the whole growth period of tomato, according to soil moisture characteristics, full used of limited water resources and regulated soil moisture. Used TDR to study the yield and soil water dynamics of greenhouse tomato by different irrigation times of some irrigation amount. The result showed that: the depth of soil water dynamics changes by different treatments was 0-100 cm, and the change of depth 0-60 cm was best fury. The change of depth 100-180 cm was not distinctness. By soil moisture migration to be divided, there were 4 layers divided by the vertical variation of soil moisture: the active layer (0-30 cm), sub-active layer (30-60 cm), graded layer (60-100 cm) and stable layer (100-180 cm). Irrigation times less then consumption of soil moisture more, led to the active layer and the second active layer of the soil water deficit easily. The more number of irrigation on soil the moisture consume less, could easily lead times active layer of soil moisture deficit.

【题目】不同灌水次数对温室黄瓜耗水规律及水分利用效率的影响
【中文关键词】日光温室;黄瓜;灌水次数;耗水规律;水分利用效率
【英文关键词】Greenhouse; Cucumber; Irrigation times; Water consumption; Water use efficiency
【中文摘要】在膜下滴灌条件下,灌溉定额为 600 mm 时,研究了不同灌水次数对日光温室黄瓜耗水规律及水分利用效率的变化规律。 研究结果表明,灌水次数达 18 次时,黄瓜耗水强度整体随着生育期的延后逐渐增大,在结果盛期达到最大,随后逐渐下降;土壤贮水量随灌水量的增加而增加,而土壤水分的消耗则随着灌水量的增加而明显减少;灌水15~18 次,既能满足黄瓜水分需求,又可为土壤补充水分,且水分利用率达到 33.4 kg/m3。

【英文摘要】Under the drip irrigation, irrigation quota was 600 mm, to study cucumber water consumption and changes of water use efficiency in greenhouse. The results showed that up to 18 times the number of irrigation, the water consumption of the overall strength increased with the growth delay period, the maximum peak in the fruiting stage, then decreased gradually. Along with irrigation increasing, the soil water storage capacity increased, but water consumption of soil signifi-cant reduced. Irrigation frequency 15-18 times, to meet the needs of cucumber water and began to supply water to the soil, and water utilization rate was 33.4 kg/m3.

【英文关键词】Ratio of N,P and K fertilizer; Greenhouse; Pepper; Use ratio of fertilizer;
【中文摘要】通过田间试验研究了二代日光节能温室氮、磷、钾及其配合施用对辣椒产量及其经济效益的影响。结果表明,供试土壤速效磷、钾丰富,速效氮素相对贫乏,表现为设施内高投肥特征并导致土壤轻度盐渍化;三要素对株高和叶绿素含量的影响顺序为:NPK>NP>NK>PK>CK,氮素的促长效应显著;而肥料配比对辣椒茎粗的影响作用顺序为

:NPK>NK>PK>NP>CK,钾素的壮苗品质作用明显。氮肥对温室辣椒的产量具有决定性影响,三要素对辣椒产量影响的顺序为氮>磷>钾;辣椒产量59%依赖于土壤供肥水平.

【英文摘要】Field experiments were conducted to study the effect of mixed N,P,K application on yield and economic benefits of pepper in second generation greenhouse.The results showed that the tested soil was abundant of available P and K,but lack of available N.The soil was lightly salinized due to over fertilization.The effective order of fertilizers on height and chlorophyll of pepper is NPK>NP>NK>PK>CK.Pepper growth was significantly promoted by N application.The effective order of fertilizers on diameter of pepper stem is NPK>NK>PK>NP>CK.K had significantly strong pepper stem.Pepper yield was significantly affected by N.The effective order of fertilizers on pepper production is N>P>K.59% of pepper yield was rely on soil fertilities.The seasonal use ratio of N,P,and K is only 19.27%,4.74% and 13.38% respectively due to over fertilization.N mixed with P,N mixed with k,and N mixed with both of them can promote the ratio of output and input,as well as promote economic benefit for pepper production in greenhouse.

【题目】不同施氮量对设施番茄生长与产量的影响及最佳用量

【中文关键词】日光温室; 产量; 施氮量; 番茄;

【英文关键词】Greenhouse; Yield; N application rate; Tomato;

【中文摘要】通过田间试验研究了二代日光节能温室不同施氮量对番茄生长、产量及其经济效益等的影响。结果表明,供试土壤全盐随施氮量的增加而增加,pH则随氮肥施用量的增加而显著降低;番茄株高、茎粗、叶绿素含量随施氮量增加而显著增加,施氮量超过600 kg.hm-2时,冠幅显著增加,造成枝叶徒长。番茄产量与施氮量呈典型的抛物线关系,即施氮量低于600 kg.hm-2时,随施氮量的增加,番茄产量增加;但进一步增加的施氮量导致产量下降,产投比也显著降低。施氮使番茄果实中可溶性糖含量的增加,总酸度下降,糖酸比的增大,Vc含量的增加,硝态氮的累积均达显著水平。设施番茄最高产量施氮量为646 kg.hm-2,最大经济效益施氮量为604 kg.hm-2。 更多还原

【英文摘要】A field experiment was conducted to study the effect of different N fertilizer application rate on tomato growth,yield and economic benefit in second generation greenhouse.The results showed that the total salts content was increased with the N application,yet pH was decreased at the same time.The height,stem diameter and chlorophyll of tomato were increased along with increment of N application.When more than 600 kg · hm-2 N was used in the field,the trunk breadth of tomato was significantly increased and led to overgrowth of leaves.The yield of tomato was increased along with enhanced N application rate,yet the yield of tomato was decreased if N applied more than 600 kg · hm-2.N application promotes the increase of soluble sugar,Vc,and NO3——N content,but reduce the total acidity.Changed ratio of sugar/acidity improves the quality of tomato.The reasonable application rate of N is 646 kg · hm-2.The optimum application rate of N is 604 kg · hm-2. 更多

【题目】不同施磷量对设施番茄生长_产量的影响及最佳施用量研究

【中文关键词】日光温室; 产量; 施磷量; 番茄;

【英文关键词】Greenhouse; Yield; Papplication rate; Tomato;

【中文摘要】通过田间试验研究了二代日光节能温室不同施磷量对番茄生长、产量及其经济效益的影响。结果表明,幼苗期,磷肥施用量显著促进茎粗和叶面积的增加;而花期叶面积和冠幅差异不显著。随着施磷量的增加,番茄株高、茎粗、叶

绿素均比对照显著增加,但处理间差异不显著。随着番茄植株的生长,至花期营养生长与生殖生长并进,不同施肥处理中番茄株高、茎粗、冠幅、叶绿素均显著增加。番茄产量的磷效应表现为典型的抛物线式,施磷量低于225kg/hm2时,随施磷量的增加,番茄产量增加;但进一步增加施磷量则会导致产量下降,从而得到其最高产量施磷量为253.90kg/hm2,最大经济效益施磷量为250.80kg/hm2

【英文摘要】A field experiment was conducted to study the effect of Phosphate on growth and yield of tomato and the optimum application amount.The results showed that seedling stage,phosphate application significantly enhanced the increase in stem diameter and leaf area;while flowering leaf area and crown size difference was not significant.With the increase in P application rate,tomato plant height,stem diameter,chlorophyll a significant increase than the control,but no significant difference among treatments.With the growth of tomato plants to flowering vegetative and reproductive growth of the times,in different fertilization treatments in the tomato plant height,stem diameter,crown width,chlorophyll were significantly increased.Non significant effects of different potassium application rate on height,diameter of stem,leaf area,breadth of tress,as well as chlorophyll were observed.However,tomato yield was significantly affected by potassium application.The Yield of Tomato was increased along with increased phosphate application rate under 225 kg/hm2.Yet further increased phosphate led to decrease of tomato production.The maximum application rate of phosphate for tomato growth is 253.90 kg/hm2.The optimum application amount of it is 250.80 kg/hm2.

【题目】不同灌溉方式对宁南黄土丘陵区设施辣椒生长发育及产量的影响

【中文关键词】灌溉方式; 设施辣椒; 宁南丘陵;

【英文关键词】irrigation method; greenhouse pepper; hilly area of southern Ningxia;

【中文摘要】在半干旱黄土丘陵典型区宁夏固原日光温室内进行了不同灌溉方式对设施辣椒生长发育及产量的影响试验。在满足设施辣椒正常生长的情况下,通过设定不同时期不同灌水量,计算不同灌溉方式灌水总量,并测定不同处理下辣椒生长发育指标及产量。结果表明:不同灌溉方式下辣椒株高、茎粗、产量差异明显。毛管滴灌下株高和叶绿素SPAD值最大,膜下沟灌株高最矮,茎粗最粗;膜下沟灌产量最高,相对传统沟灌节水50.3%,其次为滴头滴灌,毛管滴灌产量最低;采用毛管滴灌和滴头滴灌技术,比传统沟灌分别节水71.2%和65.8%,节水效果极显著;膜下沟灌和膜上沟灌较传统沟灌节水50%左右,节约成本达850.5~1227元/hm2。宁南黄土丘陵区日光温室栽培辣椒从高产角度看比较适合采用膜下沟灌,从节水高效模式来看比较适合采用滴头滴灌。

【英文摘要】An experiment was conducted to find out the impact of irrigation methods on greenhouse pepper growth and yield in the typical semiarid loess hilly regions of southern Ningxia.Under the condition of the normal growth of pepper,different periods and different irrigation volume were set to calculate the total irrigation volume and then measure the growth indicators and production.The results showed that: Under different modes of irrigation,pepper plant height,stem diameter and yield were significantly different.Under capillary drip irrigation,the plant height and SPAD were the largest;while under furrow irrigation under mulch,the plant height was the shortest and the stem diameter was the thickest.The yield of furrow irrigation under mulch was the highest and could save water by 50.3% compared with furrow irrigation,the following was emitter drip irrigation,while the yield under capillary drip irrigation was the minimum.Compared with furrow irrigation,the capillary drip irrigation and emitter drip irrigation technology could save water by 71.2% and 65.8%,and the water-saving efficiency was significant;the water-saving rate of furrow irrigation under mulch and on mulch was near 50%,and the water production cost efficiency was 850.5~1227 yuan/hm2.So drip emitter irrigation and furrow irrigation under mulch are suitable for greenhouse pepper in the loess hilly regions of southern Ningxia. 更多

【题目】设施农业滴灌用黄河水安全净化处理技术试验研究

【中文关键词】滴灌; 黄河水; 净化处理技术; 干旱区; 宁夏;

【英文关键词】drip irrigation; Yellow River water; technology of purifying water; arid region; Ningxia province;

【中文摘要】引用高含沙地表水作为滴灌水源是解决干旱地区滴灌工程水源的主要途径之一,滴灌用高含沙水净化处理成为亟待解决的重要问题。以宁夏中南部地区设施农业滴灌用黄河水净化技术为对象,开展试验研究,主要结论有:扬黄水经

2次沉沙池除沙后泥沙含量降至0.04~0.08 kg/m3,悬浮物含量0.98~1.40 mg/L,COD平均含量1.26~2.28 mg/L,已可满足滴灌要求;筛网过滤器在泥沙量0.05~0.08 kg/m3时,除沙率约1%,过滤效果差;叠片式过滤器除沙率约5%,且优点较多可作为主过滤设备;过滤设备悬浮物去除率13.1%~20.6%,COD去除率5.8%~26.5%,综合去除率21%~50%;宁夏半干旱风沙区和黄土高原区区域,以扬黄水为水源的设施农业,净化系统工程投资5.07~7.8万元/hm2,其中工程净化投资4.8~7.35万元/hm2,设备投资0.27~0.45万元/hm2。

【英文摘要】It is an important approach to solve water source for drip irrigation project in arid areas by using a high-silt content surface water.So,the technology of Purifying water for drip irrigation with high-silt content water is the first key question.In this paper,we did some experiment in central and southern regions of Ningxia province for the technology of purifying water for drip irrigation which was used by establishment agriculture with Yellow River water.Results indicate that: The Yellow River water passed two settling basins,the value of sediment charge,suspension content and COD average content were drops to 0.04~0.08 kg/m3,0.98~1.40 mg/L and 1.26~2.28 mg/L separately,which has been possible to satisfy for the drip irrigation.In case,the silt measures 0.05~0.08 kg/m3,the gauze filter eliminates sediment about 1%,the filtration effect is bad.The stack type filter eliminate sediment ratio about 5% and more advance,so may take the main filter plant.Filter plant can eliminated suspension 13.1%~20.6%,COD about 5.8%~26.5%,synthesis elimination rate 21%~50%.In sub-arid wind desert region and the Loess Highlands area region of Ningxia province,the Yellow River water is a main water source for facility agriculture.Accord to calculating the purification system project may invest 50 700~78 000 Yuan/hm2,there into,the project purification invests 48 000~73 500 Yuan/hm2,equipment invests 2 700~4 500 Yuan/hm2.

【题目】不同施氮量对设施辣椒生长与产量的影响及最佳施用量研究
【中文关键词】日光温室;施氮量;辣椒;宁夏
【英文关键词】green house; N application rate; pepper; Ningxia
【中文摘要】通过田间试验研究了宁夏二代日光节能温室不同施氮量对辣椒生长、产量及其经济效益的影响。结果表明:供试土壤速效磷、速效钾丰富,速效氮相对贫乏,设施内高投肥已导致土壤轻度盐渍化;氮素是决定辣椒生长发育的决定性指标,对辣椒的株高、叶绿素含量、茎粗及产量都有显著影响;辣椒产量83%依赖于氮素施用水平;辣椒对氮肥投入的反映表现为典型的抛物线式;温室辣椒最高产量施氮量为872 kg/hm2,最大经济效益施氮量为791 kg/hm2。
【英文摘要】A field experiment was conducted to study the effect of different N fertilizer application rate onpepper growth, yield and economic benefit in second generation greenhouse inNingxia. The resultswere shown that therewere relatively lack of nitrogen in available phosphorus and potassium in the tested soil. The soil is gently salinized due to over fertilization in the greenhouse. N is decisive factor for pepper growth because its height,chlorophyll, diameter of stem, and yield of pepperwere significantly affected by increasedN application rate. 83% of pepper yield relied on N fertilizer application amount. The relationship between N application rate and pepper yield can be described by parabola curve. The maximum application rate of N is 872 kg/hm2. The optimumapplication rate of N is 791 kg/hm2

【题目】温室蔬菜生长发育模型研究进展
【中文关键词】温室蔬菜;生长;发育;结构模型;功能模型
【英文关键词】greenhouse vegetable; growth; development; structural model; functional model
【中文摘要】作物模型是进行作物生产精确管理的有力工具,对设施作物生产优化管理具有重要理论指导意义和应用值。该文对国内外温室蔬菜生长发育模型的研究成果从功能模型、 结构模型两个方面进行了阐述。 对功能模型分别从叶面积、冠层辐射传输、光合作用、呼吸作用、干物质分配、产量形成的模拟以及生育期预测等方面进行了总结和评述。对结构模型,重点评述了从结构模型发展到结构-功能模型所取得的成果。最后讨论了研究中存在的薄弱环节以及今后的主要研究方向。
【英文摘要】Crop models are useful tools in precision management of greenhouse crop production. This paper presents a review on research progresses of both structural and functional models of greenhouse vegetable crops. Researches on functional models including leaf area development, light interception, photosynthesis, respiration, dry matter partitioning, yield formation and development were summarized. Researches on structural models with emphasis on the progress from structural models to structural- functional models and the future development trends of greenhouse vegetable crop models were discussed.

【题目】水分对日光温室独本菊生长动态影响的模拟
【中文关键词】干物质生产,模型,独本菊,基质水势
【英文关键词】dry matter production, models, standard cut chrysanthemum, substrate water potential
【中文摘要】光合作用与干物质生产是观赏植物外观品质形成的基础。水分是影响植物光合作用与干物质生产的重要因子。为定量研究水分对日光温室独本菊光合作用与干物质生产的影响,本研究以秋菊品种‘ 神马 ’(Chrysanthemum morifolium.L‘ Shenma ’) 为试验材料, 于 2006 年8 月~2007 年6 月在北京日光温室内进行了不同定植期和不同水分处理的栽培试验,以生理辐热积为发育尺度,定量分析了基质水势对独本菊叶面积指数、光合速率和干物质生产动态的影响,建立了基质水势对独本菊叶面积指数、光合速率和干物质生产影响的模拟模型,并用与建立模型相独立的数据对模型进行了检验。结果表明,模型对日光温室独本菊叶面积指数、叶片最大总光合速率和植株总干重的预测结果较好,叶面积指数、叶片最大总光合速率和植株总干重的模拟值与实测值之间基于 1∶1 线的决定系数分别为 0.94,0.90,0.94,相对预测误差分别为 11.95%、3.13%、11.14%。本研究建立的模型可以为日光温室秋菊品种‘ 神马 ’的水分管理提供理论依据和决策支持。
【英文摘要】Photosynthesis and dry matter production are essential for guaranteeing the external quality of ornamental plants. Water is the important factor affecting plant photosynthesis and dry matter production. The aim of this study was to quantitatively investigate the effects of water on photosynthesis and dry matter production of standard cut chrysanthemum grown in a solar greenhouse. Experiments of standard cut chrysanthemum (Chrysanthemum morifolium. ‘ Shenma ’) with different planting dates and different levels of water treatment were conducted in a solar greenhouse in Beijing from August 2006 to June 2007. The integrated photo-thermal index, the product of thermal effectiveness, PAR and day length (PTEP), was used to describe the seasonal change of the canopy leaf area index. Effects of substratewater potential on the dynamics of leaf photosynthesis rate and the canopy leaf area index were quantified based on the experimental data. These quantitative relationships were then integrated into a photosynthetically driven dry matter production model to predict the effects of substrate water potential on dry matter production of standard cut chrysanthemum in solar greenhouse. Independent experimental data were used to validate the model. The results showed that the coefficient of determination (R2) between the simulated and the measured values of canopy leaf area index, the maximal leaf gross photosynthesis rate and the dry matter production based on the 1:1 line were 0.94, 0.90, 0.94, respectively; and the relative prediction errors (RE) between the simulated and the measured values were 11.95%, 3.13%, 11.14%, respectively, for the canopy leaf area index, the maximal leaf gross photosynthesis rate and the dry matter production. The model developed in this study gives satisfactory predictions of the canopy leaf area index, the maximal leaf gross photosynthesis rate and the dry matter production of the standard cut chrysanthemum, hence, can be used foroptimizing water management for standard cut chrysanthemum production in solar greenhouses.

【题目】温室甜椒生长与产量预测模型
【中文关键词】模型,温室,生长,甜椒,干物质生产,干物质分配
【英文关键词】models, greenhouses, growth, sweet pepper, biomass production, dry matter partitioning
【中文摘要】基于光温的作物生长模拟模型是进行温室作物和环境优化调控的有力工具。通过不同品种、不同生态地点的温室播期试验,定量分析辐射和温度对甜椒干物质分配和果实采收指数的影响,以及果实干物质量增长和鲜质量增长的关系,建立以辐热积为预测指标的甜椒干物质分配模型,并将其与光合作用驱动的干物质生产模型以及果实干物质量增长和鲜质量增长的定量关系相结合,建立温室甜椒生长动态与产量预测模型。利用与建模相独立的试验资料对模型进行检验,结果表明,模型对Venlo 型连栋温室和日光温室中种植的不同品种甜椒的干物质生产与分配和产量的预测结果较好,建立的模型参数少且易获取,实用性较强,可以为中国温室甜椒生产中光温的管理提供决策支持。

【英文摘要】Crop growth simulation models are useful tools in optimizing greenhouse crop and climate management. In order to quantify the effects of radiation and temperature on greenhouse sweet pepper (Capsicum annuum L.) growth and yield, experiments with 2 cultivars and different sowing dates were conducted in a multi-span Venlo-type plastic greenhouse located in Shanghai and a Chinese traditional solar greenhouse located in Shi He Zi, Xingqiang, China. Theproduct of thermal effectiveness and PAR (TEP) was used as the predicting index, and the effects of radiation and temperature on dry matter partitioning and fruit harvest index were quantified based on the experimental data. And the relationship between dry weight and fresh weight of the fruits was derived according to the experimental data. A model for greenhouse sweet pepper growth and yield simulation was developed by integrating those quantitative relationships with a general photosynthesis driven biomass production model. Independent experimental data were used to validate the model. The results show that the model developed in this study gives satisfactory predictions of the growth and yield of sweet pepper grown in both the multi-span Venlo-type greenhouse and the solar greenhouse. The model developed inthis study can be used for light and temperature management for greenhouse sweet pepper production.

【题目】氮素对日光温室独本菊‘神马’外观品质影响的模拟
【中文关键词】独本菊;日光温室;叶片氮含量;外观品质;模型
【英文关键词】standard cutting chrysanthemum; solar greenhouse; leaf nitrogen content; external quality; model
【中文摘要】【目的】定量研究氮素对日光温室独本菊外观品质的影响,为温室切花菊氮肥管理提供决策依据。【方法】以温室独本菊品种‘神马’(Dendranthema morifolium‘Shenma’)为材料,根据不同定植期、不同氮素处理的试验资料,以生理辐热积为发育尺度,以现蕾期叶片累积氮含量为植株氮素特征指标,定量分析氮素对独本菊品质指标(株高、茎粗、叶片数、花头直径、花颈长)动态的影响。在此基础上,建立氮素对日光温室独本菊外观品质影响的模拟模型,并用独立的试验资料对模型进行检验。【结果】在试验的土壤当季供氮量范围内,叶片累积氮含量对株高和叶片数的影响不显著。模型对株高、茎粗、叶片数、花头直径和花颈长的预测精度较高,模拟值与实测值基于1∶1线的决定系数(R 2)分别为0.99、0.96、0.96、0.97 和0.98,相对预测误差(RSE)分别为5.25%、3.04%、8.9%、10.92%和9.22%。【结论】本研究建立的模型可以为日光温室中秋菊品种‘神马’生产中的氮素管理提供理论依据和决策支持。
【英文摘要】【Objective】 The aim of this study was to quantitatively investigate the effects of nitrogen on external quality of solar greenhouse standard cutting chrysanthemum, and to optimise the nitrogen management for standard cutting chrysanthemum production in solar greenhouse. 【Method】 Experiments with different planting date and nitrogen treatment were conducted in a solar greenhouse in Beijing during 2005 and 2006. The cultivar used in the experiments was Dendranthema morifolium ‘Shenma’. The integrated photo-thermal index, the product of thermal effectiveness, PAR and day length (PTEP), was used to describe the changes of the external quality indices (plant height, stem diameter, leaf number, diameter of flower head, length of flower neck). Effects of the accumulated leaf nitrogen content at flower bud showing stage on the dynamics of the quality indices were quantified based on the experimental data. Based on these quantitative relationships, a model for predicting the effects of nitrogen on external quality of standard cutting chrysanthemum in solar greenhouse was developed. Independent experimental data were used to validate the model. 【Result】 In the range of nitrogen available in the soil during the experimental seasons, the effect of nitrogen on plant height and leaf number were not significant. The coefficient of determination (R2) between the simulated and measured value of plant height, stem diameter, leaf number, diameter of flower head and length of flower neck of the standard cutting chrysanthemum plants were 0.99, 0.96, 0.96, 0.97, 0.98, respectively; and the relative prediction error (RSE) were 5.25%, 3.04%, 8.9%, 10.92%, 9.22%, respectively based on the 1∶1 line. 【Conclusion】 The model developed in this study can be used for the optimization of nitrogen management for solar greenhouse standard cutting chrysanthemum ‘Shenma’ production.

【题目】氮素对日光温室独本菊品种‘神马’干物质分配影响的模拟
【中文关键词】独本菊 日光温室 叶片氮含量 干物质分配 模型
【英文关键词】standard cut chrysanthemum, solar greenhouse, leaf nitrogen content, dry matter partitioning, model
【中文摘要】为定量研究氮素对日光温室独本菊(Dendranthema morifolium)干物质分配的影响，该研究以独本菊品种‘神马’为试验材料，于2005年10月~2006年7月在北京日光温室内进行了不同定植期和不同氮素水平的栽培试验，以生理辐热积为发育尺度，定量分析了氮素对独本菊品种‘神马’干物质分配指数动态的影响，建立了氮素对日光温室独本菊品种‘神马’干物质分配影响的模拟模型，并用与建立模型相独立的数据对模型进行了检验。结果表明，独本菊品种‘神马’叶片累积氮含量最大值出现在现蕾期，现蕾期叶片累积氮含量适宜值为1.62 g·m－2。模型对日光温室独本菊品种‘神马’各器官干重预测结果较好，茎、叶和花干重的预测值与实测值之间基于1:1线的决定系数分别为0.94、0.97和0.94，相对预测误差分别10.3%、5.76%和4.02%。该研究建立的模型可以根据温室内的气温、太阳辐射、日长和现蕾期叶片累积氮含量预测日光温室独本菊品种‘神马’各个器官干重随生育时期的动态变化，从而为日光温室独本菊品种‘神马’生产中氮素的优化管理提供决策支持。
【英文摘要】Aims Dry matter partitioning is the basis of external quality formation of ornamental plants. Nitrogen is the important nutrient affecting dry matter partitioning of plants. Our aim was to quantitatively investigate the effects of nitrogen on dry matter partitioning of standard cut chrysanthemum (Dendranthema morifolium ‘Shenma’) grown in a solar greenhouse. Methods We conducted our experiments using different planting dates and different levels of nitrogen application rates in a solar greenhouse in Beijing, China during October 2005 and July 2006. The integrated photo-thermal index, the product of thermal effectiveness, photosynthetically active radiation (PAR) and day length (PTEP), was used to describe changes of the partitioning indices of leaf, stem and flower with development stages. Effects of the accumulated leaf nitrogen content at bud-showing stage on the dynamics of the partitioning indices of leaf, stem and flower were quantified based on experimental data. Based on these quantitative relationships, we developed a model for predicting the effects of nitrogen on dry matter partitioning. Independent experimental data were used to validate the model. Important findings The seasonal maximum accumulated leaf nitrogen content occurred at the bud-showing stage, and the optimal value at this stage is 1.62 g·m－2. Based on the 1:1 line, the coefficients of determination (R2) between the simulated and measured dry weight of stem, leaf and flower were 0.96, 0.97 and 0.94, respectively, and the relative prediction errors (RSE) between the simulated and measured dry weight of stem, leaf and flower were 8.26%, 5.76% and 3.70%, respectively. The model we developed can satisfactorily predict dry weight of stem, leaf and flower using greenhouse air temperature, radiation, day length and the accumulated leaf nitrogen content at the bud-showing stage as inputs; hence, it can be used for the optimization of nitrogen management for standard cut chrysanthemum ‘Shenma’ production in solar greenhouse.

【题目】温室黄瓜无土栽培营养液氮素管理模型的研究
【中文关键词】温室黄瓜; 叶片含氮量; 营养液氮素浓度; 模型
【英文关键词】greenhouse cucumber; leaf nitrogen concentration; nitrogen concentration of nutrient solution; model
【中文摘要】通过温室无土栽培黄瓜不同定植期不同施氮水平试验,分析了不同定植期黄瓜叶片含氮量随生育期的变化规律,以及叶片含氮量与叶片净光合作用速率和产量的定量关系，确定了不同光温条件下黄瓜叶片适宜含氮量的求算方法,以及盛果期黄瓜叶片含氮量与营养液氮素浓度的关系。在此基础上，建立了温室黄瓜无土栽培营养液氮素管理模型。结果表明,叶片适宜含氮量在开花前随生育期推进而增加,到开花期达到最大,开花后叶片适宜含氮量随生育期推进而逐渐降低

,到盛果期达到较为稳定的状态。因此,盛果期的叶片含氮量可以作为温室黄瓜氮素管理指标。黄瓜叶片净光合作用速率和产量随盛果期叶片含氮量升高按负指数规律增加,在相同氮浓度的营养液灌溉条件下,春夏茬黄瓜盛果期的叶片适宜含氮量低于秋冬茬,春夏茬和秋冬茬黄瓜盛果期适宜的叶片含氮量分别为3.3%和3.6%,春夏茬和秋冬茬黄瓜无土栽培营养液适宜的氮素浓度分别为124 mg/L和96 mg/L。

【英文摘要】In order to investigate the optimal nitrogen concentration of the nutrient solution for soilless cultivated cucumber crops in g reenhouse, experiments with different levels of nitrogen application rate and transplanting dates were conducted in a greenhouse in Shanghai during 2005. The seasonal time course of leaf nitrogen concent ration and its relation to the leaf net photosynthesis rate and yield were analyzed. Then, the optimal leaf nitrogen concentration for soilless cultivated cucumber crop in greenhouse in different seasons was determined. Leaf net photosynthesis rate and yield of cucumber were found to be increasedexponentially with the leaf nitrogen concentration at the middle fruit harvest stage. The relationship between the leaf nitrogen concentration at the middle fruit harvest stage and the nitrogen concentration of the nutrient solution was then quantified. Based on these quantitative relationships, a management model of nitrogen concentration of the nutrient solution was developed. The results show that during the growing season, the optimal leaf nitrogen concentration reached the peak value at flowering stage. Thereafter, the optimal leaf nitrogen concentration decreased and reached a relative stable level at the middle fruit harvest stage. Therefore, the leaf nitrogen concentration at the middle fruit harvest stage was used as an index for nitrogen management for cucumber crop in greenhouse. The optimal leaf nitrogen concent ration at middle fruit harvest stage were 3.3% , 3.6% , respectively, for the Spring Summer season and the Autumn Winter season and the corresponding optimal nitrogen concentration of the nutrient solution were 124 mg/L and 96 mg/L respect ively.

【题目】玉米花丝饮品对糖尿病鼠的降血糖作用

【中文关键词】玉米花丝饮品;糖尿病,实验性;降血糖药

【英文关键词】corn filament beverage ; diabetes mellitus, experimental ; hypoglycemic agents

【中文摘要】目的:观察玉米花丝饮品(CFB)对糖尿病大鼠及小鼠降血糖作用,为玉米花丝浸提物在降糖药物和功能食品中应用提供科学依据。方法:60只大鼠随机分为空白对照组(纯净水)、四氧嘧啶模型组、康立舒胶囊(0.7g·kg-1)组及7.00、3.50、1.75mL·kg-1CFB 3个剂量组(n=10),眶静脉采血法测血糖,取肝脏测肝糖元含量。72只小鼠随机分为空白对照组(纯净水)、四氧嘧啶模型组、康立舒胶囊(1.0g·kg-1)组及10.0、5.0、2.5mL·kg-1CFB 3个剂量组(n=12),检测指标及方法同上。取72只小鼠,分组方法同上,腹腔注射盐酸肾上腺素,断头取血法测血糖,取肝脏测肝糖元含量。另取72只小鼠,分组方法同上,尾静脉注射葡萄糖,检测指标及方法同上。结果:与糖尿病大鼠模型组比较,7.00和3.50mL·kg-1CFB组血糖明显降低(P<0.01),肝糖元含量均明显增加(P<0.01),且7.00mL·kg-1CFB组优于3.50mL·kg-1组。与糖尿病小鼠模型组比较,10.0和5.0mL·kg-1 CFB组血糖明显降低(P<0.01),肝糖元含量明显增加(P<0.01),且10.0mL·kg-1CFB组优于5.0mL·kg-1组。与肾上腺素小鼠模型组比较,10.0mL·kg-1CFB组血糖明显降低(P<0.01);10.0和5.0mL·kg-1CFB组肝糖元含量明显升高(P<0.05或P<0.01)。10.0mL·kg-1CFB组外源性葡萄糖致高血糖小鼠血糖明显降低(P<0.05),肝糖原含量明显增加(P<0.01)。结论:CFB对四氧嘧啶致糖尿病大鼠或小鼠、肾上腺素血糖升高小鼠及外源性葡萄糖致血糖升高小鼠具有明显降血糖作用。

【英文摘要】Objective:To study the action of corn filament bever age (CFB) on falling blood sugar in diabetic rats and mice, provide scientific basis for application of corn filament extraction in falling sugar drug or functional food. Methods 60 rats were randomly divided into control group (pure water) , alloxan model group, Kanglishu capsule(0.7g·kg-1)group, and7.00、3.50、1.75mL·kg-1CFB groups (n = 10) . the orbital vein blood samples were obtained, the contents of blood sugar were determined; The liver samples were obtained and the contents of liver glycogen were determined.72 mice were randomly divided into control group (pure water) , alloxan model group, Kanglishu capsule (1.0g·kg-1) group, and 10.0、5.0、2.5mL·kg-1 CFB groups (n= 12) , the indexes mentioned above were determined.72 mice were divided into 6 groups same as the method mentioned above, the mice were injected adrenalin hydrochloride through abdominal cavity, blood was extracted by decapitation, and the contents of blood sugar and liver glycogen were determined. Another 72 mice w ere divided and fed same as the met ho d mentioned above, and t he mice w ere injected glucose through caudal vein, the indexes mentioned above were detected. Results:Compared wit h diabetic model rats, the contents o f

blood sugar in 7.00 and3.50mL • kg-1 CFB groups were reduced obviously (P<0.01) , and the contents of liver glycogen increased obviously (P<0.01) , and 7.00mL • kg-1 CFB group w as prior to 3.50mL • kg-1 CFB group. Compared with diabetic mo del mice, the content s of blood sugar in 10.0 and 5.0mL • kg-1 CFB groups w ere reduced obviously(P<0.01) , and the contents of liver glycogen increased obviously (P<0.01) , and 10.0mL • kg-1 CFB group was prior to 5.0mL • kg-1 CFB group. Compared with adrenine model mice, the contents of blood sugar in 10.0mL • kg-1 CFB group decreased obviously (P<0.01) , and the contents of liver glycogen in 10.0 and 5.0mL • kg-1 CFB groups w ere increased obviously (P<0.05 or P<0.01) , the blood sugar of hyperglycemia mice in 10.0mL • kg-1 CFB group was obviously reduced because o f exogenous glucose (P<0.05) , and the content of liver glycogen was obviously increased (P<0.01) . Conclusion:CFB has the function of falling blood sugar on alloxan diabetic rats or mice and hyperglycaemia mice induced by adrenine and exogenous glucose.

【英文关键词】external quality control, models, solar greenhouses, substrate water potential, standard cut chrysanthemum
【中文摘要】水分是影响菊花生长发育和外观品质的重要因子。为定量研究水分对日光温室独本菊外观品质(株高、茎粗、叶片数、 花头直径、 花颈长) 的影响, 该研究以秋菊品种“ 神马 ”(Chrysanthemum morifolium ‘ Jinba ’) 为试验材料, 于 2006年 8 月-2007 年6 月在北京日光温室内进行了不同定植期和不同水分处理的栽培试验,以生理辐热积为预测指标,定量分析了基质水势对独本菊株高、茎粗、叶片数、花头直径和花颈长的动态的影响,建立了基质水势对独本菊株高、茎粗、叶片数、花头直径和花颈长影响的模拟模型,并用与建立模型相独立的数据对模型进行检验。结果表明,模型对日光温室独本菊各外观品质指标预测结果较好,株高、茎粗、单株叶片数、花头直径和花颈长的模拟值与实测值之间基于 1∶1线的决定系数分别为 0.98、0.93、0.98、0.93、0.86,相对预测误差(RSE)分别为 8.79%、5.66%、8.45%、12.2%、12.9%。该研究建立的模型可以为日光温室秋菊品种“ 神马 ”的水分管理提供理论依据和决策支持。
【英文摘要】Water is the important factor affecting the growth and external quality of chrysanthemum. The aim of this study was to quantitatively investigate the effects of water on the external quality indices (plant height, stem diameter,leaf number, diameter of flower head, length of flower neck) of standard cut chrysanthemum grown in a solar greenhouse. Experiments of standard cut chrysanthemum (Chrysanthemum morifolium ‘ Shenma ’) with different plantingdates and different levels of water treatment were conducted in a solar greenhouse in Beijing from August 2006 to June 2007. The physiological product of thermal effectiveness and PAR(PTEP) was used to describe the seasonal change of the external quality indices. Effects of substrate water potential on the dynamics of plant height, stem diameter, leaf number, diameter of flower head, length of flower neck were quantified based on the experimental data. These quantitative relationships were then integrated into a model to predict the effects of substrate water potential on the external quality indices of standard cut chrysanthemum in solar greenhouse. Independent experimental data were used to validate the model. The results showed that the coefficient of determination (R2) between the simulated and measured values of plant height, stem diameter, leaf number, diameter of flower head, length of flower neck based on the 1:1 line were 0.98, 0.93, 0.98, 0.93, 0.86, respectively, and the relative prediction error (RE) between the simulated and measured values were 8.79%, 5.66%, 8.45%, 12.2%, 12.9%, respectively, for plant height, stem diameter, leaf number, diameter of flower head and length of flower neck. The model developed in this study gives satisfactory predictions of the external quality indices of the standard cut chrysanthemum, hence, it can be used for optimizing water management for standard cut chrysanthemum production in solar greenhouses.

【题目】玉米蛋白粉中β-胡萝卜素提取技术的研究
【中文关键词】玉米蛋白粉;β-胡萝卜素;超临界CO2萃取技术
【英文关键词】corn gluten meal;β-carotene;supercritical CO2 extraction technology
【中文摘要】以玉米蛋白粉为原料,采用超临界CO2 萃取技术提取β-胡萝卜素,通过正交试验对影响提取率的主要因素进行研究和分析,确定β-胡萝卜素提取的最佳工艺条件为:夹带剂用量10%,萃取温度40℃,萃取压力20MPa,萃取时间150min。按此工艺条件提取β-胡萝卜素,提取率达88.70%。
【英文摘要】Corn gluten meal was used as material to extract β-carotene through supercritical CO2 extraction technology. The major affecting factors of the extraction rate of β-carotene were studied by orthogonal test method. The optimal conditions for extracting β-carotene are determined as follows: amount of modifier 10%, extraction temperature 40℃, pressure 20 MPa, and time 150 min.Under the above conditions, the extraction rate is 88.70%.

【题目】A photothermal model of leaf area index for greenhouse crops
【中文关键词】无
【英文关键词】Temperature, PAR, Leaf elongation rate, Leaf area index, Leaf rank
【中文摘要】无
【英文摘要】Leaf area index (LAI) is an important variable formodelling canopy photosynthesis and crop water use. In many crop simulation models, prediction of LAI is very sensitive to errors in the value of parameter ‘ speci fi c leaf area ’ (SLA),which often relies on destructive measurements to determine. In this study,we present a model for predicting LAI of greenhouse crops based on the quanti fi cation of easily measured morphological traits as affected by temperature and radiation. Our model predicts LAI based on canopy light interception as a function of node development rate along with speci fi c leaf size and elongation rates characteristics de fi ned on a leaf number basis. Growth studies with fi ve greenhouse crops(cucumber, sweet pepper, chrysanthemum, tulip and lilium) were conducted in different greenhouses and different sites during 2003 to 2009. The model was evaluated, in comparison with two commonly used methods for predicting LAI – the growing degree days (GDD) based model and SLA based model, using independent data fromother experiments. The coef fi cient of determination (r2) and the root mean squared error (RMSE) between the predicted and measured values using our photothermal method are 0.99 and 0.95 (r2, RMSE) for leaf number, 0.98 and 0.01 m for speci fi c leaf length, and 0.98 and 0.13 m2 m 2 for canopy LAI. For the GDD-based model, the r2 and RMSE are 0.93 and 4.23, 0.82 and 0.04 m, 0.87 and 0.48 m2 m 2 for the three traits, respectively. For the SLA-basedmodel, the r2 and RMSE for canopy LAI is 0.81 and 1.24 m2 m 2 when using the estimated SLA data as input or 0.94 and 0.25 m2 m 2when using the measured SLA data as input. So, our model better predicts LAI for greenhouse crops at different latitudes and a range of planting densities and pruning systems. Althoughcalibrations for speci fi c light regime, pruning practices and cultivars are needed, the fact that production conditions in commercial greenhouse production are often well controlled and production practices are often rather standardized implies a general applicability of our model.

【题目】玉米皮多糖挤出低聚化的研究
【中文关键词】低聚化;玉米皮;多糖;挤出
【英文关键词】oligomerization;corn bran;polysaccharide;extrusion
【中文摘要】以玉米皮为原料,经超临界CO2 流体萃取,脱脂、脱杂及酶法脱除蛋白质及淀粉后获得玉米皮多糖,采用挤出技术对其进行降解处理,制取玉米皮低聚多糖,采用黏度法测定其聚合度和分子量。通过正交试验,确定最佳挤出条件为:挤出温度175℃,料水比1:1.4,玉米皮多糖粒度0.147mm,喂料速度10kg/h。按此工艺条件处理玉米皮多糖,其聚合度由894 降低至66,分子量由144828 降至10612。
【英文摘要】Polysaccharides were prepared from corn bran by the steps of supercritical CO2 fluid extraction for removing fat, alkaline protease hydrolysis for removing protein and α -amylase hydrolysis for removing starch. Then the oligomerization of corn bran polysaccharides was conducted through extrusion. According to degree of polymerization (DP) and molecular weight (MW) measured with viscosimetry, the oligomerization conditions of corn bran polysaccharides were optimized through orthogonal test. The results showed that the optimal conditions are as follows : material to liquid ratio 1:1.4, extrusion temperature 175 ℃, particle size of material 0.147 mm and feed speed of material 10 kg/h. Under the above conditions, the DP of corn bran polysaccharides drops from 894 to 66, and its MW reduces from 144828 to 10612.

【题目】玉米膳食纤维挤出功能化及粒度对其物性的影响研究
【中文关键词】玉米膳食纤维;粒度;挤出;功能化;物性
【英文关键词】corn dietary fiber;particle size;extrusion;functionalization;physical properties
【中文摘要】以玉米非淀粉组分玉米皮为原料制备玉米膳食纤维,并采用挤出技术进行功能化处理,研究不同粒度对功能化玉米膳食纤维吸脂力、膨胀性、持水力及结合水力的影响,筛选最佳挤出条件。结果表明:膳食纤维粒度0.125mm 时,玉

米纤维的综合物性最佳。当玉米膳食纤维加水量110%、温度180°C、喂料速度10kg/h、1次挤出功能化处理时玉米膳食纤维膨胀性与吸脂力均最佳,可溶性成分含量最高,显示其可作为减肥功能食品基料。

【英文摘要】Wet corn bran was washed with flowing water to remove residual starch and endosperm, centrifugalized, and dried. The dried corn bran was crushed and sieved into different particle sizes (60, 80, 100, 120 and 140 mesh) to prepare dietary fiber by removing fat, colored substances and odorous substances with supercritical carbon dioxide. Furthermore, the prepared corn dietary fiber was functionally treated by extrusion technology under 7 different combinations of water addition, extrusion temperature, feed rate and extrusion times. Effects of particle size of corn bran powder on oil retention capacity, expansion property, water holding capacity and water bonding capacity of prepared corn dietary fiber were investigated. The results showed that the comprehensive physical property of corn dietary fiber prepared from the corn bran powder with the particle size of 120 mesh (the particle size is 0.125 mm) was the best. When the extrusion was finished once under the conditions of water addition in corn dietary fiber 110%, temperature 180 °C, feed speed 10 kg/h, the oil retention capacity and expansion property of extruded dietary fiber were the best, and the amount of soluble component was the highest.

【题目】玉米皮多糖制备、分离纯化及相对分子质量的测定
【中文关键词】玉米皮;多糖;分离纯化;相对分子质量
【英文关键词】corn spermoderm;polysaccharide;purification;relative molecular mass
【中文摘要】采用微波提取及95% 乙醇沉淀处理制备玉米皮粗多糖,经D315 型离子交换树脂脱蛋白,乙醇分级沉淀及Sephadex G-100、Sephadex G-75 层析柱纯化得CSPA-1、CSPA-2 和CSPB。紫外- 可见光谱在220~400nm处扫描CSPA-1、CSPA-2 及CSPB,无蛋白及核酸吸收峰。纯化得到的多糖经葡聚糖凝胶层析法测得相对分子质量分别为186170、103885、146887。
【英文摘要】Crude corn bran polysaccharides (CBP) were obtained through microwave-assisted extraction followed by 95% alcohol precipitation, purified through D315 ion exchange resin column chromatography for the removal of protein and fractionated into 2 fractions, CBPA and CBPB, through fractional precipitation with alcohol. CBPA was further fractionated through Sephadex G-100 column chromatography into 2 subfractions, CBPA-1 and CBPA-2 of which Sephadex G-75 column elution profile exhibited a single absorption peak. Sephadex G-75 column chromatographic analysis indicated that CBPB comprised a single homogeneous composition. Neither protein nor nuclear acid characteristic absorption peaks were shown in the UV-visible spectra of CBPA-1, CBPA-2 and CBPB. The relative molecular mass of CBPA-1, CBPA-2 and CBPB were determined by the dextran gel filtration method to be 186170, 103885 and 146887 , respectively.

【英文关键词】clove;extraction;Penicillium species;antimicrobial effect
【中文摘要】采用浸提法提取丁香中抑菌成分,并以青霉为供试菌,研究其抑菌效果。通过单因素和正交试验确定丁香抑菌成分最佳提取工艺条件为乙醇溶液体积分数60%、料液比1:12(g/mL)、提取温度60°C、回流浸提2h。
【英文摘要】Solvent extraction was used to extract antimicrobial substances from clove against a Penicillium strain preserved in our laboratory, and their activity was evaluated by paper disc method. The clove extracts obtained using water, 60% ethanol, nhexane or acetone were tested for their diameters of inhibition zone and ethanol was the selected solvent due to the smallest diameter of inhibition zone. This was followed by the optimization of diameter of inhibition zone of ethanol extract from clove using single factor and orthogonal array design methods. The results showed that the optimal conditions for improved extraction of antimicrobial substances from clove were as follows: ethanol concentration 60%, solid-to-liquid ratio 1 g:12 mL and extraction temperature 60 °C for a reflux extraction duration of 2 h.

【题目】超临界CO2 处理对米糠纤维物性的影响
【中文关键词】米糠;膳食纤维;超临界CO2;物性
【英文关键词】rice bran;dietary fiber;supercritical CO2;physical properties
【中文摘要】研究超临界CO2 处理米糠粉前后制备的米糠纤维的膨胀力、持水力、结合水力及吸脂力的变化。结果表明,相同粒度的米糠纤维,其膨胀力、持水力和结合水力经超临界CO2 处理后均有所提高,而吸脂力却有所下降。超临界CO2 处理前后持水力、吸脂力均在纤维粒度0.246mm 时达到最高值,膨胀力、结合水力在0.900mm和0.175mm 时分别达到最高值。米糠纤维的综合物性在粒度0.246mm 时最佳,且超临界CO2 处理后米糠纤维的综合物性值比处理前提高27.75%,米糠纤维提取率增加36.63%。
【英文摘要】Rice bran subjected to supercritical CO2 treatment for the removal of fat was extracted to obtain dietary fiber. Dietary fibers from treated bran and untreated rice bran were compared for the differences in their physical properties including expansibility, water-holding capacity, water-retention capacity and oil-retention capacity. The expansibility, water-holding capacity, water-retention capacity of the dietary fiber from treated rice bran with the same particle sizes all increased when compared with that from untreated rice bran, while the oil-retention capability displayed an opposite change. For both of the dietary fibers, the highest water-holding capacity and oil-retention capacity were both achieved at the particle size of 0.246 mm, and the highest expansibility and water-retention capacity at 0.900 mm and 0.175 mm, respectively, and the highest weighted value of the above 4 parameters at 0.246 mm. The highest weighted value of the above 4 parameters of the dietary fiber from treated rice bran was 27.75% higher than that of the dietary fiber from untreated rice bran. Supercritical CO2 treatment resulted in an increase in dietary fiber yield of 36.63%.

【题目】响应面法优化米糠挤出工艺及其物性研究
【中文关键词】米糠;挤出;膳食纤维;响应面法
【英文关键词】rice bran;extrusion;dietary fiber;response surface methodology
【中文摘要】采用响应面法对米糠挤出试验工艺条件进行优化。在单因素试验基础上,以米糠粒度、水分含量、挤出温度为响应因素,米糠可溶性膳食纤维得率为响应值,根据中心组合及Box-Behnken试验设计原理采用三因素三水平的响应面分析法,确定最佳挤出工艺。结果表明:米糠粒度0.175mm(80 目)、水分含量33%、挤出温度164°C时,米糠可溶性膳食纤维得率为19.23%,与理论值较为接近,表明数学模型对优化挤出工艺可行,方差分析结果表明挤出过程中对可溶性膳食纤维得率

影响程度由强到弱的因素为水分含量>挤出温度>物料粒度。挤出后米糠的膨胀力、持水力、结合水力、吸脂力均较挤出前有较大改善,综合物性值为挤出前的2.12 倍。

【英文摘要】In order to optimize the extrusion technology of rice bran, the effects of rice bran granule size, water content and extrusion temperature on the yield of soluble dietary fiber from rice bran were explored by response surface methodology on the basis of single factor experiments. The optimal extrusion conditions were determined to be: rice bran granular size, 0.175 mm; water content, 33%; and extrusion temperature 164 °C. The yield of soluble dietary fiber from rice bran was 19.23% under these extrusion conditions, which was close to the theoretical value. The importance of the above three process conditions affecting the extraction rate of soluble dietary fiber from strong to weak was in an order of water content, extrusion temperature and rice bran size. The extruded rice bran exhibited a significant improvement in expansion power, water-holding capacity, water-binding capability and oil-absorbing capacity. Comprehensive material property value of extruded rice bran exhibited a 2.12-fold improvement. Therefore, the extrusion technology can greatly improve the content of soluble dietary fiber in rice bran and comprehensive material properties, which will provide theoretical references for the utilization of rice bran in food industry.

【题目】响应面法优化米糠超临界流体脱脂工艺

【中文关键词】米糠;超临界流体;脱脂纯化;响应面法

【英文关键词】rice bran;supercritical fluid;degreasing rate;response surface methodology

【中文摘要】运用响应面法优化米糠超临界流体脱脂纯化工艺。在单因素试验基础上,以萃取温度、萃取时间、萃取压力为响应因素,脂类及异杂物质脱除率为响应值,根据中心组合Box-Benhnken 试验设计原理采用三因素三水平的响应面分析法,确定最佳脱脂工艺。结果表明当萃取温度46℃、萃取时间94min、萃取压力27MPa 时脂类及异杂物脱除率18.34%(g/100g 米糠),脱脂除杂有效率为92.19%,与理论值较为接近,表明数学模型对优化脱脂工艺可行。方差分析结果表明各因素对米糠脱脂除杂率的影响强弱顺序依次为萃取压力>萃取温度>萃取时间。

【英文摘要】Supercritical carbon dioxide extraction was applied to degrease rice bran in the present study. The process conditions for the degreasing of rice bran was optimized by response surface methodology. The effects of extraction temperature, extraction time and extraction pressure on lipid removal rate were explored with Box-Benhnken experimental design coupled with response surface analysis on the basis of single factor experiments. The optimal extraction parameters were determined as follows: extraction temperature, 46 °C; extraction time, 94 min; and extraction pressure, 27 MPa. A lipid removal rate of 18.34% (g/100g rice bran, or 92.19% degreasing efficiency) under these optimal extraction conditions, which was close to the theoretical value. Therefore, the developed mathematical model was reliable in predicting lipid removal rate. The analysis of variance exhibited that the importance of the above three factors affecting lipid removal rate from strong to the weak were extraction pressure, extraction temperature and extraction time.

【题目】丁香、甘草协同抑菌作用研究

【中文关键词】香辛料;丁香;甘草;抑菌作用;协同作用

【英文关键词】spices;clove;licorice;antimicrobial activity;synergistic effect
【中文摘要】对丁香、甘草、八角、白芷、草蔻和胡椒6 种常用香辛料提取液的抑菌作用进行研究,选择抑菌作用较强的香辛料提取液进行协同抑菌作用研究,确定协同作用的最佳配比。结果表明:丁香和甘草提取液抑菌作用较强,丁香与甘草提取液的最佳配比为体积比5:3,协同抑菌作用大于单一提取液。研究了复配液的最小抑菌质量浓度(MIC),对细菌的MIC为3.125mg/mL,对霉菌的MIC 为6.25mg/mL,在较低质量浓度下即可达到较好的抑菌效果。
【英文摘要】The inhibitory effects of ethanol extracts from six commonly used spices on five species of microorganisms were measured and compared in order to screen spices with higher antimicrobial activity, and the optimal mixing ratio for screened spices resulting in the best synergistic antimicrobial effect was determined. Clove and licorice were the selected spices based on the results from the comparison of antimicrobial activity, and the best mixing ratio for the ethanol extracts from them was 5:3 (V/V), which gave a synergistic antimicrobial effect better than single uses of them. The mixture presented minimum inhibitory concentrations (MIC) of 3.125 mg/mL for bacteria and 6.25 mg/mL for mold and could show better antimicrobial effect at a low concentration.

【题目】Assessment of lipoprotein lipase gene diversity and distance between Red jungle fowl and domestic chicken breeds
【中文关键词】脂蛋白酶,遗传多样性,遗传距离,系统发育
【英文关键词】Lipoprotein lipase,genetic diversity,genetic distance,phylogeny tree
【中文摘要】在红色原鸡、如皋、安卡、文昌鸡群,中采用聚合酶链反应 - 单链构象多态性(PCR-SSCP)分析脂蛋白脂酶基因多态性。结果表明高脂蛋白脂肪酶基因在Shannon信息指数上呈现多样性有效性。平均总的遗传多样性(HT),种群内的遗传多样性(HS)和脂蛋白脂酶基因位点的遗传分化系数(GST)的所有分别为0.577±0.013 ,0.535±0.011和0.073。基因在所有位点在5个鸡群体的平均值为6.332。此外,在如皋和安卡鸡群间最高脂蛋白脂肪酶基因遗传距离为0.220。而在文昌和Silikes鸡群间的距离较低为0.013。脂蛋白发育树的构建显示,安卡和红色原鸡的基因比其他品种相关74.4%。
【英文摘要】Polymerase chain reaction single strand conformation polymorphism (PCR-SSCP) was used to analyze lipoprotein lipase gene polymorphism in Red Jungle Fowl (Gallus gallus spadiceus), Rugao, Anka, Wenchang and Slikies chicken populations. The results shows high lipoprotein lipase gene diversity, effective number of allele and Shannon information index in Silikes population. The average total genetic diversity (HT), genetic diversity within population (HS) and coefficient of genetic differentiation (GST) across all loci of lipoprotein lipase gene were 0.577±0.013, 0.535±0.011 and 0.073, respectively. The average gene flow across all loci in five

chicken populations was 6.332. in addition, the highest lipoprotein lipase genetic distance was 0.220 between Rugao and Anka populations, while the lower was 0.013 between Wenchang and Silikes populations The constructed lipoprotein lipase phylogeny tree shows that Anka and Red jungle fowl were genetically related than the other breeds with 74.4% bootstrapping percentages and then both are related by 74.4% bootstrapping percentages with Wenchang followed by Rugao and Silikes breeds.

【题目】RT-PCR analysis of LDL receptor mRNA expression in different tissues of genetically fat and lean chickens

【中文关键词】RT-PCR;低密度脂蛋白受体;mRNA表达;鸡;组织;腹部

【英文关键词】RT-PCR,LDL receptor,mRNA expression,chicken,tissue,abdominal fat

【中文摘要】组织标本包括切除(肝,肾,小肠,腹部脂肪),瘦肉(如皋)和脂肪(安卡)鸡,这两个品种在同等条件下提出的。在各种脂肪鸡和瘦肉鸡组织中的低密度脂蛋白受体mRNA的表达采用半定量RT-PCR测定。每个单独的基因的PCR产物的基因表达水平的测定如积分峰面积的比率,与共扩增β-肌动蛋白的内部标准相关联。结果表明,低密度脂蛋白受体mRNA的表达显着不同于腹部脂肪和肝脏组织,而非其他组织的差异。在脂肪鸡和瘦肉鸡组织中低密度脂蛋白R1的表达在肠,肾,腹部脂肪组织中的表达水平没有显著不同,而在肝脏中较显著。此外,在脂肪和瘦肉鸡中低密度脂蛋白R5在不同组织中的表达没有显著不同。

【英文摘要】Tissues specimens include (liver, kidney, small intestine and abdominal fat) were excised from lean (Rugao) and fat (Anka) chickens, both breeds were raised under the same conditions. The expression of LDL receptor mRNA in various tissues of genetically fat and lean chickens were determined by semi-quantitative RT-PCR. The level of gene expression was determined as the ratio of integrated peak area for each individual gene PCR product relative to that of the co-amplified ß-actin internal standard. The results shows that the expression of low density lipoprotein receptor mRNA was significantly ($p< 0.05$) different between abdominal fat and liver tissues, while they were non significantly different between the other tissues. The levels of LDLR1 mRNA expression in intestine, kidney and abdominal fat tissues were none significantly different between genetically fat and lean, while it was significantly ($p< 0.05$) different in liver. In addition, the levels of LDLR5 mRNA expression in various tissues were non significantly different between genetically fat and lean chickens.

【题目】Analysis of Genetic Diversity and Phylogenetic Relationships among Red Jungle Fowls and Chinese Domestic Fowls

【中文关键词】红色原鸡,家禽,微卫星,遗传多样性,亲缘关系

【英文关键词】red jungle fowl, domestic fowl, microsatellite, genetic diversity, phylogenetic relationship

【中文摘要】两个红色原鸡的亚种的568个个体和14个国内鸡的基因多样性鸡亲缘关系,用29个定位点进行评估,基因变异及鸡群间基因差异进行估算。红色原鸡和中国家禽群体间的遗传分化及遗传多样性和系统发育的关系进行分析。

【英文摘要】Genetic diversity and phylogenetic relationships among 568 individuals of two red jungle fowl subspe-cies (Gallus gallus spadiceus in China and Gallus gallus gallus in Thailand) and 14 Chinese domestic chicken breeds were evaluated with 29 microstaellite loci, the genetic variability within population and genetic differentiation among population were estimated, and then genetic diversity and phylogenetic relationships were analyzed among red jungle fowls and Chinese domestic fowls. A total of 286 alleles were detected in 16 population with 29 microsatellite markers and the average number of the alleles observed in 29 microsatellite loci

was 9.86±6.36. The overall expected heterozygosity of all population was 0.6708±0.0251, and the number of population deviated from Hardy-Weinberg equilibrium per locus ranged from 0 to 7. In the whole population, the average of genetic differentiation among population, measured as FST value, was 16.7% (P<0.001), and all loci contributed significantly (P<0.001) to this differentiation. It can also be seen that the deficit of heterozygotes was very high (0.015) (P<0.01). Reynolds ’ distance values varied between 0.036 (Xiaoshan chicken-Luyuan chicken pair) and 0.330 (G. gallus gallus-Gushi chicken pair). The Nm value ranged from 0.533 (between G. gallus gallus and Gushi chicken) to 5.833 (between Xiaoshan chicken and Luyuan chicken). An unrooted consensus tree was constructed using the neighbour-joining method and the Reynolds ’ genetic distance. The heavy-body sized chicken breeds, Luyuan chicken, Xiaoshan ch icken, Beijing Fatty chicken, Henan Game chicken, Huainan Partridge and Langshan chicken formed one branch, and it had a close genetic relationship between Xiaoshan chicken-Luyuan chicken pair a nd Chahua chicken-Tibetan chicken pair. Chahua chicken and Tibetan chicken had closer genetic relationship with these two subspecies of red jungle fowl than other domestic chicken breeds. G. gallus spadiceus showed closer phylogenetic relationship with Chinese domestic chicken breeds than G. gallus gallus. All 29 microstaellite loci in this study showed high levels of polymorphism and significant genetic differentiation was observed among two subspecies of red jungle fowl and 14 Chinese domestic chicken breeds. The evolutional dendrogram is as follows: evolutional breeds primitive breeds (Chahua chicken and Tibetan) red jungle fowl in China (G. gallus spadiceus) red jungle fowl in Thailand (G. gallus gallus). The results supported the theory that the domestic fowls might originate from different subspecies of red jungle fowl and Chinese domestic fowls had independent origin.

【题目】Assessment of Population Structure and Genetic Diversity of 15 Chinese Indigenous Chicken Breeds Using Microsatellite Markers
【中文关键词】鸡,微卫星,遗传分化,遗传结构
【英文关键词】Chicken, Microsatellites, Genetic Differentiation, Genetic Structure
【中文摘要】使用29个微卫星标记对15名中国本土鸡品种的遗传结构和多样性进行调查。被检查的鸟类总数为542只,平均每36只一个品种。总共有277等位基因(从2到25的范围内,每个基因座平均有9.55等位基因,)被观察。所有群体表现出高水平的杂合度,始固鸡为最低的估计,为0.440,为,最高的是0.644,为皖南三黄鸡。球形杂合子在所有群体的逆差值(FIT)达

0.180(p < 0.001)。大约16%的总遗传变异起源于品种之间的差异,从而所有位点显著地造成了这种区别。使用近邻加入方法和基于标记估计关系的双向距离构造一个无根的共识树。两个主要的群被发现。重体类型的群体分在一个集群中,轻体类型群体分为第二个集群。这个结构软件被用来评估这些鸡品种的遗传聚类。相似于系统分析,重体类型与轻体类型群体开始被分开,聚类分析来提供提供一个准确的当前遗传品种之间的关系表示。使用所有的方法得到非常相似的品种排名。

【英文摘要】The genetic structure and diversity of 15 Chinese indigenous chicken breeds was investigated using 29 microsatellite markers. The total number of birds examined was 542, on average 36 birds per breed. A total of 277 alleles (mean number 9.55 alleles per locus, ranging from 2 to 25) was observed. All populations showed high levels of heterozygosity with the lowest estimate of 0.440 for the Gushi chickens, and the highest one of 0.644 observed for Wannan Three-yellow chickens. The global heterozygote deficit across all populations (FIT) amounted to 0.180 (p<0.001). About 16% of the total genetic variability originated from differences between breeds, with all loci contributing significantly to this differentiation. An unrooted consensus tree was constructed using the Neighbour-Joining method and pair-wise distances based on marker estimated kinships. Two main groups were found. The heavy-body type populations grouped together in one cluster while the light-body type populations formed the second cluster. The STRUCTURE software was used to assess genetic clustering of these chicken breeds. Similar to the phylogenetic analysis, the heavy-body type and light-body type populations separated first. Clustering analysis provided an accurate representation of the current genetic relations among the breeds. Remarkably similar breed rankings were obtained with all methods.

【题目】不同产量水平小麦最适总茎数动态模型研究
【中文关键词】小麦;产量水平;品种类型;最适总茎数;模拟
【英文关键词】Wheat; Yielding levels; Cultivar types; The optimum TSN; Simulation
【中文摘要】以2000~2002年田间试验为基础,结合相关文献资料,借鉴R/WCSODS思路,建立了不同产量水平小麦最适总茎数动态模拟模型,利用济南与南京地区常年气象资料及相应品种参数等进行了检验。结果表明,7 500 kg.ha-1产量时济麦19号和济麦20号在济南的最适总茎数动态模拟值与实测值的相关系数0.9649~0.9690,差值标准误154.2万~155.2万·ha-1,平均绝对误差14.25万~127.5万·ha-1;6 000 kg.ha-1产量时扬麦5号在南京的最适总茎数动态模拟值与实测值相关系数0.9987,差值标准误81.56万·ha-1,平均绝对误差1.38万·ha-1。相关系数达显著或极显著。本文综合考虑了品种类型、产量水平、最适叶面积及单茎(穗)叶面积等因素,为确定不同地区、品种类型及产量水平小麦最适总茎数动态提供了理论方法。
【英文摘要】A simulation model of optimum total shoot number(TSN) dynamic for wheat under different yielding levels was developed based on field experiment from 2000 to 2002 and relative reference data, employed idea of R/WCSODS (Rice / Wheat Cultivation-Simulation-Optimization Decision Making System), which was calibrated adopting climate data in the normal year in Jinan and Nanjing areas and correspond cultivar parameters. The results showed that the correlation coefficient, standard error of absolute deviation, and average absolute deviation between the simulated and the observed of the optimum TSN dynamic were 0.9649~0.9690, 154.2×104~155.2 ×104stems · ha-1, and 154.2×104~155.2×104stems · ha-1 for Jimai 19 and Jimai 20 at 7 500 kg.ha-1 yield in

Jinan area, respectively, 0.9987,81.56(104 • ha-1), and 1.38×104stems • ha-1) for Yangmai 5 at 6 000 kg.ha-1 yield in Nanjing area, respectively. Thereinto, the correlation coefficient were significant at 0.05 or 0.01 level. The paper took into account factors such as cultivar types, yielding levels, the optimum LAI and leaf area per shoot or ear, and so on, provided theoretical method for confirming the optimum TSN dynamic for wheat under different sites and yielding levels.

【中文摘要】在NET编程环境下,运用代理程序的方法从GenBank中获取中国地方鸡种数据,并将有关mtDNA的数据进行整理,引用Matlab生物信息学工具箱,以组件技术将其打包和发布,建成中国地方鸡种mtDNA数据库。实验人员可以应用系统发生分析组件、经过运算得到中国地方鸡种进化树图结果。说明通过Matlab、SQL和. NET混合编程构建中国地方鸡种mtDNA数据库系统,实现了基于mtDNA的中国地方鸡种生物进化关系分析功能。
【英文摘要】Thousands of sequences were downloaded by agent p rogram using. NET Studio. The phylogenetic analy2sis component had been designed, developed, packaged and distributed with citedMatlab bioinformatics toolkit, and thenthe Chinese local chicken speciesmtDNA customized database was built using the component. The database was a three hi2erarchical architecture composed of chicken nucleotide, mtDNA, and localmtDNA datasets. The system was also an inte2grated information workbench for the storage, retrieval, analysis of chicken nucleotide data.

【题目】Correlation analysis between single nucleotide polymorphisms in ADSL gene and IMP content in chicken
【中文关键词】ADSL基因,鸡SNP;肌苷酸含量
【英文关键词】ADSL gene;chicken;SNP;Inosine monophosphate content
【中文摘要】本研究旨在探讨在各种品种中ADSL基因的单核苷酸多态性SNP,包括隐性白色鸡、丝羽乌骨鸡、萧山鸡,鸡和西藏鸡。根据鸡基因组序列的数据库设计ADSL基因中的外显子9的引物,并且使用PCR-SSCP和DNA测序的方法侦测多态性。在5鸡品种重三个基因型个体被发现,并且再9 839核苷酸发现一个突变体CA。这是一个非同义替换突变,导致氨基酸序列在273从苏氨酸相应地改变到脯氨酸。结果X ~(2)表明,基因型频率与基因频率在不同品种中显著不同。然而,从变异分析的结果说明在鸡中SNP位点和IMP位点之间没有显著关系。
【英文摘要】This study was designed to investigate the single nucleotide polymorphismSNP of ADSL gene in various breeds, including Recessive White chickens, Silkies chickens, Xiaoshan chickens, Baier chickens and Tibetan chickens. Primers for exon 9 in ADSL gene were designed from the database of chicken genomic sequence and polymorphisms were detected by PCR-SSCP and DNA sequencing. Three genotypes were found among individuals within 5 chicken breeds and a mutation C A at 9 839 nucleotide was found. It was a nonsynonymous mutation, resulted in amino acid sequence at 273 change accordingly from Pro to Thr. The results X~(2) showed that the frequency of genotype and the frequency of gene were significant different among breeds. However, The results from analysis of variation suggested that there was no significant relationship between this SNP site and IMP content in chickens.

【题目】Sex Identification of Seven Species of Cranes in China by PCR
【中文关键词】EE0.6序列,性别鉴定,PCR,DNA
【英文关键词】EE0.6 sequence, sex identification, PCR, DNA
【中文摘要】鹤的性别可以在视觉上被区分开是由于形态学上雄性和雌性之间的相似性。为了便于实施保护为濒临灭绝的鸟类的计划,尤其是丹顶鹤,从羽毛样本提取基因组DNA,使用三个引物组合的鸟类性别EE0.6序列建立一个以PCR为基础的性别检测方法。通过从22种已知性别的鹤中挑选的七种,放大其基因组DNA的方法,PCR的特异性被证实了。经过30周期的放大,使用琼脂糖凝胶电泳容易区分单条带的雄性和双条带的雌性。使用PCR后,七种中的50只未知性别的鹤被成功识别。以PCR为基础的性别检测方法不仅仅能促进鹤的种繁殖,而且能提供对确定其他濒危鸟类性别有用的参考。
【英文摘要】Sexes of cranes cannot be distinguished visually due to the morphological similarities between male and female. To facilitate the protection program for the endangered birds, red-crowned cranes in particular, genomic DNA was extracted from feather samples and a PCR-based sexing method was established using three primer combinations of avian sex-specific EE0.6 sequence. The specificity of the PCR was confirmed by amplifying genomic DNA from 22 known-sex cranes of seven species. After 30 cycles of amplification, easily distinguishable single bands for males and two bands for females were displayed by agarose gel electrophoresis. The sexes of 50 unknown-sex cranes of seven species were successfully identified using the PCR. The noninvasive PCR-based sexing method can not only facilitate the human-assisted breeding of cranes, but also provide useful reference for accurate sexing of other endangered birds.

【题目】棉花纤维特异表达GhCesA4启动子的克隆及序列分析

【中文关键词】棉花;纤维特异启动子; GhCesA4 ;克隆;序列分析

【英文关键词】cot ton ; fiber2specific promoter ; GhCesA4 ;cloning ; sequence analysis

【中文摘要】摘要:以新疆陆地棉品种新陆早19 的DNA 为模板,克隆了棉花纤维特异启动子GhCesA4 ,GenBank 登录号: EU183119 ,将启动子基因序列克隆到pMD192T 载体中,由载体通用引物M13247 、RV2M 经PCR 鉴定获得pMD192T/ GhCesA4 重组载体。测序和序列分析表明,该启动子序列由1503 bp 核苷酸组成,与GenBank 中GhCesA4 基因启动子序列同源性高达98 %。分别用限制性内切酶Cl a Ⅰ和B amH Ⅰ双酶切重组质粒pMD192T/ GhCesA4 和双元植物表达载体pB I121 ,分别回收pMD192T/ GhCesA4 重组质粒中的GhCesA4 小片段和pBI121 植物表达载体中缺失CaMV35S 组成型启动子的大片段,经连接、转化、酶切及测序鉴定,获得由GhCesA4 驱动报告基因GUS 的新型植物表达载体,命名为pB I2GhCesA 4 。

【英文摘要】Abstract : Differentiation of cot ton fiber experience four development stages , including initiation , prolongation , secondary wall thickening , and dehydration and mat uration. During t he stages , many genes , known to be fiber2specific or preferentially expressed in cot ton fiber , are developmentally expressed. Inhere promoter of cot ton fiber development related gene play an important role. In t his experiment , we cloned cot ton fiber2specific promoter GhCesA4 f rom " Xinluzao 19" , GenBank accession number is EU183119. The promoter is cloned into pMD192T vector , t hen we successf ully identified and obtained recombinant plasmid pMD192T/ GhcesA4 t hrough vector specific PCR primer M13247 and RV2M. Sequencing and sequence analysis showed the promoter is up of 1503 bp nucleotide and has 98 % identity wit h GhCesA4 gene submitted in GenBank. Respectively rest riction enzyme Cl a Ⅰ and B amH Ⅰ digested recombinant plasmid pMD192T/ GhCesA4 and binary plant expression vector,recovering t he small f ragment in the recombinant plasmid pMD192T/ GhCesA4 and t he big fragment lack of CaMV35S promoter in binary plant expression vector pBI121. By ligating , transforming , digestion and sequencing , we obtained a new pat tern plant expression vector which was drivenby GhCesA4 GUS reporter gene , namely pB I2GhCesA4.

【题目】Three cotton homeobox genes are preferentially expressed during early seedling development and in response to phytohormone signaling
【中文关键词】无
【英文关键词】Cotton;Homeodomain-leucine zipper protein;Gene expression;Seedling development; Phytohormone signaling
【中文摘要】无
【英文摘要】Abstract:Homeodomain-leucine zipper (HD-Zip) proteins are transcription factors unique to plants. In this study, three cDNAs (designated as GhHB2, GhHB3 and GhHB4) encoding HD-Zip proteins were isolated from cotton cDNA library. GhHB2 gene encodes a protein of 300 amino acids, GhHB3 gene encodes a peptide with 254 amino acids, and GhHB4 gene encodes a protein of 281 amino acids. The deduced proteins, which contain the homeodomain and leucine-rich zipper motif, share relatively high similarities with the other plant HD-Zip proteins. Quantitative RT-PCR analysis indicated that GhHB3and GhHB4 were preferentially expressed in hypocotyls and cotyledons, whereas GhHB2 gene was predominantly expressed in young stems, at relatively high levels in hypocotyls. Expressions of all the three genes were up-regulated in roots, hypocotyls and cotyledons after GA3 treatments. Additionally, GhHB4 expression was enhanced by 6-BA treatment. A GhHB2 promoter fragment was isolated from cotton by Genome-Walking PCR. Expression of GUS gene controlled under GhHB2 promoter was examined in the transgenic Arabidopsis plants. Strong GUS staining was detected in cotyledon, veins of the emerging leaves and shoot apices of 5- to 15-day-old transgenic seedlings, but GUS activity became more and more weak as the seedlings further developed. In addition, the promoter activity was induced by exogenous GA, indicating that GhHB2 promoter is very active during early seedling development, and may be GA-inducible. The results suggested that the three HB genes may function in early seedling development of cotton and in response to gibberellin signaling.

【题目】Cotton BCP genes encoding putative blue copper-binding proteins are functionally expressed in fiber development and involved in response to high-salinity and heavy metal stresses
【中文关键词】无
【英文关键词】AMINO-ACID-SEQUENCE; CELL ELONGATION; HORSERADISH ROOTS; MOLECULAR CHARACTERIZATION; ARABIDOPSIS-THALIANA; TRICHOME DEVELOPMENT; CUCUMBER PEELINGS; OXIDATIVE STRESS; IN-VITRO; STELLACYANIN
【中文摘要】无
【英文摘要】Copper is vitally required for plants at low concentrations but extremely toxic for plants at elevated concentrations. Plants have evolved a series of mechanisms to prevent the consequences of the excess or deficit of copper. These mechanisms require copper-interacting proteins involved in copper trafficking. Blue copper-binding proteins (BCPs) are a class of copper proteins containing one blue copper-binding domain binding a single type I copper. To investigate the role of BCPs in plant development and in response to stresses, we isolated nine cDNAs encoding the putative blue copper-binding proteins (GhBCPs) from cotton (Gossypium hirsutum). Meanwhile, four corresponding genes (including GhBCP1-GhBCP4), which contain a single intron inserted in their conserved position, were isolated from cotton genome. Quantitative reverse transcriptase-polymerase chain reaction (RT-PCR) analysis indicated that the nine GhBCP genes are differentially expressed in cotton tissues. Among them, GhBCP1 and GhBCP4 were predominantly expressed in fibers, while the transcripts of GhBCP2 and GhBCP3 were accumulated at relatively high levels in fibers. These four genes were strongly expressed in early fiber elongation, but dramatically declined with further fiber development. In addition, these GhBCP genes were upregulated in fibers by Cu2+, Zn2+, high-salinity and drought stresses, but downregulated in fibers by Al3+ treatment. Overexpression of GhBCP1 and GhBCP4 in yeast (Schizosaccharomyces pombe) significantly increased the cell

growth rate under Cu2+, Zn2+ and high-salinity stresses. These results suggested that these GhBCPs may participate in the regulation of fiber development and in response to high-salinity and heavy metal stresses in cotton.

【题目】Mapping QTLs for Tissue Culture Response of Mature Wheat Embryos
【中文关键词】无
【英文关键词】callus induction; plantlet regeneration; QTL; wheat
【中文摘要】无
【英文摘要】The mature wheat embryo is arguably one of the best explants for genetic transformation because of its unlimited availability and lack of growth season restriction. However, an efficient regeneration system using mature wheat embryos (Triticum aestivum L.) is still not available. To identify genes related to the tissue culture response (TCR) of wheat, QTLs for callus induction from mature embryos and callus regeneration were mapped using an RIL population derived from the cross of 'Wangshuibai' with 'Nanda2419', which has a good TCR. By whole genome scanning we identified five, four and four chromosome regions conditioning, respectively, percent embryos forming a callus (PEFC), percent calli regenerating plantlets (PCR-P), and number of plantlets per regenerating callus (NPRC). The major QTLs QPefc.nau-2A and QPcrp.nau-2A were mapped to the long arm of chromosome 2A, explaining up to 22.8% and 17.6% of the respective phenotypic variance. Moreover, two major QTLs for NPRC were detected on

chromosomes 2D and 51); these together explained 51.6% of the phenotypic variance. We found that chromosomes 2A, 2D, 5A, 5B and 5D were associated via different intervals with at least two of the three TCR indexes used. Based on this stud), and other reports, the TCRs of different explant types of wheat may be under the control of shared or tightly linked genes, while different genes or gene combinations may govern the stages from callus induction to plantlet regeneration. The importance of group 2 and 5 chromosomes in controlling the TCRs of Triticeae crops and the likely conservation of the corresponding genes in cereals are discussed

【题目】Molecular genetic analysis of five spike – related traits in wheat using RIL and immortalized F2 populations
【中文关键词】无
【英文关键词】Wheat,Spike-related traits, QTLs,Inheritance mode, Epistasis
【中文摘要】无
【英文摘要】Kernel number per spike is one of the most important yield components of wheat. To map QTLs related to kernel number including spike length (SPL), spikelet number per spike (SPN), fertile spikelet number (FSPN), sterile spikelet number (SSPN) and compactness, and to characterize the inheritance modes of the QTLs and two-locus interactions, 136 recombinant inbred lines (RILs) derived from 'Nanda2419' x 'Wangshuibai' and an immortalized F-2 population (IF2) generated by randomly permutated intermating of these RILs were investigated. QTL mapping made use of the previously constructed over 3300 cM linkage map of the RIL population. Three, five, two, two and six chromosome regions were identified, respectively, for their association with SPL, SPN, FSPN, SSPN, and compactness in at least two of the three environments examined. All compactness QTLs but one shared the respective intervals of QSpn.nau-5A and the SPL QTLs. Xcfd46-Xwmc702 interval on chromosome 7D was related to all traits but SSPN and had consistently the largest effects. The fact that not all the compactness QTL intervals were related to both SPL and SPN indicates that compactness is regulated by different mechanisms. Interval coincidence between QTLs of SPL and SPN and between QTLs of FSPN and SSPN was minimal. For all the traits, favorable alleles exist in both parents. Inheritance modes from additiveness to over-dominance of the QTLs were revealed and two-locus interactions were detected, implying that the traits studied are under complex genetic control. The results could contribute to wheat yield improvement and better use of Wangshuibai and Nanda2419 the two special germplasms in wheat breeding program.

【英文关键词】genetic diversity; microsatellite; genetic distance; geographical distance; chicken
【中文摘要】使用29种微随体基因座对红色原鸡的遗传多样性和遗传距离和地理距离之间的关系,以及14种中国本土鸡种进行评估。在从2到25范围内,每个基因座上等位基因的数量和所有基因座上预期的平均杂合度和多态信息含量分别是0.6683和0.5。在从固始鸡品种的3.41到皖南三黄鸡的6.28范围内,每个基因座上等位基因的平均数量。15个中国鸡品种总体期望值为0.6686±0.0254,并且所有品种显示相对较大的杂合性。族群间的平均遗传分化值为16.4%(P < 0.001)。红原鸡和固始鸡与其他品种有遥远的遗传关系,然而淮南鹧鸪和藏鸡与其他品种有更密切相关。结果没有提供足够的信息来证明遗传和地理双向的距离间的显著相关。

【英文摘要】Genetic diversity and the relationship between genetic distance and geographical distance inred jungle fowl and 14 Chinese indigenous chicken breeds were evaluated using 29 microsatellite loci. Thenumber of alleles per locus ranged from 2 to 25 and the average expected heterozygosity and PIC of all lociwere 0.6683 and 0.50, respectively. The average number of alleles per locus ranged from 3.41 in Gushi chickenbreed to 6.28 in Wannan Three-yellow chicken breed. The overall expected heterozygosity of 15 Chinesechicken breeds was 0.6686 ± 0.0254 and all breeds showed relatively large heterozygosity. The average ofgenetic differentiation among populations was 16.4% (P < 0.001). Red jungle fowl and Gushi chicken haddistant genetic relationship from other breeds, while Huainan Partridge and Tibetan chicken were moreclosely related with other breeds. The results did not provide enough support for a significant correlationbetween the genetic and geographical pair-wise distances.

【题目】Mapping chromosomal regions affecting flowering time in a spring wheat RIL population
【中文关键词】无
【英文关键词】Earliness per se; Epistasis; Flowering time; QTL; Wheat
【中文摘要】无
【英文摘要】Flowering time is an important trait for the adaptation of wheat to its target environments. To identify chromosome regions associated with flowering time in wheat, a whole genome scan was conducted with five sets of field trial data on a recombinant inbred lines (RIL) population derived from the cross of spring wheat cultivars '2419' and 'Wangshuibai'. The identified QTLs involved seven chromosomal regions, among which QFlt.nau-1B and QFlt.nau-2B were homoeologous to QFlt.nau-1D and QFlt.nau-2D, respectively. Nanda 2419, the earlier flowering parent, contributed early flowering alleles at five of these QTLs. QFlt.nau-1B and QFlt.nau-7B had the largest effects in all trials and were mapped to the Xwmc59.2-Xbarc80 interval on chromosome 1BS and the Xgwm537-Xgwm333 interval on 7BS. Most of the mapped QTL intervals were not coincident with known vernalization response or photoperiod sensitivity loci and QFlt.nau-1B seems to be an orthologue of EpsA(m)1. Four pairs of loci showed significant interactions across environments in determining flowering time, all of which involved QFlt.nau-1B. These findings are of significance to wheat breeding programs

【题目】A high-density intervarietal map of the wheat genome enriched with markers derived from expressed sequence tags
【中文关键词】小麦,表达序列标签,简单重复序列,标记,遗传图谱
【英文关键词】bread wheat,EST-STS,SSR,marker,genetic map
【中文摘要】无
【英文摘要】Bread wheat (Triticum aestivum L.) is a hexaploid species with a large and complex genome. A reference genetic marker map, namely the International Triticeae Mapping Initiative (ITMI) map, has been constructed with the recombinant inbred line population derived from a cross involving a synthetic line. But it is not sufficient for a full understanding of the wheat genome under artificial selection without comparing it with intervarietal maps. Using an intervarietal mapping population derived by crossing Nanda2419 and Wangshuibai, we constructed a high-density genetic map of wheat. The total map length was 4,223.1 cM, comprising 887 loci, 345 of which were detected by markers derived from expressed sequence tags (ESTs). Two-thirds of the high marker density

blocks were present in interstitial and telomeric regions. The map covered, mostly with the EST-derived markers, approximately 158 cM of telomeric regions absent in the ITMI map. The regions of low marker density were largely conserved among cultivars and between homoeologous subgenomes. The loci showing skewed segregation displayed a clustered distribution along chromosomes and some of the segregation distortion regions (SDR) are conserved in different mapping populations. This map enriched with EST-derived markers is important for structure and function analysis of wheat genome as well as in wheat gene mapping, cloning, and breeding programs.

【题目】Characterization of 12 single nucleotide polymorphisms (SNPs) in Pacific abalone, Haliotis discus hannai
【中文关键词】non
【英文关键词】AS-PCR; Haliotis discus hannai; Pacific abalone; polymorphism; SNP
【中文摘要】无
【英文摘要】We report here for the first time 12 polymorphic single nucleotide polymorphisms (SNPs) in a commercially important gastropod, Pacific abalone (Haliotis discus hannai) that were identified by searching expressed sequence tag database. These SNP loci (seven nuclear and five mitochondrial SNPs) were polymorphic among 37 wild abalone individuals, based on a four-primer allele-specific polymerase chain reaction analysis. All loci had two alleles and the minor allele frequency ranged from 0.027 to 0.473. For the seven nuclear SNPs, the expected and observed heterozygosities ranged from 0.053 to 0.499 and from 0.054 to 0.811, respectively.

【题目】The full-length transcripts and promoter analysis of intergenic microRNAs in Drosophila melanogaster
【中文关键词】无
【英文关键词】miRNA; Transcription factor; Promoter; Drosophila melanogaster; Chromatin immunoprecipitation; Luciferase reporter assays; RNA interference
【中文摘要】无
【英文摘要】MicroRNA (miRNA) transcription is still not well understood until now. To increase the miRNA abundance, we stimulated miRNA transcription with CuSO(4) and knocked down Drosha enzyme using dsRNA in Drosophila S2 cells. The full length transcripts of bantam, miR-276a and miR-277, the 5'-end of miR-8, the 3'-end of miR-2b and miR-10 were obtained. We also conducted a series of miRNA promoter analysis to prove the reliability of RACE results. Luciferase-reporter assays proved that both bantam and miR-276a promoters successfully drove the expressions of downstream luciferase genes. The promoter activities were impaired by introducing one or multiple mutations at predicted transcription factor binding sites. Chromatin immunoprecipitation analysis confirmed that hypophosphorylated RNA polymerase II and transcription factor c-Myc physically bind at miRNA promoter. RNA interference of transcription factors Mad and Prd led to down-expression of bantam, miR-277 and miR-2b but not miR-276a, whereas RNAi of Dorsal had the opposite effect.

【题目】Phenotypic characterization ,genetics ananlysis , ad molecular mapping of a new mutant gene for male sterility in rice
【中文关键词】无
【英文关键词】rice; male sterility; mutant; genetic mapping
【中文摘要】无
【英文摘要】xs1 is a male-sterile rice mutant derived from a spontaneous mutation. The floret of the mutant, consisting of 6 stamens and 1 pistil, looks the same as that of the wild type except that the filaments are long and thin and the anthers are withered in white transparence. It is confirmed that xs1 is a no-pollen type of male-sterile mutant, for no pollen grains can be stained with I-2-KI solution and the anther locules are always hollow. Anther transverse sections indicate that the mutant microspores are abnormally condensed and agglomerated to form a deeply stained cluster at the late microspore stage, which results in cessation of the vacuolation process of microspores, and, therefore, the mutant forms no functional pollens for reproduction. Genetic analysis of 4 F-2 populations and 3 BC1F1 populations revealed that the mutation is controlled by a single recessive gene, termed VR1 (Vacuolation retardation 1). Screening of 432 F-2 mutant individuals derived from the cross of xs1 x G603 with simple sequence repeat markers revealed that VR1 is located between the molecular markers RM17411 and RM5030, at distances of 0.7 and 1.5 cM, respectively, on chromosome 4. VR1 is a new male fertility controlling gene located on chromosome 4 in rice.

【题目】RNA interference of ace1 and ace2 in Chilo suppressalis reveals their different contributions to
【中文关键词】无
【英文关键词】acetylcholinesterase, RNA interference,
rice stem borer, nontypical functions, larvae growth,
motor ability.
【中文摘要】无
【英文摘要】Acetylcholinesterase (AChE, EC 3.1.1.7) is a keyenzyme in terminating synaptic transmission. Weknocked down the expression of Csace1 or Csace2using chemically synthesized small interfering RNAs(siRNAs) designed from divergent regions. The mRNAabundance of the two ace genes was reduced to50 – 70% of control levels. The enzyme activities weredecreased to 40 – 70%. Silencing of Csace1 or Csace2resulted in a ~25% mortality rate. Knockdown ofCsace1 had major effects on larval growth inhibitionand resulted in reduced larval weight and length, malformationand motor disability, whereas silencing ofCsace2 had only minor effects. These results suggestedthat both AChE-1 and AChE-2 have importantroles in maintaining life in this insect and indicatedthat AChE-1 might have nontypical functions in regulatinglarval growth and motor ability

【题目】A novel shell color variant of the Pacific abalone Haliotis discus hannai Ino subject to genetic control and dietary influence
【中文关键词】无
【英文关键词】color adaptation; Haliotis discus hannai; Pacific abalone; predator avoidance; shell color variation
【中文摘要】无
【英文摘要】Molluscan shells may display a variety of colors, which formation, inheritance, and evolutionary significance are not Well understood. Here we report a new variant of the Pacific abalone Haliotis discus hannai that displays a novel orange shell coloration (O-type) that is clearly distinguishable from the Wild green-shelled abalone (G-type). Controlled mating experiments between O- and G-type abalones demonstrated apparent Mendelian segregations (1:1 or 3:1) in shell colors in F(2) families, which support the notion

that the O- and G-types are under strict genetic control at a single locus With a recessive o (for orange shell) allele and a dominant G (for green shell) allele. Feeding with different diets caused modifications of shell color within each genotype, ranging from orange to yellow for O-type and green to dark-brown for the G-type, without affecting the distinction between genotypes. A previously described bluish-purple (B-type) shell color was found in one of the putative oo X oG crosses, suggesting that the B-type may be it recessive allele belonging to the same locus. The new O-type variant had no effect on the growth of Pacific abalone on the early seed-stage. This Study demonstrates that shell color in Pacific abalone is subject to genetic control as well as dietary modification, and the latter probably offers selective advantages in camouflage and predator avoidance.

【题目】Fine mapping of a male sterility gene, vr1,on chromosome 4 in rice
【中文关键词】雄性不育,分子标记,精细定位,水稻
【英文关键词】Male sterility; Molecular maker; Fine mapping; Rice
【中文摘要】无
【英文摘要】xs1 is a male sterile rice mutant derived from a spontaneous mutation. Pollen development in the xs1 mutant proceeds normally until the vacuolation stage, at which time xs1 pollen fails to vacuolate and no viable pollen is produced. Genetic analysis indicates that the xs1 mutant phenotype is controlled by a single recessive gene, designated vacuolation retardation 1 (vr1), which was mapped to rice chromosome 4. In order to fine-map the vr1 locus, two large mapping populations were generated and several SSR and InDel markers were developed from publicly available rice genomic sequences. By employing a strategy of chromosome-walking, the vr1 gene was finally located within a genetic interval of 0.27 cM, flanked by the markers FID30 and FS15, with distances of 0.11 and 0.16 cM, respectively, and co-segregating with the marker FC4-2. Based on the japonica rice genome sequence, the vr1 locus is estimated to cover a 48-kb region containing eight putative genes. Our results will facilitate the cloning and functional characterization of the vr1 gene

【题目】Effects of the initial size, stocking density and sorting on the growth of juvenile Pacific abalone, Haliotis discus hannai Ino
【中文关键词】皱纹盘鲍; 初始规格; 养殖密度; 生长速率
【英文关键词】Haliotis discus hannai Ino; initial size; stocking density; sorting; growth
【中文摘要】无
【英文摘要】During winter months, a novel overwintering mode of transferring juvenile abalones to open seawaters in southern China rather than keeping them in closed land-based nursery systems in northern China is a popular practice. The initial size, stocking density and sorting are among the first considerations when establishing an abalone culture system. This study aimed to investigate the effects of these factors on the growth of juvenile Pacific abalone, Haliotis discus hannai Ino, during overwintering. Juvenile abalones were reared in multi-tier basket form for overwintering in open seawaters in southern China for 106 days. The daily growth rates (DGRs) in the shell length of all experimental groups ranged from 67.08 to 135.75 mu m day(-1), while the specific growth rates (SGRs) were 0.2447-0.3259% day(-1). Variance analysis indicated that both DGRs and SGRs in shell length were significantly affected by the initial body size and stocking density. Furthermore, the effects of stocking density on DGRs and SGRs varied with the initial size. However, sorting abalones according to their initial sizes may not be necessary in practice as sorting did not alter growth significantly at all densities in this study. Factors potentially affecting abalone growth such as genetic control and intraspecific competition were discussed.

【题目】Discovering conserved insect microRNAs from expressed sequence tags
【中文关键词】无
【英文关键词】MicroRNA; Insect; EST; Computational identification; RT PCR
【中文摘要】无
【英文摘要】MicroRNAs (miRNA) participate in regulating diverse biological pathways by translational repression in animals They have attracted increasing attention recently However little work has been done on the miRNA genes in agriculturally important pests Because the transcripts of most miRNA genes are the products of type-II RNA polymerase pri-miRNA has a poly(A) tail and appears in expressed sequence tags (EST) We developed a computational pipeline to identify miRNA genes from insect ESTs First 980 697 ESTs from 63 Insects were collected and used to search the nr database The ESTs which did not share significant similarities with any known

protein-coding genes were treated as non-coding ESTs Next known mature miRNAs were used to align with non-coding ESTs The ESTs which contain the sequence of mature miRNA were treated as candidate ESTs Finally putative precursors were extracted flanking the mature miRNA region in candidate ESTs and evaluated by the Triplet-SVM algorithm As a result 86 miRNAs from 30 Insect species were found based on a strict criterion while 330 miRNAs from 51 species were found based on a loose criterion Evolution analysis indicated that mir-467 mir-297 and mir-466 were the highest conserved miRNA families in insects To confirm the reliability of putative insect miRNAs the expression profile of nine predicted miRNAs in Locusta migratoria was investigated Eight miRNAs were successfully detected by RT-PCR. Most miRNAs were expressed ubiquitously at all examined tissues and developmental stages whereas Lmi-mir-509 was specifically expressed in the thorax of the 2nd 4th and 5th instars and adult locust In all our work reported an efficient computational strategy for predicting miRNA genes from insect ESTs and presented tens of miRNAs in diverse insect species which are expected to participate in many important physiological processes

【题目】Mining expressed sequences for single nucleotide polymorphisms (SNPs) in Pacific abalone Haliotis discus hannai
【中文关键词】SNP; EST; 皱纹盘鲍; PCR-DS; AS-PCR
【英文关键词】SNPs;EST;Pacific abalone;Haliotis discus hannai;PCR-DS;AS-PCR
【中文摘要】无
【英文摘要】Although single nucleotide polymorphisms (SNPs) are important resources for population genetics, pedigree analysis and genomic mapping, such loci have not been reported in Pacific abalone so far. In this study, a bioinformatics strategy was adopted to discover SNPs within the expressed sequences (ESTs) of Pacific abalone, Haliotis discus hannai, and furthermore, polymerase chain reaction direct sequencing (PCR-DS) and allele-specific PCR (AS-PCR) were used for SNPs detection and genotype scoring respectively. A total of 5893 ESTs were assembled and 302 putative SNPs were identified. The average density of SNPs in ESTs was 1%. Fifty-two sets of sequencing primers were designed from SNPs flanking ESTs to amplify the genomic DNA, and 13 could generate products of expected size. Polymerase chain reaction direct sequencing of the amplification products from pooled DNA samples revealed 40 polymorphic SNP loci. Using a modified tetra-primer AS-PCR, seven mitochondrial and six nuclear SNPs were typed and characterized among 37 wild abalones. In conclusion, it is feasible to discover SNPs from number limited ESTs and the AS-PCR as a simple, robust and reliable assay could be a primary method for small- and medium-scale SNPs detection in abalones as well as other non-model organisms.

【题目】IDENTIFICATION OF TWO PIWI GENES AND THEIR EXPRESSION PROFILE IN HONEYBEE,Apis mellifera
【中文关键词】无
【英文关键词】Piwi; Apis mellifera; gene expression; worker and queen; nutritional control
【中文摘要】无
【英文摘要】Piwi genes play an important role in regulating spermatogenesis and oogenesis because they participate in the biogenesis of piRNAs, a new class of noncoding RNAs. However, these genes are not well understood in most insects. To understand the function of piwi genes in honeybee reproduction, we amplified two full-length piwi-like genes, Am-aub and Am-ago3. Both the cloned Am-aub

and Am-ago3 genes contained typical PAZ and PIWI domains and active catalytic motifs "Asp-Asp-Asp/His/Glu/Lys," suggesting that the two piwi-like genes possessed slicer activity. We examined the expression levels of Am-aub and Am-ago3 in workers, queens, drones, and female larvae by quantitative PCR. Am-aub was more abundant than Am-ago3 in all the tested samples. Both Am-aub and Am-ago3 were highly expressed in drones but not in workers and queens. The significant finding was that the larval food stream influenced the expression of Piwi genes in adult honeybees. This helps to understand the nutritional control of reproductive status in honeybees at the molecular level.

【题目】Effects of missing marker and segregation distortion on QTL mapping in F2 populations
【中文关键词】无
【英文关键词】missing marker,segregation distortion,QTL,F2 populations
【中文摘要】无
【英文摘要】Missing marker and segregation distortion are commonly encountered in actual quantitative trait locus (QTL) mapping populations. Our objective in this study was to investigate the impact of the two factors on QTL mapping through computer simulations. Results indicate that detection power decreases with increasing levels of missing markers, and the false discovery rate increases. Missing markers have greater effects on smaller effect QTL and smaller size populations. The effect of missing markers can be quantified by a population with a reduced size similar to the marker missing rate. As for segregation distortion, if the distorted marker is not closely linked with any QTL, it will not have significant impact on QTL mapping; otherwise, the impact of the distortion will depend on the degree of dominance of QTL, frequencies of the three marker types, the linkage distance between the distorted marker and QTL, and the mapping population size. Sometimes, the distortion can result in a higher genetic variance than that of non-distortion, and therefore benefits the detection of linked QTL. A formula of the ratio of genetic variance explained by QTL under distortion and non-distortion was given in this study, so as to easily determine whether the segregation distortion marker (SDM) increases or decreases the QTL detection power. The effect of SDM decreases rapidly as its linkage relationship with QTL becomes looser. In general, distorted markers will not have a great effect on the position and effect estimations of QTL, and their effects can be ignored in large-size mapping populations

【中文摘要】无
【英文摘要】We developed 14 single nucleotide polymorphism (SNP) markers for the Pacific abalone, Haliotisdiscus hannai, one valuable fishery resource in East Asian countries and popular seafood worldwide. The polymorphisms of these SNP loci were assessed using a wild population comprising 37 unrelated individuals. The minor allele frequency ranged from 0.1216 to 0.4865, and the observed and expected heterozygosities ranged from 0.189 to 0.865 and from 0.217 to 0.507, respectively. Only one locus (HdS82) deviated significantly from Hardy – Weinberg equilibrium and no significant linkage disequilibrium was detected after Bonferroni

corrections. These polymorphic markers appear suitable for conservation surveys and population genetic studies for the Pacific abalone.

【题目】银耳微波真空干燥特性及动力学模型
【中文关键词】农产品,微波,模型,干燥,银耳
【英文关键词】agriculture products;microwaves;models;drying;white fungus
【中文摘要】利用微波真空干燥技术,对银耳微波真空干燥特性进行研究,探讨不同微波强度、真空度及初始含水率对失水速率的影响,其中微波强度对失水速率影响最大.根据试验数据建立银耳微波真空干燥的水分比与干燥时间关系的动力学模型,并对模型进行拟合检验.结果发现银耳微波真空干燥过程符合Page模型,该模型预测值与实测值拟合良好.该模型可以准确预测银耳在微波真空干燥过程中的含水率和失水速率.

【英文摘要】White fungus is a edible fungus,which is characterized of high nutrition value and short shelf life.Microwave vacuum drying technique was used to dry white fungus to research its drying properties.The effects of microwave power, vacuum degree and initial moisture content on the drying rate were investigated,and microwave intensity had the greatest influence on the dehydrating rate.The suitable kinetics model which could be used to describe the relationship of moisture ratio and drying time was established base on experimental data and the proof test was performed.The results showed that the drying procedure of white fungus could accurately be described by the Page model,the predicted values of the model were nearly consistent with the observed values.The moisture contents and dehydrating rate during the drying procedure can be exactly estimated by it.

【题目】Validation of Reference Genes for Quantitative Expression Analysis by Real-Time
【中文关键词】无
【英文关键词】expression stability; housekeeping gene; qPCR; reference gene
【中文摘要】无
【英文摘要】Quantitative real-time polymerase chain reaction (qPCR) is an efficient and widely used technique to monitor gene expression. Housekeeping genes (HKGs) are often empirically selected as the reference genes for data normalization. However, the suitability of HKGs used as the reference genes has been seldom validated. Here, six HKGs were chosen (actin A3, actin A1, GAPDH, G3PDH, E2F, rp49) in four lepidopteran insects Bombyx mori L. (Lepidoptera: Bombycidae), Plutella xylostella L. (Plutellidae), Chilo suppressalis Walker (Crambidae), and Spodoptera exigua Hubner (Noctuidae) to study their expression stability. The algorithms of geNorm, NormFinder, stability index, and Delta Ct analysis were used to evaluate these HKGs. Across different developmental stages, actin A1 was the most stable in P. xylostella and C. suppressalis, but it was the least stable in B. mori and S. exigua. Rp49 and GAPDH were the most stable in B. mori and S. exigua, respectively. In different tissues, GAPDH, E2F, and Rp49 were the most stable in B. mori, S. exigua, and C. suppressalis, respectively. The relative abundances of Siwi genes estimated by 2(-Delta Delta Ct) method were tested with different HKGs as the reference gene, proving the importance of internal controls in qPCR data analysis. The results not only presented a list of suitable reference genes in four lepidopteran insects, but also proved that the expression stabilities of HKGs were different among evolutionarily close species. There was no single universal reference gene that could be used in all situations. It is

indispensable to validate the expression of HKGs before using them as the internal control in qPCR.

【题目】Development of Gene-targeted SNP Markers for Genomic Mapping in Pacific Abalone Haliotis discus hannai Ino
【中文关键词】SNPs; 皱纹盘鲍; 直接测序法; AS-PCR
【英文关键词】SNPs; Pacific abalone; Haliotis discus hannai Ino; Direct sequencing; AS-PCR
【中文摘要】无
【英文摘要】Useful and novel DNA markers are needed for aquaculture genetics and breeding. In this study, we report the discovery and development of gene-targeted single nucleotide polymorphisms (SNPs) for genomic mapping in the Pacific abalone Haliotis discus hannai Ino. Single EST or EST-contigs from 66 genes that had positive BLASTx matches (E-value a parts per thousand currency sign 1e-8) were used for polymerase chain reaction (PCR) amplification. PCR products from the two parents of one mapping family were directly sequenced, and 83 SNP loci were found from 17 genes. Allele-specific PCR (AS-PCR) was developed and optimized for genotyping of 11 SNP loci in 120 progeny of the mapping family. Nine of the loci conformed to the expected Mendelian ratio of 1:1 based on the chi(2) test (P > 0.05) and could potentially be used for linkage map construction. Our data also indicate that the sequencing of two parents may be a practical strategy for the discovery of informative SNPs for linkage mapping in a particular mapping population.

【题目】基于两个相关群体的玉米花期相关性状QTL定位
【中文关键词】玉米;花期相关性状;QTL定位
【英文关键词】maize; flowering-related traits; quantitative trait loci
【中文摘要】【目的】利用具有共同亲本黄早四的2个F2：3群体,定位控制玉米的抽雄期(DTT)、散粉期(DTP)、吐丝期(DTS)以及散粉-吐丝间隔期(ASI)的QTL,为玉米分子育种与相关基础研究提供参考和依据。【方法】以自交系齐319和掖478分别与黄早四杂交构建的230个和235个F2：3家系为定位群体(分别写作Q/H和Y/H),利用完备区间作图方法,对在不同生态环境下(2007-北京、2008-北京、2007-河南、2008-河南、2007-新疆以及2008-新疆)玉米花期相关性状进行QTL定位。同时利用基于混合线性模型的QTLNetwork-2.0软件进行基因×环境互作及上位性的分析。【结果】尽管4个花期相关性状的表现在2个群体中存在明显差异,但它们之间均呈现高度的相关性。在6个环境下对2个群体的4个性状进行了QTL检测,Q/H群体共定位到了85个QTLs,分布在玉米的10条连锁群上;Y/H群体共检测到了30个QTLs,呈现成簇分布。在Q/H群体中检测到2个重要的与多个性状相关且在不同环境条件下同时表达的QTL区域,分别位于第8染色体的umc1562—bnlg1651和第10染色体的phi062—umc1115区段;在Y/H群体中也检测到了1个与多性状相关且在多环境表达的QTL区域,位于第3染色体的nc030—umc2166区域。进一步分析发现,贡献率较大的QTL同时控制着多个性状。对比2个群体的定位结果,共检测到4个在不同遗传背景下的“一致性”QTLs。【结论】玉米花期相关性状的遗传机制较为复杂,而在不同环境及不同遗传背景下能够稳定存在的QTL可为这类性状的生产应用以及精细定位与图位克隆提供有价值的参考。
【英文摘要】【Objective】 Quantitative trait loci (QTL) for maize flower-related traits including days to tasseling (DTT), days to pollen-shedding (DTP), days to silking (DTS) and anthesis-silking interval (ASI) were mapped in two different F2:3 families with a shared male parent to provide reference for molecular breeding and related basic research in maize. 【Method】 230 and 235 F2:3

families derived from Qi 319×Huangzaosi population (Q/H) and Ye 478×Huangzaosi population (Y/H), respectively, under six different environments (2007-Beijing, 2008-Beijing, 2007-Henan, 2008-Henan, 2007-Xinjiang, and 2008-Xinjiang) were used to map QTL controlling four flower-related traits of maize by using the inclusive composite interval mapping method (ICIM). Meanwhile, QTL Network-2.0 was used to analyze epistasis among QTLs and QTL by environment interaction (QEI). 【Result】 Phenotypic analysis showed that DTT, DTP, DTS and ASI differed significantly in both Q/H and Y/H populations, while significant statistical correlations were observed between these flower-related traits in both populations. Under all of the six environments, 85 QTLs distributed on the 10 chromosomes were identified in Q/H, while 30 QTLs among which some were clustered were identified in Y/H for these four flower-related traits. Two and one important QTLs related to multiple traits were detected in each population, which were located on the interval of umc1562-bnlg1651 of Chrom. 8, phi062-umc1115 of Chrom. 10 and nc030-umc2166 of Chrom. 3, respectively. They could be expressed under different environments (may be called constitutive QTL). The results also indicated that those QTLs which could explain a relatively higher proportion of phenotypic variation seemed to control multiple target traits. Further, four QTLs were observed to be consistent between Q/H and Y/H. 【Conclusion】 Previous studies suggested that the genetic mechanisms of the flowering-related traits in maize are quite complicated. However, the results obtained here may give an important clue for precise mapping and positional cloning of QTL which could be stably expressed under different environments or genetic backgrounds.

【题目】基于元分析和生物信息学分析的玉米抗旱相关性状QTL一致性区间定位
【中文关键词】玉米; 抗旱性; “一致性”QTL; 元分析; 生物信息学方法
【英文关键词】Maize (Zea mays L.); Drought tolerance; Meta-QTL; Meta-analysis; Bioinformatics approach
【中文摘要】定位玉米基因组中一致的抗旱性区段是玉米抗旱分子育种的重要基础。本研究对至今发表的在干旱条件下定位的相关性状 QTL 信息搜集整理, 以 IBM2 2008 Neighbors 为参考图谱, 利用 overview 分析和元分析方法进行Meta-QTL (MQTL)检测, 共发掘 79 个 MQTL, 生物信息学分析结果显示, 有 43 个区间内包含抗旱相关基因信息, 占检出 MQTL 总数的 54.43%。基于 MaizeGDB 网站的 Genome Browser 中的遗传图谱与物理图谱的整合信息, 进行MQTL 物理距离的估算, 根据 maizesequence 网站的玉米基因组序列信息, 进行初步的抗旱基因预测表明, 这些区段中包含丰富的 MYB、bZIP 以及 DREB 转录因子序列信息以及大量的 LEA 基因家族成员。
【英文摘要】Mapping consensus genomic regions for drought-tolerance is of great importance in the molecular breeding of maize. The present research integrated informations of the published QTLs relevant to drought-tolerance mapped in the environment of water

stress. On the basis of the high-density linkage map of IBM2 2008 Neighbors, a total of 79 Meta-QTLs (MQTLs) were screened out through the methods of “ overview ” and meta-analysis, and the bioinformatic analysis indicated that 43 of these MQTLs (54.43%) contained the information of genes conferring drought tolerance. By integrating the genetic map and the physi-cal map of maize via Genome Brower in maize genome database (http://www.maizegdb.org/), we estimated the physical map distance of MQTLs and analyzed the function of these candidate drought tolerance-related genomic regions based on the maize genome sequence information from the maize sequence database (http://www.maizesequence.org/). The results showed that these regions contained abundant sequences of transcription factors of MYB, bZIP and DREB, and a number of functional genes of LEA family.

【题目】Mitogenome of the small abalone Haliotis diversicolor Reeve and phylogenetic analysis within Gastropoda.
【中文关键词】杂色鲍 线粒体DNA 腹足纲 SNP
【英文关键词】Haliotis diversicolor; mtDNA; Haliotidae; Gastropoda; Ka/Ks; SNP
【中文摘要】无
【英文摘要】The complete mitochondrial coding regions of three small abalones Haliotis diversicolor Reeve, two collected from Vietnam and one from southern China, were successfully sequenced. The molecular feature of the mitochondrial genome is identical with the general description of the family Haliotidae mtDNAs that have been sequenced so far. The sequenced nucleotides are 16,186-16,266 bp in length. The mitogenome encodes 13 protein-coding genes, 2 ribosomal RNA genes, and 22 transfer RNA genes. Between adjacent genes trnH and nad5 there is an overlapping region. Comparison of the ratios of Ka and Ks among four species of Haliotis (H. diversicolor, H. discus hannai, H. rubra and H. tuberculate tuberculate) reveals that values of Ka/Ks in some NADH dehydrogenase and ATPase genes such as nad2, nad6 and atp8 are higher than those in other mitochondrial genes. Genome-wide gene arrangement among four species of Haliotis has been compared. Although all gene arrangement is the same in H. diversicolor, H. discus hannai and H. rubra, the location of trnS(2) and trnF in H. tuberculate tuberculate are inter-exchanged. Both gene arrangement and phylogenetic analysis support that the family Haliotidae is at a relatively primordial phylogenetic position in Gastropoda. Through alignment between Vietnam and southern China individuals, 111 SNPs are detected, most SNPs are synonymous mutations, and 7, 94 and 10 SNPs are observed at NCR, protein-coding region and RNA region, respectively. The result of SNP analysis also demonstrates that the difference is mainly in some NADH dehydrogenase genes between the Vietnam and southern China individuals. (C) 2011 Elsevier B.V. 【题目】基于SSR标记的小麦骨干亲本育种重要性研究
【中文关键词】小麦;大面积推广品种;骨干亲本;基因型分析
【英文关键词】common wheat; major cultivar; founder; microsatellite genotyping
【中文摘要】【目的】通过对大面积推广小麦品种和育种骨干亲本的全基因组多位点扫描分析,探讨两者之间的遗传关系及骨干亲本在小麦育种中的作用。【方法】利用ABI3730对中国66份大面积推广的小麦品种和13份育种骨干亲本的481个SSR位点进行基因型扫描分析。【结果】以基因型数据为基础的主坐标及NJ聚类分析,发现中国大面积推广品种可聚成6个大组,每一组中至少有一个骨干亲本。系谱分析表明,每一组中大面积推广品种和骨干亲本之间均存在密切的血缘关系

,前者大多为骨干亲本的后裔;同一省份的品种多数聚在一起。来自同一组合的骨干亲本碧蚂4号含有的优势等位变异数多于大面积推广品种碧蚂1号,同样,郑引4号(St2422-464)多于郑引1号(St1472-506) ;新一代骨干亲本往往由上一代骨干亲本衍生而来;来源于同一组合的骨干亲本与大面积品种相比,前者与其组合中的骨干亲本间存在更大的遗传差异。 【结论】只有对资源的创新、引进和利用给予足够的重视,育种工作才能取得大的突破。

【英文摘要】【Objective】 The purpose of this study was to reveal genetic relationship between the large-scale cultivated wheat varieties and the founder genotypes (cornerstone breeding parents) and illuminate the role of the founder genotypes in breeding at genomic level. 【Method】 Sixty-six large-scale planted varieties and 13 founder genotypes were genotyped at 481 SSR loci by the ABI 3730. 【Result】 Analyses of principal coordinate (PCO) and neighbor-joining cluster based on the genotyping data showed that the 66 large-scale planted varieties were clustered into six major groups. In each group, there is at least one founder. Within each group, most of the large-scale planted varieties are the descendents of the founder. Varieties from the same province usually jointed into one group. Two founders, Bima 4 and St2422-464 convey more alleles favored in breeding than their sister lines, Bima 1 and St1472-506, respectively. Usually, the older cornerstone breeding parents are the founders for the new ones. Among sister lines, the new founder has more difference than large-scale cultivated varieties to their founder genotype. 【Conclusion】 Therefore, innovation and enhancement of germplasm is the base for breeding large-scale planted varieties. It should occupy proper portion in national breeding program.

【题目】A multiplex allele-specific PCR method for the detection of carbendazim-resistant Sclerotinia sclerotiorum

【中文关键词】Benzimidazole fungicide
b-Tubulin gene
Point mutation
Sclerotinia stem rot

【英文关键词】Benzimidazole fungicide
b-Tubulin gene
Point mutation
Sclerotinia stem rot

【中文摘要】The benzimidazole fungicide carbendazim (CBD) has been used extensively in China for the control ofsclerotinia stem rot (SSR) of rapeseed caused by Sclerotinia sclerotiorum. In this study, 245 isolates of S.sclerotiorum were examined for their sensitivities to CBD, and two resistance levels were identified.Among 245 isolates, 78 isolates were highly resistant to CBD. These CBD highly resistant (CBD-HR) isolateswere more sensitive to the phenylcarbamate fungicide diethofencarb than CBD sensitive (CBD-S)isolates. One isolate was medium resistant to CBD, and insensitive to diethofencarb. Random amplifiedpolymorphic DNA (RAPD) analysis showed the CBD-HR isolates had different genetic backgrounds. Analysisof the DNA sequence of the b-tubulin gene showed that all CBD-HR isolates had a point mutation atthe codon 198, causing a substitution of glutamic acid to alanine. The CBD medium resistant (CBD-MR)isolate had a point mutation at the codon 200 causing a substitution of phenylalanine to tyrosine. Basedon these point mutations, a multiplex allele-specific PCR method was developed to detect two differentpoint mutations simultaneously in single PCR amplification.

Vegetative differentiation
Virulence
【中文摘要】We present a characterization of bos5 from Botrytis cinerea, a gene that encodes a mitogen-activated proteinkinase kinase (MAPKK), which is homologous to OS-5 of Neurospora crassa. The bos5 gene deletionmutant exhibited reduced vegetative growth and strongly impaired conidiation. The mutant also exhibitedincreased sensitivity to the dicarboximide fungicide iprodione and to osmotic stress mediated byNaCl or KCl. Western-blot analysis showed that the BcSAK1 protein, the putative downstream componentof BOS5, was not phosphorylated in the mutant. Plant inoculation tests showed that the mutants wereunable to infect cucumber leaves. All of these defects were restored by genetic complementation ofthe Dbcos5-21 mutant with the wild-type bos5 gene. These results indicated that BOS5 is involved inthe regulation of vegetative differentiation, virulence, adaptation to iprodione and ionic stress in B.cinerea.

【题目】利用SSR标记研究不同来源的同名玉米骨干自交系的遗传同一性和遗传差异
【中文关键词】玉米; SSR 标记; 遗传同一性;遗传差异
【英文关键词】Zea mays ; SSR marker ; Genetic uniformity ; Genetic variation

【中文摘要】从分子水平上阐明不同单位保存的同一份种质资源的遗传同一性和遗传差异对种质资源的保存和利用有重要意义。本研究利用116对SSR引物对不同来源的5个玉米骨干自交系(黄早四、掖478、Mo17、丹340和自330,共39份材料)进行了鉴定,共检测到400个等位变异,每对引物可以检测到1~4个等位变异,平均为3.45个。5个自交系中每个自交系间检测的等位变异在156~228个,5个自交系同名材料之间遗传相似系数变化范围为0.7~0.9。聚类分析结果表明,在供试自交系中黄早四、掖478、Mo17等3个材料的同名自交系能很好地聚为一类,且遗传相似系数很高。丹340和自330的同名材料在聚类时个别材料互有交叉,在利用时需要注意。

【英文摘要】Understanding genetic uniformity and genetic variation of germplasm with same name but different origin at molecular level is important to conservation and utilization of germplasm resources. In the present study, totally 39 accessions of 5 maize inbred lines, . ie. Huangzaosi, Ye478, Mo17, Dan 340 and Zi330 from different institutes were characterized by 116 SSR markers. A total of 400 alleles were detected, with a range of 14 alleles per SSR loci with the average of 3.45. For these 5 inbreds, the range of numbers of alleles was 156-228 and the range of alleles per loci was 1.35-1.89. The range of genetic similarity within inbred lines of same name was 0.70.9. The results of cluster analysis indicated that Huangzaos, iYe 478 and Mo 17 from different origin could beclustered into respective groups due to higher similarity. However, Dan 340 and Zi 330 from different origins hadhigher genetic difference, implying thatmore attention should be paid when using these inbred lines.

【题目】玉米籽粒构型与产量性状的关系及QTL作图

【中文关键词】玉米;籽粒构型;产量;QTL

【英文关键词】maize; kernel structure; yield; QTL

【中文摘要】【目的】探讨玉米籽粒构型性状(粒长、粒宽、粒厚、粒形等)与产量性状间的相互关系,进行籽粒构型性状相关QTL的检测与定位。【方法】以自交系齐319和黄早四构建的226个F2:3家系为试验材料,利用相关分析、主成分分析、出籽率模拟运算及QTL定位等方法,对在不同生态环境下(北京春播和河南夏播)玉米籽粒构型与产量性状间相关性进行探讨,并初步分析籽粒构型性状遗传基础。【结果】单穗产量与绝大多数籽粒构型性状显著相关,特别是与粒长的相关系数最高。主成分分析结果表明,对单穗产量影响较大的性状有粒长、粒厚、穗长、出籽率和粒长/穗半径。出籽率是影响果穗同化产物分配状况的衡量指标,受到粒长、粒长/穗半径、穗长和粒宽的显著影响。模拟运算亦表明粒长/穗半径与出籽率具有十分紧密的关系。对在两个生态环境下籽粒构型性状和产量性状的相关QTL进行了检测,共检测到了36个QTL。进一步分析发现,在不同生态环境下的部分QTL定位在相同的染色体区域;同时,还有不同性状的QTL定位在相同或临近的染色体区域。【结论】玉米籽粒构型性状与产量性状具有较高的相关关系,籽粒构型QTL与产量相关QTL的重叠区域对剖析玉米产量形成遗传机制可能具有重要的研究价值。

【英文摘要】【Objective】 The correlation of traits of kernel structure with yield components was investigated and quantitative trait loci (QTL) for these traits were analyzed in this paper. 【Method】 Two hundred and twenty-six F2:3 lines from the cross of Qi 319×Huangzaosi in two different environments (spring-sown in Beijing and summer-sown in Henan) were used to conduct correlation analysis, principle component analysis, simulated calculation of rate of kernel production (RKP) and QTL mapping. 【Result】 Kernel yield per ear (KYE) showed significant correlation with most traits of kernel structure, especially with kernel depth (KD). Principle component analysis indicated that KD, kernel thickness (KT), ear length (EL), rate of kernel production (RKP) and KD/ear semidiameter (EsemiD) determined the performance of KYE. As the parameter reflecting the distribution of assimilation in ear, RKP was influenced by KD, KD/EsemiD, EL and Kernel Width (KW). Simulated calculation of RKP also showed that KD/EsemiD had a close relationship with RKP. A total of thirty-six QTLs for traits of kernel structure and yield components were detected. It was found that some QTLs detected in different environments were located in the same genetic regions. Several chromosomal regions with QTL cluster relevant to multiple traits were also detected. 【Conclusion】 Traits of kernel structure have high correlations with yield components. The detection of genetic regions with QTL cluster might be helpful to the understanding of genetic mechanism of maize yield.

【题目】Identification of specific fragments of HpaGXooc, a harpin from Xanthomonas oryzae pv. oryzicola, that induce disease resistance and enhance growth in plants
【中文关键词】无
【英文关键词】hypersensitive response (HR), systemic acquired resistance (SAR).
【中文摘要】无
【英文摘要】Harpin proteins from gram-negative plant-pathogenic bacteria can stimulate hypersensitive cell death (HCD) and pathogen defense as well as enhance growth in plants. Two of these diverse activities clearly are beneficial and may depend on particular functional regions of the proteins. Identification of beneficial and deleterious regions might facilitate the beneficial use of harpin-related

proteins on crops without causing negative effects like cell death. Here, we report the identification and testing of nine functional fragments of HpaGXooc , a 137-amino-acid harpin protein from Xanthomonas oryzae pv. oryzicola , the pathogen that causes bacterial leaf streak of rice. Polymerase chain reaction-based mutagenesis generated nine proteinaceous fragments of HpaGXooc; these caused different responses following their application to Nicotiana tabacum (tobacco) and Oryza sativa (rice). Fragment HpaG62-137 , which spans the indicated amino acid residues of the HpaG, induced more intense HCD; in contrast, HpaG10-42 did not cause evident cell death in tobacco. However, both fragments stimulated stronger defense responses and enhanced more growth in rice than the full-length parent protein, HpaGXooc . Of the nine fragments, the parent protein and one deletion mutant of HpaGXooc tested, HpaG10-42 , stimulated higher levels of rice growth and resulted in greater levels of resistance to X. oryzae pv. oryzae and Magnaporthe grisea . These pathogens cause bacterial leaf blight and rice blast, respectively, the two most important diseases of rice world-wide. HpaG10-42 was more active than HpaGXooc in inducing expression of several genes that regulate rice defense and growth processes and activating certain signaling pathways, which may explain the greater beneficial effects observed from treatment with that fragment. Overall, our results suggest that HpaG10-42 holds promise for practical agricultural use to induce disease resistance and enhance growth of rice.

【题目】Thirty-seven transcription factor genes differentially respond to a harpin protein and affect resistance to the green peach aphid in Arabidopsis

【中文关键词】无

【英文关键词】Arabidopsis; defence; ethylene; green peach aphid; transcription factor

【中文摘要】无

【英文摘要】The harpin protein HrpNEa induces Arabidopsis resistance to the green peach aphid by activating the ethylene signalling pathway and by recruiting EIN2, an essential regulator of ethylene signalling, for a defence response in the plant. We investigated 37 ethylene-inducible Arabidopsis transcription factor genes for their effects on the activation of ethylene signalling and insect defence. Twenty-eight of the 37 genes responded to both ethylene and HrpNEa , and showed either increased or inhibited transcription, while 18 genes showed increased transcription not only by ethylene but also by HrpNEa . In response to HrpNEa , transcription levels of 22 genes increased, with AtMYB44 being the most inducible, six genes had decreased transcript levels, and nine remained unchanged. When Arabidopsis mutants previously generated by mutagenicity at the 37 genes were surveyed, 24 mutants were similar to the wild type plant while four mutants were more resistant and nine mutants were more susceptible than wild type to aphid infestation. Aphid-susceptible mutants showed a greater susceptibility for atmyb15 , atmyb38 and atmyb44 , which were generated previously by T-DNA insertion into the exon region of AtMYB15 and the promoter regions of AtMYB38 and AtMYB44 . The atmyb44 mutant was the most susceptible to aphid infestation and most compromised in induced resistance. Resistance accompanied the expression of PDF1.2 , an ethylene signalling marker gene that requires EIN2 for transcription in wild type but not in atmyb15 , atmyb38 , and atmyb44 , suggesting a disruption of ethylene signalling in the mutants. However, only atmyb44 incurred an abrogation in induced EIN2 expression, suggesting a close relationship between AtMYB44 and EIN2 .

【题目】Transcription factor AtMYB44 regulates induced expression of the ETHYLENE INSENSITIVE2 rene in Arabidopsis responding to a harpin protein
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】AtMYB44 is a transcription factor that functions in asso-ciation with the ethylene-signaling pathway in Arabidopsis thaliana . The pathway depends on ETHYLENE INSENSI-TIVE2 (EIN2), an essential component of ethylene signal-ing, to regulate defense responses in the plant following treatment with HrpNEa , a harpin protein from a bacterial plant pathogen. Here, we show that AtMYB44 regulates in-duced expression of the EIN2 gene in HrpNEa-treated Arabidopsis plants. A HrpNEa and ethylene – responsive fragment of the AtMYB44 promoter is sufficient to support coordinate expression of AtMYB44 and EIN2 in specific transgenic Arabidopsis . In the plant, the AtMYB44 protein localizes to nuclei and binds the EIN2 promoter; the HrpNEa treatment promotes AtMYB44 production, binding activity, and transcription of AtMYB44 and EIN2 . AtMYB44 overexpression results in increased production of the AtMYB44 protein and the occurrence of AtMYB44- EIN2 interaction under all genetic backgrounds of wild-type Arabidopsis and the etr1-1 , ein2-1 , ein3-1 , and ein5-1 mu-tants, which have defects in the ethylene receptor ETR1 and the signal regulators EIN2, EIN3, and EIN5. However, AtMYB44 overexpression leads to enhanced EIN2 expression only under backgrounds of wild type, ein3-1 , and ein5-1 but not etr1-1 and ein2-1 , suggesting that ethylene percep-tion is necessary to the regulation of EIN2 transcription by AtMYB44.

【题目】The antagonistic effect of hydroxyl radical on the development of a hypersensitive response in tobacco
【中文关键词】无
【英文关键词】elicitin;hydroxyl radicals;hypersensitive response;reactive oxygen species;riboflavin
【中文摘要】无
【英文摘要】Reactive oxygen species (ROS) are important signalling molecules in living cells. It is believed that ROS molecules are the main triggers of the hypersensitive response (HR) in plants. In the present study of the effect of riboflavin, which is excited to generate ROS in light, on the development of the HR induced by the elicitin protein ParA1 in tobacco (Nicotiana tabacum), we found that the extent of the ParA1-induced HR was diminished by hydroxyl radical (OH•), a type of ROS. As compared with the zones treated with ParA1 only, the HR symptom in the zones that were infiltrated with ParA1 plus riboflavin was significantly diminished when the treated plants were placed in the light. However, this did not occur when the plants were maintained in the dark. Trypan blue staining and the ion leakage measurements confirmed HR suppression in the light. Further experiments proved that HR suppression is attributed to the involvement of the photoexcited riboflavin, and that the suppression can be eliminated with the addition of hydrogen peroxide scavengers or OH• scavengers. Fenton reagent treatment and EPR measurements demonstrated that it is OH• rather than hydrogen peroxide that contributes to HR suppression. Accompanying the endogenous OH• formation, suppression of the ParA1-induced HR occurred in the tobacco leaves that had been treated with high-level abscisic acid, and that suppression was also removed by OH• scavengers. These results offer evidence that OH•, an understudied and little appreciated ROS, participates in and modulates biologically relevant signalling in plant cells.

【题目】The induction of abscisic-acid-mediated drought tolerance is independent of ethylene signaling in Arabidopsis plants responding to a harpin protein
【中文关键词】无
【英文关键词】Abscisic acid Arabidopsis Drought tolerance Ethylene HrpN_(Ea) ABI2
【中文摘要】无
【英文摘要】Harpin proteins from plant pathogenic bacteria can activate distinct signaling pathways and cause multiple effects in plants. When Arabidopsis thaliana (Arabidopsis) plants are treated with the HrpN_(Ea) harpin produced by Erwinia amylovora, a bacterial pathogen that causes fire blight in rosaceous plants, abscisic acid (ABA) is stimulated to mediate drought tolerance, and ethylene signaling is activated to regulate plant growth enhancement and insect resistance. It is unclear if ABA and ethylene signaling interacts in response to harpin proteins. Here we report that ethylene signaling is dispensable to the induction of ABA-mediated drought tolerance in Arabidopsis. In wild-type (WT) plants growing under drought stress conditions, ABA, but not ethylene, was required for HrpN_(Ea) to promote cellular adaptive responses and decrease drought severity of plants. During the induction of drought tolerance in HrpN_(Ea)-treated WT plants, expression of the ABA signaling gene ABI2 was induced coincidently with decreases in transcripts of ETR1, which encodes an ethylene receptor, and several other genes that are also involved in ABA and ethylene signal transduction pathways. In response to HrpN_(Ea), the Arabidopsis etrl-1 mutant developed drought tolerancesimilarly as did WT, but the abi2-1 mutant did not, suggesting that sensing of ABA is essential, but sensing of ethylene is not. Consistently, the induction of drought tolerance was abolished by inhibiting WT to synthesize ABA, instead of ethylene. Ourresults suggest that HrpN_(Ea) treatment enables plants to prioritize the ABA signal transduction pathway over ethylene signaling in accordance with the real-time requirement to survive under drought stress conditions.

【题目】A selected fragment of HpaGXooc, a harpin protein from Xanthomonas oryzae pv. oryzicola, affects disease reduction and grain yield of rice in extensive grower plantings
【中文关键词】无
【英文关键词】disease severity index, secure crop production.
【中文摘要】无
【英文摘要】Harpins of phytopathogenic bacteria stimulate defense and plant growth in many types of plants, conferring disease resistance and enhanced yield. In a previous study, we characterized nine fragments of the harpin protein HpaG Xooc from Xanthomonas oryzae pv. oryzicola for plant defense elicitation and plant growth stimulation activity relative to the intact protein. In plants grown under controlled conditions, the fragment HpaG10-42 was more active in both regards than HpaG Xooc . Here, we demonstrate that the activity of HpaG10-42 in rice under field conditions significantly exceeds that of HpaGXooc , stimulating resistance to three important diseases and increasing grain yield. We carried out tests in 672 experimental plots with nine cultivars of rice planted at three locations. Application protocols were optimized by testing variations in application rate, frequency, and timing with respect to rice growth stage. Of the concentrations (24, 24, 12, and 6 μg/ml), and number and timing of applications (at one to four different stages of growth) tested, HpaG10-42 at 6 μg/ml applied to plants once at nursery seedling stage and three times in the field was most effective. Bacterial blight, rice blast, and sheath blight were reduced 61.6 and 56.4, 93.6 and 76.0, and 93.2 and 55.0% in indica and japonica cultivars, respectively, relative to controls. Grain yields were 22 to 27% greater. These results are similar to results obtained with typical local management practices, including use of chemicals, to decrease disease severities and increase yield in rice. Our results demonstrate that the HpaG10-42 protein fragment can be used effectively to control diseases and increase yield of this staple food crop.

【题目】Development and Linkage Analysis of 104 New Microsatellite Markers for Bay Scallop (Argopecten irradians)
【中文关键词】海湾扇贝 微卫星 无效等位基因 基因分离 遗传连锁图谱
【英文关键词】Argopecten irradians; Bay scallop; Microsatellites; Null allele; Segregation; Linkage map
【中文摘要】无
【英文摘要】For genetic analysis and linkage mapping of bay scallop (Argopecten irradians), a set of 120 novel simple sequence repeat markers were developed from microsatellite-enriched libraries and expressed sequence tags. An inter-subspecies hybrid bay scallop family (CC5) of 46 progeny was analyzed as the reference population to confirm polymorphism and test the segregation patterns of these loci. A total of 104 microsatellite markers were polymorphic in the reference family, among which 36 in female, 28 in male, and 40 in both parents, respectively. Linkage analysis allowed mapping these markers to 15 linkage groups, which is close to the haploid chromosome number of bay scallop (n = 16). Analysis of the 40 markers segregating in both parents showed a higher recombination rate in the female parent, with the average of female-to-male recombination ratio of 1.09:1 between linked pairs of markers. When null alleles were considered, there were 17 loci showing segregation distortion at the 5% significance level using the chi-square test. The microsatellite markers developed in this study provide a useful resource for future linkage mapping and quantitative loci analysis in A. irradians.

【题目】A consensus microsatellite-based linkage map for the hermaphroditic bay scallop (Argopecten irradians) and its application in size-related QTL analysis
【中文关键词】无
【英文关键词】non
【中文摘要】无
【英文摘要】Bay scallop (Argopecten irradians) is one of the most economically important aquaculture species in China. In this study, we constructed a consensus microsatellite-based genetic linkage map with a mapping panel containing two hybrid backcross-like families involving two subspecies of bay scallop, A. i. irradians and A. i. concentricus. One hundred sixty-one microsatellite and one phenotypic (shell color) markers were mapped to 16 linkage groups (LGs), which corresponds to the haploid chromosome number of bay scallop. The sex-specific map was 779.2 cM and 781.6 cM long in female and male, respectively, whereas the sex-averaged map spanned 849.3 cM. The average resolution of integrated map was 5.9 cM/locus and the estimated coverage was 81.3%. The proportion of distorted markers occurred more in the hybrid parents, suggesting that the segregation distortion was possibly resulted from heterospecific interaction between genomes of two subspecies of bay scallop. The overall female-to-male recombination rate was 1.13∶1 across all linked markers in common to both parents, and considerable differences in recombination also existed among different parents in both families. Four size-related traits, including shell length (SL), shell height (SH), shell width (SW) and total weight (TW) were measured for quantitative trait loci (QTL) analysis. Three significant and six suggestive QTL were detected on five LGs. Among the three significant QTL, two (qSW-10 and qTW-10, controlling SW and TW, respectively) were mapped on the same region near marker AiAD121 on LG10 and explained 20.5% and 27.7% of the phenotypic variance, while the third (qSH-7, controlling SH) was located on LG7 and accounted for 15.8% of the phenotypic variance. Six suggestive QTL were detected on four different LGs.

The linkage map and size-related QTL obtained in this study may facilitate marker-assisted selection (MAS) in bay scallop.

【中文摘要】为更加直观的展示小麦的整个生长过程, 同时为教学科研提供支持, 将系统分析方法和数学建模技术应用于小麦植株的形态建成, 通过对小麦形态数据的定量分析, 并结合前人的研究成果,构建了小麦形态建成模拟模型, 包括叶片形态建成子模型(包括叶长、叶形、叶面积、叶片空中伸展曲线、茎叶夹角、叶色和叶片衰亡)、茎形态建成子模型(包括茎长和茎粗)、叶鞘形态建成子模型(包括叶鞘长和叶鞘粗)和麦穗形态建成子模型(包括穗长和麦芒)等。并以此为基础, 结合已有小麦生长模拟模型WheatGrow,在Microsoft Visual C++ 平台上利用OpenGL构建了基于形态模型的小麦虚拟生长系统(WVGS),初步实现了小麦生长过程的可视化表达。建立的模型库主要包括形态模型、生长模型、可视化模型以及场景控制模型四部分。所建数据库主要存储气象数据、土壤数据和品种参数。系统运行结果表明该系统能较好地模拟小麦形态特征,能较逼真的实现小麦生长过程的虚拟显示。
【英文摘要】By applying the system analysis principle and mathematical modeling technique to the morphogenesis, the morphogenesis model for wheat was developed through the quantitative analyses of the experimental data and integrating the existing theory and knowledge. The whole morphogenesis model includes four submodels of leaf, stem, sheath and ear morphogenesis. The submodel of leaf morphogenesis can quantitatively describe the dynamics of leaf length, leaf shape, leaf area, leaf curve, leaf angle, leaf color and leaf senescence, and the stem morphogenesis submodel can simulate the dynamics of stem length and thickness. By integrating the existing wheat growth model WheatGrow, a morphogenesis model based wheat virtual growth system for organs and plant was developed with OpenGL on the platform of Microsoft Visual C++ 6.0. The system comprised of models, database and interface (or browser), in which the models included the morphogenesis model, growth model, visualization model and scene control model, and the database included the weather data, soil data and variety parameters. The operational results of the system show that the system can primarily realize the visual description of growth process of organs and single plant in wheat.

【题目】Transfer of the beta-tubulin gene of Botrytis cinerea with resistance to carbendazim into Fusarium graminearum

【中文关键词】fungicide resistance; carbendazim; Fusarium graminearum; Fusarium head blight; Triticum aestivum; Gibberella zeae

【英文关键词】fungicide resistance; carbendazim; Fusarium graminearum; Fusarium head blight; Triticum aestivum; Gibberella zeae

【中文摘要】BACKGROUND: Resistance to carbendazim and other benzimidazole fungicides in Botrytis cinerea (Pers. ex Fr.) and most otherfungi is usually conferred by mutation(s) in a single chromosomal β-tubulin gene, often with several allelic mutations. InFusarium graminearum Schwade, however, carbendazim resistance is not associated with a mutation in the corresponding β-tubulin gene.RESULTS: The β-tubulin gene conferring carbendazim resistance in B. cinerea was cloned and connected with two homologousarms of the β-tubulin gene of F. graminearum by using a double-joint polymerase chain reaction (PCR). This fragment wastransferred into F. graminearum via homologous double crossover at the site where the β-tubulin gene of F. graminearum isnormally located (the β-tubulin gene of F. graminearum had been deleted). The transformants were confirmed and tested fortheir sensitivity to carbendazim.CONCLUSION: The β-tubulin gene conferring carbendazim resistance in B. cinerea could not express this resistance in F.graminearum, as transformants were still very sensitive to carbendazim.

【题目】Genetic parameter estimates for growth traits at early stage of Pacific abalone Haliotis discus hannai Ino
【中文关键词】皱纹盘鲍; 生长特征; 遗传力; 遗传相关
【英文关键词】Haliotis discus hannai Ino; growth traits; heritability; genetic correlations
【中文摘要】无
【英文摘要】Heritability and genetic and phenotypic correlations were estimated for juvenile growth traits of Pacific abalone Haliotis discus hannai Ino. The estimates were calculated from shell length and shell width measurements on progeny resulting from 12 half-sib families and 36 full-sib families obtained using artificial fertilization of mating three females to each male. The measurements were taken at 10, 20 and 30 d after fertilization. It was found that heritability estimates based on sire component ranged from 0.23 to 0.36 for shell length and 0.21 to 0.32 for shell width. Heritability estimates from dam component were larger than those from sire component at three ages, indicating presence of maternal effects, non-additive genetic effects and common environmental effects. Phenotypic correlations were significant at three ages ($P < 0.05$), with values of 0.92, 0.93 and 0.92, respectively. Genetic correlations from the paternal half-sib correlation analysis were highly positive at three ages, with values of 0.50, 0.78 and 0.81, respectively. The results suggest that selective breeding is an effective approach to improving growth traits of Pacific abalone stocks.

【题目】Effects of fungicides JS399-19, azoxystrobin, tebuconazloe, and carbendazim on the physiological and biochemical indices and grain yield of winter wheat.
【中文关键词】无
【英文关键词】Agrochemicals
Leaf senescence
Oxidative status
【中文摘要】无
【英文摘要】The impact of four modern fungicides JS399-19 (2-cyano-3-amino-3-phenylancryic acetate) (novel fungicide),azoxystrobin (a strobilurin), tebuconazole (a triazole) and carbendazim (a benzimidazole),applied as foliar spray at the recommended field rate, on the physiology and biochemistry of the senescenceprocess and grain yield was studied in winter wheat (Triticum aestivum L. cv. ‘Nannong No. 9918’)under natural environmental conditions. Fungicide treatments to wheat plants at growth stage [ZGS] 57(3/4 of head emerged) significantly increased the chlorophyll (CHL) and soluble protein (SP) content anddecreased the malondialdehyde (MDA) content and electrolyte leakage. Additionally, activities of theantioxidative enzymes superoxide dismutase (SOD), catalase (CAT) and peroxidase (POD) in flag leavesof the fungicide-treated plants were also higher than

that in untreated plants. These coincided with elevatedlevels of H2O2 and reduced level of O 2 in the fungicide-treated plants. The results suggested thatthe fungicide-induced delay of senescence was due to an enhanced antioxidant enzyme activity protectingthe plants from harmful active oxygen species (AOS). Because all fungicides can induce the delay ofwheat senescence, fungicide-treated wheat shown higher grain yield than untreated wheat. Of all testedfungicides, JS399-19, azoxystrobin and tebuconazole showed similar effects on delaying senescence ofwheat and enhancing the grain yield of wheat, but JS399-19 was more efficient in general.

【题目】Experimental evaluation of heterobeltiosis and heterosis between two populations of Pacific abalone Haliotis discus hannai
【中文关键词】皱纹盘鲍; 群体交配; 杂种优势
【英文关键词】Haliotis discus hannai Ino; population mating; heterobeltiosis; heterosis
【中文摘要】无
【英文摘要】A2 x 2 factorial cross between two populations of Pacific abalone Haliotis discus hannai Ino, collected separately from Dalian (D) in China and Miyagi (M) in Japan, was conducted to compare performances in fertilization rate, hatching rate, metamorphosis rate and growth at days 20, 43, 160 and 330 between purebreds (DD and MM) and crossbreds (DM and MD) and investigate the magnitude of heterobeltiosis (better parent) and heterosis (mid-parent). Heterobeltiosis and heterosis for all the traits analyzed were evidently different between crossbreds DM and MD. Heterobeltiosis in the crossbred DM varied among traits, with values of 2.5% for the fertilization rate, 2.2% for the hatching rate, -1.9% for the metamorphosis rate and 7.4% for the growth at the (lay 330. The crossbred DM displayed positive heterotic values for fertilization rate (5.4%), hatching rate (7.4%), metamorphosis rate (7.6%) and growth (12.0%) at the day 330. However, both heterobeltiosis and heterosis for all the traits in the crossbred MD were negative except those for the growth at days 20 and 43. The results indicate the importance of selecting superior hybrid varieties if the exploitation of hybrid vigor is considered in the Pacific abalone breeding program.

【题目】A single amino acid substitution in the SdhB protein of succinate dehydrogenase determines resistance to amicarthiazol in Xanthomonas oryzae pv. oryzae
【中文关键词】无
【英文关键词】Xanthomonas oryzae pv. oryzae; amicarthiazol resistance; succinate dehydrogenase; sdhB; carboxamide fungicides
【中文摘要】无
【英文摘要】BACKGROUND: Xanthomonas oryzae pv. Oryzae Ishiyama, a causal agent of rice bacterial leaf blight, was found to be sensitivein vitro to the systemic fungicide amicarthiazol (2-amino-4-methylthiazole -5-carboxanilide), which is a potent inhibitor ofsuccinate dehydrogenase (SDH, EC 1.3.99.1). This paper aimed to determine the molecular resistance mechanism of X. oryzaepv. oryzae to amicarthiazol.RESULTS: UV-induced resistantmutants of X. oryzae pv. oryzae to amicarthiazol were isolated. The activity of SDH in wild-typeX. oryzae pv. oryzaewas strongly inhibited by amicarthiazol,while that in resistantmutantswas insensitive, although their SDHactivity was decreased compared with the wild-type sensitive strain without amicarthiazol. A mutation of Histidine229 (CAC) toTyrosine229 (TAC) was identified in sdhB, which encoded the iron – sulfur protein subunit of SDH. The sdhB from themutantwasligated into a cosmid, pUFR034, to generate pUFR034RAX, which conferred resistance to amicarthiazol when transformed intothe wild-type sensitive strain.CONCLUSION: A mutation of His229 (CAC) to Tyr229 (TAC) in SdhB was responsible for determining amicarthiazol resistance. c 2010 Society of Chemical Industry

【题目】Biological Mode of Action of Dimethomorph on Pseudoperonospora cubensis and Its Systemic Activity in Cucumber
【中文关键词】无
【英文关键词】biological activity, dimethomorph, Pseudoperonospora cubensis, systemic activity
【中文摘要】无
【英文摘要】Dimethomorph is a fungicide with high activity against Peronosporomycetes plant pathogens. The present study showedthat dimethomorph is effective on controlling the oomycete fungal pathogen Pseudoperonospora cubensis causingdowny mildew on cucumber. The fungicide did not affect zoospores discharge from sporangia of P. cubensis, but itstrongly inhibited mycelial growth and sporangial production in vitro and increased lysis of zoospores. Dose of 2 mg L-1 ofdimethomorph was sufficient to inhibit mycelial growth and sporangial production of P. cubensis on leaf disks, 5 mg L-1 wasenough to lyse zoospores of P. cubensis, and 25 mg L-1 was required to inhibit sporangial production on detached leaves.In whole plant tests, dimethomorph exhibited strong

protective and curative activity. Dimethomorph when applied at adose of 300 mg L-1 for 1, 3, 5, 7 days before inoculation exhibited 100% efficacy on disease control. On the other hand,efficacies of 67.1 and 31.5% were obtained when the same dose of dimethomorph was applied for 1 and 3 days afterinoculation, respectively. So dimethomorph had persistence effect on leaves for 7 days at least and exhibited strongprotective and curative activity. Bioassay analyses showed that dimethomorph could be translocated in the xylemsystem, redistributed in the leaf, and penetrated from the upper surface to the lower surface of the leaf but could not betranslocated in phloem system or transferred from the roots to leaves of cucumber plants in sufficient amounts for diseasecontrol. The biocharacteristics of dimethomorph make it well suitable for integration of a control programme againstdowny mildew disease on cucumber and as a component to delay other peronosporomycetes fungicide-resistancedevelopment.

【题目】冬小麦麦穗生长过程的模拟研究
【中文关键词】小麦; 穗长; 穗宽; 穗厚; 穗形; 模拟模型
【英文关键词】Wheat; Spike length; Spike width; Spike thickness; Spike shape; Simulation model
【中文摘要】为了实现小麦麦穗生长过程的可视化表达, 以不同氮肥处理条件下不同类型小麦品种的两年田间试验为基础, 通过连续观测并记载不同处理条件下的小麦主茎和分蘖麦穗形态指标(包括穗长、穗宽和穗厚),综合分析了小麦麦穗形态指标随生育进程和环境条件的变化规律, 并利用系统分析方法和动态建模技术, 构建了冬小麦麦穗生长过程的动态模拟模型。结果表明, 麦穗的伸长过程符合 S 型曲线, 而不同蘖位麦穗的最终长度符合二次曲线, 且在不同氮肥处理之间均差异明显; 采用 Logistic 方程描述了麦穗长度的动态变化过程, 用二次曲线和线性方程定量描述了穗形的动态变化过程, 同时采用旗叶的SPA D值量化了氮素对麦穗生长特征的影响; 并利用不同小麦品种的田间试验资料对所建模型进行了测试和检验。结果显示, 不同时期麦穗穗长、穗宽和穗厚预测值的平均RMSE分别为0.28、0.05和0.04 cm。表明模型具有较强的动态预测性和可靠性,从而为进一步建立虚拟小麦生长系统奠定了基础。
【英文摘要】Modeling spike growth dynamics in wheat is of significant importance for realizing virtual and digital wheat plant growth. Based on time-course observations on spike morphological properties (spike length, spike width and spike thickness) on main stems and tillers under different nitrogen rates and winter wheat cultivars in two growing seasons, the change patterns of spike morphology with growth progress and environmental factors were characterized and a dynamic model was developed to simulate time-course growth characters of spike on wheat plant. The results showed that the final spike length at different tiller positions accorded with quadratic equation, which showed marked differences under different nitrogen rates. The growth dynamics of spike length could be described with a logistic model (sigmoid curve), and the growth dynamics of spike shape described with quadratic equation and linear equation. The effect of nitrogen status on spike growth was quantified by the value of leaf SPAD. The model was validated with the field experiment data of different winter wheat cultivars. The average RMSEs of time-course spike length, width and thickness were 0.28, 0.05 and 0.04cm, respectively. The results indicated that the present model had a good performance in predicting spike morphological growth on wheat plant, and thus lay a foundation for further constructing virtual wheat plant.

【题目】Heterosis and combining ability in a diallel cross of three geographically isolated populations of Pacifc abalone Haliotis discus hannai Ino

【中文关键词】皱纹盘鲍 杂种优势 配合力
【英文关键词】Haliotis discus hannai; Inoheterosis; combining ability
【中文摘要】无
【英文摘要】We conducted a complete diallel cross among three geographically isolated populations of Pacific abalone Haliotis discus hannai Ino to determine the heterosis and the combining ability of growth traits at the spat stage. The three populations were collected from Qingdao (Q) and Dalian (D) in China, and Miyagi (M) in Japan. We measured the shell length, shell width, and total weight. The magnitude of the general combining ability (GCA) variance was more pronounced than the specific combining ability (SCA) variance, which is evidenced by both the ratio of the genetic component in total variation and the GCA/SCA values. The component variances of GCA and SCA were significant for all three traits ($P<0.05$), indicating the importance of additive and non-additive genetic effects in determining the expression of these traits. The reciprocal maternal effects (RE) were also significant for these traits ($P<0.05$). Our results suggest that population D was the best general combiner in breeding programs to improve growth traits. The DM cross had the highest heterosis values for all three traits.

【题目】一株高效降解胆固醇乳酸菌的筛选鉴定及其益生潜能初探
【中文关键词】筛选;鉴定;发酵乳杆菌DF-4;降胆固醇;益生菌
【英文关键词】screening;identification; Lactobacillus fermentum DF-4; cholesterol-reducing effect; probiotics
【中文摘要】从新鲜牛粪中分离出的5株乳酸菌中筛选得到一株具有高效降胆固醇能力的乳酸菌,其体外胆固醇脱除率达到50.83%。经API50CHL系统及16SrDNA基因序列比对鉴定为发酵乳杆菌Lactobacillus fermentum,命名为发酵乳杆菌DF-4。模拟胃液中的低pH值和小肠中的胆汁盐浓度进行了耐受性实验,结果表明该菌株具有较强的耐酸和耐胆盐的性能,对致病大肠杆菌和金黄色葡萄球菌均有显著抑制作用,是一株具有开发前景的高效降胆固醇的益生菌。
【英文摘要】A probiotic strain with an excellent cholesterol-reducing ability of 50.83 % was screened from 5 strains of lactic acid bacteria, which were isolated from fresh cattle feces. This strain was identified as Lactobacillus fermentum with API identification system and 16srRNA sequence alignment and was nominated as Lactobacillus fermentum DF-4. It exhibited a strong tolerance to 0.3% bile salt and low pH and an antagonistic effect against both enteropathogenic E.coli and S.aureas when incubated in the simulated gastroenteric environment. These results indicate that Lactobacillus fermentum DF-4 is a potential probiotics with an excellent cholesterol-reducing effect.

【题目】Activity of Azoxystrobin and SHAM to Four Phytopathogens
【中文关键词】无
【英文关键词】azoxstrobin;
salicylhydroxamic acid (SHAM);
plant pathogens;
spore germination;
mycelial growth;

oxygen consumption rate
【中文摘要】无
【英文摘要】The study was conducted to make clear the activity of azoxystrobin to 4 plant pathogens and the synergistic effects of salicylhydroxamic acid (SHAM), which acted on the alternative oxidase. It was also conducted to be aware of the mechanism of azoxystrobin in inhibition on mycelial respiration and the influence of SHAM. The activity test of azoxystrobin and SHAM was carried out with a mycelial linear growth test and spore germination test. Other related biological properties were also observed. Inhibition of azoxystrobin and SHAM on 4 pathogens was determined by using SP-II oxygraph system. Azoxystrobin inhibited mycelial growth in Colletotrichum capsici, Botrytis cinerea, Rhizoctonia solani, and Magnaporthe grisea, respectively; it also inhibited conidia germination, and conidia production in C. capsici, B. cinerea M. grisea, and sclerotia formation in R. solani. Moreover, it created stayed pigment biosynthesis in C. capsici and M. grisea somehow. Salicylhydroxamic acid enhanced inhibition by azoxystrobin. An oxygen consuming test of the mycelia showed that azoxystrobin inhibited all the 4 fungi's respiration in the early stages. With the concentration rising up, the effectiveness increased. However, as time went on, the respiration of the mycelia treated with fungicides recovered and SHAM could not inhibit the oxygen consuming. This reaction between the mycelia and the fungicides appeared not to initiate alternative respiration but rather the other mechanism created a lack of efficacy.

【题目】水稻叶色变化动态的模拟模型研究
【中文关键词】水稻; 叶色; 变化动态; 模拟模型
【英文关键词】Rice; Leaf color; dynamic Change; Simulation model
【中文摘要】定量描述叶片颜色变化的动态过程是植物生长数字化和可视化的重要内容。本研究通过对不同水稻品种和不同水氮处理条件下主茎和分蘖不同叶位叶色变化过程的连续观测和定量分析, 构建了水稻叶片颜色随生长度日变化的动态模拟模型。水稻叶片颜色变化的基本过程可以用3 个阶段的 SPAD 值分别表达, 第一阶段为基于幂函数的伸长期,叶色逐渐增强, 第二阶段为相对稳定的功能期, 叶色基本不变, 第三阶段为基于二次曲线的衰老期, 叶色逐渐减弱; 并基于二次曲

线方程分别描述了叶片含氮量和含水量对叶色变化过程的调控效应。在此基础上, 进一步建立了叶片SPAD 值与叶色组分(RGB)值的关系模型。利用独立的水稻田间试验资料对所建模型进行了测试和检验, 显示主茎不同叶位叶色变化 3个阶段模拟值的均方根差分别为 2.58、3.69 和 3.82, 4个分蘖不同叶位叶色变化模拟值的均方根差分别为4.65、4.39、3.51和 4.25; SPAD值与叶色组分间模拟值的均方根差分别为 2.98和 3.25。表明本模型可较好地模拟不同生长条件下水稻不同茎蘖上不同叶位叶色的动态变化过程, 从而为实现水稻生长系统的数字化模拟和可视化显示奠定了基础。

【英文摘要】With the development of digital agriculture, the visualization expression of plant growth process is very important. Quantifying the dynamic process of leaf color is the basic part of plant growth visualization. At present, the study on plant leaf color visualization at home and abroad is emphasized on reversing and rebuilding crop virtual growth with the figure identifying technique in computer, however, simulation model and visualization technique based on leaf color dynamic process have not been established successfully.Modeling leaf color dynamics in rice is an important task for realizing virtual and digital plant growth. Based on time-course observations on leaf color changes at different leaf positions of stem and tillers under different nitrogen rates and water conditions with four rice cultivars, we developed a simulation model on leaf color dynamic changes in rice in relation to GDD. Leaf color changes in the model were described with SPAD in three phases. The first phase during leaf growth period was based on the exponential relationship of leaf color to cumulative GDD; the second phase during leaf function period was represented with a relative stable SPAD; the third phase during leaf senescence period was described in a quadratic equation between SPAD and GDD. In addition, the effects of nitrogen and water conditions on leaf color were quantified through the effectiveness values of leaf nitrogen concentration and water content in relation to SPAD. Then, the RGB values were further predicted from the changing SPAD. The model was validated with the independent field experiment data involving different rice cultivars and nitrogen rates. The average RMSEs between the simulated and observed SPAD dynamics at different leaf positions were 2.58, 3.69, and 3.82, respectively, for three leaf color phases on main stem, 4.65, 4.39, 3.51, and 4.25, respectively, for four individual tillers in rice, and 2.98, 3.25, respectively, for SPAD and R, G values. The results indicate that the present model has a good performance in predicting leaf color changes at different leaf positions in rice under different growth conditions, and thus lays a foundation for further constructing digital and visual rice growth system.

【题目】Development of gene-associated intronic TR markers for the Pacific abalone Haliotis discus hannai
【中文关键词】无
【英文关键词】non
【中文摘要】无
【英文摘要】The Pacific abalone, Haliotis discus hannai, isone of the most important shellfish cultured in China. Thelarge-scale hatchery production of this marine mollusc calls forthe development and implementation of sound genetic managementpractices and selective breeding programmes. Geneticmarkers such as RAPD, AFLP and microsatellites have beendeveloped and used in H. discus hannai. Useful and novel DNAmarkers, especially type I markers1 associated with genes ofinterest, are particularly useful for association studiesto elucidate possible gene function. We developed intronictandem repeat (TR) markers associated with genes of knownfunction using exon-primed intron-crossing polymerase chainreaction (EPIC-PCR)2 sequencing.

【题目】Mutations in a beta-Tubulin Confer Resistance of Gibberella zeae to Benzimidazole Fungicides
【中文关键词】无
【英文关键词】gene-deletion and -complementation mutants.
【中文摘要】无
【英文摘要】Wheat head blight caused by Gibberella zeae (anamorph: Fusariumgraminearum) is a threat to food safety in China because of mycotoxincontamination of the harvested grain, the frequent occurrence of thedisease, and the failure of chemical control in some areas due tobenzimidazole resistance in the pathogen population. The molecularresistance mechanism, however, of G. zeae to benzimidazole fungicides(especially carbendazim; active ingredient: methyl benzimidazol-2-ylcarbamate [MBC]) is poorly understood. DNA sequences of a β-tubulingene (β2tub) (GenBank access number FG06611.1) in G. zeae wereanalyzed. Mutations in β2tub in moderately resistant strains (MBCMR)included TTT (Phe)→TAT (Tyr) at codon 167 or TTC (Phe)→TAC (Tyr)at codon 200. A highly resistant strain (MBCHR) had two point mutations,one at codon 73, CAG (Gln)→CGG (Arg), and the other at codon 198,GAG (Glu)→CTG (Leu). To confirm that mutations in the β2tub conferresistance to benzimidazole fungicides, the entire β2Tub locus was deletedfrom MBCMR and MBCHR strains of G. zeae. The resulting Δβ2tubmutants from both MBCMR and MBCHR strains grew normally on MBCfreepotato dextrose agar medium and were supersensitive to MBC. Complementationof the Δβ2tub mutants by transformation with a copy of theintact β2Tub locus from their parent strains exhibited less resistance thanthe original strains, and complementation of the Δβ2tub mutants bytransformation with a copy of the intact β2Tub locus from sensitive strainsrestored MBC sensitivity. The results indicated that the mutations in the β2tub gene conferred resistance of G. zeae to benzimidazole fungicidesand this gene can be used as a genetic marker in G. zeae.

【英文关键词】Rice; Unit organ; Dry weight; Partitioning index; Quantitative simulation
【中文摘要】【目的】定量描述水稻植株地上部单位器官(叶片、叶鞘、节间、稻穗)干物质的动态分配过程,为作物形态建成模拟和可视化表达奠定基础。【方法】通过不同水稻品种和水氮试验中主茎和分蘖单位叶片、茎鞘及穗的干物质与水分及氮素含量的连续观测和定量分析,构建水稻地上部各单位器官干物质分配指数动态模型。【结果】模型采用线性和指数方程描述了叶片、茎鞘及穗单位器官分配指数随 GDD 的动态变化过程;分别用指数方程及一元二次方程描述了叶片、茎鞘及穗最大单位分配指数随不同叶位、鞘位以及穗位的动态变化过程;另外,以叶片、茎鞘及穗的氮素和水分因子法分别描述了水氮限制对各单位器官干物质分配过程的定量影响。利用独立的水稻田间试验资料对所建模型进行了初步的测试和检验,主茎与分蘖各单位器官干物重的观测值与模拟值的根均方差分别为 0.93、0.81 及 6.8 kg·ha-1。【结论】本模型可较好地模拟不同生长条件下水稻不同茎蘖各单位器官干物质动态的变化过程。
【英文摘要】【Objective】 Modeling dynamics of the dry matter partitioning among unit organs (leaf, sheath, internode and panicle) in rice is an important task for realizing virtual and digital plant growth. In the past years, some great progresses had been made on the dynamics of dry matter partitioning among leaves, stem and sheath, and panicles of rice, but the dry matter partitioning among unit organs of plant was seldom addressed. The present study was conducted to develop a simulation model on the dry matter partitioning dynamics for various unit organs of rice having relation to GDD. 【Method】Four experiments were carried out involving different nitrogen rates and water regimes with four rice cultivars, and time-course observations were made on the dry matter changes in different unit organs on stem and tillers. 【Result】The results showed that the dynamic change of the unit organ partitioning index could be characterized by linear and exponential equation, respectively for leaf, internode and sheath, and panicle in relation to accumulated GDD. The changes in the maximum partitioning index for unit organ could be described by exponential equation (unit leaf and sheath) and quadratic equation (unit panicle) with different leaf, internode and sheath and panicle positions on main stem and tillers. In addition, the effects of nitrogen and water conditions on the dry weight and partitioning index for unit organs were quantified through the effectiveness values of nitrogen concentration and water content in unit organs. The model was validated by the independent field experiment data involving different rice cultivars and nitrogen rates. The average RMSEs between the simulated and observed values for the dry weights of unit organs on main stem and tillers under varied nitrogen and water levels with different cultivars were 0.93, 0.81, and 6.8 kg·ha-1 for leaf, internode and sheath, and panicle, respectively. 【Conclusion】The results indicated that the present model had a good performance in predicting the dynamic changes in the dry weight and partitioning index for different unit organs in rice under different growth conditions, and thus it will be a foundation for further constructing digital and visual organ growth system in rice.

【题目】Isolation of 106 microsatellite markers for the Pacific abalone from a trinucleotide-enriched library
【中文关键词】无
【英文关键词】non
【中文摘要】无
【英文摘要】The Pacific abalone, Haliotis discus hannai Ino, has been considered one of themost flavorful species among molluscs in many Asian countries (Sekino and Hara2001). Numerous genetic breeding programs have been initiated to improve itseconomically important traits, such as growth rate and disease resistance. Several ofthese traits are controlled primarily by quantitative trait loci (QTL), the geneticbases of which are studied using high-density linkage maps. Microsatellites are oneof the most popular types of markers for constructing genetic linkage maps becauseof their codominant inheritance, high degree of polymorphism, large volume ofinformation on segregation, and transferability among mapping families (Tautz1989; Toth et al. 2000; Zhan et al. 2009). The majority of microsatellite markersdeveloped for the Pacific abalone are dinucleotides (Li et al. 2002; An and Han2006; Sun et al. 2007; Zhan et al. 2008; Li et al. 2010). The trinucleotidemicrosatellites can be more easily and accurately scored, however, because fewerghost bands/peaks are associated with them than with the dinucleotides (e.g.,Rongwen et al. 1995). The objectives for our researches were to increase thediversification of microsatellite markers and to construct a high-density linkage mapfor the Pacific abalone, and we

succeeded in isolating 106 novel polymorphictrinucleotide microsatellite markers.

【题目】Root growth of Arabidopsis thaliana is regulated by ethylene and abscisic acid signaling interaction in response to HrpNEa, a bacterial protein of harpin group.
【中文关键词】无
【英文关键词】Abscisic acid
Ethylene
HrpNEa
Plant growth
【中文摘要】无
【英文摘要】HrpNEa is a harpin protein from Erwinia amylovora, a bacterial pathogen that causes fire blight in rosaceous plants. Treating plants with HrpNEa stimulates ethylene and abscisic acid (ABA) to induce plant growth and drought tolerance, respectively. Herein, we report that both growth hormones cooperate to mediate the role of HrpNEa in promoting root growth of Arabidopsis thaliana seedlings. Root growth is promoted coordinately with elevation in levels of ABA and ethylene subsequent to soaking of germinating seeds of wild-type (WT) Arabidopsis in a solution of HrpNEa. However, these responses are arrested by inhibiting WT roots from synthesizing ethylene as well as sensing of ABA and ethylene. The effects of HrpNEa on roots are also nullified in ethylene-insensitive etr1-1 and ein5-1 mutants and in the ABA-insensitive mutant abi2-1 of Arabidopsis. These results provide evidence for presence of a relationship between root growth enhancement and signaling by ABA and ethylene in response to HrpNEa. Nevertheless, when HrpNEa is applied to leaves, ethylene signaling is active in the absence of ABA signaling to promote plant growth. This suggests the presence of a different signaling mechanism in leaves from that in roots.

【题目】Activity of carbendazim, dimethachlon, iprodione, procymidone and boscalid against Sclerotinia stem rot in Jiangsu Province of China
【中文关键词】无
【英文关键词】Carboxamides . Disease management .
Fungicides . Oilseed rape . Sclerotinia sclerotiorum
【中文摘要】无
【英文摘要】Carbendazim (MBC) was widely used tocontrol Sclerotinia stem rot routinely during the 1980sin China, but development of MBC resistance in thecausal agent Sclerotinia sclerotiorum led to controlfailures of this disease. In this study it was found thatthe MBC resistance in S. sclerotiorum populations waswidespread throughout Jiangsu Province with a resistancefrequency of 29.54% in the 1786 collectedisolates during the growing seasons of 2006 to 2008.The resistance frequencies differed among sampledcities, ranging from 3.1% to 54.9%. The field MBCresistantisolates showed comparable mycelialgrowth, sclerotia production and pathogenicity tothe wild-type sensitive isolates, which suggestedthat the field MBC-resistant isolates might havesufficient parasitic fitness to compete with the fieldMBC-sensitive isolates in the field. In the in vitrosensitivity test, boscalid showed greater activityagainst

S. sclerotiorum than dicarboximide fungicides(dimethachlon, iprodione and procymidone).The treatment 50% boscalid (WG) 125 g a.i. ha.1was comparable in efficacy to the treatment 50%iprodione (WP) 600 g a.i. ha.1, and better than othertreatments of 6% dimethachlon (WP) 690 g a.i. ha.1and 50% procymidone (WP) 337.5 g a.i. ha.1,whereas MBC failed to control Sclerotinia stem rot(control efficacy only 16.0%). The most active agentfor controlling Sclerotinia stem rot was boscalid inour study.

【题目】冬小麦叶色动态的量化研究
【中文关键词】小麦;叶片;颜色;SPAD;RGB;模拟模型
【英文关键词】Wheat; Leaf; Color; SPAD; RGB; Simulation model
【中文摘要】【目的】模拟小麦叶色变化的动态过程,为实现小麦生长的可视化表达奠定基础。【方法】以不同施氮水平下不同类型小麦品种的两个生长季田间试验为基础,通过连续测量不同处理条件下小麦主茎和分蘖不同叶位叶片的 SPAD 值,综合分析小麦叶片 SPAD 值随生育进程的变化规律及其与 RGB 值的关系,进而构建基于 SPAD 的冬小麦叶色变化动态的模拟模型。【结果】模型采用分段函数描述叶片 SPAD 值随生育进程的动态变化过程:第 1 阶段为基于二次曲线的叶色增强过程;第 2 阶段为相对稳定的功能期叶色维持过程;第 3 阶段为基于二次曲线的叶色减弱过程;并基于叶片氮含量表达了氮素供应水平对叶片 SPAD 值变化规律的影响,同时用线性方程描述了叶片SPAD 值与 RGB 值之间的定量关系。利用独立的小麦田间试验资料对所建模型进行了测试和检验,显示不同时刻主茎和分蘖叶片 SPAD 预测值的平均 RMSE分别为 11.60%和 9.03%。【结论】本模型具有较强的动态预测性和可靠性,为进一步建立虚拟小麦生长系统奠定了基础。
【英文摘要】【Objective】 Modeling leaf color dynamics in wheat is of significant importance for realizing virtual wheat plant growth. 【Method】 Based on time-course observations on leaf SPAD value on main stem and tillers under different nitrogen rates and winter wheat cultivars in two growing seasons, the change patterns of leaf SPAD with growth progress and environmental factors were characterized, and the relationship between leaf SPAD and RGB was analyzed. Using systematic analysis method and dynamic modeling technology, a SPAD-based leaf color dynamic model was developed to simulate time-course change characters of leaf SPAD on wheat plant. 【Result】 The leaf color dynamic could be described with three phases in SPAD. The first phase in SPAD during leaf growth period was based on the quadratic relationship of leaf color to growing degree days (GDD), the second phase during leaf function period was represented with a relative stable SPAD, and the third phase during leaf senescence period was described in a quadratic equation between SPAD and GDD. In addition, the effect of nitrogen status on leaf SPAD was quantified by the value of leaf nitrogen concentration, and the relationship between SPAD and RGB was described with linear equation. The model was validated with the independent field experiment data of different winter wheat cultivars. The average RMSEs of time-course leaf SPAD on stem and tiller were 11.60% and 9.03%, respectively. 【Conclusion】 Thus, the present model has a good performance in predicting leaf color on wheat plant, laying a foundation for further constructing virtual leaf growth system of wheat.

【题目】Acclimation-dependent expression of heat shock protein 70 in Pacific abalone (Haliotis discus hannai Ino) and its acute response to thermal exposure
【中文关键词】皱纹盘鲍 高温胁迫 低温刺激 Hsp70 生物标记

【英文关键词】Haliotis discus hannai Ino; heat shock; cold stress; Hsp70; biomarker
【中文摘要】无
【英文摘要】Heat shock protein 70 (Hsp70) is one important member of heat shock protein (Hsp) family that is responsible for various stresses, especially thermal stress. Here we examined the response of Hsp70 gene to both chronic and acute thermal exposure in Pacific abalone (Haliotis discus hannai Ino). For the chronic exposure, abalones were maintained at 8, 12, 20, and 30 ° C for four months and their mRNA levels were measured. The highest mRNA level of Hsp70 gene relative to actin gene was detected in the 30 ° C-acclimated group, followed by the 8 ° C-acclimated group and then the 12 ° C- and 20 ° C-acclimated groups. After the long-term acclimation, gills from each of the above acclimation groups were dissected and exposed to different temperatures between 8 ° C and 38 ° C for 30 min. Hsp70 expression in gills acclimated to different temperatures responded differentially to the same temperature exposure. The incubation temperature that induced maximum Hsp70 mRNA expression was higher in the higher temperature acclimation groups than lower temperature groups. Pacific abalones could alter the expression pattern of Hsp70 gene according to environmental thermal conditions, through which they deal with the stress of thermal variations.

【题目】基于OpenGL的小麦形态可视化技术
【中文关键词】小麦,可视化,几何建模,渲染,OpenGL
【英文关键词】wheat, visualization, geometric modeling, rendering, OpenGL
【中文摘要】形态可视化技术是虚拟植物研究的关键技术之一。本研究以小麦作物为对象,在提出小麦形态可视化技术框架的基础上,首先研究了小麦不同器官的三维几何建模技术,构建了基于器官形态特征参数的几何模型,包括叶、茎秆和麦穗几何模型。用 NURBS 曲面来模拟叶片和叶鞘;用圆柱体模拟茎秆的节间;并采用组合单器官的方式来构建麦穗模型:用圆柱体模拟穗轴,用椭球体和圆柱体分别模拟小穗的谷粒及小穗枝梗。然后,基于 OpenGL 图形平台,绘制了小麦器官的三维形态,并提出了颜色渲染、纹理映射、光照处理等真实感图形显示技术;最后,通过耦合小麦植株的拓扑结构模型以及小麦个体之间的相互关系,实现了小麦从器官-个体-群体三个层次的形态可视化,从而为构建可视化小麦生长系统奠定了技术基础。
【英文摘要】Morphology visualization is one of the key technologies for constructing visual plants. Based on the framework of wheat morphology visualization, the 3D geometric modeling technologies of wheat organs were investigated, and the organ geometrical models were developed with characteristic architecture parameters. The model included three submodels: leaf geometry, stem geometry and wheat spike geometry submodels. The NURBS was used to simulate leaf blade and sheath, and stem geometry submodel was developed by a cylinder. The wheat spike geometry submodel was developed by means of assembling a single organ. The spike axis was simulated with a cylinder, and the spikelet was simulated with an ellipsoid and a cylinder. Based on the platform of OpenGL, the 3D morphology of organs was drawn, and the rendering models of color, texture and light were developed. By further integrating the model of topographic structure of wheat plant and the interaction among individual plants, the wheat 3D morphologies at the organ, individual and population levels were visualized on the computer. These results lay a foundation for further development of visual growth system for the wheat plant.

【题目】Molecular Cloning, Characterization and Expression Analysis of Two Members of the Pht1 Family of Phosphate Transporters in Glycine max
【中文关键词】无
【英文关键词】soybean (Glycine max); Abiotic stress; Expression analysis
【中文摘要】无
【英文摘要】AbstractBackground: Phosphorus is one of the macronutrients essential for plant growth and development. The acquisition and translocation of phosphate are pivotal processes of plant growth. In a large number of plants, phosphate uptake by roots and translocation within the plant are presumed to occur via a phosphate/proton cotransport mechanism.Principal Findings:We cloned two cDNAs from soybean (Glycine max), GmPT1 and GmPT2 , which show homology to the phosphate/proton cotransporter PHO84 from the budding yeastSaccharomyces cerevisiae. The amino acid sequence of the products predicted from GmPT1 and GmPT2 share 61% and 63% identity, respectively, with the PHO84 in amino acid sequence. The deduced structure of the encoded proteins revealed 12 membrane-spanning domains with a central hydrophilic region. The molecular mass values are, 58.7 kDa for GmPT1 and , 58.6 kDa for GmPT2. Transiently expressed GFP – protein fusions provide direct evidence that the two Pi transporters are located in the plasma membrane. Uptake of radioactive orthophosphate by the yeast mutant MB192 showed that GmPT1 and GmPT2 are dependent on pH and uptake is reduced by the addition of uncouplers of oxidative phosphorylation. The Km for phosphate uptake by GmPT1 and GmPT2 is 6.65 mM and 6.63 mM, respectively. A quantitative real time RT-PCR assay indicated that these two genes are expressed in the roots and shoots of seedlings whether they are phosphate-deficient or not. Deficiency of phosphorus caused a slight change of the expression levels of GmPT1 and GmPT2 .Conclusions: The results of our experiments show that the two phosphate transporters have low affinity and the corresponding genes are constitutively expressed. Thereby, the two phosphate transporters can perform translocation of phosphate within the plant.

【题目】Riboflavin-induced priming for pathogen defense in Arabidopsis thaliana.
【中文关键词】无
【英文关键词】callose deposition;
defense responses;
hypersensitive cell death;
hydrogen peroxide;
priming;
riboflavin
【中文摘要】无
【英文摘要】Riboflavin (vitamin B2) participates in a variety of redox processes that affect plant defense responses. Previously we have shown that riboflavin induces pathogen resistance in the absence of hypersensitive cell death (HCD) in plants. Herein, we report that riboflavin induces priming of defense responses in Arabidopsis thaliana toward infection by virulent Pseudomonas syringae pv.tomato DC3000 (Pst). Induced resistance was mechanistically connected with the expression of defense response genes and cellular defense events, including H2O2 burst, HCD, and callose deposition in the plant. Riboflavin treatment and inoculation of plants with Pst were neither active but both synergized to induce defense responses. The priming process needed NPR1 (essential regulator of systemic acquired resistance) and maintenance of H2O2 burst but was independent of salicylic acid, jasmonic acid, ethylene, and abscisic acid. Our results suggest that the role of riboflavin in priming defenses is subject to a signaling process distinct from the known pathways of hormone signal transduction.

【题目】Effect of Carbendazim Resistance on Trichothecene Production and Aggressiveness of Fusarium graminearum
【中文关键词】无
【英文关键词】无
【中文摘要】无
【英文摘要】Fusarium graminearum (teleomorph, Gibberella zeae)causes head blight of cereals and contaminates grains withtrichothecene mycotoxins that are harmful to humans anddomesticated animals. Control of Fusarium head blightrelies on carbendazim (MBC) in China, but resistance toMBC in F. graminearum is now widespread. Sixty-sevenstrains were evaluated for trichothecene production inshake culture or in the field. The strains included 60 wildtypestrains (30 MBC-resistant and 30 MBC-sensitive),three MBC-resistant site-directed mutants at codon 167 in β 2-tubulin, three MBC-sensitive site-directed mutants atcodon 240 in β 2-tubulin, and their MBC-sensitive wild-typeprogenitor strain ZF21. The incidence of infected spikeletsand the amount of F. graminearum DNA in field grain(AFgDNA) also were evaluated for all strains. MBC resistanceincreased trichothecene production in shake cultureor in the field. Although MBC resistance did not changethe incidence of infected spikelets, it did increase AFgDNA.Tri5 gene expression increased in MBC-resistant strainsgrown in shake culture. We found a significant exponentialrelationship between trichothecene production and Tri5gene expression in shake culture and a linear relationshipbetween the incidence of infected spikelets or AFgDNAand trichothecene production in field grain.

【题目】不同株型小麦干物质积累与分配对氮肥响应的动态分析
【中文关键词】小麦; 株型; 施氮量; 干物质; 积累与分配; 动态分析
【英文关键词】Wheat; Plant type; Nitrogen Rate; Dry matter; Accumulation and partitioning; Dynamic analysis
【中文摘要】为了揭示株型和施氮量对小麦干物质积累与分配动态的影响, 通过实施不同株型小麦品种和氮肥处理的田间试验, 于主要生育期测定了各处理单株及不同器官干物质积累量, 并分别利用 Richards 和 VP 方程对其进行拟合。结果表明, 适量施氮提高了各株型小麦的干物质平均增长速率(Ra)和最大增长速率(Rmax), 缩短了各株型小麦到达Rmax的时间, 延长了各株型小麦的缓增持续期(D3)。施氮提高了紧凑型矮秆品种矮抗 58、松散型品种淮麦 17 和中间型品种扬麦 12的起始生长势(R0), 缩短了上述 3种株型小麦的渐增持续期(D1), 降低了其到达 Rmax时的干物质积累量(WRmax), 而紧凑型高秆品种宁麦 9 号的 R0、WRmax和 D1与上述 3 种株型小麦的变化趋势相反。随施氮量的增加, 矮抗 58 和宁麦 9 号的快增持续期(D2)呈下降趋势, 而淮麦 17 和扬麦 12 的 D2以中氮处理(150 kg hm − 2)最低。施氮降低了淮麦 17 和扬麦 12 的叶、穗最大分配比例(Pmax)以及矮抗 58 和宁麦 9 号的茎鞘最大分配比例(PSmax), 但增加了矮抗58 和宁麦 9 号的叶部和穗部 Pmax以及淮麦 17 和扬麦 12 的 PSmax。施氮降低了宁麦 9 号、淮麦 17 和扬麦 12 的叶分配比例最大下降速率及矮抗 58 和宁麦 9 号的穗分配比例最大增长速率, 而增加了矮抗 58 的叶分配比例最大下降速率及淮麦 17 和扬麦 12 的穗分配比例最大增长速率, 但过量施氮抑制了宁麦 9 号穗分配比例最大增长速率的增加和扬麦 12 穗分配比例最大增长速率的下降。施氮对各株型小麦茎鞘分配比例最大增长和下降速率(RSimax和RSdmax)的影响无明显规律。因此, 在建立高产小麦栽培技术体系时, 应充分考虑到不同株型小麦干物质积累和分配动态对施氮量的响应差异。
【英文摘要】Ningmai 9 (compact-high type) exhibited an opposite pattern. In Aikang 58 and Ningmai 9, the second phase duration (D2) decreased when the nitrogen rate increased, and Yangmai 12 and Huaimai 17 had the smallest D2 value under the medium

nitrogen rate. With the increase of nitrogen rate, the maximum dry matter partitioning percentage (Pmax) of leaf and spike in Huaimai 17 and Yangmai 12 as well as the maximum dry matter partitioning percentage of stem and sheath (PSmax) in Aikang 58 and Ningmai 9 decreased. In contrast, the Pmax of leaf and spike in Aikang 58 and Ningmai 9, and the PSmax in Huaimai 17 and Yangmai 12 increased accompanying with the increase of nitrogen rate. In terms of the maximum decreasing rate of dry matter partitioning percentage (MDRP) to leaf, Ningmai 9, Huaimai 17 and Yangmai 12 showed a decrease trend when nitrogen rate increased, while Aikang 58 was in an increase tendency. For the maximum increasing rate of dry matter partitioning percentage (MIRP) to spike, Aikang 58 and Ningmai 9 had a negative response to nitrogen rate and Huaimai 17 and Yangmai 12 had a positive response. Excessive application of nitrogen had negative effects on the promotion of MDRP to spike in Ningmai 9 and the reduction of MIRP to spike in Yangmai 12. No consistent effects were observed on the maximum changing rate of dry matter partitioning percentage to stem and sheath (RSimax and RSdmax). Thereby, plant types of wheat cultivars should be considered in the nitrogen application regime in practical system of cultivation techniques.

【题目】不同温度下皱纹盘鲍“ 中国红 ”与各家系代谢和吸收效率的比较

【中文关键词】皱纹盘鲍; 家系; 温度; 代谢; 吸收效率

【英文关键词】Haliotis discus hannai; family strain; temperature; metabolism; absorption efficiency

【中文摘要】为了综合评价皱纹盘鲍Haliotis discus hannai红壳色新品系中国红(RwRh)的生理能量学特性,采用实验生态学的方法比较了12、15、18、21、24℃条件下,RwRh与皱纹盘鲍不同地理群体(J_1Jm、C_1Jm、C_1Rh、J_7Rh和RjRh)的代谢率和吸收效率。结果表明:J_1Jm(皱纹盘鲍日本群体♀*日本群体♂)和C_1Jm(皱纹盘鲍中国群体♀*日本群体♂)的耗氧率随水温的升高而上升,但超过18℃在21℃下耗氧率明显下降,RwRh与其半同胞家系(C1Rh、J7Rh、RjRh)的耗氧率拐点出现在21℃,说明中国红及其半同胞家系更适宜较高温度;各家系排氨率随温度升高的变化趋势与耗氧率基本相同。方差分析显示,在12-24℃内,家系对吸收效率的影响未达到显著水平,但在21-24℃下中国红有较高的吸收效率。

【英文摘要】Comparison of metabolism and absorption efficiency between new stock named "Chinese red" (RwBh) with red shell and different geographical populations of abalone Haliotis discus hannai(J_1Jm, C_1Jm, C_1Bh, J_7Bh and RjRh)were conducted at 12, 15, 18, 21 and 24 ℃ in order to evaluate bioenergetic properties of this stock using experimental eeologieal methods. The results showed that the respiration rate of J_1 Jm (Japan ♀ * Japan ♂) and C_1Jm (China ♀ * Japan ♂)inereased with inerease in water temperature, but signifieantly decreased at over 18 ℃. The respiration rate in "Chinese red" (RwRh) and its half-sib families(C_1Rh, J_7Rh, RjRh) sharply deereased at 21 ℃, indieating that the "Chinese red" (RwRh) and its half- sib families adopted higher temperature. The ehanges in NH_4 -N exeretion rate showed a similar tendeney to the respiration during the experiment. Absorption eflieieney was not signifieantly affeeted by family strains at 12 -24 ℃ while the "Chinese red" showed higher absorption et/ieieney at 21 -24 ℃.

【题目】Quantification of Fusarium graminearum in harvested grain by real-time polymerase chain reaction to assess efficacies of fungicides on Fusarium head blight, deoxynivalenol contamination, and yield of winter wheat

【中文关键词】无

【英文关键词】mycotoxins.
【中文摘要】无
【英文摘要】We used a real time polymerase chain reaction-based assay and visualdisease assessment to evaluate the efficacies of Js399-19, tebuconazole, amixture of tebuconazole and thiram, azoxystrobin, carbendazim, andthiram on the development of Fusarium head blight (FHB) anddeoxynivalenol (DON) contamination and on the yield of winter wheat(cv. Nannong no. 9918) after artificial inoculation under field conditionswith Fusarium graminearum. The incidence of infected spikelets (IIS),amount of F. graminearum DNA (Tri5 DNA), total DON (containingDON, 3-acetyl-deoxynivalenol, and 15-acetyl-deoxynivalenol) concentration,and 1,000-grain weight (TGW) were quantified in 2006 and 2007.A strong positive correlation was found between IIS or Log10Tri5 DNAand total DON concentration in the harvested grain. The Js399-19,tebuconazole, and the mixture of tebuconazole and thiram significantlyreduced IIS of FHB, amount of Tri5 DNA, and total DON within thegrain and increased TGW. Although azoxystrobin, carbendazim, andthiram can increase TGW, they had no effect on the occurrence of F.graminearum compared with those of the untreated controls. Surprisingly,azoxystrobin and carbendazim significantly increased the totalDON content in the harvested grain because they might have stimulatedthe amount of total DON production per Tri5 DNA. The fungicidesJs399-19, tebuconazole, and the mixture of tebuconazole and thiram werethe most effective in controlling FHB and reducing DON contaminationof the wheat.required only 7 – 8 h while the conventional method required 5 – 7 days. This study demonstrates that PIRA-PCR not onlymonitors the appearance of moderately res

【题目】Nicotiana tabacum TTG1 contributes to ParA1-induced signalling and cell death in leaf trichomes
【中文关键词】无
【英文关键词】NtTTG1
Hypersensitive cell death (HCD)
ParA1
Leaf trichome
Signalling
【中文摘要】无
【英文摘要】Leaf trichomes serve as a physical barrier and can also secrete antimicrobial compounds to protect plants from attacks by insects and pathogens. Besides the use of the physical and chemical mechanisms, leaf trichomes might also support plant responses by communicating the extrinsic cues to plant intrinsic signalling pathways. Here we report a role of leaf trichomes in tobacco (Nicotiana tabacum) hypersensitive cell death (HCD) induced by ParA1, an elicitin protein from a plant-pathogenic oomycete. After localized treatment with ParA1, reactive oxygen species were produced first in the leaf trichomes and then in mesophylls. Reactive oxygen species are a group of intracellular signals that are crucial for HCD to develop and for cells to undergo cell death subsequent to chromatin condensation, a hallmark of HCD. These events were impaired when the production of hydrogen peroxide (H2O2) was inhibited by catalase or a NADPH-oxidase inhibitor applied to trichomes, suggesting the importance of H2O2 in the pathway of HCD signal transduction from the trichomes to mesophylls. This pathway was no longer activated when leaf trichomes were treated with C51S, a ParA1 mutant protein defective in its interaction with N. tabacum TTG1 (NtTTG1), which is a trichome protein that binds ParA1, rather than C51S, in vitro and in trichome cells. The ParA1-NtTTG1 interaction and the HCD pathway were also abrogated when NtTTG1 was silenced in the trichomes. These observations suggest that NtTTG1 plays an essential role in HCD signal transduction from leaf trichomes to mesophylls.

【题目】Molecular cloning and functional characterization of OsJAG gene based on a complete-deletion mutant in rice (Oryza sativa L.)
【中文关键词】无
【英文关键词】Oryza sativa; Os JAG; floral organ development; stamen specification
【中文摘要】无
【英文摘要】In this article, we report an independent work of positional cloning and functional characterization of Os JAG gene in rice. The advantage of our work is that we used a genuine null mutant, in which the wild-type allele was completely deleted. This allowed us to identify the mutant phenotypes accurately without the interference of residual function of the target gene. Os JAG is an important gene with pleiotropy, expressing almost throughout the plant and acting in both vegetative phase and reproductive phase. But its main and crucial roles are in regulating the development of all floral organs, especially in specifying the identity of stamens. Interestedly, Os JAG does not affect the number of floral organ primordial and so of floral organs in each whorl, suggesting that Os JAG does not influence the initiation of floral organ primordia, but affect the developmental fate of all floral organs after their primordia have initiated. Loss of Os JAG function results in maldevelopment of all floral organs, such as degenerated lemma and palea, elongated lodicules and deformed and sterile pistil. The stamen appears to be more sensitive to the mutation, exhibiting that all the six stamens were thoroughly transformed into six pistil-like organs developed at the presumptive positions of the stamens in whorl 3.

【题目】大豆不同产量水平生物量积累与分配的动态分析
【中文关键词】大豆; 产量; 生物量累积; 动态生物量分配; 动态相关
【英文关键词】Soybean; Yield; Biomass accumulation; Dynamic biomass partition; Dynamic correlation
【中文摘要】利用亲本间生物量、产量有较大差异的重组自交家系群体(NJRIKY), 在相对控制遗传背景的条件下研究地下和地上部生物量与产量相关的动态, 比较高中低产家系生物量累积和分配的动态特征, 为大豆高产栽培管理和育种提供生物量动态调控与选择的依据。结果表明: (1) 地下部和地上部生物量与产量显著相关, 随生长进程, 相关系数逐渐增加, 至鼓粒期(R5~R6 期)相关系数达到最大, r 分别约 0.76 和 0.79; (2) 大田条件 2 500~2 800 kg hm − 2以上的高产家系, 地下部和地上部生物量显著高于中、低产家系, 最大累积值均出现在鼓粒期, 地下部和地上部生物量最大值分别为 660~700 kg hm − 2和 7 200~7 800 kg hm − 2。(3) 两年高产组所包含的家系不尽相同, 产量下降的家系相应生物量也下降, 这归因于环境所致的生物量累积不足; (4) 高产家系各器官生物量分配动态特征为茎秆、叶柄占同时期全生物量的比例显著高于中、低产家系, R5 时分别为 30.8%和 10.6%, 而叶、根比例显著低于中、低产家系, R5 时分别为 34.1%和 9.7%。未来大豆产量的突破有赖于品种生物量与收获指数的综合改良和生长调控技术的继续改进。
【英文摘要】The dynamic correlation between yield and above- and below-ground biomass and the dynamic partition of biomass of high, medium and low yield lines were studied by using the population of recombinant inbred lines NJRIKY derived from a cross between parents with different biomass and yield potential levels to obtain some information for dynamic control of biomass accumulation in high yield breeding and management of soybean. The results obtained were as follows: (1) Yield was significantly and positively correlated with above- and below-ground biomass accumulation, their correlation increased during the growing stages and the peak correlation occurred at seed filling stage (R5 – R6) with $r = 0.76$ for below-ground biomass and 0.79 for above-ground biomass. (2) The high yield lines (2 500 – 2 800 kg ha − 1) had a significantly higher below-ground and above-ground biomass accumulation than the medium yield and low yield lines. Both below- and above-ground biomass accumulation reached the peak at seed filling stage with the highest below-ground biomass of 660 – 700 kg ha − 1 and above-ground biomass of 720 – 780 kg ha − 1 at R5.

(3) The composition of high yield lines was not consistent in the two years. Lines with decreased yield had also a decreased biomass, which demonstrated reduction of biomass accumulation caused by different environments was the reason for yield decrease. (4) The dynamic partition of biomass to stem and petiole during growing stages in high yield lines (30.8% and 10.6% at R5, respectively) was significantly higher than that in medium and low yield lines and the dynamic partition of biomass to leaf and root during growing stages in high yield lines (34.1% and 9.7% at R5, respectively) was significantly lower than that in medium and low yield lines. The results implied that the more increase of yield in the future depends on the comprehensive genetic improvement of both biomass and harvest index and the successive advancement of growth regulation technology in soybean.

【题目】Baseline and differential sensitivity of Peronophythora litchi (lychee downy blight) to three carboxylic acid amide fungicides
【中文关键词】无
【英文关键词】dimethomorph, flumorph,
Litchi chinensis
, pyrimorph
【中文摘要】无
【英文摘要】Downy blight, caused byPeronophythora litchii, is an important disease of lychee (litchi) plants in China. Thein vitrosensitivities of various asexual stages ofP. litchiito the three carboxylic acid amide (CAA) fungicides dimethomorph,flumorph and pyrimorph were studied with four single-sporangium isolates. None of the three fungicides affectedzoospore discharge from sporangia, but they strongly inhibited mycelial growth (mean EC50values of 0・075, 0・258 and0・115 mg L.1, respectively); sporangial production (mean EC50values of 0・085, 0・315 and 0・150 mg L.1, respectively);germination of cystospores (mean EC50values of 0・140, 0・150 and 0・645 mg L.1, respectively); and germination ofsporangia (mean EC50values of 0・203, 0・5 and 0・743 mg L.1, respectively). As mycelial growth was the most sensitivestage to dimethomorph and pyrimorph, it was chosen to test baseline sensitivities to the three fungicides. In 2007, from131 isolates collected in Fujian, Guangdong and Guangxi provinces, 127, 116 and 113 isolates were used to establishbaseline sensitivity for dimethomorph, flumorph and pyrimorph respectively. Isolates from different provinces exhibitedsimilar baseline sensitivity to the same fungicide. Baseline sensitivities to dimethomorph, flumorph and pyrimorph weredistributed as unimodal curves, with mean EC50values of 0・082 (±0・01), 0・282 (±0・047), and 0・115 (±0・032) mg L.1,respectively. This information will serve as a baseline for tracking future changes in sensitivities ofP. litchiipopulationsto these three CAA fungicides.

【题目】皱纹盘鲍杂交幼鲍闽东内湾度夏初探
【中文关键词】皱纹盘鲍 Haliotis discus hanna; 杂交鲍; 度夏; 生长; 存活
【英文关键词】Pacific abalone; hybrid abalone; over-summer; growth; survival
【中文摘要】为探讨皱纹盘鲍杂交鲍幼鲍在闽东内湾度夏的生长与存活,以山东荣成两家育苗场培育的皱纹盘鲍Haliotis discus hannai杂交鲍幼鲍(XXK、DY)、福建东山岛培育的盘鲍H.discus discus幼鲍(DS)为材料,分别运输至福建霞浦内湾长腰海区、山东荣成爱连湾进行度夏培育.各幼鲍组XXK、DY、DS均为1龄苗种,起始壳长分别为31.51 mm2.66 mm、30.76 mm3.30 mm、30.63 mm2.57 mm,且无显著性差异(P<0.05).经过6个月的培育,在南方闽东内湾培育条件下,皱纹盘鲍杂交鲍幼鲍组壳长的日增长率达95.34 mum/d29.14mum/73.81 mum/d29.37 mum/d,存活率为50.06%0.25%、49.88%0.17%;盘鲍组壳长的日增长率则为65.81 mum/d29.71mum/d,存活率为28.81%4.87%.作为对照,在北方培育条件下,皱纹盘鲍杂交鲍幼鲍组壳长的日增长率达67.85mum/d29.01mum/d、63.749 mum/d22.99 mum/d,存活率为78.90%2.24%、86.56%2.98%;盘鲍组壳长的日增长率则为27.87mum/d29.21mum/d,存活率为43.19%1.85%.双因素方差分析结果表明养殖环境与幼鲍来源,以及两者的交互作用均显著影响幼鲍度夏的生长发育.本研究结果对皱纹盘鲍杂交幼鲍在南方闽东内湾的养成提供了一定的参考.
【英文摘要】Experiments on growth and survival of juvenile hybrid abalone(Haliotis discus hannai)during over-summer time in southern China were conducted in the present study. Two juvenile hybrid abalone H. Discus hannai Ino groups(XXK and DY)from commercial hatcheries in Rongcheng, Shandong Province, and one juvenile H. Discus discus group(DS)from a hatchery in Dongshan, Fujian Province were utilized as experimental materials in the study. Initial body sizes of each juvenile abalone group are near 3cm(SL, Shell lengths), and no significant differences were found among them. After 6 months experiment in southern environmental conditions, DGRs(Daily growth rates)by SL increments of groups XXL and DY were 95.34 mum/d29.14 mum/d and 73. 81 mum/d29.37 mum/d, respectively, while survival rates were 50.06% 0.25% and 49.88%0.17%, respectively. However, both DGRs by SL increments and survival rates of group DS were poor, which were only 65.81mum/d29.71mum/d and 28.81%+4.87%, respectively. As a control, juvenile H. Discus hannai XXK and DY in northern environmental conditions had a higher survivalrate of 78.90%2.24% and 86.56% 2.98%, respectively, but little slower DGRs by SL increments of 67.85 mum/d29.01 mum/d and 63.74 mum/d22.99 mum/d, respectively. Similarly, juvenile H. Discus dis-cus had a poor growth and survival performance in northern environmental conditions. DGR by SL incre-ments and survival rate of juvenile DS were only 27.87 mum/d+29.21 mum/d and 43.191.85%, respec-tively. Two-way analysis of ANOVA showed effects of environmental condition, juvenile abalone group and the interaction between them have significant impacts on juvenile abalone growth and survival during over-summer times. The results of the present study can be helpful to the development of abalone production in-dustry in southern China.

【题目】Characterization of Fusarium graminearum Isolates Resistant to Both Carbendazim and a New Fungicide JS399-19
【中文关键词】无
【英文关键词】fungicide resistance, multi-drug resistance, phenotype, wheat scab.
【中文摘要】无
【英文摘要】Fusarium head blight (FHB) of wheat and other cereals, caused mainlyby Fusarium graminearum, is one of the most economically importantdiseases worldwide, especially in the United States and China. Thebenzimidazole fungicides, particularly carbendazim (MBC), have beenconsistently used during the period of wheat heading and flowering inareas with warm and moist weather to control FHB in China for over30 years. The effectiveness of MBC, however, has been threatened by theemergence of resistant pathogen populations in the field. JS399-19 (experimentalnumber; a.i. 2-cyano-3-amino-3-phenylancryic acetate) is anovel cyanoacrylate fungicide discovered and patented by the JiangsuBranch of National Pesticide Research & Development South Center ofChina. To evaluate the potential risk of resistance development in MBCresistantF. graminearum isolates to this new fungicide JS399-19, fiveisolates each of MBC-resistant or -sensitive, which were classified intothree different sensitivity phenotypes, such as sensitive (S), moderatelyresistant (MR), and highly resistant (HR) to MBC, were selected toinduce JS399-19-resistant mutants by selecting resistance on potatosucrose agar (PSA) plates amended with JS399-19 at 10 μg/ml. In thisway, a total of 24 JS399-19-resistant mutants were obtained from alltested MBC-resistant or -sensitive isolates. All 50 single-spore progeniesof each of the resistant mutants could grow normally on PSA platesamended with JS399-19 at 10 μg/ml, indicating stability of resistance tothis fungicide. Also, all of the resistant mutants maintained their resistanceto JS399-19 and/or MBC through eight transfers on PSA plates for40 days and when stored on PSA slants at 4 ° C for 60 days. The mycelialgrowth and conidial production capacity were decreased in 52.4% of theresistant mutants,

indicating that a fitness cost was associated with JS399-19-resistant phenotypes of F. graminearum isolates. However, most of themutants resistant to both MBC and JS399-19 exhibited high sexualreproduction capacity and pathogenicity as their parental isolates. Nevertheless,the majority of these mutants possessed fitness levels comparableto their parents. The results on the efficacy of the two fungicides forcontrolling FHB incited by the fungicide-resistant mutants were generallyconsistent with those of the in vitro sensitivity tests. JS399-19 waseffective in controlling FHB caused by MBC-resistant isolates under fieldconditions, while it was not effective in controlling FHB caused by isolatesresistant to JS399-19 or those that were resistant to both MBC andJS399-19. Moreover, the efficacy of the mixture of MBC and JS399-19was also significantly lower in controlling FHB caused by the isolatesresistant to both MBC and JS399-19 than the efficacy against the diseasecaused by the sensitive isolates, the MBC-resistant isolates, or the JS399-19-resistant isolates. The results suggest that JS399-19 possessed a highrisk in development of resistance in MBC-resistant and -sensitive F.graminearum isolates, and this double resistance to both of these fungicidescould presumable emerge and create a major problem since boththese fungicides are extensively used in China. Therefore, careful use ofJS399-19 should be followed to delay resistance development in naturalpopulations of F. graminearum, avoid unexpected control failures, andsustain the usefulness of MBC and the new product JS399-19.

【题目】海湾扇贝微卫星标记开发及其分离方式分析
【中文关键词】海湾扇贝(Argopecten irradians); 微卫星; 富集文库; 无效等位基因; 分离方式
【英文关键词】Bay scallop (Argopecten irradians); SSR; microsatellite-enriched library; null allele; allele transmission
【中文摘要】利用尼龙膜吸附杂交法构建了海湾扇贝的(AC)_(15)、(AG)_(15)微卫星富集文库,随机挑取3 000个克隆,经菌落原位杂交二次筛选共获得阳性克隆1 268个(42.3%).经序列测定和生物信息学分析后得到521个独立的阳性克隆,其中微卫星506个,小卫星15个.微卫星中,完美型248个,占总数的49.0%;非完美型216个,占42.7%;复合型42个,占8.3%;其中AG/TC重复占70.4%(356个),AC/TG重复29.6%(150个).选择其中的55条序列设计引物,筛选出其中的20对引物检测它们在海湾扇贝CC10家系的双亲和94个子代个体中的分离情况,结果表明:(1) 其中6个位点在母本和子代中发生分离,10个位点在父本和子代中发生分离,4个为双亲共享位点;(2) 2个位点存在无效等位基因;(3) 16个位点符合孟德尔遗传定律,4个位点的子代个体基因型频率偏离孟德尔遗传定律.上述结果表明,这些微卫星引物可以用于构建海湾扇贝的遗传连锁图谱,并且所构建的富集文库适用于微卫星标记的大规模开发.
【英文摘要】Three genomic libraries enriched for (AC)_(15) and (AG)_(15) were constructed using the method of nylon membrane hybridization in bay scallop (Argopecten irradians). A total of 3 000 clones derived from the enrichment libraries were screened by (AC)_(15) and (AG)_(15) probes, and 1 268 (42.3%) were proved to contain microsatellite repeat sequences. One thousand positive clones were sequenced, 506 independent microsatellites, and 15 minisatellite sequences were obtained. Among the 506 microsatellite repeat sequences, 248 (49.0%) were identified to be perfect microsatellites, 216 imperfect(42.7%) and 42 compound (8.3%). Fifty-five primer pairs were designed and amplified in one bay scallop family to test their polymorphism in this family. Twenty polymorphic microsatellite markers were selected to analyze their segregation and inheritance in parents and their 94 progenies of this bay scallop family, among which 4 were polymorphic in both parents, 6 in female and 10 in male. Two markers were observed to produce null alleles; and when null alleles were considered, there were 4 loci showing segregation distortion at 5% significance level. These results indicated that the microsatellite-enriched libraries constructed in the present study are efficient and suitable to isolate a large amount of microsatellite markers in bay scallop.

【题目】不同统计遗传模型 QTL 定位方法应用效果的模拟比较
【中文关键词】QTL 定位; 遗传模型; 定位程序; 定位方法与数据模型的适配性
【英文关键词】QTL mapping; Genetic model; Mapping procedure; Pertinence between mapping method and data model
【中文摘要】分子遗传和数量遗传的结合, 发展了 QTL 定位研究。随着定位方法与软件的建立和完善, QTL 定位的研究越来越多。准确定位的 QTL 可用于分子标记辅助选择和图位克隆, 而假阳性 QTL 将误导定位信息的应用。本文分析了迄今主要定位方法(软件)对于各种遗传模型数据的适用性。应用计算机模拟 4 类遗传模型不同的重组自交系群体(RIL), 第一类只包含加性 QTL; 第二类包含加性和上位性互作 QTL; 第三类包含加性 QTL 和 QTL 与环境互作效应; 第四类包含加性、上位性互作 QTL 和 QTL 与环境互作效应。每类按模拟 QTL 个数不同设两种情况, 共分为 8种数据模型(下称 M-1~M-8)。选用 WinQTLCart 2.5 的复合区间作图(下称 CIM)、多区间作图前进搜索(MIMF)、多区间作图回归前进选择(MIMR)、IciMapping 2.0 的完备复合区间作图(ICIM)、MapQTL 5.0 的多 QTL 模型(MQM)以及QTLnetwork 2.0 的区间作图(MCIM) 6 种程序对 8 种不同遗传模型的 RIL 进行 QTL 检测。结果表明, 不同程序适用的遗传模型范围不同。CIM 和 MQM 只适于检测第一类模型; MIMR、MIMF 和 ICIM 只适于检测第一类和第二类模型; 只有 MCIM 适于检测所有 4 类遗传模型; 因而不同遗传模型数据的最适合检测程序不同。由于未知实际数据的遗传模型, 应采用在复杂模型程序, 如 QTLnetwork 2.0, 扫描基础上的多模型 QTL 定位策略, 对所获模型用相应模型软件进行验证。
【英文摘要】QTL mapping has emerged based on the development and integration of molecular genetics and quantitative genetics. Along with the establishment and improvement of QTL mapping procedures, a great number of studies of QTL mapping in vari-ous crop species have been carried out. QTLs detected with high accuracy can be used for marker-assisted selection and map-based cloning, while the false-positive QTLs are meaningless, even mislead their usefulness. In the present study, the recom-binant inbred line (RIL) populations were simulated based on four kinds of genetic models, including Model I, additive QTL; Model II, additive and epistatic QTLs; Model III, additive QTL and QTL×environment interaction, and Model IV, additive, epistatic QTLs and QTL×environment interaction. Two sets of RIL data for each of the four models were obtained, in a total of eight sets of RIL data designated as M-1 to M-8. Six QTL mapping procedures, i.e. CIM (Composite interval mapping), MIMF (forward search of multiple interval mapping) and MIMR (regression forward selection of multiple interval mapping) of WinQTL Cartographer Version 2.5, ICIM (Inclusive composite interval mapping) of IciMapping Version 2.0, MQM (multiple-QTL model) of MapQTL Version 5.0, and MCIM (mixed model based CIM) of QTLnetwork Version 2.0 were used for detecting QTLs of the eight sets of RIL data. The results showed: (1) Different mapping procedures fit different genetic models. CIM and MQM were only suitable for Model I data. MIMR, MIMF, and ICIM were only suitable for Model I and Model II data. Only MCIM was suit-able for all four models ’ data. Therefore, the data from different genetic models corresponded to different optimal QTL mapping procedures. (2) Since the genetic model of the practical experimental data was unknown, a multiple model mapping strategy should be taken, i.e., a full model scanning with complex model procedure, such as QTLnetwork 2.0, followed by verification with another procedure corresponding to the scanning results.

【题目】Characterization of Osmads6-5, a null allele, reveals that OsMADS6 is a critical regulator for early flower development in rice (Oryza sativa L.)
【中文关键词】无
【英文关键词】rice, Osmads6-5, null allele, floral meristem determinacy, floral organ identity
【中文摘要】无
【英文摘要】AGL6-clade genes are a subfamily of MADS-box genes and preferentially expressed in floral organs. OsMADS6 and OsMADS17 are two AGL6-like genes in rice. OsMADS17 has been shown to play a minor role in floral development and appears to result from a duplication of OsMADS6. OsMADS6 was initially named as MFO1 for mosaic floral organs based on its moderate mutant

phenotypes. So far, four moderate or weak mutant alleles of OsMADS6 have been described, providing valuable insights into its role in flower development. Here, we report a null allele of OsMADS6 (Osmads6-5), which exhibited a strong mutant phenotype in spikelet without affecting vegetative traits, causing all floral organs except lemma homeotically transformed into lemma-like organs (LLOs) as well as an indeterminate floral meristem, thus resulting in a mutant floret consisting of reiterating whorls of lemma and LLOs. In consistently, over-expression of OsMADS6 led to additional lodicule-, stamen- and carpel-like organs. Expression analysis showed that OsMADS6 controls the formation of the incipient primordia of lodicule, stamen and carpel via regulating the expression of class B, C and SEP-like MADS-box genes. Taken together, our results revealed that OsMADS6 acts as a critical regulator for early flower development in rice and provide novel insights into the molecular mechanism of OsMADS6.

【题目】线粒体COI、COII 和CYTB 基因在鲍属物种鉴定中的适用性
【中文关键词】鲍属(Haliotis); DNA条形码; 线粒体基因; 物种鉴定
【英文关键词】Haliotis; DNA barcode; mitogenome; species identification
【中文摘要】为寻找最适于进行鲍属物种鉴定的线粒体基因,测定了中国及日本沿海5个皱纹盘鲍(Haliotis discus hannai)群体共16个个体的线粒体基因COI、COII以及CYTB的完整序列,并结合杂色鲍(H. diversicolor)、疣鲍(H. tuberculata)和黑唇鲍(H. rubra)的线粒体基因组信息,比较分析了3种基因的G+C含量、种间/种内遗传距离和序列多态性等特征。研究结果表明,上述3种基因的序列构成和遗传多样性都具有一定相似性,且三者都可用于区分上述鲍属物种。鉴于目前CO/具有完善的通用引物,并且具有较多的公布序列,本研究建议采用CO/序列作为目前鲍属物种鉴定的DNA条形码。
【英文摘要】In order to select appropriate mitochondrial genes for Haliotis species identification, COI, COII and CYTB of sixteen Haliotis discus hannai individuals collected from five populations along Chinese and Japanese coasts, were sequenced in this study. With available mitogenomes of H. diversicolor, H. tuberculata and H. rubra, G+C content, intra-/inter-specific K2P distance, and sequence diversity were compared among Haliotis. The results show that sequence composition, genetic diversity of COI, COII and CYTB are similar. Furthermore, both genetic distance and diversity results imply that all these genes can be used for Haliotis species identification. Since there are effective, universal primers for COI and more COI sequences published than the other two genes in Haliotis, we suggest that COI could be used as a DNA barcode for Haliotis species identification.

【题目】Effects of carbendazim on conidial germination and mitosis in germlings of Fusarium graminearum and Botrytis cinerea. International
【中文关键词】无
【英文关键词】Botrytis cinerea; carbendazim-resistance; Fusarium graminearum; mitosis
【中文摘要】无
【英文摘要】The effects of carbendazim on carbendazim-sensitive (wild-type) and -resistant strains of Fusarium graminearumand Botrytis cinerea were compared. When treated with carbendazim, conidia and germlings of wild-typeF. graminearum and B. cinerea germinated and grew to produce stunted, distorted, and abnormally branchedgermlings; in addition, distinct nuclei were replaced by irregularly distributed chromosome masses, and normalnuclear division was not observed. The CMI (chromosome mitosis index) values of wild-type strains rapidlyincreased within 60 min of treatment with carbendazim and then rapidly declined. Whereas the wild-type strainsof the two fungi responded similarly, the carbendazim-resistant strains of F. graminearum and B. cinerearesponded differently to carbendazim. The resistant strain of F. graminearum showed normal mitosis butproduced significantly more branches and higher CMI values when treated with carbendazim than whenuntreated. In contrast, the carbendazim-resistant strain of B. cinerea exhibited normal morphology and mitosisafter carbendazim treatment. The results suggest that the mechanism for carbendazim resistance in F.graminearum differs from that in B. cinerea and other fungi.

【题目】大豆产量有关性状 QTL 的检测
【中文关键词】大豆;产量;生物量;叶部性状;产量组分;相关;QTL定位
【英文关键词】soybean; yield; biomass; leaf trait; yield component; correlation; QTL mapping
【中文摘要】【目的】研究大豆产量和生物量、叶面积指数、冠层以及产量构成因素间的相关性,定位控制这些性状的QTL。【方法】以地理和遗传来源均有较大差异的北方亲本科丰 1 号和南方亲本南农 1138-2 所衍生的 184 个重组自交家系2年有重复的田间试验结果进行产量有关性状的QTL分析。【结果】(1)产量与地上部生物量、叶面积指数、根重、冠层宽和高等均有极显著正相关,相关系数 0.5~0.7。(2)地上部生物量检测到 7 个 QTL,贡献率6.2%~21.1%, 其中2年重复检出1个 (qSBO-1) ; 根重8个 QTL, 贡献率5.2%~20.1%, 重复检出1个 (qRTB1-1) 。(3)开花期叶面积指数5个QTL,贡献率6.4%~17.2%;结荚期叶面积指数5个QTL,贡献率7.3%~26.2%,重复检出1个(qLAIR3A2);冠层宽4个QTL,贡献率6.3%~13.1%,重复检出1个(qCWD1b-2);冠层高11 个QTL,贡献率5.2%~9.2%,重复检出 4个(qCHH-1、qCHO-1、qCHO-2和qCHO-3)。(4)百粒重 6个,荚粒数 2 个,荚数1个QTL,贡献率6.9%~15.7%;分枝荚数5个,主茎荚数3个QTL,贡献率6.3%~11.1%;主茎节数8个QTL,有效分枝数 3 个 QTL,贡献率 4.7%~15.2%。(5)根重和地上部生物量各有 1 个,R1(始花期)和 R3(始荚期)叶面积指数各有 2 个,冠层宽和高各有 2 个,产量与荚数各有 1 个,百粒重和分枝荚数各有 1 个,荚粒数和主茎节数各有 1 个,分枝荚数与有效分枝数各有 1 个共享的 QTL。【结论】大豆产量有关的 13 个性状共检测到 68 个 QTL;年份间有重复检出的,但不多,其表达较大程度上与环境有关;尽管性状间普遍有相关、有共享的QTL,但不多,各有其遗传体系;产量有关性状中很少有贡献率大的主效QTL,产量育种要考虑多数基因聚合的技术。
【英文摘要】【Objective】 The present study was aimed to reveal the correlation between yield and biomass, leaf area and yield components, and to detect and map the QTLs of the yield-related traits. 【Method】 The 184 recombinant inbred lines derived from a cross between geographically and genetically distant parents, Kefeng 1 from northern China and Nannong 1138-2 from southern China, were tested in two years and then analyzed for detecting and mapping QTLs of the traits related to yield. 【Result】 A very significant positive correlation was observed between yield and above ground biomass, leaf area index, root weight, canopy width and canopy height with r values of 0.5-0.7. Seven QTLs of above ground biomass were mapped with contribution rate of 6.2%-21.1% and one QTL (qSBO-1) repeatedly detected in both years while eight QTLs of root weight mapped with contribution rate of 5.2%-20.1% and one QTL (qRTB1-1) repeatedly detected. Five QTLs of R1 leaf area index were mapped with contribution rate of 6.4%-17.2% while five QTLs of R3 leaf area index mapped with contribution rate of 7.3%-26.2% and one QTL (qLAIR3A2) repeatedly detected. Four QTLs of canopy width were mapped with contribution rate of 6.3%-13.1% and one QTL (qCWD1b-2) repeatedly detected while 11 QTLs of canopy height mapped with contribution rate of 5.2%-9.2% and four QTLs repeatedly detected. Six, two and one QTL of 100-seed weight, number of seeds per pod and number of pods per plant, respectively, were mapped with their contribution rate of 6.9%-15.7%. Five and three QTLs of number of pods on branches and number of pods on main stem, respectively, were mapped with their contribution rate of 6.3%-11.1%. Eight and three QTLs of number of nodes on main stem and effective number of branches, respectively, were mapped with their contribution rate of 4.7%-15.2%. There was one QTL shared by above ground biomass and root weight, two QTLs shared by R1 and R3 leaf area index, two QTLs by canopy width and height, one by yield and number of pods per plant, one by 100-seed weight and number of pods on branches, one by number of seeds per pod and number of nodes on main stem, and one by number of pods on branches and effective number of branches. 【Conclusion】 A total of 68 QTLs were mapped for 13 yield-related traits. Among them, only a small part was repeatedly detected in both years, implied their expression depended on years or environmental conditions. Although significant correlations existed among the traits extensively, only a small part of the QTLs was shared between the traits, which indicted different gene systems for various traits. There were few QTLs with large contribution found in the yield-related traits, thus breeding technology for pyramiding multiple genes should be considered for yield improvement.

【题目】水稻单株产量与根系主要几何属性的定量关系
【中文关键词】水稻;根系;几何属性;单株产量
【英文关键词】rice;root system;geometric property;yield per plant

【中文摘要】为揭示水稻单株产量与不同生育阶段根系主要几何属性的定量关系。以两优108(杂交籼稻)、86优8(杂交粳稻)和南粳43(常规粳稻)为材料,设施肥(N:每盆 3.6g;P2O5每盆0.8g;K2O:每盆 3.6g)与不施肥2个水平,共6个处理,采用塑料桶土培。在试验观测的基础上,建立回归模型及模型统计量,结果表明拔节期至灌浆末期水稻单株产量与单株总根长及单株总根表面积之间的定量关系以二次模型较好,分蘖初期至拔节期根系几何属性与单株产量关系则以三次模型拟合较好;单株产量与根系各参数相关分析结果表明单株总根长、总根表面积及总根体积的增加有利于提高产量。

【英文摘要】The objectives of this study were to build the best-fit mathematical models for quantitative relationships between the individual plant yield and the main geometric properties of rice root system in different growth stages.Three rice cultivars,Liangyou 108(indica hybrid rice),86You8(japonica hybrid rice)and Nanjing43(conventional japonica rice),were planted in pots,applying fertilizer at rates of3.6g, N 0.8g,P2O5and 3.6g, K2O per pot as treatment and no fertilizer as contro1.Based on the experimental observations,the mathematical models were developed by regression analysis.Cubic model was the best-fit relationship between the geometric properties of rice root system and the individual plant yield except the best-fit quadratic equation between the yield of individual plant and the total root length per plant,and total root surface area per plant during jointing to end filling periods.Correlation analyses between yield per plant and various parameters of root system revealed that increasing total root length,total surface area and total volum per plant will be of benefit for raising rice yeild per plant.

【题目】Sensitivity of Fusarium graminearum to fungicide JS399-19: in vitro determination of baseline sensitivity and the risk of developing fungicide resistance

【中文关键词】无

【英文关键词】Crop resistance; disease management; Fusarium head blight; Gibberella zeae; resistance stability.

【中文摘要】无

【英文摘要】The baseline sensitivity of Fusarium graminearum Schwade [teleomorph = Gibberella zeae(Schweinitz) Petch] to the fungicide JS399-19 (development code no.) [2-cyano-3-amino-3-phenylacrylic acetate] and the assessment of risk to JS399-19 resistance in vitro are presented.The mean EC50 values for JS399-19 inhibiting mycelial growth of three populations ofwild-type F. graminearum isolates were 0.102±0.048, 0.113±0.035 and 0.110±0.036 μgml.1, respectively. Through UV irradiation and selection for resistance to the fungicide, weobtained a total of 76 resistant mutants derived from five wild-type isolates of F. graminearumwith an average frequency of 1.71×10.7% and 3.5%, respectively. These mutants couldbe divided into three categories of resistant phenotypes with low (LR), moderate (MR) andhigh (HR) level of resistance, determined by the EC50 values of 1.5 – 15.0 μg ml.1, 15.1 – 75.0 μg ml.1 and more than 75.0 μg ml.1, respectively. There was no positive crossresistancebetween JS399-19 and fungicides belonging to other chemical classes, such asbenzimidazoles, ergosterol biosynthesis inhibitors and strobilurins, suggesting that JS399-19 presumably has a new biochemical mode of action. Although the resistant mutantsappeared to have comparable pathogenicity to their wild-type parental isolates, they showeddecreased mycelial growth on potato-sucrose-agar plates and decreased sporulation capacityin mung bean broth. Nevertheless, most of the resistant mutants possessed fitness levelscomparable to their parents and had MR or HR levels of resistance. As these studies yieldeda high frequency of laboratory resistance in F. graminearum, appropriate precautions againstresistance development in natural populations should be taken into account.

【题目】大豆蛋白质有关性状的 QTL 定位
【中文关键词】大豆; 蛋白质含量; 蛋油总量; 11S; 7S; 11S/7S; 亚基组; QTL 定位
【英文关键词】Soybean; Protein content; Protein plus fat content; 11S; 7S; 11S/7S; Subunit group; QTL mapping
【中文摘要】以科丰 1号×南农 1138-2 组合衍生的 184个重组自交家系(简称RIKY)和(Essex×ZDD2315)×ZDD2315 衍生的 114 个BC1F2家系(简称BIEX)为材料, 对蛋白质含量、蛋油总量与油脂含量, 11S、7S、11S/7S, 11S-1~11S-4, 7S-1~7S-6等 4 组 16 个性状利用WinQTL Cartographer Ver.2.5 的复合区间作图法(CIM)、多区间作图法(MIM)和IciMapping Ve r.2.0 的完备区间作图法(ICIM)进行QTL分析, 结果表明: (1) 在RIKY和BIEX群体分别定位到 17+个和 21+个QTL, 合计 38+个QTL; 在RIKY有蛋白、油脂、蛋油总量QTL11 个, 在 11S和 7S亚基组上分别只有 1+和 3+个; 在BIEX有前性状QTL2+个, 有后性状QTL分别 9+和 6+个; (2) 两群体 16 个性状上均没有检测到共享的QTL, 说明两群体的蛋白质有关性状具有完全不同的遗传基础; RIKY的两个亲本间蛋白、油脂和蛋油总量有明显遗传差异, 但在亚基组上遗传差异不大, 而BIEX则反之; (3) 4 组总、分性状中, 两群体一致表现出蛋白、油脂和蛋油总量和 11S、7S和 11S/7S比值两组在总、分性状间共享QTL(共同遗传基础), 而 11S亚基组和 7S亚基组两组性状在总、分性状间无共享的QTL; (4) 蛋白质有关性状QTL定位结果和分离分析结果共同表明这类性状主效基因和微效基因均占较大比重, 要考虑两者兼用的育种方法。
【英文摘要】Soybean processing industry places emphasis on the quality of soybean protein which is related to the protein components, mainly 11S, 7S and 11S/7S, and their subunit constituents. In the improvement of soybean protein quality, the knowledge of genetic structure of the traits related to protein quality is of great importance. Therefore, the present paper was aimed at mapping QTLs of 16 traits, including protein content, protein plus fat content, fat content, 11S, 7S, 11S/7S, and subunit groups. Two popu-lations, RIKY population with 184 recombinant inbred lines derived from Kefeng 1×Nannong 1138-2 and BIEX population with 114 BC1F2 lines derived from (Essex×ZDD2315) ×ZDD2315, were used to map QTLs with the softwares of composite interval mapping (CIM), multiple interval mapping (MIM) of WinQTL Cartographer Ver. 2.5 and the inclusive composite interval map-ping (ICIM) of IciMapping. The results showed that there were totally 17+ QTLs detected with 11 for protein content, fat content and total content of protein and fat, and 1+ and 3+ for 11S subunit groups and 7S subunit groups, respectively, in RIKY, as well as totally 21+ detected with only 2+ for protein content, fat content and protein plus fat content, but 9+ and 6+ for 11S subunit groups and 7S subunit groups, respectively, in BIEX. There was no shared QTL detected for all 16 traits in both populations, indicating that the 16 traits between RIKY and BIEX have completely different genetic systems, and there existed obvious genetic differ-ences between two parents of RIKY in protein content, fat content and protein plus fat content but less genetic differences in 11S subunit groups and 7S subunit groups, and those of BIEX were on the contrary. The group of protein content, fat content and pro-tein plus fat content and the group of 11S, 7S and 11S/7S had common QTLs, showing their common genetic base, but there were no common QTLs in the groups of 11S subunit and 7S subunit. The results from QTL mapping and segregation analysis showed jointly that both major genes and minor genes contributed a large part of phenotypic variations for all 16 traits, suggesting that both major genes and minor genes should be considered in the breeding for protein-related traits.

【题目】Characterization and fitness of carbendazim-resistant strains of Fusarium graminearum (wheat scab)
【中文关键词】无
【英文关键词】Fusarium graminearum; carbendazim resistance; characterization; fitness
【中文摘要】无
【英文摘要】BACKGROUND: Carbendazim (MBC) has failed to control wheat scab, caused by Fusarium graminearumSchwabe, on the eastern coast of China in recent years after about 30 years of application.RESULTS: MBC resistance was found to be common in pathogen populations on the eastern coast and alongareas of the Yangze River. EC50 and minimum inhibitive concentration (MIC) values of MBC inhibiting myceliumgrowth of wild-type isolates were less than 0.9 and 1.4 μ gmL.1 respectively, while EC50 values of

resistant collectionsaveraged 7.02 ± 11.86 μgmL.1. The slope of the MBC dosage – response curve (DRC) for resistant isolates of F.graminearum was flat: 1 < b < 2.8 for resistant isolates and 3.5 < b < 11 for sensitive isolates). Both field resistantand sensitive MBC strains shared similar temperature sensitivity, fitness and virulence on ears. Field resistantstrains and UV-induced mutants showed positive cross-resistance to other benzimidazole derivatives and weremainly at intermediate MBC resistance level. Highly resistant field MBC strains rarely appeared, but only some ofthe highly resistant MBC UV mutants were insensitive to N-phenylaminecarbamates. Nomutation in beta-tubulinwas found in F. graminearum, in contrast to mutation in this tubulin which has led to MBC resistance in otherplant pathogens.CONCLUSION: MBCR isolates have high fitness and competition in field, conferred by a novel molecularmechanism.

【题目】Genetic Study on JS399-19 Resistance in Hyphal Fusion of Fusarium graminearum by using nitrate non-utilizing mutants as genetic makers.

【中文关键词】无

【英文关键词】Fusarium graminearum; JS399-19 resistance; biological properties; genetic marker; hyphal fusion

【中文摘要】无

【英文摘要】Twenty-two nitrate nonutilizing (nit) mutants were recovered from five wild-type isolates of Fusarium graminearum and fifty nit mutants were recovered from three JS399-19-resistant mutants of F. graminearum cultured on MMC medium. Some biological properties were compared between nit mutants and their parental isolates. The results showed that there were no significant differences in growth rate, cultural characters or pathogenicity between JS399-19-resistant nit mutants and their parental isolates. But the conidial production and the sexual reproduction ability changed to some extent. There was no cross resistance toward chlo-rate and JS399-19 in F. graminearum and the resistance could be stable through 20-time subcultures. Therefore, the nit could be used as a genetic marker for studying the genetics of JS399-19 resistance in F. graminearum, which was used to study JS399-19 resistance transferability in hyphal fusion. Resistance in JS399-19 could not be transferred by hyphal fusion or could be transferred with low chance between two compatible isolates, which would delay the development of JS399-19 resistance in the field.

【中文摘要】Segregation analysis is a method of detecting major genesfor quantitative traits without using marker information. Itserves as an important tool in helping investigators to planfurther studies such as quantitative trait loci mapping or moresophisticated genomic analyses. However, current methodsof segregation analysis for a single trait typically have lowstatistical power. We propose a multivariate segregationanalysis (MSA) that takes advantage of the correlationstructure of multiple quantitative traits to detect major genes.

【题目】Vegetative compatibility of Fusarium graminearum isolates and genetic study on their carbendazim-resistance recombination in China
【中文关键词】无
【英文关键词】fungicide resistance, Fusarium head blight.
【中文摘要】无
【英文摘要】Monoconidial isolates of 33 carbendazim-sensitive isolates and 31carbendazim-resistant isolates of Fusarium graminearum were selectedfrom three regions of China for vegetative compatibility group (VCG)analysis. A total of 213 and 224 nit mutants were recovered from the 33sensitive and the 31 resistant isolates, respectively. Of all the nit mutants,the frequency of the different phenotypes was 44.6, 46.5, 5.7, and 3.2%for nit1, nit3, nitM, and nitA, respectively. VCG analysis identified 30different VCGs among the 33 sensitive- and the 31 carbendazim-resistantisolates, with VCG diversity 0.91 and 0.97, respectively. Both, a carbendazim-sensitive and a -resistant isolate from the same field belongedto the same VCG. In all then, a total of 59 VCGs were identified amongthe 64 isolates with an overall VCG diversity 0.92. Direct hyphal fusionwas observed in six pairs of vegetatively compatible complements, whichis evidence of heterokaryon formation. It was hypothesized that carbendazimresistance could not be transferred by hyphal fusion or there is asmall chance to be transferred between two compatible isolates. Threestable sexual recombinants of F. graminearum were randomly chosenfrom each of the three genetic crosses to study their biological properties.There were no significant differences in mycelial linear growth andpathogenicity between recombinants and their parents, but they differ insporulation ability and capacity to produce perithecia. We concluded thatsexual recombination presumably played a role in the development ofcarbendazim resistance under field conditions.

【题目】大豆蛋白质有关性状遗传的分离分析

【中文关键词】大豆;蛋白质含量;蛋油总量;11S;7S;11S/7S;亚基组;主基因+多基因混合遗传模型分离分析

【英文关键词】Soybean; Protein content; Protein plus fat content; 11S; 7S; 11S/7S; Subunit group; Segregation analysis based on mixed major gene and polygene inheritance model

【中文摘要】采用科丰 1 号×南农 1138-2 衍生的重组自交家系群体(RIKY)和(Essex×兴县灰布支)×兴县灰布支回交自交衍生群体(BIEX)为材料，应用 SDS-PAGE 电泳测定 11S、 7S、 11S/7S 比值及其 10 个亚基组的相对含量，用凯氏(Kjeltec)自动定氮仪测定蛋白质含量、自动索氏(Soxtec)抽提仪测定油脂含量。结果表明: (1) 两群体蛋白质组分及其亚基组有关性状以及油脂与蛋油总量等均有不同程度超亲分离，双亲间存在不同程度的位点互补。(2) 蛋白质含量遗传，两群体均为 1 对主基因+多基因模型，主基因和多基因遗传率分别为 31.3%~40.9%和 37.2%~53.7%。蛋油总量均为 3 对主基因+多基因模型，主、多基因遗传率分别为 59.9%~66.6%和 23.2%~27.9%。油脂含量为 2~3 对主基因+多基因模型，两类遗传率分别为 48.6%~71.7%和 4.2%~29.7%。(3) 11S 组分均为 3 对主基因+多基因模型，两类遗传率分别为14.3%~60.7%和 17.0%~50.7%。7S 组分均为 3 对主基因+多基因模型，两类遗传率分别为 34.5%~44.1%和 21.5% ~45.1%。11S/7S 比值遗传均为 2 对主基因+多基因模型，两类遗传率分别为 56.6%~74.8%和 10.1%~20.1%。(4) 11S的 4 个亚基组依次分别为 2~3 对主基因+多基因、2 对主基因+多基因、2 对主基因+多基因、2~3 对主基因+多基因模型。(5) 7S 的 6 个亚基组依次分别为 1~2 对主基因+多基因、2 对主基因+多基因、2~3 对主基因+多基因、3 对主基因+多基因、1~2 对主基因+多基因和 2 对主基因+多基因模型。所有 16 个性状都由主基因和多基因控制，其中有 10个性状两群体具相同的主基因数，其他 6 个性状两群体间相差 1 对主基因，两群体间遗传模型大同小异。 这些相关性状的育种既要利用主基因还必须利用微效多基因，要考虑兼用两者的育种方法。

【英文摘要】The quality and processing property of soy protein depend on its constitution of components and subunit groups, as well as their related traits. The recombinant inbred line population (RIKY) derived from Kefeng 1×Nannong 1138-2 and backcross inbred derived line population (BIEX) derived from (Essex×ZDD2315)×ZDD2315 were tested for their 16 traits related to protein components and their subunit groups, including protein content, protein plus fat content, 11S, 7S, 11S/7S ratio, four 11S subunit groups and six 7S subunit groups, by using Kjeltec, Soxtec and SDS-PAGE analysis. The data obtained were analyzed for the inheritance of the 16 traits by using segregation analysis based on mixed major gene plus polygene inheritance model. The results showed that there existed transgressive segregations in all the traits, which indicated the mutual complement among loci between the parents. One major gene plus polygene mixed model was detected for protein content in both populations with major gene heritability (MGH) 31.3 – 40.9% and polygene heritability (PGH) 37.2 – 53.7%; three major genes plus polygene model for protein plus fat content with MGH 59.9 – 66.6% and PGH 23.2 – 27.9%; two to three major genes plus polygene model for oil content with MGH 48.6 – 71.7% and PGH 4.2 – 29.7%. Three major genes plus polygene inheritance model was detected for 11S protein content with MGH 14.3 – 60.7% and PGH 17.0 – 50.7%; three major genes plus polygene model for 7S protein content with MGH 34.5 – 44.1% and PGH 21.5 – 45.1%; two major genes plus polygene model for 11S/7S ratio with MGH 56.6 – 74.8% and PGH 10.1 – 20.1%. Two to three major gene plus polygene, two major genes plus polygene, two major genes plus polygene and two to three major genes plus

polygene inheritance models were detected for 11S-1 through 11S-4, respectively; one to two major genes plus polygene, two major genes plus polygene, two to three major genes plus polygene, three major genes plus polygene, one to two major genes plus polygene and two major genes plus polygene inheritance models were detected for 7S-1 through 7S-6, respectively. All of 16 traits are controlled by both major genes and minor genes. Among them, ten traits are controlled by same numbers of major genes in both populations and for the other six traits there is one major gene difference between the two populations. Thus, between the two populations, for each trait, the inheritance model is mainly similar in number of major genes while somewhat different in gene effect for those with same major gene numbers. Therefore, plant breeders have to pyramid both major genes and polygenes in breeding for protein content and related quality traits.

【中文摘要】无
【英文摘要】Alternaria tenuissima is a fungus widely present in the environment and causes diseases in plants and humans in the world. In this study, we constructed an A. tenuissima cDNA expression library in a centromeric yeast vector that allows the isolation of functional cDNA sequences from this environmental and pathogenic fungus. Through a genetic approach we have isolated and functionally characterized the cDNA sequences encoding the MAP kinase (MAPK) Hog1p and the MAPK kinase Pbs2p of A. tenuissima. AtHOG1 cDNA encodes a protein of 355 amino acids, while AtPBS2 cDNA encodes a protein of 683 amino acids

【题目】大豆嫁接体系中砧木或接穗保留叶片数对接穗生长发育的影响

【中文关键词】大豆; 嫁接; 保留叶片数; 可传导开花物质; 剂量效应

【英文关键词】Soybean; Graft; Maintained leaf number; Transmissible floral substance; Accumulative effect

【中文摘要】以早熟品种黑河 27 为砧木, 晚熟品种自贡冬豆为接穗, 通过嫁接并结合去叶处理, 创造砧木和接穗叶片数各不相同的嫁接体, 观察砧木及接穗的叶片数目对接穗发育的效应, 分析大豆叶片中可传导开花诱导物质和抑制物质的有无、作用方式及其对植株发育的影响。结果表明, 在长日照(16 h)条件下, 与黑河 27 嫁接, 导致自贡冬豆在嫁接后第 30 天(出苗后第 41 天)开花, 而自体嫁接的自贡冬豆在试验结束前(>120 d)仍未开花, 说明在非诱导光照条件(长日照)下, 早熟品种黑河 27 的叶片产生可传导的开花促进物质, 并通过嫁接传导至晚熟品种自贡冬豆的顶端分生组织, 诱导其实现成花转变。 砧木诱导接穗开花的效应大小与其所保留的叶片数目呈正比, 说明上述可传导物质对大豆开花的促进作用存在剂量效应。 接穗去叶可导致自身花期提前, 花数增加, 显示晚熟接穗的叶片在长日照下可产生开花抑制物质。 接穗上的花朵和荚果数目与其保留叶片数呈反比, 说明开花抑制物质阻止生殖器官的发育, 且其作用也具有剂量效应。接穗去叶部位对其成花发育状态亦有一定影响。试验表明, 在大豆生长发育过程中, 叶片根据光周期信号的变化, 调节开花促进物质和开花抑制物质的多少和比例, 进而协调营养生长和生殖生长的进度, 保证生命周期的完成。

【英文摘要】To elucidate whether there exist floral stimuli and inhibitors in flowering process, what the underlying mechanism is, and how they regulate plant growth and development, we used the early-maturing soybean cultivar Heihe 27 and late-maturing cultivar Zigongdongdou as stock and scion, respectively to make graf in which scions and stocks had different leaf numbers in combination with defoliation, and to study the effect of leaf number of stock and scion on the reproductive development. Under long-day (16 h) conditions, Zigongdongdou scions flowered at day 30 after being grafted onto Heihe 27 stocks, while its self-grafts failed to flower until the experiment finished (over 120 days). It suggested that under noninductive photoperiods (long-day), the transmissible floral stimuli were produced in the leaves of the early-maturing Heihe 27 and moved to the apical meristem of the late-maturing Zigongdongdou to induce the scion to flower. And the effect of the stock on the flowering of the scion was dependent on the number of leaves remained in the stock. It indicated that there exists an accumulative effect of the transmissible stimuli on soybean flowering. Defoliation on scions promoted flowering and increased flower number, which showed that some floral inhibitors were produced in the leaves of scions under long-day conditions. The number of flowers and pods on scions negatively correlated with the number of remained scion leaves. It indicated that the floral inhibitors suppress the development of the reproductive organs, and the inhibitions have an accumulative effect as well. The node location where scions were defoliated also had an effect on the flowering development. It was proposed that, during the growth and development of soybean, leaves regulate the amount and balance of floral stimuli and inhibitors based on photoperiodic signals, and consequently trigger the proceeding from vegetative growth to the reproductive development to ensure the completion of life cycle.

【题目】Synthesis and Herbicidal Activity of Novel N-(2,2,2)-Trifluoroethylpyrazole Derivatives
【中文关键词】无
【英文关键词】N-(2,2,2)-Trifluoroethylpyrazole; herbicidal activity; synthesis; safety
【中文摘要】无
【英文摘要】A series of novel N-(2,2,2)-trifluoroethylpyrazole derivatives were synthesized, and their structures were characterized by IR, mass spectroscopy, 1H NMR, and elementary analysis. The herbicidal activities of target compounds 10a − c and 11a − c were assessed. The bioassay results showed that these pyrazole derivatives exhibited good herbicidal activity. Compound 11a showed the best pre-emergence herbicidal effects against both dicotyledonous and monocotyledonous weeds with good safety to maize and rape at the dosage of 150 g a.i. ha − 1 in greenhouse. Field trials indicated that compound 11a exhibited better herbicidal activity by soil application than the commercial herbicide, metolachlor. Moreover, compound 11a showed the same level of safety to maize as metolachlor.

【题目】大豆苗期耐淹性的遗传与 QTL 分析
【中文关键词】大豆; 耐淹性; RIL 群体; 分离分析; QTL 定位
【英文关键词】Soybean; Waterlogging tolerance; Recombinant inbred line (RIL); Segregation analysis; QTL mapping
【中文摘要】洪涝灾害是大豆生产的主要逆境之一, 培育耐涝品种是抗灾保收的重要措施。大豆耐涝性育种方案的设计必须以耐涝性遗传为前提。 以苏 88-M21(淹水不敏感)×新沂小黑豆(淹水敏感)衍生的 175 个重组自交系(NJRISX)为材料, 在盆栽V2 期土壤表层保持5~7 cm水层 20 d的淹水条件下, 研究大豆苗期耐淹性的遗传和QTL定位。通过对8 个耐淹性有关性状的相关分析和主成份分析, 确定以处理前后株高变化量、 处理终叶龄和成熟期株高 3个性状的平均耐淹指数为评价指标。NJRISX 家系间耐淹性差异极显著, 存在超亲分离。主基因+多基因分离分析表明该群体的耐淹性为 2 对连锁主基因+多基因遗传, 主基因遗传率为 62.83%, 多基因的遗传率为 8.90%。WinQTLCart2.5 复合区间及多区间 QTL 定位分析均检测到 2 个 QTL, 位于连锁群 L2 上的 Satt229~Satt527 和 Satt527~Sat_286 区间, 对表型的解释率分别为11.76%~25.20%和10.10%~12.34%。大豆NJRISX群体苗期耐淹性遗传分离分析与QTL定位结果相对一致。
【英文摘要】Flooding is a serious problem for soybean production in eastern and southern China. Development of cultivars with tolerance to waterlogging is one of the effective ways to cope with the stress problem. For which, the genetic knowledge of wa-terlogging tolerance is of essential importance. The present study was aimed at revealing the inheritance and mapping the QTLs for waterlogging tolerance of soybean at seedling stage. The materials used were 175 recombinant inbred lines (RILs) derived from the cross Su88-M21 (tolerant) × Xinyixiaoheidou (highly sensitive), designated as NJRISX. A pot experiment was held un-der 5 – 7 cm waterlogging stress for 20 days at V2 stage. Based on the correlation and principal component analysis of eight traits, we calculated the joint waterlogging tolerance index from the average of individual tolerance index of plant height increment, number of leaves at the end of waterlogging and plant height at maturity to evaluate the tolerances of the materials. There existed obvious transgressive segregation and significant differences among the RIL lines. The segregation analysis under major gene plus polygene mixed inheritance model showed that waterlogging tolerance of soybean was controlled by two linked major genes plus polygenes with major gene heritability of 62.83% and polygene heritability of 8.90%. By using composite interval mapping (CIM) and multiple interval mapping (MIM) of WinQTL Cartographer Version 2.5, two QTLs conferring waterlogging tolerance were mapped in the marker regions of Satt229 – Satt527 and Satt527 – Sat_286 on linkage groups L2, explaining 11.76% – 25.20% and 10.10% – 12.34% of the total phenotypic variation, respectively. Accordingly, the results from segregation analysis and QTL map-ping are relatively consistent in NJRISX population.

【题目】不同药剂处理对马铃薯种薯生理生化特性的影响
【中文关键词】马铃薯种薯; 药剂处理; 生理生化特性; 发病率
【英文关键词】seed potato; pesticide; physiological and biochemical character; morbidity rate
【中文摘要】为筛选出窖藏条件下马铃薯种薯贮藏的理想防病药剂,以庄薯3 号原种为供试材料,利用病毒克星、72%农用硫酸链霉素、50%多菌灵可湿性粉剂和75%百菌清可湿性粉剂对种薯进行喷药处理,研究不同药剂处理对贮藏期种薯生理生化特性及其发病率的影响。结果表明: (1) 经150 d 贮藏后,不同喷药处理间种薯发病率存在极显著差异(P < 0. 01) ; 与对照相比,用病毒克星、农用硫酸链霉素、多菌灵和百菌清处理后种薯发病率分别降低了4. 98 个百分点、6. 94 个百分点、5. 22 个百分点、6. 03 个百分点。(2) 不同药剂处理间种薯淀粉含量存在显著性差异(P < 0. 05) ; 干物质含量无显著性差异; 种薯含水量存在极显著差异(P < 0. 01) 。(3) 与对照相比,各处理均能抑制种薯的多酚氧化酶(PPO) 活性、降低过氧化物酶(POD) 活性、减少丙二醛(MDA) 含量。(4) 与对照相比,农用硫酸链霉素、多菌灵和百菌清可以提高种薯活力,其中采用72%农用硫酸链霉素处理的种薯活力最高,而病毒克星反而降低了种薯活力。表明较为理想的防病药剂为72%农用硫酸链霉素和百菌清。
【英文摘要】The seed potato Zhuangshu No. 3 was used to study the effects of different pesticides on physiological and biochemical characters and morbidity rates of the seed potatoes by spraying virus buster,72% streptomycin sulfate,50% carbendazim and 75%

chlorothalonil,in order to select the optimal chemicals during cellaring. There were extremely significantdifferences (P < 0. 01) in the morbidity rates of seed potatoes among the different treatments after storage for five months. In the treatments of virus buster,streptomycin sulfate,carbendazim and chlorothalonil,the morbidity rates of seed potatoes were lower than that of control by 4. 98 percentage point,6. 94 percentage point,5. 22 percentage point and 6. 03 percentage point respectively. Among the four treatments, the difference of the starch content of seed potatoes was significant (P < 0. 05) ,the difference of the dry matter content was not significant,and the difference of the water content was extremely significant (P < 0. 01) . Compared with the control,all four treatments could inhibit polyphenol oxidase (PPO) activity and peroxidase (POD) activity and decrease malondialdehyde (MDA) content. The 24 vigor of seed potatoes was the highest in 72% streptomycin sulfate treatment,and was lowered by virus buster treatment. It was indicated that 72% streptomycin sulfate and 72% chlorothalonil were better for control of seed potato diseases.

【题目】热分析对马铃薯抑芽粉剂中氯苯胺灵缓释机理的研究
【中文关键词】马铃薯,抑芽剂,氯苯胺灵,热分析
【英文关键词】potato; inhibit-sprout powder; chloropropham; thermoanalysis
【中文摘要】采用热重法、导数热重法和差热分析法,分别对基料凹凸棒、主效成分氯苯胺灵和抑芽粉剂进行热分析测定,通过对热分析结果的比较,提出了基料凹凸棒对主效成分氯苯胺灵的缓释机理。结果表明,经过液化工艺将氯苯胺灵附载到凹凸棒上,由于基料凹凸棒的比表面积较大,吸附在凹凸棒上的氯苯胺灵因表面效应在较低的温度下也易于挥发,并延缓了挥发速率,为选用凹凸棒作为基料对氯苯胺灵的缓释提供了理论依据
【英文摘要】In this research, base-powder clay, chlorpropham and potato sprout inhibitor were determined bythermogravimetry (TG), derivative thermogravimetry (DTG) and differential thermal analyses (DTA), respectively. And theslow-release mechanism of chloropropham in potato sprout inhibitor was put forward by comparisons. It was concluded that when chlorpropham was carried on the clay by colliquative technology, chlorpropham absorbed on the clay could easily evaporate even at low temperature due to the clay's large specific surface area, and be slowed down for the rate of volatilization, which suggested that the clay could be used as base-powder for chlorpropham's slow-release.

【题目】Comparative Study of SBP-box Gene Family in Arabidopsis and Rice
【中文关键词】SBP-box proteins are plant-specific putative transcription factors, which contain highly conserved SBP domain and could bind specifically to
promoters of the floral meristem identity gene SQUAMOSA and its orthologous genes to regulate their expressions.
【英文关键词】SBP-box proteins are plant-specific putative transcription factors, which contain highly conserved SBP domain and could bind specifically to
promoters of the floral meristem identity gene SQUAMOSA and its orthologous genes to regulate their expressions.
【中文摘要】SBP-box proteins are plant-specific putative transcription factors, which contain highly conserved SBP domain and could bind specifically topromoters of the floral meristem identity gene SQUAMOSA and its orthologous genes to regulate their expressions. In this study, 17 nonredundantSBP-box genes in Arabidopsis genome and 19 in rice genome were identified by using the known SBP domain sequences as queries.The phylogenetic analysis suggested that the main characteristics of this family might have been in existence before the split of Arabidopsis andrice, and most SBP-box genes expanded in a species-specific manner after the split of monocotyledon and dicotyledon.

【中文摘要】Composite interval mapping (CIM) is the most commonly used method for mapping quantitative trait loci(QTL) with populations derived from biparental crosses. However, the algorithm implemented in thepopular QTL Cartographer software may not completely ensure all its advantageous properties. In addition,different background marker selection methods may give very different mapping results, and the nature ofthe preferred method is not clear. A modified algorithm called inclusive composite interval mapping (ICIM)is proposed in this article. In ICIM, marker selection is conducted only once through stepwise regressionby considering all marker information simultaneously, and the phenotypic values are then adjusted byall markers retained in the regression equation except the two markers flanking the current mappinginterval.

epistatic effects are diffi

【中文摘要】It has long been recognized that epistasis orinteractions between non-allelic genes plays an importantrole in the genetic control and evolution of quantitativetraits. However, the detection of epistasis and estimation ofepistatic effects are difficult due to the complexity of epistaticpatterns, insufficient sample size of mappingpopulations and lack of efficient statistical methods. Underthe assumption of additivity of QTL effects on the phenotypeof a trait in interest, the additive effect of a QTL canbe completely absorbed by the flanking marker variables,and the epistatic effect between two QTL can be completelyabsorbed by the four marker-pair multiplicationvariables between the two pairs of flanking markers.

【中文摘要】A permanent mapping population of rice consistingof 65 non-idealized chromosome segment substitutionlines (denoted as CSSL1 to CSSL65) and 82 donorparent chromosome segments (denoted as M1 to M82) wasused to identify QTL with additive effects for two ricequality traits, area of chalky endosperm (ACE) and amylosecontent (AC), by a likelihood ratio test based on stepwiseregression.Target genotypes DG3 andDG4 can be developed by a double cross among the fourlines CSSL4, CSSL28, CSSL49, and CSSL52. In a doublecross, the order of parents affects the frequency of targetgenotype to be selected. Results suggested that the doublecross between the two single crosses (CSSL4 · CSSL28)and (CSSL49 · CSSL52) resulted in the highest frequencyfor DG3 and DG4 genotypes in its derived doubledhaploid derivatives. Using an enhancement selection methodology,alternative ways were investigated to increase thetarget genotype frequency without significantly increasingthe total cost of breeding operations.

【题目】Candida mengyuniae sp. nov., a novel metsulfuron-methyl -resistant yeast.
【中文关键词】甲磺隆抗性;分离鉴定;D1/D2区;梦筠假丝酵母;乙酰乳酸合酶
【英文关键词】metsulfuron-methyl-resistant; isolation and identification; D1/D2 rigion; Candida mengyuniae sp. nov.; acetohydroxyacid synthase
【中文摘要】菌株JHLT的系统发育分析表明,其与假丝酵母Candida vartiovaarae及土星拟威尔酵母Williopsis saturnus的五个变种W. saturnus var. saturnus、var. mrakii、var. sargentensis、var. suaveolens和var. subsufficiens在26S rDNA D1/D2区系统发育树上聚于一个分支。18S rDNA的序列分析同样支持了它们的近缘性。参照菌株与JHLT的D1/D2区序列差异率最小值为3.3%,大于种间差异最小值1%;ITS1区和ITS2区差异率分别多达25%以上和30%以上,这些数据则明显指出了JHLT是一新种的可能性。菌株JHLT可在玉米粉平板上形成假菌丝,不产子囊孢子;发酵D-葡萄糖、蔗糖,不发酵麦芽糖;可以D-葡萄糖、D-半乳糖、蔗糖、海藻糖、甲基-α-D-葡萄糖苷、棉籽糖、菊粉、D-山梨醇、D-甘露醇等为唯一碳源生长,不能以L-鼠李糖、麦芽糖、纤维二糖、水杨苷、熊果苷、松三糖、木糖醇、琥珀酸盐为唯一碳源生长;可以硝酸盐、亚硝酸盐和L-赖氨酸为唯一氮源生长;可在无维生素培养基上生长;最高生长温度45 ° C;脲酶试验反应阴性;DBB试验反应阴性。经鉴定,JHLT(JHLT=CGMCC2.3681T=CBS 10845T)属于假丝酵母属(Candida Berkhout)一个新种,并将该新种命名为Candida mengyuniae sp. nov.。
【英文摘要】An ALS inhibitors herbicide-resistant yeast strain, JHL, was isolated from sulfonylureas-contaminated soil collected in the campus of Nanjing Agriculture University, Jiangsu Province, China. This strain was revealed, by molecular phylogenetic analysis based on 26S rRNA gene D1/D2 region and internal transcribed spacer (ITS), to represent novel specie in the genus williopsbs. The name williopsbs WenXinii sp. nov (type strain JHLT=AS2.3110T=CBS 10357T) is proposed for this novel specie.

【题目】大豆对大豆疫霉菌株Pm14抗性的遗传分析及基因定位
【中文关键词】大豆;大豆疫霉;遗传分析;抗性基因;SSR 标记
【英文关键词】soybean; Phytophthora sojae ; genetic analysis; resistance gene; SSR marker
【中文摘要】摘要:【目的】研究大豆对大豆疫霉菌株 Pm14 的遗传模式,并对其抗性基因进行定位。【方法】采用下胚轴创伤接种方法进行抗性鉴定,利用苏 88-M21 与新沂小黑豆构建的重组自交系群体进行遗传分析,并通过 SSR 技术结合 BSA 方法对苏 88-M21 的抗性基因进行定位。【结果】苏 88-M21 对大豆疫霉菌株 Pm14 的抗性由 1 对主效基因控制,抗病对感病表现为显性。通过分子作图,将抗性基因RpsSu 定位于大豆分子遗传图谱 O 连锁群微卫星标记Satt358 和 Sat_242 之间,与这 2 个标记的遗传距离分别为 3.5 cM 和 7.4 cM。【结论】苏 88-M21 对大豆疫霉菌株Pm14 的抗性是由 1 对单显性基因控制的,并将在苏 88-M21 发现的抗性基因 RpsSu 定位于 O 连锁群。
【英文摘要】Abstract: 【Objective 】 The objective of this study was to reveal the inheritance pattern and map resistance gene to Phytophthora sojae (P. sojae) strain Pm14 in soybean.【Method】 A population of 176 recombinant inbred lines (RIL) derived from the cross of Su88-M21×Xinyixiaoheidou was evaluated for phytophthora resistance using the hypocotyl inoculation technique. The RIL was used to analyze the inheritance of resistance and map the resistance gene to a linkage group.【Result】 The results showed that the resistance of Su88-M21 to strain Pm14 is controlled by a single gene (Rps), and the resistance is dominant to susceptible. RpsSu (resistance gene in Su88-M21 was temporarily designated) is a novel phytophthora re sistance gene which was firstly found on molecular linkage group O, and flanked by Satt358 and Sat_242 with genetic distances 3.5 cM and 7.4 cM. 【Conclusion】 The resistance to Pm14 is controlled by a single dominant gene (Rps), and the resistance gene RpsSu in Su88-M21 was firstly mapped on molecular linkage group O.

【题目】MicroRNA profiling reveals microRNAs are involved in soybean resistance to Phytophthora sojae
【中文关键词】无
【英文关键词】microRNAs,Phytophthora sojae , resistance, microar ray, Glycine max
【中文摘要】无
【英文摘要】Abstract: MicroRNAs (miRNAs), a group of small noncoding RNAs, may ser ve as a class of post-transcr iptional regulators in plant immune systems. Never theless, little is known about their roles in plant immune response to the oomycete pathogens. To identify miRNAs involved in the response of soybean to Phytophthora sojae , we examined expressional patter ns of miRNAs upon infection by P. sojae by microar ray analysis in three soybean cultivars: Williams (susceptible), Conrad (quantitative resistance), and Williams 82 (qualitative resistance). Expression of a number of miRNAs was signif icantly altered upon infection and (or) in the different genotypes. qRT – PCR data with some miRNAs fur ther conf ir med the microar ray results. Comparative analysis of the selected miRNAs and their targeted gene expression datasets uncovered many reciprocally expressed miRNA – target pairs, which could proposed a feedback circuit between miRNA(s) and protein-coding genes. These results may ser ve as a basis for fur ther in-depth studies of miRNAs involved in soybean resistance to P. sojae.

【题目】大豆叶茸毛着生状态的变异及其与豆卷叶螟抗性的相关性
【中文关键词】大豆;叶茸毛着生状态;豆卷叶螟;抗虫性;选择效率
【英文关键词】Soybean; Pubescence status ; Lam prosem a indicata (Fabricius) ; Resistance to insects ; Selecti on effect
【中文摘要】大量观察发现大豆叶柄茸毛着生状态有别于叶片茸毛着生状态。根据对 392份来自全国各生态区的代表性样本的观察,将叶片茸毛着生状态分为匍匐、 半匍匐和斜立 3类,将叶柄茸毛着生状态分为紧贴、 倾斜和直立 3类。发现茸毛着生状态与地理来源有关,纬度增大,斜立型叶片茸毛和直立型叶柄茸毛有增加的趋势。叶片和叶柄茸毛着生状态存在极显著相关性, χ2为 164 . 72。叶片茸毛着生状态和叶柄茸毛着生状态与豆卷叶螟抗性等级间也存在极显著相关, χ2分别为 187 . 46和 123 . 44。匍匐、 半匍匐叶片茸毛和紧贴、 倾斜叶柄茸毛是抗虫性状,而斜立叶片茸毛和直立叶柄茸毛是感虫性状。卷叶率、 虫包在叶片和叶柄茸毛着生状态间都存在显著差异。匍匐型、 半匍匐型叶片茸毛能分别降低 32 . 25%和 3 . 72%的虫包数, 51 . 37%和 6 . 89%的卷叶率。紧贴型、 倾斜型叶柄茸毛能分别降低 25 . 93%和 46 . 40%的虫包数, 42 . 20%和 62 . 81%的卷叶率。大豆叶茸毛着生状态可作为豆卷叶螟抗性的指示性状,用于大豆抗豆卷叶螟的种质筛选和育种。
【英文摘要】Itwas found that the pubescence status on leaf bladeswas different from that on leaf peti oles . According t o a sur2vey on 392 cultivars fr om all the six eco2regi ons of s oybeans in China, the status of pubescence on leaf blade was classifiedas p rostrate, semi2p rostrate and skewed and that on leaf peti ole as app ressed, semi2app ressed and erect . Itwas found that therati o of skewed leaf blade pubescence and erect leaf peti ole pubescence increased al ongwith the increase of geographic lati2tude, indicating the status of leaf pubescence being related with their geographic s ources . Significant correlati onswere detec2ted bet ween status of leaf blade pubescence and that of leaf peti ole pubescence, bet ween status of leaf blade pubescence andresistance t o bean pyralid (Lam prosem a indicate) , and bet ween status of leaf peti ole and resistance t o bean pyralid,with χ 2values as 164 . 72, 187 . 46 and 123 . 44, res pectively . There showed significant differences of percentage of r olled leaves(PRL) and number of r olled leaves (NRL) bet ween different leaf blade and peti ole pubescence types . The PRL of p r ostrateand semi2p r ostrate leaf blade pubescence were 51 . 37% and 6 . 98% l ower than, while those of NRL were 32 . 25% and3172% l ower than the skewed leaf blade pubescence, res pectively . The PRL of app ressed and semi2app ressed leaf peti olepubescence were 42 . 20% and 62 . 81% l ower than,while those of NRL were 25 . 93% and 46 . 40% l ower than the erectleaf peti ole pubescence, res pectively . Therefore, the results showed both the leaf blade pubescence type and the leaf peti olepubescence type can be used as the indicat ors of resistance t o bean pyralid in ger mpasm evaluati on and breeding p r ograms

【题目】Diverse cadherin mutations conferring resistance to Bacillus thuringiensis toxin Cry1Ac in Helicoverpa armigera
【中文关键词】棉铃虫;Bt;钙粘蛋白;抗性;Bt棉花
【英文关键词】Helicoverpa armigera; Bacillus thuringiensis; cadherin; resistance; Bt cotton
【中文摘要】本文采用F1筛选策略和基因克隆技术,揭示了棉铃虫江苏江浦种群钙粘蛋白基因突变的多样性。
【英文摘要】Transgenic cotton expressing Bacillus thuringiensis (Bt) toxins has been widely adopted to control some key lepidopteran pests including the bollworm Helicoverpa armigera. Evolution of resistance to Bt cotton by target pests is a major threat to the continued success of Bt cotton. Previous results revealed 3 null alleles (r1-r3) of a cadherin gene (Ha_BtR) conferring Cry1Ac resistance in H. armigera. An F1 screen of 123 single-pair families was conducted between a Cry1Ac-resistant strain (the SCD-r1 strain, homozygous for the r1 allele of Ha_BtR) and field-derived insects from Jiangpu population (Jiangsu province, China) in 2008. Five new null alleles of Ha_BtR (r4-r8) were identified in six candidate single-pair families. These null alleles were created through either an insertion or a point mutation. Interestingly, intact alleles of Ha_BtR were found in two field-derived insects from another two candidate single-pair families. It suggests that these two field-derived insects may carry novel resistance alleles of Ha_BtR, with missense mutations resulting in a non-functional cadherin protein, or a major dominant mutation at a locus other than cadherin. The resistance allele

frequency of Ha_BtR was detected at an appreciable level (0.024) in the Jiangpu population of H. armigera in 2008. Together with previous findings, a total of eight different resistance alleles of Ha_BtR were identified from three Chinese strains of H. armigera. Mutational diversity of Ha_BtR could impair DNA screening for Bt resistance allele frequency in the field, and an F1 screen should be used routinely for monitoring cadherin-based resistance allele frequencies in H. armigera.

【题目】大豆杂种产量相关的位点及等位变异分析
【中文关键词】大豆; 双列杂交; 杂种优势; 单标记分析; 杂合位点; 纯合位点
【英文关键词】Soybean; Diallel cross; Heterosis; Single marker analysis; Heterozygous loci; Homozygous loci
【中文摘要】选用来源于中国黄淮和美国的熟期组 II~IV 的 8 个大豆品种，按 Griffing 方法 II 设计，配成 28 个双列杂交组合，包括 8 个亲本共计 36 份材料。选用 300 个 SSR 标记，对 8 个大豆亲本进行全基因组扫描，利用基于回归的单标记分析法，对大豆杂种产量和分子标记进行相关性分析，估计等位变异的效应和位点的基因型值，剖析杂种组合的等位变异。结果表明，300 个 SSR 标记中有 38 个与杂种产量显著相关，分布于 17 个连锁群上，其中 D1a 和 M 连锁群上较多，有8个位于连锁定位的QTL区段内(±5 cM)。单个位点可分别解释杂种产量表型变异的11.95%~30.20%。杂种的位点构成中包括有增效显性杂合位点、增效加性纯合位点、减效加性纯合位点和减效显性杂合位点 4 部分，其相对重要性依次递减。从 38 个显著相关的 SSR 标记位点中，遴选出 Satt449、Satt233 和 Satt631 等 9 个优异标记基因位点，Satt449~A311、Satt233~A217 和 Satt631~A152 等 9 个优异等位变异，以及 Satt449~A291/311、Satt233~A202/ 207 和 Satt631~A152/180 等 9 个优异杂合基因型位点。这些结果为理解杂种优势的遗传构成和大豆杂种产量聚合育种提供了依据。
【英文摘要】Single marker regression analysis is an effective way to detect differences among genotypes associated with marker alleles in quantitative traits. Eight soybean parental materials, seven from Huang-Huai region in China and one from the USA with maturity groups II – IV, were used to develop a set of diallel crosses according to Griffing ' s Method II, including the eight parents and their 28 crosses. The molecular data of 300 SSR markers on eight parental materials were obtained and analyzed for association between SSR markers and hybrid yield using the single marker regression analysis. The hybrid crosses were dissected into their allele constitution and the effects of alleles and genotypic values of single locus were estimated. The results showed that 38 SSR loci located on 17 linkage groups were identified to associate with hybrid yield in the diallel crosses with more loci on linkage groups D1a and M. Eight of the 38 loci were located within a region of ±5 cM apart from a known QTL identified from family-based linkage (FBL) mapping. Each of the loci explained 11.95% – 30.20% of the phenotypic variance of hybrid yield. The allele pairs of the hybrids were composed of four parts, i.e. positive dominant heterozygous loci, positive additive homozygous loci, negative additive homozygous loci and dominant heterozygous loci, with their relative importance in a descending order. Among the 38 loci associated with hybrid yield, nine elite (loci such as Satt449, Satt233, and Satt631) and nine elite alleles (such as Satt449 – A311, Satt233 – A217, and Satt631 – A152) were identified. Nine heterozygous allele pairs such as Satt449 – A291/311, Satt233 – A202/207, and Satt631 – A152/180 were detected. These results may provide some relevant information for understanding the genetic basis of heterosis and lay a foundation for hybrid soybean breeding by design.

【题目】大豆质核互作雄性不育系 NJCMS3A 双亲雄性育性基因的 SSR 标记
【中文关键词】大豆; 质核互作雄性不育; 雄性育性遗传; 基因定位
【英文关键词】Soybean; Cytoplasmic-nuclear male sterility; Fertility inheritance; Gene mapping
【中文摘要】利用大豆质核互作雄性不育系 NJMCS3A 的质、 核供体亲本 N21566 和 N21249 构建 F2 和 BC1F1 育性分离群体进行雄性育性的遗传分析与基因定位。结果表明, F1 正反交可育, F2 和 BC1F1 的可育株与不育株分离比例经 χ2测验分别符合 3∶1 和 1∶1, 表明 NJCMS3A 供体亲本雄性育性由一对基因控制, 可育等位基因为显性。该基因可能是 NJCMS3A 的一个恢复基因。选用 793 对 SSR 引物对 F2 和 BC1F1 群体分别进行育性基因定位, 发现该育性基因位于O 连锁群上, 在 Satt331 和 Satt477 标记之间, 与 Satt331、 CSSR133 和 Satt477 标记距离的次序一致, 分别为 8.1~10.4、11.4~16.4 和 13.3~19.2 cM。
【英文摘要】Utilization of the three lines [cytoplasmic-nuclear male-sterile (CMS) line, maintainer line, and restorer line] in producing hybrids with heterosis has been very successful in a number of crops including soybean. The soybean CMS line NJCMS3A was developed through six consecutive backcross generations with N21566 as cytoplasm source and N21249 as nuclear donor. The objective of our study was to reveal the genetic mechanism and mapping the male fertility gene in the two parents of the CMS line NJCMS3A, i.e. N21566 and N21249. The male fertility of (N21566×N21249) F2 and BC1F1 showed that the segregation ratio of fertile to sterile plants fitted the expected ratios of 3:1 and 1:1, respectively, indicating one pair of gene conferring male fertility in the parents of NJCMS3A with dominance allele in N21249 being male fertile. This gene might be one of the restorer genes for the male sterility of NJCMS3A. The mapping results on BC1F1 and F2 showed that out of the 793 randomly selected SSR markers, Satt331, CSSR133 and Satt477 on linkage group O were linked to the male fertility gene Rf with their genetic distances of 8.1 − 10.4, 11.4 − 16.4, and 13.3 − 19.2 cM, respectively, in a same order and its location between Satt331 and Satt477.

【题目】Introgression of a disrupted cadherin gene enables susceptible Helicoverpa armigera to obtain resistance to Bt toxin Cry1Ac
【中文关键词】Cry1Ac;抗性;钙粘蛋白;适合度代价
【英文关键词】Cry1Ac;resistance;cadherin;fitness costs
【中文摘要】通过渐渗杂交,证实了钙粘蛋白与棉铃虫Bt抗性连锁。
【英文摘要】A disrupted allele (r1) of a cadherin gene (Ha_BtR) is genetically associated with incompletely recessive resistance to Bacillus thuringiensis toxin Cry1Ac in a Cry1Ac-selected strain (GYBT) of Helicoverpa armigera. The r1 allele of Ha_BtR was introgressed into a susceptible SCD strain by crossing the GYBT strain to the SCD strain, followed by repeated backcrossing to the SCD strain and molecular marker assisted family selection. The introgressed strain (designated as SCD-r1, carrying homozygous r1 allele) obtained 438-fold resistance to Cry1Ac, >41- fold resistance to Cry1Aa and 31-fold resistance Cry1Ab compared with the SCD strain, however there was no significant difference in susceptibility to Cry2Aa between the integrated and parent strains. It confirms that the loss of function mutation of Ha_BtR alone can confer medium to high levels of resistance to the three Cry1A toxins in H. armigera. Reciprocal crosses between the SCD and SCD-r1 strains showed that resistance to Cry1Ac in the SCD-r1 strain was completely recessive. Life tables of the SCD and SCD-r1 strains on artificial diet in the laboratory were constructed, and results showed that the net replacement rate (R0) did not differ between the strains. The toxicity of two chemical insecticides, fenvalerate and monocrotophos, against the SCD-r1 strain was not significantly different from that to the SCD strain. However, larval development time of the SCD-r1 strain was significantly longer than that of the SCD strain, indicating a fitness cost of slower larval growth is associated with Ha_BtR disruption in H. armigera.

【题目】大豆种皮色相关基因研究进展
【中文关键词】大豆; 种皮色; 基因; 研究进展
【英文关键词】soybean; seed coat color; gene; research progress
【中文摘要】大豆种皮色在从野生大豆到栽培大豆的演变过程中逐渐从黑色变成黄色, 是重要的形态标记, 因此, 大豆种皮色相关基因研究无论对进化理论还是育种实践都具有重要的意义。种皮颜色是通过各种花色苷的沉积而形成的。虽然很多植物色素沉积的分子调控机制比较明晰, 但大豆中控制种皮颜色形成的基因尚未被完全了解。文章综述了控制大豆种皮色基因与位点的相关研究进展, 主要有 I、T、W1、R、O 5 个经典遗传位点, 其中 I 位点被定位在第 8 号染色体(A2 连锁群)一个富含查尔酮合成酶(CHS)的区域, CHS 基因在大豆中是多基因家族且同源性较高;定位于第 6 号染色体(C2 连锁群)T 位点的基因 F3 ’ H 已被克隆和转基因验证,由于碱基缺失导致所编码的氨基酸缺少了保守域 GGEK, 从而不能与血红素结合而丧失功能; R 位点定位在第 9 号染色体(K连锁群)A668-1与 K387-1两标记之间, 可能是 R2R3类 MYB转录因子, 也可能是 UDP类黄酮 3-O糖基转移酶; O 位点定位在第 8 号染色体(A2 连锁群)Satt207 与 Satt493 两标记之间, 其分子特性尚不清楚; W1 位点可能由F3 ’ 5 ’ H 基因控制遗传。
【英文摘要】Seed-coat color has changed from black to yellow during natural and artificial selection of cultivated soybean from wild soybean, and it is also an important morphological marker. Therefore, discovering genes related to the soybean seed-coat color will play a very important role in breeding and evolutionary study. Different seed-coat colors caused by deposition of various anthocyanin pigments. Although pigmentation has been well dissected at molecular level in several plant species, the genes controlling natural variation of seed-coat color in soybean remain to be unknown. Genes related to seed-coat color in soybean were discussed in this paper, including 5 genetic loci (I, T, W1, R and O). Locus I is located in a region that riches in chalcone synthase (CHS) genes on chromosome 8. Gene CHS is a multi-gene family with highly conserved sequences in soybean. Locus T located on chromosome 6 has been cloned and verified, which encodes a flavonoid-3'-hydroxylase. Mutant of F3'H can not interact with the heme-binding domain due to lack of conservative domain GGEK caused by a nucleotide deletion in the coding region of F3'H. Locus R is located between A668-1 and K387-1 on chromosome 9 (linkage group K). This locus may encode a R2R3 MYB transcription factor or a UDP flavonoid 3-O glyco-syltransferase. Locus O is located between Satt207 and Satt493 on chromosome 8 (linkage group A2) and its molecular characteristics has not been characterized. Locus W1 may be a homology of F3'5'H gene.

【题目】A single linkage group confers dominant resistance to Bt toxin Cry1Ac in Helicoverpa armigera
【中文关键词】棉铃虫;Bt;Cry1Ac;显性抗性;AFLP
【英文关键词】Helicoverpa armigera, Bacillus thuringiensis, Cry1Ac, dominant resistance, amplified fragment length polymorphism (AFLP)
【中文摘要】通过AFLP技术,将一种Bt抗性显性基因定位于单条染色体上。
【英文摘要】The BKBT strain of Helicoverpa armigera was derived from a susceptible BK77 strain (collected from Bouake, Cote D ’ Ivoire in 1977) through 30 generations of selection with activated Bacillus thuringiensis δ-endotoxin Cry1Ac. Unlike recessive inheritance of Cry1Ac resistance in H. armigera from previous reports, resistance to activated Cry1Ac in the BKBT strain is dominant. A backcross approach was used to map dominant resistance to Cry1Ac in the BKBT strain. One hundred and forty-seven informative amplified fragment length polymorphism (AFLP) DNA markers covered all 31 linkage groups of H. armigera. Five AFLP markers linked to Cry1Ac resistance in the BKBT strain were on the same autosomal linkage group, which is the only linkage group contributing dominant Cry1Ac resistance in the BKBT strain of H. armigera.

【题目】大豆重组自交家系群体动态株高及其相对生长速率与产量的关系
【中文关键词】大豆; 动态株高; 相对生长速率; 产量; 相关
【英文关键词】Soybean; Dynamic plant height; Relative growth rate; Yield; Correlation
【中文摘要】提高产量潜力始终是大豆育种的重要目标, 研究产量相关性状是解析产量重要途径之一。大豆株高影响产量, 但存在不确定性。本研究利用一套包含 212 个家系的大豆重组自交家系(RIL), 于 2008—2009 年连续 2 年测定各家系动态株高, 并计算相对生长速率, 研究与产量的关系, 以期为大豆产量改良中对株高的选择提供参考信息。试验结果表明: (1) 产量和株高变幅分别为 1 000~5 000 kg hm – 2和 38~103 cm, 说明样本有较大代表性。(2) 出苗后 20 d的株高即与产量具极显著正相关, 随生长进程, 相关系数逐渐增大, 至株高生长停止达到最大。株高生长速率前期与产量呈显著正相关, 后期与产量具负相关, 说明后期过快增加株高不利于产量。(3) 在试验范围内, 株高与产量呈负指数回归关系, 随株高增加, 产量逐渐增加, 当株高为 80 cm 时, 随株高增加, 产量的增加逐渐缓慢。发现株高的变异在 70~90 cm 之间时, 均能获得 4 000 kg hm – 2产量。本文还简要讨论了重组自交家系用于表型分析的优势, 以及在大豆产量育种中如何对株高进行选择。
【英文摘要】Selection for increasing yield potential is consistantly the main goal of soybean breeding. Plant height influences yield with uncertainty in soybean. A population of 212 recombinant inbred lines (RIL) was used to analyze the correlation of dynamic plant height and its relative growth rate with yield across two-year field experiments. The results were as followed: (1) The range of yield and plant height was 1 000 – 5 000 kg ha – 1, 38 – 128 cm respectively, which indicated the sample in the study had a good representativeness. Significant differences between plant height and its relative growth rate at the same developmental stages were observed among the RILs. (2) Yield was significantly and positively correlated with plant height at 20 days after emergence, and the correlation increased with the growing stages and the highest correlation occurred when plant height culminated. Yield was positively correlated with relative growth rate in plant height at earlier growth stages and negatively correlated at later stages, indicating that faster growth in plant height at later stage would not be beneficial to higher yield. (3) A negative exponential regression mode was observed in the relationship between yield and plant height. Yield increased steeply when plant height was less than 80 cm and this trend would slow down when plant height was over 80 cm. We found yields reached 4 000 kg ha – 1 when plant heights were 70 – 90 cm. The merits and demerits of phenotypic analysis using RIL and how to select plant height in soybean breeding were discussed.

【题目】Disruption of Ha_BtR alters binding of Bacillus thuringiensis δ-endotoxin Cry1Ac to midgut BBMVs of Helicoverpa armigera
【中文关键词】配基印迹;钙粘蛋白
【英文关键词】Ligand blotting; Cadherin
【中文摘要】通过配基结合和印迹技术,发现了钙粘蛋白r1突变对毒素受体结合具有一定影响。
【英文摘要】Disruption of Ha_BtR (a cadherin gene) is genetically linked to resistance to Cry1Ac δ-endotoxin of Bacillus thuringiensis in the GYBT strain of Helicoverpa armigera. Brush border membrane vesicles (BBMVs) prepared from midguts of both the Cry1Ac-resistant GYBT strain (homozygous for a deletion knockout of Ha_BtR) and the susceptible GY strain (homozygous for

the wild type of Ha_BtR) possessed saturable and specific binding ability to 125I-Cry1Ac. The binding affinity (Kd) of the GY strain was significantly lower than that of the resistant GYBT strain, whereas their binding site concentrations (Bmax) were similar. When midgut BBMVs was reacted directly with streptavidin conjugated to horseradish peroxidase, the GY strain had very clear 120- and 85-kDa protein bands, which indicated the 120- and 85-kDa bands are endogenous biotin-containing proteins. However, the GYBT strain nearly lost these two biotin-containing proteins. Ligand blotting with biotinylated Cry1Ac toxin showed midgut BBMVs of the GY strain contain five protein bands of 210-, 190-, 150-, 120- and 85-kDa respectively, however BBMVs of the GYBT strain contain only two protein bands of 150- and 120-kDa. 120-kDa bands may consist of two proteins with coincidentally same molecular weight (putatively, an APN and a biotin-containing protein). Our results showed that binding pattern of Cry1Ac to midgut BBMVs of H. armigera was altered quantitatively and qualitatively by knockout of Ha_BtR. There are multiple Cry1Ac-binding proteins in the midgut of susceptible H. armigera, but only the Ha_BtR can be considered as a putative functional receptor of Cry1Ac. Possible involvement of other receptor proteins in the intoxication process in vivo could not be excluded.

【题目】大豆重组自交系群体 NJRIKY 遗传图谱的加密及其应用效果

【中文关键词】大豆; 遗传连锁图谱; SSR 标记; QTL

【英文关键词】Soybean; Genetic linkage map; SSR markers; QTL

【中文摘要】作物基因组研究, 包括基因或数量性状位点(QTL)定位、图位克隆以及物理图谱构建等, 首先必须建立具有丰富标记信息的高密度遗传连锁图谱。由科丰 1 号和南农 1138-2 杂交组合衍生的重组自交系群体 NJRIKY 已经构建了 4 张大豆遗传连锁图谱, 但由于遗传信息和标记数目不够充分, 在基因和 QTL 作图时仍然存在精确度和准确度问题。为增加 NJRIKY 图谱密度, 本研究在 967 对 SSR 引物中获得了 401 个多态性 SSR 标记。结合其他分子数据, 使用作图软件 Mapmaker/Exp 3.0b, 获得一张含有 553 个遗传标记, 25 个连锁群, 总长 2 071.6 cM, 平均图距 3.70 cM 的新遗传连锁图谱, 其中 SSR 标记 316 个, RFLP 标记 197 个, EST 标记 39 个, 形态标记 1 个。连锁群上大于 20 cM 的标记间隔由原来 42 个减少到 2 个。原图谱的 3 个 SMV 抗性基因定位于 D1b 连锁群末端的开放区间上且仅与一个RFLP 标记连锁, 利用加密图谱对 Rsc-3、Rsc-7、Rsc-9、Rsc-13、Rsa、Rn1 和 Rn3 等 7 个 SMV 抗性基因重定位, 全部位于 D1b 连锁群, 与相邻分子标记距离均小于 6 cM, 其中 Rsc-9、Rn1、Rsa 的距离小于 1 cM, Rsc-13 与 EST 标记GMKF168a 共分离。对本群体农艺性状进行 QTL 重定位, 获得 8 个性状相关的 42 个主效 QTL, 其中 20 个 QTL 遗传贡献率大于 10%, 与原图谱比较, 新定位的各 QTL 的标记区间明显缩短, 与相邻标记的连锁更加紧密。

【英文摘要】A high-density genetic linkage map with informative markers is essential for plant genome analysis, including gene mapping, identification of quantitative trait locus (QTL), map-based cloning, and physical map construction. Though four genetic linkage maps for the recombinant inbred line population NJRIKY derived from (Kefeng 1×Nannong 1138-2) have been established already, there are still problems of precision and accuracy in mapping genes and QTLs due to insufficiency of genetic information and number of markers. A total of 401 polymorphic SSR markers were screened out from 967 ones for density-enhancement of the previous maps. Along with other marker data, a new genetic linkage map was constructed by using Mapmaker/Exp 3.0b, with 553 markers, including 316 SSR, 197 RFLP, 39 EST and one morphologic markers, spanning 25 linkage groups, covering total length 2 071.6 cM of the soybean genome, with an average marker interval distance of 3.70 cM. In comparison with the old map, the number of gaps larger than 20 cM decreased from forty-two to two on the enhanced map. Using this map to relocate the seven SMV resistant genes, Rsc-3, Rsc-7, Rsc-9, Rsc-13, Rsa, Rn1, and Rn3 were mapped on LG D1b again with distances to the flanking markers all less than 6 cM, among them, Rsc-9, Rn1, and Rsa less than 1 cM and Rsc-13 co-segregating with EST-SSR marker GMKF168a. After re-mapping the QTLs for eight agronomic traits, 42 QTLs were detected on 12 linkage groups, with 20 of them accounted for more than 10% of the total variation, respectively, and their marker intervals obviously shortened.

【题目】Mutated cadherin alleles of Helicoverpa armigera conferring resistance to Bacillus thuringiensis toxin Cry1Ac detected in the field
【中文关键词】F1筛选;钙粘蛋白等位基因
【英文关键词】F1 screen; Cadherin allele
【中文摘要】从河南安阳棉铃虫田间种群分离到两个Cry1Ac相关钙粘蛋白等位基因。。
【英文摘要】The cotton bollworm, Helicoverpa armigera is the major insect pest targeted by transgenic Bt cotton in the Old World. The evolution of resistance by this pest to Bt toxins is the main threat to the long-term effectiveness of transgenic Bt cotton. A deletion mutation allele (r1) of a cadherin gene (Ha_BtR) was previously identified as genetically linked with Cry1Ac resistance in a laboratory-selected strain of H. armigera. Through a biphasic screen strategy, two new cadherin alleles (r2, r3) associated with Cry1Ac resistance in H. armigera were successfully trapped from a field population collected from the Yellow River cotton area of China in 2005. The r2 and r3 alleles were created by insertions of a long terminal repeat of a retrotransposon (designated as HaRT1) and the intact HaRT1 at the same position in exon 8 of Ha_BtR respectively, which results in a truncated cadherin containing only two ectodomain repeats in the N terminal of Ha_BtR. This is the first time that Bt resistance alleles of a target insect of Bt crops have been successfully detected in the open field. It is also demonstrated that bollworm larvae carrying two resistance alleles can complete development on Bt cotton. The cadherin locus should be an important target for intensive DNA-based screening in field populations of H. armigera.

【中文摘要】中黄 13是我国目前种植面积最大的大豆品种,适宜推广范围覆盖黄淮海流域夏大豆区、 北方春大豆区、 南部和南方多作大豆区部分区域,表现出较强的适应能力。为分析中黄 13广适应的机制, 在不同光周期条件下研究中黄 13开花期、 成熟期等生育期性状,株高、 节数、 分枝数等农艺性状和蛋白质含量、 脂肪含量等品质性状对光周期的反应,比较中黄 13不同性状间以及中黄 13与成熟期相近的品种中黄 24和凤交 66 - 12间光周期反应敏感性的差异,并分析中黄 13在各级区域试验中的产量稳定性, 以期为中黄 13的进一步推广和广适应大豆新品种选育提供理论依据。结果表明: 中黄 13在短日照 (12 h)、 长日照 (16 h)和北京自然光照条件下均能正常开花结实, 生育期性状的光周期反应敏感性弱于中黄 24和凤交 66 - 12。随光照长度的增加, 中黄 13的株型和农艺性状变化较为明显,但与中黄 24和凤交 66 - 12相比, 其株高、 主茎节数、 分枝数、 顶端花序荚数、 单株有效荚数、 单株粒数和单株粒重等性状的光周期反应敏感性均较弱,表现出较好的稳定性,但其蛋白质含量受光周期影响较大。综合分析光照处理和区域试验的结果,认为光周期反应相对钝感是中黄 13广适应的重要原因。

【题目】黄淮地区大豆重要亲本间产量杂种优势、配合力及其遗传基础
【中文关键词】大豆; 产量; 杂种优势; 一般配合力; 特殊配合力; 亲本系数; SSR 标记
【英文关键词】Soybean; Yield; Heterosis; General combining ability; Specific combining ability; Coefficient of parentage; SSR marker
【中文摘要】2003—2005 年以选自黄淮地区及美国的 8 个大豆重要亲本品种(系)及其组配的 28 个双列杂交组合为材料, 分析大豆亲本间的产量杂种优势及其配合力, 探讨高优势组合的遗传基础, 包括杂种优势与亲本系数、 SSR 标记遗传距离的相关。结果表明: (1) 黄淮地区大豆亲本间存在产量超亲优势, 平均 20.39%, 组合间差异甚大, 变幅为 − 5.34%~76.88%, 优选出豫豆 22×晋豆 27、淮豆 4 号×晋豆 27、诱变 30×蒙 90-24, 超亲优势分别为 76.88%、29.90%和 34.42%, 超标率均在 25.00%以上, 晋豆 27 和诱变 30 为优秀亲本材料。单株荚数及单株粒数的优势和产量优势相对一致。(2) 大豆亲本间产量杂种优势既与双亲一般配合力之和及特殊配合力有关, 又不完全相关。高优势高产组合的亲本产量配合力特点为亲本之一具有较高的一般配合力, 或双亲具有较高的一般配合力之和, 兼有较高的特殊配合力。单株荚数和单株粒数的情况和产量一致。(3) 按亲本系数聚类和按 SSR 标记遗传相似系数聚类揭示的 8 个亲本间的遗传关系相对一致, 均分为两组, 一组包含 6 个黄淮中、南部品种(系), 另一组包含 1 个山西和 1 个美国品种。要获得高优势高产组合, 亲本间必须具有一定的遗传距离, 但遗传距离大并不一定都高产高优势, 还有其他因素决定杂种优势。
【英文摘要】In recent years, breeding for hybrid cultivars of soybean [Glycine max (L.) Merr.] for utiliazation of heterosis has been paid great attention, but there are few reports on the fundamental aspects regarding the heterosis in soybeans.. In fact, for a real utilization of hybrid soybean, the important prerequisite is high heterosis. Therefore, a fundamental effort in hybrid breeding is the choice of parents and identification of superior hybrid combinations. In this paper, heterosis and combining ability were determined using eight key parental materials, including seven from Huang-Huai region and one from US as well as their 28 F1 diallel crosses in Huai ’ an, Jiangsu, China from 2003 to 2005, and relationships between F1 performance and its pedigree-based and SSR-based genetic distances were investigated. The results showed that there were heterobeltiosis in yield among parents in Huang-Huai region with the average heterobeltiosis of 20.39%, and a large difference among hybridized combinations with a range from − 5.34% to 76.88%. We screened combinations, among them, Yudou 22 × Jindou 27, Huaidou 4 × Jindou 27, and Youbian 30 × Meng 9024 had the heterobeltiosis in yield of 76.88%, 29.90%, and 34.42%, respectively. Among these parents used above, Youbian 30 and Jindou 27 were the elite. Heterosis of pods per plant and seeds per plant were relatively in accord with yield heterosis. Yield heterosis in parents was related to general combining ability (GCA) and specific combining ability(SCA). One of parents has high GCA or both have high GCA and high SCA in high-yield combinations. Parents-based cluster and SSR-based cluster analysis revealed that genetic relationships for eight parents were basically consistent, and eight parents were classified into two groups, one including six varieties from middle and south of Huang-Huai region, the other consisting of one from Shanxi and one from America. Therefore, certain genetic distance is require for a cross with high heterosis and high yield, but genetic distance is not an only determinant factor for high-yield heterosis.

【题目】Computational identification of new porcine microRNAs and their targets
【中文关键词】EST, 同源搜索,microRNA, 猪
【英文关键词】EST, Homology search, microRNA, pig
【中文摘要】微RNA(miRNA)代表一种新发现的一类非蛋白编码～22个核苷酸的小分子RNA,在多种生物学过程中扮演着重要降解目标mRNA或抑制mRNA的翻译的角色。在这里,我们提出了一个表达序列标签(EST)为基础的新型猪miRNA的检测相结合的办法。这是由以前已知的miRNA序列,从智人(人)和小家鼠(小鼠)爆野猪(猪)EST数据库的。一系列的过滤条件后,共65个新的miRNA被检测。我们使用这些新的潜在的miRNA序列,进一步获得公开可用的猪基因数据库从NCBI和检测48586使用的软件RNA杂交的潜在目标命中。到目前为止,人类和小鼠,少的miRNA(只有54个miRNA的),确定了野猪种。这65个新的miRNA和它们的目标在猪已经通过了miRHelper的产量数据,可以帮助我们更好地理解可能发挥的作用的miRNA在调节猪的生长和发展的。这些结果表明,EST分析是一个很好的替代策略,确定新的miRNA的候选人,他们的目标和其他基因。
【英文摘要】MicroRNAs (miRNAs) represent a newly identified class of non-protein-coding ~22 nt small RNAs which play important roles in multiple biological processes by degrading targeted mRNAs or repressing mRNA translation. Here we present an expressed sequence tag (EST)-based combined approach for the detection of novel porcine miRNAs. This was initiated by using previously known miRNA sequences from Homo sapiens (human) and Mus musculus (mouse) to blast the databases of Sus scrofa (pig) EST. A total of 65 new miRNAs were detected following a range of filtering criteria. Using these new potential miRNA sequences, we further obtained the publicly available porcine mRNA database from NCBI and detected 48 586 potential target hits using a software RNA hybrid. So far, compared to human and mouse, fewer miRNAs (only 54 miRNAs) were identified in Sus scrofa species. These 65 new miRNAs and their targets in pig have been run through miRHelper to yield data that may help us better understand the possible role of miRNAs in regulating the growth and development of pigs. These findings suggest that EST analysis is a good alternative strategy for identifying new miRNA candidates, their targets and other genes.

【题目】开花后不同光周期条件下大豆农艺性状和品质性状的 QTL 分析
【中文关键词】大豆; 开花后光周期; 农艺性状; 品质性状; QTL 定位
【英文关键词】Soybean; Post-flowering photoperiod; Agronomic trait; Quality trait; QTL mapping
【中文摘要】以开花期相近的181个大豆重组自交系(RIL)为材料, 研究开花后不同光照长度对大豆主要农艺性状的影响, 并在利用 SSR 标记构建大豆遗传图谱的基础上, 分别在长日(16 h)和短日(12 h)条件下检测与主要农艺性状及其光周期敏感度(PS)相关的 QTL。结果表明, 开花后光照处理对大豆农艺性状和品质性状有较大影响, 不同性状的光周期敏感度差异明显, 株高>主茎节数>蛋白质含量、脂肪含量>百粒重>单株荚数>蛋白质和脂肪总量。利用复合区间作图法检测到 12 个与株高、主茎节数、单株荚数、百粒重、蛋白质和脂肪总量等性状及各性状对开花后光周期处理的敏感度相关的 QTL, 分别定位于 A1、A2、B1、B2、C1、D1a、F、L 等 8 个连锁群上。其中, 在短日条件下检测到 4 个 QTL, 可解释的遗传变异范围在 11.37%~26.63%之间; 在长日条件下检测到 3 个 QTL, 可解释的遗传变异范围在 11.84%~27.85%之间; 检测到 5 个与不同性状光周期敏感度有关的 QTL, 可解释相对应性状表型变异的范围在6.15%~21.44%之间。针对同一性状, 未检测到在长日和短日条件下均起作用的主效 QTL, 说明开花后光周期对大豆产量和品质性状相关基因的表达有较大影响。
【英文摘要】Most of agronomic and quality traits of soybean (Glycine max L. Merr.) are quantitatively inherited, and sensitive to photoperiod. In this study, 181 recombinant inbred lines (RIL) of F10 generation were used to analyze the post-flowering photoperiod

effects on yield and quality traits of soybean, and 129 SSR markers were used to map QTLs associated with the above traits under both long day (LD) and short day (SD) conditions and their photoperiod sensitivity (PS). The results showed that photoperiod greatly affected the performances of agronomic and quality traits of soybean, and the photoperiod sensitivity of the traits were plant height>node number on the main stem>protein content and oil content>100-seed weight>pod number per plant>total percentage of protein and oil. By using CIM (composite interval mapping) method, a total of 12 QTLs associated with the agronomic and quality traits and their sensitivity to the post-flowering photoperiod were identified and mapped on eight linkage groups including A1, A2, B1, B2, C1, D1a, F, and L. Among the QTLs mentioned above, four were identified under SD and could explain 11.37% – 26.63% of phenotypic variation, and three were identified under LD condition and could explain 11.84% – 27.85% of phenotypic variation. The other five were associated with photoperiod sensitivity of various traits and could explain 6.15% – 21.44% of phenotypic variation. For the same individual agronomic or quality trait, no major QTL was detected under both SD and LD, indicating that post-flowering photoperiod dramatically regulates the expression of genes determining yield and quality traits, and the agronomic and quality traits of soybean are sensitive to environmental factors. It was drawn that photoperiod sensitivity is a key index for adaptability improvement of soybean. For breeding elite varieties with ideal yield potential, quality and stress tolerance, the photoperiod-insensitive genes related to various traits should be explored and pyramided with other needed genes.

【题目】MicroRNA expression profiles of porcine skeletal muscle
【中文关键词】同源搜索,芯片,小RNA, 猪
【英文关键词】homology search, microarray, microRNA, pig.
【中文摘要】为了研究猪骨骼肌中miRNA的作用,本研究检测了大白公猪×二花脸母猪的杂种猪在90胎龄和120日龄时的背最长肌样品中miRNA的表达谱。首先,我们用已知的人和小鼠的miRNA序列在猪的EST序列中进行Blast, 经过一系列的筛选后得到了98个新的候选猪miRNA。随后,用这些候选猪miRNA 和73个已知的猪的miRNA来做猪的miRNA 芯片分析。结果,16个新鉴定的猪miRNA和31个以前已知的猪miRNA被检测在猪的骨骼肌中有表达。在90胎龄时,miR-1826、miR-26a、miR-199b和let-7 表达量最高,而在120日龄时miR-1a、miR-133a、miR-26a和miR-1826表达量最高。从NCBI上下载猪的mRNA序列,用RNAhybrid软件计算了这47个从miRNA芯片中检测到的猪miRNA在猪骨骼肌的mRNA中潜在的靶位点。总之,本研究预测并验证了16个新的miRNA基因,得到了18个miRNA家族潜在的44个靶位点,检测了不同发育时期猪骨骼肌中miRNA的表达谱。这些研究结果为进一步研究猪miRNA的转录后调控提供了有价值的参考。
【英文摘要】MicroRNAs (miRNAs) are endogenous non-coding RNAs of 22 nucleotides in length that play important roles in multiple biological processes by degrading targeted mRNAs or repressing mRNA translation. To evaluate the roles of miRNA in porcine skeletal muscle, miRNA expression profiles were investigated using longissimus muscle tissue from pigs at embryonic day 90 (E90) and postpartum day 120 (PD120). First, we used previously known miRNA sequences from humans and mice to perform blast searches against the porcine expressed sequence tag (EST) database; 98 new miRNA candidates were identified according to a range of filtering criteria. These miRNA candidates and 73 known miRNAs (miRBase 13.0) from pigs were chosen for porcine miRNA microarray analysis. A total of 16 newly identified miRNAs and 31 previously known miRNAs were detected in porcine skeletal muscle tissues. During later foetal development at E90, miR-1826, miR-26a, miR- 199b and let-7 were highly expressed, whilst miR-1a, miR-133a, miR-26a and miR-1826 showed highest abundance during the fast growing stage at PD120. Using the 47 miRNAs detected by the microarray assay, we performed further investigations using the publicly available porcine mRNA database from NCBI and computed potential target hits using the software RNAHYBRID. This study identified 16 new miRNA candidates, computed potential target hits for 18 miRNA families and determined the miRNA expression profiles in porcine skeletal muscle tissues at different developmental stages. These results provide a valuable resource for investigators interested in post-transcriptional gene regulation in pigs and related animals.

【题目】Optimization of IgG conjugation with R-phycoerythrin from Porphyra yezoensis
【中文关键词】藻红蛋白,免疫球蛋白G,结合,荧光探针,制备,优化
【英文关键词】Phycoerythrin . IgG . Conjugation .Fluorescence probes . Preparation . Optimization
【中文摘要】要优化的R-藻红蛋白(R-PE)和抗体,不同的摩尔比的异双功能试剂的N-琥珀酰亚胺基-3-2-吡啶基二硫代丙酸酯(SPDP),R-PE进行了测试的R-PE推导成R之间的化学缀合-PE-PDP,以及不同的二硫苏糖醇(DTT)到IgG抗体的摩尔比进行了测试对IgG的硫醇化。结果表明,在由紫外线(UV)分光光度法测定的最好的产品产量方面,最佳的R-PE的SPDP的摩尔比为40:1用于PE的推导,和,DTT与IgG抗体为硫醇化500:1。 R-PE标记的二次抗体,产生的交联PE-PDP和巯基化的抗体。在进一步纯化之后,紫外光谱和非变性聚丙烯酰胺凝胶电泳确定其高纯度和分子量。最后,在结合抗原特定的第一抗体,应用R-PE标记的IgG作为二次抗体的荧光免疫测定法,并成功地检测到抗原上的硝酸纤维素膜,以及SMCC-7721细胞的细胞内抗原的斑点。本研究条斑紫菜R-PE荧光抗体的制备提供了一个可行的方法,并演示了荧光标记效率高的产品和良好的免疫反应。
【英文摘要】To optimize the chemical conjugation between R-phycoerythrin (R-PE) and antibody, different molar ratios of the heterobifunctional reagent N-succinimidyl- 3-2-pyridyldithio propionate (SPDP) to R-PE were tested for R-PE derivation into R-PE-PDP, and different molar ratios of dithiothreitol (DTT) to IgG were tested for IgG thiolation. The results showed that in terms of best product yields determined by ultraviolet (UV) spectrophotometry, the optimal molar ratio of SPDP to R-PE was 40:1 for PE derivation, and that of DTT to IgG was 500:1 for thiolation. R-PE-labeled secondary antibody was produced by cross-linking PE-PDP and thiolated IgG. After further purification, UV spectra and native polyacrylamide gel electrophoresis determined its high purity and molecular weight. Finally, in conjunction with antigen-specific first antibodies, the R-PE-labeled IgG was applied in fluorescence immunoassays as secondary antibody and successfully detected antigens spotted on nitrocellulose membrane as well as intracellular antigen in SMCC-7721 cells. This study provides a feasible method of fluorescence antibody preparation from R-PE of Porphyra yezoensis and demonstrates high fluorescent labeling efficiency and good immunologic reactivity of the product.

【题目】双列杂交设计的主-微位点组遗传分析方法研究
【中文关键词】双列杂交遗传设计; 主基因加微基因遗传模型; 主位点组; 微位点组; 逐步回归
【英文关键词】Diallel cross design; Major gene and polygene model; Major locus group; Minor locus group; Stepwise regression
【中文摘要】数量性状遗传研究通常以双亲本杂交后代为对象, 而作物育种中常涉及多个具有优良性状的亲本作为有利基因的供体, 因此有必要研究多个材料间的遗传关系, 以便从中选择最佳亲本组合, 这对杂种品种选育尤其重要。本研究在以往位点组分析方法的基础上, 将其扩展为主基因+多基因遗传模型框架下双列杂交设计的主-微位点组遗传分析方法, 将微位点组从原来的剩余部分中分离出来。该方法针对双列杂交设计的主位点组和微位点组及其与环境互作的统计遗传模型提出了主位点组检测与效应估计和微位点组效应估计的逐步选入回归法; 因模拟实验发现逐步选入回归法的 F 测验有偏, 提出了 F 测验的调整方法。利用模拟方法评估了遗传率、主位点组个数、增效基因型频率、主位点组间相似性和微基因效应等因素与方法功效的关系。然后通过模拟实验数据和油菜实际试验数据的分析验证了所提方法的应用效果。本研究建立的双列杂交设计的主-微位点组遗传分析方法为杂种品种的亲本选配提供了方法和理论依据。
【英文摘要】Studies on inheritance of quantitative traits are usually based on two-way crosses, while in plant breeding, knowledge on inheritance of traits among a group of parental materials is needed since elite genes or QTLs are scattered in different materials. It is

especially true in breeding for hybrids. Based on our previous studies on major locus group analysis among a set of parents, we aimed at extending the analysis to major-minor locus groups in diallel cross experiment. The statistical method was derived from a forward stepwise regression for identifying major locus groups and estimating their genetic effects as well as the estimation of genetic effect of collective minor locus groups. In which the procedure of adjusting F criterion was raised since biased F-test was found in a simulation study. Then the procedure was used to evaluate the relationship between its power and some factors, including heritability value, number of major locus groups, genotypic frequency with increment alleles, similarity among major locus groups and effect of collective minor locus groups. A simulated diallel cross experiment was used to demonstrate the effectiveness of the procedure. A diallel cross experiment on days to flowering of rapeseed was given to show the statistical steps and its utilization. The procedure of major-minor locus group analysis in diallel crosses based on major gene plus polygene inheritance model provides a way to analyze the genetic constitution of a group of parental materials for obtaining the best hybrid combinations.

【题目】亚洲地区大豆育成品种幼苗期耐淹性鉴定和优选
【中文关键词】大豆;育成品种; 亚洲;耐淹性; 遗传变异
【英文关键词】Soybean ; Released cultivar ; Asia ; Submergence to lerance ; Geneticvariation
【中文摘要】以亚洲大豆育成品种为对象, 评价其幼苗期耐淹性,揭示其遗传变异特点,从而为耐涝育种提供种质基础。采用我国黄淮、 南方及亚洲其它 15国的 350份大豆育成品种,以相对死苗率为主要鉴定指标, 结合叶片相对失绿率与相对萎蔫率, 在苗期进行大豆耐淹性盆栽鉴定。结果表明: 以相对死苗率为主的指标体系可以有效鉴定大豆品种的苗期耐涝性。亚洲品种群体存在丰富的耐淹性遗传变异, 相对死苗率变幅为 4 . 8% ~ 212 . 0%。中国黄淮、中国南方、 东亚、 东南亚和南亚 5个区域的品种均呈现中间多、 两头少的单峰态分布, 遗传变异系数均高于21 24%, 耐淹性变异丰富,尤其中国黄淮地区覆盖了全群体相对死苗率变幅。各地区均存在耐淹品种, 山东、 江苏相对较多; 从 5个区域中依次优选出 7、 4、 1、 1、 2 , 共 15份耐淹性种质;系谱追踪发现莒选 23 、 南农 493- 1 、 黔豆 2号的耐淹性可能传递给后代; 4份国外耐淹性品种兼具有抗病性可作为亲本拓宽中国耐涝育种的种质基础。

【中文关键词】基因表达,胰岛素样生长因子,猪,骨骼肌
【英文关键词】Gene expression; Insulin-like growth factor; Pig; Skeletal muscle
【中文摘要】在这项研究中,我们检测到的表达,IGF-I,IGF-II,IGF-IR,IGF-IIR和IGFBP-3 mRNA在50(E50),70(E70),90(E90)天的妊娠,和1(D1),20(D20),70(D70),120(D120)和180(D180)天(LD)的背最长肌和半腱肌(ST)的,从约克夏公猪×二花脸猪的年龄母猪(YE)交叉以及一个二花脸公猪×约克夏母猪(EY)交叉。我们发现,骨骼肌组织中IGF-I和IGF-II mRNA的表达差异的基础上发育年龄和相互交叉型(P <0.05)。 IGF-I基因的表达呈现波动上升的趋势。与此相反,IGF-II在出生后呈波动下降的趋势。 IGF-IR mRNA的水平明显高于出生前,出生后,除了ST D120的EY猪在(P <0.05)。随着年龄的增长和相互交叉型(P <0.05),IGF-IIR和IGFBP-3基因的表达显着改变。 IGF-I,IGF-II,IGFBP-3的表达呈正相关,与IGF-IR50E180D。这些数据表明,在肌肉组织中从正反杂交猪在不同的发展阶段和IGF系统基因的表达具有特定的发育模式在一定时期的发展,可能会出现与表达。我们的研究结果可能为猪的分子育种提供了宝贵的资源。
【英文摘要】In this study, we detected the expression of IGF-I, IGF-II, IGF-IR, IGF-IIR, and IGFBP-3 mRNA at 50 (E50), 70 (E70), and 90 (E90) days of gestation, and 1 (D1), 20 (D20), 70 (D70), 120 (D120), and 180 (D180) days of age in the longissimus dorsi (LD) and the semitendinosus (ST) of pigs from a Yorkshire boar × Erhualian sow (YE) cross as well as a Erhualian boar × Yorkshire sow (EY) cross. We found that the expression of IGF-I and IGF-II mRNA in skeletal muscle tissues differed based on developmental age and reciprocal cross type (P < 0.05). The expression of IGF-I mRNA exhibited a fluctuant ascending trend. In contrast, IGF-II showed a fluctuant descending trend after birth. The levels of IGF-IR mRNA were higher before birth compared with after birth except for the ST of EY pigs at D120 (P < 0.05). The expression of IGF-IIR and IGFBP-3 mRNA remarkably changed with age and reciprocal cross type (P < 0.05). IGF-I, IGF-II, and IGFBP-3 mRNA were positively correlated with IGF-IR from 50E to 180D. These data suggest that the expression of IGF-system genes exhibits specific developmental patterns in the skeletal muscle tissues of pigs from reciprocal crosses at different developmental stages and may show linked expression during certain periods of development. Our results may provide a valuable resource for the molecular breeding of pigs.

【题目】以光周期处理与分期播种试验综合鉴定大豆品种的光温反应
【中文关键词】大豆; 生态类型; 光周期; 温度; 光温互作
【英文关键词】Soybean; Ecotype; Photoperiod; Temperature; Photothermal interaction
【中文摘要】设置短日照(12 h)和长日照(16 h)两种光周期处理, 并以春播模拟低温、夏播模拟高温条件, 形成长日+低温、长日+高温、短日+低温、短日+高温 4 种光温组合。2007 年对近年育成的 10 个北方春大豆[Glycine max (L.) Merr.]品种(系)和 18 个黄淮海夏大豆品种(系)进行了光温反应特性鉴定。2008 年对 50 份材料进行了光周期反应鉴定。结果表明, 不论在低温(春播)还是高温(夏播)条件下, 短日照均加快大豆的发育进程, 导致开花提前; 不论在长日照还是短日照条件下, 高温均减少出苗至初花的日数。光周期和温度对大豆的发育存在明显的互作, 随着温度的升高, 短日照促进大豆发育的效应有所加强; 随着日照的缩短, 高温加快发育的作用也有所增大。 供试大豆品种生态类型在光周期反应敏感度(PRS)、温度反应敏感度(TRS)及光温综合反应敏感度(PTCRS)等方面均存在显著差异。北方春大豆品种的上述 3 个指标均小于黄淮海夏大豆品种, 但前者在不同光照条件下的温度反应敏感度差值和在不同温度条件下的光周期反应敏感度差值均较后者高, 说明北方春大豆品种光温互作效应较强。

【英文摘要】Soybean [Glycine max (L.) Merr.] is a short-day crop that favors temperate weather. There have been a lot of studies on the responses to photoperiod, temperature or photothermal comprehensive regimes in soybean. However, little work has been conducted in the interactive effects of photoperiod and temperature on the development of soybean. To fully understand the photothermal responses of soybean and to identify the varietal variations in these traits, we designed two photoperiodic treatments of 12 h (short day or SD) and 16 h (long day or LD) integrated with two thermal conditions, i.e. high temperature (HT) (summer seeding in Beijing) and low temperature (LT) (spring seeding) in the current study. In 2007, the responses to the photoperiod, temperature, and photoperiod-temperature combinations of 10 spring sowing soybean varieties (lines) from the Northeast and 18 summer sowing varieties (lines) from Yellow-Huai-Hai River Valleys of China were identified in 4 photothermal regimes (LD+LT, LD+HT, SD+LT, SD+HT). In 2008, 50 varieties (lines) were used to test the photoperiodic responses. The results showed that SD promoted the developmental rate of soybean regardless of the temperature conditions; HT shortened the number of the days from emergence to flowering no matter whether the photoperiod was long or short. There was significant interaction between temperature and photoperiod from emergence to flowering. With the increase of temperature, the promotive effect of SD on developmental rate of soybean was enhanced, and the HT hastening effect was strengthened by SD as well. The apparent differences in photoperiod response sensitivity (PRS), temperature response sensitivity (TRS) and photothermal comprehensive response sensitivity (PTCRS) between ecotypes were observed. The above three indices of spring sowing soybean varieties from the Northeast were all lower than those of summer sowing varieties from Yellow-Huai-Hai River Valleys. However, the differences between TRS values under the two photoperiod treatments and that between PRS values under the two temperature conditions in spring sowing soybean varieties from the Northeast were both larger than those in summer sowing varieties from the Valleys, and it indicated that there was higher photoperiod × temperature interaction in the spring sowing varieties. The relationship between photothermal responses of soybean varieties and their ecological adaptability was discussed, and it was proposed that, in breeding program, emphasis should be paid not only on the identification of responses of soybean varieties to the individual photoperiod or temperature factor but also on the photothermal interaction.

【题目】应用关联分析鉴定大豆对斜纹夜蛾的抗性基因
【中文关键词】关联分析, 遗传多样性, 连锁不平衡, 抗虫性, 大豆
【英文关键词】association analysis, genetic diversity, linkage disequilibrium, resistance to insects, soybean (Glycine max (L.) Merr.)
【中文摘要】用135个分布于全基因组的SSR(simple sequence repeat)标记分析196份大豆(Glycine max)地方品种的遗传变异、群体结构和连锁不平衡(linkage disequilibrium, LD)。在考虑群体结构的条件下, 应用全基因组关联分析的方法鉴定与大豆抗斜纹夜蛾有关的数量性状位点, 进而发掘各关联位点的优异等位基因及代表性载体材料。结果表明: (1) 该群体不仅地理起源广, 而且遗传变异丰富; (2) 在整个群体内, 有17.9%的标记对处于显著的连锁不平衡, 而且在相同染色体上标记对间连锁不平衡延伸的平均距离约为6.61 cM(D'>0, P<0.05); (3) 通过关联分析发现, 有7个SSR标记分别与3个大豆抗斜纹夜蛾性状关联(P<0.01), 其中4个位点对性状的变异解释率超过了10%, 6个位点所在的连锁群上存在已报道的食叶性害虫抗性位点; (4) 各位点等位基因的效应分析显示, 幼虫重相关位点的等位基因主要表现为减效作用, 等位基因Sat_334-A208减效作用最大(43.9%); 单虫食叶量和蛹重相关位点的等位基因主要表现为增效作用; 等位基因Satt199- A186对单虫食叶量增效作用最大(36.4%); 等位基因Sat_320-A286对蛹重增效作用最大(31.4%)。
【英文摘要】We used 135 genome-wide simple sequence repeat (SSR) markers to assess genetic diversity, population structure and linkage disequilibrium (LD) of 196 soybean landraces. On the basis of estimated population structure, we conducted association mapping for soybean resistance to common cutworm (CCW) using genomic-wide mapping strategies and detected the elite alleles of soybean resistance to CCW, along with their carriers. In addition to wide geographic origin, the population showed extensive genetic variation, and 17.9% of the SSR pairs were in LD (with D'>0, P<0.05). The extent of LD was > 6.61 cM with genetic distance of locus pairs for the loci in the same linkage group (LG). Association analysis revealed 7 SSRs associated with soybean resistance to CCW (P<0.01): 4 accounted for >10% of the total genetic variation for resistance; 6 located in the linkage groups reported to be related to soybean resistance to insects. Allele effect analysis revealed that the alleles related to larval weight of CCW mainly had a negative effect,

the allele Sat_334-A208 showing the largest negative effect (43.9%). The alleles related to leaf consumption of single larva (LCL) and pupal weight (PW) of CCW mainly had a positive effect, the allele Satt199-A186 showing the largest positive effect for LCL (36.4%) and the allele Sat_320-A286, the largest positive effect for PW (31.4%).

【题目】基于生物量的水稻叶片主要几何属性模型研究
【中文关键词】水稻;生物量;叶长;叶宽;比叶重
【英文关键词】rice; biomass; leaf length; leaf width; specific leaf weight
【中文摘要】构建基于生物量的水稻叶片主要几何属性模型,为水稻株型设计与调控提供理论依据。【方法】以两优108、86优8、南粳43及扬稻6号为材料,设置品种、氮肥与密度田间试验,观测水稻主茎不同叶位叶片长度和宽度,分析了水稻主茎叶片长和宽的关系、比叶重(SLW)随叶位的变化规律,以及水稻叶片干重与叶长和叶宽的关系,构建基于生物量的水稻叶片主要几何属性模型。【结果】叶长与叶宽的关系可用幂指数方程表达,比叶重随叶位呈二次曲线变化。采用独立的试验资料检验模型,主茎叶片叶长、叶宽模拟值与实测值的根均方差(RMSE)分别为2.55和0.06cm。【结论】表明该模型可较好地模拟不同生长条件下水稻主茎不同叶位叶片的主要几何属性,为生长模型与形态结构模型的结合奠定了基础。
【英文摘要】【Objective】 To develop a geometrical property model of leaf blade based on dry weight (DW), which is the output of growth model.【Method】 Firstly, the model was deduced from the relationship between biomass and geometrical parameters of leaf theoretically. And then, based on observations on leaf length and leaf width of different leaf position (LP) on main stems under different nitrogen rates and density with four cultivars (LY108#, 86Y8#, NJ43#, YD 6#), the change patterns of specific leaf weight (SLW) with leaf position and the relationship between leaf length and width of rice on main stem were discussed.【Result】 The results indicated that the relationship between leaf blade length and its width could be expressed in power function, and SLW changed with the leaf position (LP) in quadratic equation. 【Conclusion】 The validation of the model with independent experimental data under different nitrogen rates and density with four cultivars showed that the RMSE of dynamic leaf length and leaf width on main stem were 2.55cm and 0.06cm, respectively, and the model could simulate the geometrical characteristics of rice leaf blade on main stem under different growth conditions.

【题目】中国野生大豆群体特征和地理分化的遗传分析
【中文关键词】野生大豆(Glycine soja Sieb. et Zucc.);SSR;连锁不平衡(LD);群体结构;地理分化;全生育期遗传分化
【英文关键词】wild soybean (Glycine soja Sieb. et Zucc.); simple-sequence repeat (SSR); linkage disequilibrium (LD); population structure; geographic differentiation; genetic differentiation of days to maturity
【中文摘要】【目的】从分子标记等位变异水平上探讨中国野生大豆群体的遗传特征、连锁不平衡特点和地理生态分化的遗传机制,并以重要生态性状全生育期为代表解析性状地理分化的遗传基础。【方法】从全国 24 个省区不同地理生态型的野生大豆材料中抽选 174份组成代表性样本,选用 204个 SSR标记,利用 TASSEL及 STRUCTURE 2.2软件进行群体连锁不平衡(linkage disequilibrium,LD)和群体遗传结构分析。在此基础上对群体的地理分化、亚群体特异性及全生育期位点等位变异的地理分化进行遗传分析。【结果】中国野生大豆群体蕴含丰富的遗传变异,20条连锁群中,I和 C2连锁群有相对较多

的位点平均等位变异和遗传分化。不论是共线性组合,还是非共线性组合,都有一定程度的 LD存在,说明历史上发生过连锁群间的大量重组;野生群体 D ′ 平均值为 0.34,高值多,比栽培大豆高,说明野生群体发生过更多的重组,保留下较高的 LD。采用 H-W平衡模型将野生群体聚成 4类,模型聚类亚群划分与地理生态分类相关、有交叉,推测各地理亚群体发生过材料的迁移。各地理亚群经长期自然选择,各位点等位基因的频率发生变化,还有新生的与绝灭的,因此,各地理亚群间产生明显的等位基因分化。与地理生态性状全生育期关联的有 15个位点 160个等位变异,其中,亚群特有等位变异共 58个,来自 14个位点,同一位点可以在多个亚群体产生不同的特有等位变异,其效应从南至北逐渐下降,这说明生态区间不仅有强烈的遗传分化,而且是有规律的遗传分化。【结论】中国野生大豆群体遗传多样性高,共线、非共线位点间连锁不平衡程度高,4 个生态亚群体间位点高度遗传分化,产生大量地区特有等位变异,全生育期还表现由南向北降效的规律性遗传分化。

【英文摘要】【Objective】 The objective of the present study was to explore the genetic characteristics, linkage disequilibrium (LD) and genetic mechanism of geographic differentiation of the Chinese wild soybean population, and based on it, the geographic differentiation mechanism of days to maturity, the key geographic-ecological trait, is to be revealed. 【Method】 A sample composed of 174 accessions of wild soybean (Glycine soja Sieb. et Zucc.) from all growing areas (24 provinces) in China was established as the representative population of the Chinese wild soybean. The genotyping data of 204 simple-sequence repeat (SSR) markers on 174 accessions were obtained and analyzed for LD among marker pairs and the genetic structure of the population by using the TASSEL and STRUCTURE 2.2 program. Based on it, the genetic mechanism of the geographic differentiation of the population, the characteristics of the geographic subpopulations, and geographic differentiation of alleles of loci related to days to maturity were studied. 【Result】 There showed a plenty of genetic diversity in the Chinese wild soybean population and showed relatively larger average number of alleles and genetic differentiation on Linkage group (LG) I and C2 than others among the 20 LGs. Different LD degrees were detected not only among syntenic marker pairs but also among nonsyntenic pairs, suggesting there had been historical recombination among linkage groups. The average D ′ was 0.34 for the population, larger than the previously reported value for cultivated soybean (G. ma x (L.) Merr.), implying more recombination occurred in the history and therefore higher LD values remained at present. The population was classified into four subpopulations according to H-W model-clustering analysis which was not completely but somewhat consistent with the geographic classification, indicating multiple migrations among eco-regions happened in the long history. There showed a great deal of allelic differentiation among the geographic subpopulations, including changes of allelic frequencies, new outcome of alleles and extinct of old alleles due to the long term natural selection. For the key geographic-ecological trait of the wild population, days to maturity, 160 alleles on 15 loci were detected, among them, 58 alleles from 14 loci were subpopulation-specific. Even multiple subpopulation-specific alleles of a same locus happened on each of the four subpopulations. The allelic genetic effects varied in a systematic decrease from the south to the north, which indicates not only strong but also systematic genetic differentiation among ecological subpopulations happened in the history for the trait. 【Conclusion】 The Chinese wild soybean population is characterized by higher genetic diversity and higher syntenic and nonsytenic LD. Among the four geographic subpopulations, there happened great genetic differentiation, which caused outcomes of subpopulation-specific alleles. The genetic differentiation of the key geographic-ecological trait, days to maturity, is characterized by not only strong but also systematic decrease of allelic effect from the south to the north.

【中文摘要】蛋白质和油脂是大豆的主要营养成分, 掌握大豆种质蛋白质和油脂含量的遗传变异是专用型品种选育的基础。以全国各生态区的野生豆 138份、 地方品种 408份、 国内育成品种 145份、 国外育成品种 77份, 合计 768份大豆种质为材料, 测定蛋白质和油脂含量, 研究其遗传变异特点。结果表明:在南京同一环境下全国野生豆蛋白质含量、 油脂含量和蛋脂总含量变幅分别为 39 . 2 % ~ 54 . 2%、 7 . 5 % ~ 17 . 5%和 47 . 3 % ~ 64 . 6%, 地方品种 38 . 8% ~51 5%、 11 . 5%~ 22 . 5%和 55 . 6%~ 69 . 0 %, 国内育成品种 41 . 7%~ 49 . 4%、 12 . 9 %~ 22 . 9% 和 55 . 6 %~ 68 . 6 %。野生豆驯化为栽培豆并经人工选育后油脂含量和蛋脂总含量有大幅增加, 而蛋白质含量平均数和变异度则有减小,说明以往人工进化着重在油脂含量的改进。三个性状各群体在各生态区内均有较大变异,区平均间差异并不大,各区都有优良变异。野生豆蛋白质含量、 油脂含量和蛋脂总含量与来源地纬度并未发现相关; 栽培豆地方品种和育成品种的油脂含量与地理纬度出现显著正相关;育成品种蛋白质含量与地理纬度还出现显著负相关;野生自然状态下蛋白质含量和油脂含量之间无相关,而栽培豆地方品种和育成品种依次增强了负相关; 形成这种相关的原因在于地区间油脂含量人工进化程度的差异。

【题目】中国栽培及野生大豆的遗传多样性、地理分化和演化关系研究
【中文关键词】栽培大豆;野生大豆;地理生态型;遗传多样性;遗传特异性;遗传分化;演化关系
【英文关键词】无
【中文摘要】栽培大豆的起源和演化是大豆生物学和农学基础研究的重要命题之一. 本研究选用 60 对细胞核 SSR标记(nuSSR)和 11 对叶绿体 SSR (cpSSR)标记, 在检测由 393 份地方品种和 196份野生材料组成的全国代表性样本的细胞核、叶绿体基因组变异的基础上, 分析了栽培、野生地理生态群体间的遗传演化关系. 结果表明: (ⅰ) 野生群体核、质遗传多样性都明显大于栽培群体, 核、质等位变异数分别为 1067:980 和 57:44 个; 栽培大豆 980 个核等位变异中有 377 个(38.5%)为驯化后新生等位变异, 44 个质等位变异中出现了 7 个(15.9%)新生等位变异. (ⅱ) 栽培生态类群中, 以南方 3个地理生态类群(中南、华南、西南)遗传多样性较高; 野生生态类群中以长江中下游野生类群遗传多样性较高. (iii) 从分子方差分析、遗传聚类与地理类群间关联分析及群体特有等位变异三方面证实我国栽培、野生大豆地理生态分化有其遗传分化的基础. (iv) 以材料为单位的聚类结果表明与栽培大豆近缘的野生材料大多来自长江中下游及西南-中南野生地理类群; 进一步分析地理群体间的遗传距离, 并作 UPGMA 聚类, 发现各栽培地理类群与长江中下游野生大豆群体的遗传距离一致, 小于与包括本区在内的其他野生群体的距离, 结合该区野生群体特有的 cpDNA等位变异 NTCP10-117 在所有栽培生态类群中都有分布的现象, 推论在南方野生群体中的长江中下游野生祖先可能是栽培大豆共同的野生祖先.

【题目】重组自交家系群体 4 对主基因加多基因混合遗传模型分离分析方法的建立
【中文关键词】重组自交家系群体(RIL); 主基因加多基因混合遗传; 分离分析
【英文关键词】RIL population; Major gene plus polygenes mixed inheritance; Segregation analysis
【中文摘要】主基因加多基因混合遗传模型分离分析方法是基于数量性状表型数据的统计遗传分析方法, 该方法适于育种工作者利用杂种分离世代的数据对育种性状的遗传组成做出初步判断, 制订相应的育种策略, 也可用以校验 QTL定位所揭示的性状遗传组成。重组自交家系群体(RIL)是一种永久性群体, 可以进行有重复的比较试验, 适合于环境影响较大的复杂性状的遗传研究。本研究以 RIL 群体为对象, 将遗传模型拓展到 4 对主基因, 建立相应的分离分析方法。新构建的模型共包括 4 对主基因和 4 对主基因加多基因两类共 15 个遗传模型, 通过极大似然法和 IECM 算法估算各种模型的分布参数, 由 AIC 值和一组适合性测验选取最佳遗传模型, 再由最小二乘法估计模型的遗传参数。通过模拟实验对所建立的模型进行验证, 模拟群体中一阶遗传参数的估计值与设定值之间有很好一致性。以大豆科丰 1 号×南农 1138-2 构成的 RIL 群体及其亲本棕榈酸含量的遗传(I-1 模型, 即 4 对加性-上位性主基因和加性-上位性多基因遗传模型)为例, 说明该方法的应用效果。
【英文摘要】The segregation analysis of major genes plus polygenes is a statistical method for genetic analysis of quantitative traits. This method is particularly valuable for breeders to use their data accumulated from segregation populations to estimate the genetic system of target traits which is necessary for designing breeding strategies and also useful for validating the results of QTL mapping. The recombinant inbred line (RIL) population is a permanent population, which is suitable for genetic analyses of complex traits and can be used in replicated experiments. For RIL, the analytical procedures of three major genes plus polygenes mixed inheritance models have been established and widely used in crops. There is an increasing demand on the genetic model expanding from three major genes plus polygenes to four or more major genes plus polygenes. Therefore, the objective of the present study was to establish the analytical procedures of segregation analyses for four major genes plus polygenes mixed inheritance model in RIL population. Fifteen genetic models with four additive and/or epistatic major genes including those without and with polygenes were established. The genetic models and their distribution parameters were solved and estimated with maximum likelihood method and IECM algorithm. The best model was chosen based on Akaike ’s Information Criterion (AIC) and a set of goodness of fit tests. The genetic parameters of the best model were estimated with the least square method. The established procedure was validated with a set of Monte Carlo simulation experiments. The results showed a relatively high accuracy and consistency for first order parameters between the simulated population and scheduled population. For demonstration of the usefulness of the established procedure, the data of palmitic acid content obtained from a RIL population NJRIKY (derived from Kefeng 1 × Nannong 1138-2) along with their P1 and P2 were analyzed. The results showed that the data fitted to Model I-1, i.e. four additive and epistasis major genes plus additive and epistatic polygenes mixed inheritance model.

【中文摘要】为进一步深化与促进作物模型发展,并融入国际潮流,本文以系统学思想为指导,采用系统分析、分类、比较及认识论挖掘等方法,通过作物模型概念、分类、作用及其与数字种植业的关系分析,阐述了作物模型作用,综述了国内外作物模型研究与应用新动态,比较了国际上作物生长模型四大研究组(DSSAT,School of de Wit,APSIM及中国)和功能-结构植物模型三大研究组(L-Studio,GREENLAB及中国)间作物模型的差异,分析了存在问题,提出了进一步发展的对策和建议。目前,虽然作物模型及数字种植业的应用较少,但随着中国农业的发展,特别是城乡结构的变化,未来它将具有广阔应用和发展前景。
【英文摘要】In order to deepen the studies of crop models (CMs), promote its development, and make it to join into international development tide, the methods of systematic analysis, classifying, comparison, and dig of epistemology, etc were adopted in this paper.

The roles in CMs were set forth through putting forward clearly to the concepts and classifying of CMs, and analyzing the relationships between CMs and digital plant (DP) in this paper. The latest studies and application progresses of CMs in internal and abroad were reviewed, the issues in their current studies and application were analyzed through comparison of differences for plant growth models among 4 research groups (DSSAT, School of de Wit, APSIM, and China) and for functional structural plant models (FSPMs) among 3 research groups (L-Studio, GREENLAB, and China) in the world, and some countermeasures and suggestions for their further development were advised. At present, although the application of CMs and DP is little, it will have a wide development and application foreground with development of agriculture in China in future, especially, changes in proportion of town and countryside.

【题目】A novel focal adhesion kinase from Marsupenaeus japonicus and its response to WSSV infection
【中文关键词】无
【英文关键词】Focal adhesion kinase; Shrimp; Phosphorylation; Cell adhesion
【中文摘要】无
【英文摘要】Focal adhesion kinase (FAK) is a cytoplasmic protein-tyrosine kinase involved in integrin-mediated signal transduction which regulates multiple cell functions in mammalian cells. In contrast to the well document of FAK in mammalian cells, the properties of FAK in crustacean have not been reported yet and even none of their gene or protein sequences is known to date. Here, we report for the first time the cloning of FAK from Marsupenaeus japonicus (designated as MjFAK) and the identification of its involvement in the virus infection and host defense. Sequence analysis displayed that MjFAK shared strong similarity to FAK family protein-tyrosine kinase, including conserved tyrosine phosphorylation sites, PTK domain and FAT domain. Immunofluorescence staining analysis showed that MjFAK was located prominently at the cell periphery and partly in cytoplasm and nucleus. Notably, considerable high content of MjFAK and MjFAK (pY399) were found in shrimp, which differs greatly from the low level of endogenous FAK and pFAK in the mammalian cells. It implies that pMjFAK may play a significant role in shrimp. Moreover, pMjFAK increased at the early infection stage, and the hemocyte adhesion activity of fibronectin also increased significantly accompanying with its phosphorylation. These results suggest that pMjFAK may not only promote the WSSV infection, but also participate in the defense mechanism via the enhancement of the immune-cell adhesion. Our data provide a clue to recognize the FAK-mediated signaling connection in the control of immunity and virus infection in crustaceans, which will be helpful to shrimp viral disease control.

【题目】A transglutaminase from Chinese shrimp (Fenneropenaeus chinensis), full length cDNA cloning, tissue localization and expression profile after challenge
【中文关键词】无
【英文关键词】Transglutaminase; Cloning; Expression profile; Challenge; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Transglutaminase can catalyze the cross-linking reaction between soluble clotting protein molecules from the plasma for prevention of excess blood loss from a wound and obstructing micro-organisms from invading the wound in crustaceans. A novel transglutaminase (FcTG) gene was cloned from hemocytes of Chinese shrimp Fenneropenaeus chinensis by 3′ and 5′ rapid

amplification of cDNA ends (RACE) PCR. The full-length cDNA consists of 2972 bp, encoding 757 amino acids with a calculated molecular mass of 84.96 kDa and a theoretical isoelectric point of 5.61. FcTG contains a typical transglutaminase-like homologue (TGc domain: E-value = 1.94e-38). Three catalytic sites (Cys-324, His-391 and Asp-414) are present in this domain. The deduced amino acid sequence of FcTG showed high identity with black tiger shrimp TG, kuruma shrimp TG and crayfish TG. Transcripts of FcTG mRNA were mainly detected in gill, lymphoid organ and hemocytes by RT – PCR. RNA in situ hybridization further confirmed that FcTG was constitutively expressed in hemocytes both in the circulatory system and lymphoid organ. The variation of mRNA transcription level in hemocytes and lymphoid organ following injection of killed bacteria or infection with white spot syndrome virus (WSSV) was quantified by RT – PCR. The up-regulated expression ofFcTG in shrimp lymphoid organ following injection of bacteria indicates that it is inducible and might be associated with bacterial challenge.

【题目】Antiviral phagocytosis is regulated by a novel Rab-dependent complex in shrimp Penaeus japonicus
【中文关键词】无
【英文关键词】Rab GTPase; protein complex; phagocytosis; antivirus
【中文摘要】无
【英文摘要】Rab GTPases are involved in phagosome formation and maturation. However, the role of Rab GTPases in phagocytosis against virus infection remains unknown. In this study, it was found that a Rab gene (PjRab) from marine shrimp was upregulated in virus-resistant shrimp, suggesting that Rab GTPase was involved in the innate response to virus. The RNAi and mRNA assays revealed that the PjRab protein could regulate shrimp hemocytic phagocytosis through a protein complex consisting of the PjRab, beta-actin, tropomyosin, and envelope protein VP466 of shrimp white spot syndrome virus (WSSV). It was further demonstrated that the PjRab gene silencing by RNAi caused the increase in the number of WSSV copies, indicating that the PjRab might be an intracellular virus recognition protein employed by a host to increase the phagocytic activity. Therefore, our study presents a novel Rab-dependent signaling complex, in which the Rab GTPase might detect virus infection as an intracellular virus recognition protein and trigger downstream phagocytic defense against virus in crustacean for the first time. This discovery would improve our understanding of the still poorly understood molecular events involved in innate immune response against virus infection of invertebrates.

【题目】Arginine kinase from Litopenaeus vannamei Cloning, expression and catalytic properties
【中文关键词】无
【英文关键词】Arginine kinase; Cloning; Expression; Litopenaeus vannamei; LPS; Activity
【中文摘要】无
【英文摘要】Arginine kinase (AK) is a phosphotransferase that plays a critical role in energy metabolism in invertebrates. In this paper, the full-length cDNA of AK was cloned from shrimp, Litopenaeus vannamei by using RT-PCR and RACE PCR. It was 1446 bp encoding 356 amino acids, and belongs to the conserved phosphagen kinase family. The quantitative real-time reverse transcription PCR analysis revealed a broad expression of AK with the highest expression in the muscle and the lowest in the skin. The expression of AK after challenge with LPS was tested in hemocytes and muscle, which indicated that the two peak values were 6.2 times

(at 3 h) and 10.14 times (at 24 h) in the hemocytes compared with the control values, respectively (P < 0.05), while the highest expression of AK was 41 times (at 24 h) in the muscle compared with the control (P < 0.05). In addition, AK was expressed in Escherichia coli by prokaryotic expression plasmid pGEX-4T-2. The recombinant protein was expressed as glutathione s-transferase (GST) arginine kinase (GST – AK) fusion protein, which was purified by affinity chromatography using Glutathione Sepharose 4B. After cleavage from GST by using a site-specific protease, the recombinant protein was identified by ESI-MS and showed AK activity. After treatment with 10 mM ATP, the enzyme activity significantly increased. However, the enzyme activity was inhibited by 10 mM α-ketoglutarate, 50 mM glucose and 200 mM ATP. This research suggested that AK might play an important role in the coupling of energy production and utilization and the immune response in shrimps.

【题目】cDNA cloning and gene expression pattern following bacterial challenge of peroxinectin in Chinese shrimp Fenneropenaeus chinensis

【中文关键词】无

【英文关键词】Cell adhesion gene; Peroxinectin; Expression pattern; Real-time RT-PCR; Fenneropenaeus chinensis;

【中文摘要】无

【英文摘要】Peroxinectin, a cell-adhesive hemoperoxidase that binds superoxide dismutase and mediates blood cells adhesion and migration in invertebrate, is believed to play an important role in cellular immune reaction. In this study, we reported a new peroxinectin gene homologue from Chinese shrimpFenneropenaeus chinensis. Based on expressed sequence tags (ESTs) of haemocyte cDNA library, we cloned a 2,611 bps full-length cDNA of peroxinectin gene homologue encoded 801 amino acids. Motif scanning of the predicted polypeptide revealed a peroxidase domain and an integrin binding motif (Lys-Gly-Asp, KGD). Peroxinectin gene expressed constitutively in haemocyte as determined by quantitative real-time RT-PCR, the expression level varied following bacterial challenge. These findings suggested that peroxinectin expression is susceptible to exterior stimulus and maintains at a high expression level during bacterial infection.

【题目】cDNA cloning, characterization and expression analysis of the antioxidant enzyme gene, catalase of Chinese shrimp Fenneropenaeus chinensis.

【中文关键词】无

【英文关键词】Catalase; Cloning; WSSV; Immune response; Expression; Fenneropenaeus chinensis

【中文摘要】无

【英文摘要】Catalase is an important antioxidant protein that protects organisms against various oxidative stresses by eliminating hydrogen peroxide. The full-length catalase cDNA of Chinese shrimp Fenneropenaeus chinensis was cloned from the hepatopancreas using degenerate primers by the method of 3′ and 5′ rapid amplification of cDNA ends PCR. The cDNA sequence consists of 1892 bp with a 1560 bp open reading frame, encoding 520 amino acids with high identity to invertebrate, vertebrate and even bacterial catalases. The sequence includes the catalytic residues His71, Asn144, and Tyr354. The molecular mass of the predicted protein is 58824.04 Da with an estimated pI of 6.63. Sequence comparison showed that the deduced amino acid sequence of F.

chinensis catalase shares 96%, 73%, 71% and 70% identity with that of Pacific white shrimp Litopenaeus vannamei, Abalone Haliotis discus hannai, Zhikong scallopChlamys farreri and Human Homo sapiens, respectively. Catalase transcripts were detected in hepatopancreas, hemocytes, lymphoid organ, intestine, ovary, muscle and gill by real-time PCR. The variation of catalase mRNA transcripts in hemocytes and hepatopancreas was also quantified by real-time PCR and the result indicated that the catalase showed up-regulated expression trends in hemocytes at 14 h and in hepatopancreas at 37 h after injection with white spot syndrome virus (WSSV).

【题目】Characterization of a Rab GTPase up-regulated in the shrimp Peneaus japonicus by virus infection

【中文关键词】无

【英文关键词】Rab; Shrimp immunity; WSSV

【中文摘要】无

【英文摘要】The molecular mechanisms of the immune system against virus in shrimp are not well known, despite its economic importance as an aquaculture species. In this investigation, a Rab gene (named as PjRab gene) was obtained from Peneaus japonicus shrimp, which exhibited high homology with Rab 6 of other species. The PjRab protein, having GTP-binding activity, contained characteristic signatures of Rab proteins with 6 GTP binding domains and 5 Rab specific domains. However, the PjRab protein exhibited a very different prenylation site (CLLNL) at its C-terminus from most of other Rabs. The PjRab gene was ubiquitously expressed in shrimp tissues. Real-time PCR revealed that the PjRab gene was up-regulated in WSSV-resistant shrimp, suggesting that the PjRab protein might play an important role in shrimp immune response against virus infection. This discovery might contribute better understanding to the molecular events involved in shrimp as well as invertebrate immune responses.

【题目】Characterization of a ras-related nuclear protein (Ran protein) up-regulated in shrimp antiviral immunity.

【中文关键词】无

【英文关键词】WSSV;Shrimpimmunity;RanGTPase

【中文摘要】无

【英文摘要】Diseases caused by viruses, especially white spot syndrome virus (WSSV), are the greatest challenge to worldwide shrimp aquaculture. Therefore, the innate immunity of shrimp has attracted extensive attentions these years. To date, however, no mechanism of immuno-related signal transduction pathway has been reported. In this investigation, an important signal transduction factor-Ran gene encoding ras-related nuclear protein (Ran protein) was characterized in shrimp. The shrimp Ran gene, without introns when compared with genomic DNA, was 645bp in length. The GTP-binding assay showed that the Ran protein had GTP-binding activity. The results of RT-PCR and Western blot indicated that the transcript and protein of Ran were detected in every tissue of shrimp including hepatopancreas, haemolymph, gill, intestine, heart and muscle. In the WSSV-resistant and WSSV-infected shrimp at 4h postinfection, the Ran gene was obviously up-regulated, indicating that it played a role in shrimp immunity against virus infection. This study, therefore, might provide a clue to elucidate shrimp innate immunity.

【题目】Cloning and recombinant expression of a crustin-like gene from Chinese shrimp, Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropenaeuschinensis; Crustin-likegene; Prokaryotic expression; Function identification
【中文摘要】无
【英文摘要】Antimicrobial peptides or proteins (AMPs) are proved to be one of the most important humoral factors to resist pathogen infection. As an antimicrobial protein, crustin had been described in invertebrates as acomponent of the innate immune system. Acrustin-likegene (CruFc) was cloned from haemocytes ofChineseshrimpFenneropenaeuschinensis by 3′ and 5′-RACE PCR. The full-length cDNA consists of 523 with 405 bp open reading frame encoding 134 amino acids and the deduced peptide contains aputative signal peptide of 17 amino acids. The sequence also contains a whey-acidic protein (WAP) domain at the C-terminal. Transcripts of CruFc were mainly detected in haemocytes and gill by RT-PCR analysis. In addition, another full-length cDNA named CshFc was also cloned from haemocytes ofChineseshrimp and its inferred amino acid sequence lacks the WAP-type ‘four-disulfide core’ domain. The fusion proteins containing CruFc and CshFc were, respectively, produced and the antimicrobial assays revealed that the recombinant CruFc could inhibit the growth of gram-positive bacteria in vitro but the recombinant CshFc could not inhibit at the same conditions. The difference of antimicrobial activity between recombinant CruFc and CshFc provides the evidence that the four-disulfide core domain ofcrustin may play an important role in its biological function.

【题目】Cloning, Expression and Identification of Ferritin from Chinese Shrimp,Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropenaeus chinensis; Ferritin; White spot syndrome virus; Semi-quantitative RT-PCR; Metal ions
【中文摘要】无
【英文摘要】Ferritin, the iron storage protein, plays a key role in iron metabolism. A cDNA encoding ferritin (FcFer) was cloned from hepatopancreas of Chinese shrimp, Fenneropenaeus chinensis. The predicted protein contains 170 amino acid residues with a predicted molecular weight (MW) about 19, 422.89 Da and theoretical isoelectric point (PI) of 4.73. Amino acid alignment of FcFer revealed 97% homology withLitopenaeus vannamei ferritin. Results of the RT-PCR showed that the expression of FcFer mRNA was up-regulated after shrimp was challenged with either white spot syndrome virus (WSSV) or heavy metal ions (Zn^{2+} and Cu^{2+}) in the laboratory. A fusion protein containing FcFer was produced and the purified recombinant protein exhibited similar function of iron uptake in vitro. The result of in-gel digestion and identification using LC – ESI – MS showed that two peptide fragments (-DDVALPGFAK- and -LLEDEYLEEQVDSIKK-) of the recombinant protein were identical to the corresponding sequence of L. vannamei ferritin. The recombinant FcFer protein will be proved useful for study on the structure and function of ferritin in F. chinensis.

【题目】Comparative proteomic profiles of the hepatopancreas in Fenneropenaeus chinensis response to hypoxic stress
【中文关键词】无
【英文关键词】2-DE; Chinese shrimp; enneropenaeus chinensis; Hypoxia; Real-time PCR
【中文摘要】无
【英文摘要】Hypoxia, as one suboptimal environmental condition, can affect the physiological state of shrimp during pond aquaculture. To better understand the mechanism of response to hypoxic stress in Chinese shrimp Fenneropenaeus chinensis, proteome research approach was utilized. Differentially expressed proteins of hepatopancreas in adult Chinese shrimp between the control and hypoxia-stressed groups were screened. By 2-DE analysis, 67 spots showed obvious changes after hypoxia. Using LC-ESI-MS/MS, 51 spots representing 33 proteins were identified including preamylase, arginine kinase, phosphopyruvate hydratase, citrate synthase, ATP synthase alpha subunit, chymotrypsin BI, chitinase, ferritin, C-type lectin receptors, transketolase, formylglutathione hydrolase, formyltetrahydrofolate dehydrogenase, aldehyde dehydrogenase, glutathione peroxidase, cytosolic manganese superoxide dismutase, protein disulfide isomerase, beta-actin, oncoprotein nm23, crustacyanin-C1 and so on. These proteins could be functionally classified into several groups such as proteins related to energy production, metabolism-related proteins, immune-related proteins, antioxidant proteins, chaperones, cytoskeleton proteins and ungrouped proteins. The transcription levels of ten selected genes encode the identified proteins were analyzed by real-time PCR at different sampling times of hypoxia. This study is the first analysis of differentially expressed proteins in the hepatopancreas of shrimp after hypoxia and provides a new insight for further study in hypoxic stress response of shrimp at the protein level.

【题目】Comparison of Antiviral Efficiency of Immune Responses in Shrimp.
【中文关键词】无
【英文关键词】Marsupenaeus japonicus; White spot syndrome virus; Innate immunity; Apoptosis; Phagocytosis; Phenol oxidase
【中文摘要】无
【英文摘要】The antiviral effectiveness of three major immune responses including phagocytosis, apoptosis and proPO system in the shrimp Marsupenaeus japonicus was characterized. It was found that the suppression of apoptosis and phagocytosis in vivo by their corresponding inhibitors resulted in the increase of white spot syndrome virus (WSSV) copies and shrimp mortality, whereas the inhibition of phenol oxidase generated the least influence on WSSV infection and shrimp mortality. These results suggest that apoptosis and phagocytosis were the essential immune responses to protect shrimp from virus infection, while the phenol-oxidase-dependent proPO system plays a comparatively minor role in antiviral defense of shrimp.

【题目】Comparison of gene expression profiles of Fenneropenaeus chinensis challenged with WSSV and Vibrio
【中文关键词】无
【英文关键词】WSSV; Vibrio; cDNA microarray; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Microarray technique was used to analyze the gene expression profiles of shrimp when they were challenged by WSSV and heat-inactivated Vibrio anguillarum, respectively. At 6 h post challenge (HPC), a total of 806 clones showed differential expression profile in WSSV-challenged samples, but not in Vibrio-challenged samples. The genes coding energy metabolism enzyme and structure protein were the most downregulated elements in 6 h post WSSV-challenged (HPC-WSSV) tissues. However, a total of 155 clones showed differential expression in the Vibrio-challenged samples, but not in WSSV-challenged samples. Serine-type endopeptidase and lysosome-related genes were the most upregulated elements in tissues 6 h post Vibrio challenge (HPC-Vibrio). Totally, 188 clones showed differential expression in both 6 and 12 HPC-WSSV and HPC-Vibrio samples. Most of the differentially expressed genes (185/188) were downregulated in the samples of 12 HPC-WSSV, whereas upregulated in the samples at 6 and 12 HPC-Vibrio and 6 HPC-WSSV. The expression profiles of three differentially expressed genes identified in microarray hybridization were analyzed in hemocytes, lymphoid organ, and hepatopancreas of shrimp challenged by WSSV or Vibrio through real-time PCR. The results further confirmed the microarray hybridization results. The data will provide great help for us in understanding the immune mechanism of shrimp responding to WSSV or Vibrio.

【题目】Construction and Characterization of a Bacterial Artificial Chromosome (BAC) Library of Pacific White Shrimp,Liptopenaeus vannamei
【中文关键词】无
【英文关键词】Pacific white shrimp; Litopenaeus vannamei; Bacterial artificial chromosome (BAC) library; Genome; Overgo probe
【中文摘要】无
【英文摘要】The pacific white shrimp (Litopenaeus vannamei) is one of the most economically important marine aquaculture species in the world. To facilitate gene cloning and characterization, genome analysis, physical mapping, and molecular selection breeding of marine shrimp, we have developed the techniques to isolate high-quality megabase-sized DNA from hemocyte nuclear DNA of female shrimp and constructed a bacterial artificial chromosome (BAC) genomic library for the species. The library was constructed in the Hind III site of the vector pECBAC1, consisting of 101,760 clones arrayed in 265 384-well microtiter plates, with an average insert size of 101 kb, and covering the genome approximately fivefold. To characterize the library, 92,160 clones were spotted onto high-density nylon filters for hybridization screening. A set of 18 pairs of overgo probes designed from eight cDNA sequences of L. vannamei genes were used in hybridization screening, and 35 positive clones were identified. These results suggest that the shrimp BAC libraries will provide a useful resource for screening of genomic regions of interest candidate genes, gene families, or large-sized synthetic DNA region and promote future works on comparative genomics, physical mapping, and large-scale genome sequencing in the species.

【题目】Difference between hemocyanin subunits from shrimp Penaeus japonicus in anti-WSSV defense
【中文关键词】无
【英文关键词】WSSV, white spot syndrome virus; CT, cycle threshold value
【中文摘要】无
【英文摘要】Hemocyanin, the respiratory protein of arthropods and mollusks, was found to function against bacterial and fungal invasion. In this study, we show that this protein complex could delay the infection of white spot syndrome virus (WSSV) in vivo and cloned two hemocyanin subunits genes (PjHcL and PjHcY) from the shrimp Penaeus japonicus. Further investigation of their transcriptional regulation during viral invasion showed that in contrast to subunit PjHcY, PjHcL expression could be strongly induced by WSSV infection. These findings not only reveal an important role of hemocyanin in shrimp antiviral defense but also suggest a possible discrepancy between the two subunits in shrimp innate immunity.

【题目】Expression, purification, and characterization of recombinant Chinese shrimp crustin-like protein (CruFc) in Pichia pastoris
【中文关键词】无
【英文关键词】Crustin-like protein; Fenneropenaeus chinensis; Pichia pastoris
【中文摘要】无
【英文摘要】A crustin-like protein (CruFc) from Fenneropenaeus chinensis was expressed in Pichia pastoris and then puri fi ed to electrophoretic homogeneity on a Sephacryl S-100 column with a band corresponding to the expected one (13 kDa) shown by 15% SDS-PAGE. Western blot indicated that the rCruFc speci fi cally reacted with polyclonal rabbit anti-Fenneropenaeus chinensis CruFc. Production in a 5 l bioreactor gave 237 mg rCruFc/l. Antimicrobial assay revealed that 4 lM rCruFc inhibited growth of Staphylococcus aureus.

【题目】Genomic organization of the translationally controlled tumor protein (TCTP) gene from shrimp Marsupenaeus japonicus
【中文关键词】无
【英文关键词】Marsupenaeus japonicus; TCTP; Genomic organization; Promoter
【中文摘要】无
【英文摘要】The shrimp translationally controlled tumor protein (TCTP) gene was previously found up-regulated in response to viral infection. In order to further understand the transcriptional regulation of TCTP gene expression under viral challenge, the 5′-flanking promoter region of the TCTP gene in shrimpMarsupenaeus japonicus (Mj-TCTP) was cloned by using genomic walking method. The sequence shows that this region contains many important potential binding sites for transcription factors, such as

activator protein1 (AP1), cAMP response element binding protein (CREB), Ets like transcription factor-1 (Elk-1), suggesting its expression is highly regulated. The promoter activity of this 5′-flanking region was confirmed by fusing to the enhanced green fluorescence protein (EGFP) gene and testing in Trichoplusia ni High Five cell line. Along with the introns and exons cloned in this study, the Mj-TCTP DNA sequence was reported here as the first TCTP gene with complete genomic organization in crustaceans.

【题目】Identification of a novel inducible cytosolic Hsp70 gene in Chinese shrimp Fenneropenaeus chinensis and comparison of its expression with the cognate Hsc70 under different stresses
【中文关键词】无
【英文关键词】Heat shock proteins; Hsp70; Heat shock; Heavy metal; Stress; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】The heat shock protein 70 (Hsp70) family is widely expressed in eukaryotic cells as the major chaperone protein. In this study, the full-length complementary DNA (cDNA) of a novel inducible cytosolic Hsp70 family member (FcHsp70) was cloned from Fenneropenaeus chinensis. FcHsp70full-length cDNA consists of 2,511 bp with a 1,890-bp open reading frame encoding 629 amino acids. Three Hsp70 protein family signatures, IDLGTTYS, IIDLGGGTFDVSIL, and IVLVGGSTRIPKVQK, were found in the predicted FcHsp70 amino acid sequence. Phylogenetic analysis showed that FcHsp70 was categorized together with the inducible HSP70s reported in other crustaceans. Compared to the previously identified cognate Hsp70 (FcHsc70) in F. chinensis, the expression of FcHsp70 showed quite different expression profiles when the shrimp were subjected to different stresses including heat shock and heavy metal treatments. Under heat shock treatment, the expression of FcHsp70 showed much higher up-regulation than FcHsc70. Copper treatment also induced higher up-regulation of FcHsp70 than FcHsc70. Cadmium treatment did not induce the expression of FcHsp70, but caused down-regulation of FcHsc70. The different expression profiles of FcHsp70 and FcHsc70 in shrimp may indicate their different reactions to different stresses. Therefore, Hsp70 or Hsc70 could be developed as a biomarker to indicate different stresses in shrimp.

【题目】Identification of a novel relish homolog in Chinese shrimp Fenneropenaeus chinensis and its function in regulating the transcription of antimicrobial peptides
【中文关键词】无
【英文关键词】Relish; Immunity; Antimicrobial peptides; Transcription; RNA interference; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Penaeid shrimp, as an invertebrate, relies on the innate immunity to oppose the microbial invaders. Antimicrobial peptides (AMP) are an integral component of the innate immune system in most organisms and function as an early first line of defense against pathogens, but the knowledge about the pathways to regulate the shrimp AMP gene expression is still absent up to date. In the current study, a Relish homolog (FcRelish) was cloned from Chinese shrimp Fenneropenaeus chinensis. The full length cDNA of FcRelish consists of 2157 bp, including 1512 bp open reading frame, encoding 504 amino acids. The predicted molecular weight of

FcRelish is 57 kDa, and the theoretical PI is 7.00. Spatial expression profiles showed that FcRelish had the highest expression levels in the hemocytes and lymphoid organ. Both Vibrio anguillarium and Micrococcus lysodeikticus stimulation to shrimp can affect the transcription profile of FcRelish. Silencing of FcRelish through DsRNA interference can greatly change the transcription profile of AMP. Therefore, we suggest that FcRelish identified in the present study is closely related to the transcription of AMP, and then we inferred that Imd pathway might exist in shrimp.

【题目】Mj—DWD, a double WAP domain—containing protein with antiviral relevance in Marsupenaeus japonicus.
【中文关键词】无
【英文关键词】Marsupenaeus japonicus; WAP domain; WSSV; Real-time PCR; Pichia pastoris; Bacillus subtilis
【中文摘要】无
【英文摘要】The Mj-DWD (Marsupenaeus japonicus ’ double-WAP domains) gene was originally found up-regulated in virus-resistant shrimp M. japonicus by suppression subtractive hybridization (SSH). The full-length cDNA of Mj-DWD encodes a novel protein containing a KGD (Lys – Gly – Asp) motif and double WAP domains. Performed by quantitative real-time PCR, the expression level of Mj-DWD gene was consistently maintained at a high level in the newly prepared virus-resistant shrimp compared to the normal one. In addition, the Mj-DWD gene was also found to be rapidly up-regulated by WSSV infection during the early phase. Furthermore, the recombinant Mj-DWD, expressed by Pichia pastoris, showed specific protease inhibitory activity on Bacillus subtilis. These findings suggest that Mj-DWD plays an important role in the host defence system against WSSV infection in M. japonicus, possibly through its protease inhibitory activity.

【题目】Molecular characteristics and expression analysis of calreticulin in Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Calreticulin; Cloning; Expression; Fenneropenaeus chinensis; Heat shock; Molting stage; WSSV challenge
【中文摘要】无
【英文摘要】Calreticulin (CRT), as an endoplasmic reticulum luminal resident protein, plays important roles in Ca2+homeostasis and molecular chaperoning. CRT on the surface of the cell can modulate cell adhesion, phagocytosis and integrin-dependent Ca2+ signaling. The full length cDNA of calreticulin (FcCRT) was cloned from Chinese shrimp Fenneropenaeus chinensis. It consists of 1672 bp with an open reading frame of 1221 bp, encoding 406 amino acids. This is the first reported cDNA sequence of calreticulin in Crustacea. The deduced amino acid sequence of FcCRT showed high identity with those of Bombyx mori(88%), Drosophila melanogaster (83%), Mus musculus (82%) and Homo sapiens (82%). Highest expression of FcCRT was detected in ovary by Northern blot and in situ hybridization. Different mRNA levels of FcCRT were detected at various molting stages. Expression of FcCRT was induced significantly after 3 h of heat shock treatment, reached the maximum at 4 h and dropped after that. Differential expression profiles of FcCRT were observed in hepatopancreas and haemocytes when shrimp were challenged by white spot syndrome virus (WSSV). From the above results, we inferred that FcCRT might play important roles in Ca2+ homeostasis, chaperoning and immune function in shrimp.

【题目】Molecular characterization and effect of RNA interference of retinoid X receptor (RXR) on E75 and chitinase gene expression in Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Retinoid X receptor; Molting; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Retinoid X receptor (RXR)/ultraspiracle (USP) is the heterodimeric partner of ecdysteroid receptor and is required for the molting process of arthropods. To better understand the molecular aspects governing the process of molting in shrimp, the full-length cDNA of two RXRs, named as FcRXR-1 and FcRXR-2 were obtained from Chinese shrimp Fenneropenaeus chinensis which were of 1715 and 1700 bp long, revealed a 1315 and 1300 bp open reading frame (ORF) respectively. Quantitative Real time PCR analysis showed a marked tissue-specific difference in the expression of FcRXR transcript, which revealed that the expression of FcRXR could be regulated in a tissue-specific manner. Moreover, high expression of FcRXR mRNAs was observed in late pre-molt period (D3) and post molt stages (A-B) of shrimp. Among the two isoforms, FcRXR-2 appeared in a considerably high level in all the stages compared to the FcRXR-1. In addition, we examined the temporal expression of two chitinase genes: FcChitinase (FcChi) and FcChitinase-1 (FcChi-1) during the molt cycle of F. chinensis. Both the FcChi and FcChi-1 transcripts were detected in all stages of molting, although considerable fluctuations observed through the molt cycle. Injection of double stranded RXR (dsRXR) into juvenile shrimp resulted in a maximum silencing effect at 48 h post injection. We analyzed the expression levels of FcChi, FcChi-1 and the ecdysone inducible gene E75 (FcE75) in samples of dsRXR injected shrimp. Significant reduction in levels of both FcE75, FcChi and FcChi-1 transcripts occurred in the silenced shrimp. This correlation suggested that RXR might involve in the downstream regulation of E75 and chitinase gene transcription in the ecdysone signaling pathway of decapod crustaceans.

【题目】Molecular characterization and expression analysis of chitinase (Fcchi-3) from Chinese shrimp, Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropenaeus chinensis; Chitinase; Recombinant expression; LC-ESI-MS
【中文摘要】无
【英文摘要】Complementary DNA (cDNA) and genomic DNA, including flanking regions of the chitinase gene (Fcchi-3) of Fenneropenaeus chinensis, were cloned and sequenced. Fcchi-3 was found to have 92.0 and 91.4% identity at the cDNA level to that of Litopenaeus vannamei and Marsupenaeus japonicus, respectively. The predicted amino acid sequence had an overall similarity with a comparable region of L. vannamei (96.8%) and M. japonicus (93.4%). Based on the cDNA sequence, the genomic structure of the gene was characterized. Sequence analysis revealed that the Fcchi-3 gene was composed of seven exons with 411, 252, 186, 132, 171, 117 and 135 bp and six introns with 232, 196, 121, 90, 159 and 157 bp. Analysis by RT-PCR revealed that Fcchi-3 was a hepatopancreas specific gene. Semi-quantitative RT-PCR analysis revealed that Fcchi-3 transcript was down-regulated significantly in response to the challenge of WSSV at 5 h post-injection and then came back to normal level at 37 h. A fusion protein containing Fcchi-3 was produced and the purified recombinant protein exhibited similar biological function. The result

of identification through LC-ESI-MS showed that three peptide fragments (-MAADPVLR-, -ATIDPAYNVPELSK- and -AILAVGGWNEGSPK-) of the recombinant protein were identical to the corresponding sequence of L. vannamei chitinase-3. The recombinant Fcchi-3 could degrade the colloid chitin confirming that the recombinant protein is actually the chitinase.

【题目】Molecular characterization of an ecdysone inducible gene E75 of Chinese shrimp
【中文关键词】无
【英文关键词】E75; Molting; Fenneropenaeus chinensis; RNAi
【中文摘要】无
【英文摘要】Ecdysone inducible gene, E75 is a primary target of ecdysone receptor (EcR), and is found to play a critical role in the molting process of arthropods. In this study, a cDNA encoding the E75 of Chinese shrimp Fenneropenaeus chinensis (FcE75) was cloned using RT-PCR and RACE techniques. FcE75 cDNA was 3611 bp in length with an ORF of 2394 bp. The deduced amino acid sequence of FcE75 had the highest sequence identity to E75 from a land crab Gecarcinus lateralis and E75 of the shrimpMetapenaeus ensis. Quantitative real-time PCR revealed a prominently high expression of FcE75 mRNA in the whole body RNA extract of late premolt period (D3) juvenile shrimp. The role of E75 in the process of shrimp molting was investigated using the RNA interference technique. Long double-stranded RNA corresponding to the FcE75 (dsE75) efficiently silenced the FcE75 transcript levels in juvenile F. chinensis. Further, injection with dsE75 completely arrested the molting process in experimental shrimp which eventually caused death. Setogenic analysis of the uropods from molt-arrested shrimp, showed defective epidermal retraction, poor development of setae and new cuticle. These results indicate that E75 might be related to the molting process and is essential for proper molting and survival of shrimp. This is the first report demonstrating the use of double stranded RNA to elucidate the possible role of E75 in the molting of decapod crustaceans.

【题目】Molecular cloning and characterisation of a pattern recognition protein, lipopolysaccharide and b-1,3-glucan binding protein (LGBP) from the Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropenaeus chinensis; LGBP; Innate immunity; Pattern-recognition
【中文摘要】无
【英文摘要】A pattern recognition protein (PRP), lipopolysaccharide and β-1,3-glucan binding protein (LGBP) cDNA was cloned from the haemocyte of Chinese shrimp Fenneropenaeus chinensis by the techniques of homology cloning and RACE. Analysis of nucleotide sequence revealed that the full-length cDNA of 1,275 bp has an open reading frame of 1,098 bp encoding a protein of 366 amino acids including a 17 amino acid signal peptide. Sequence comparison of the deduced amino acid sequence of F. chinensis LGBP showed a high identity of 94%, 90%, 87%, 72% and 63% withPenaeus monodon BGBP, Litopenaeus stylirostris LGBP, Marsupenaeu japonicus BGBP, Homarus gammarus BGBP and Pacifastacus leniusculus LGBP, respectively. The calculated molecular mass of the mature protein is 39,857 Da with a deduced pI of 4.39. Two putative integrin binding motifs, RGD (Arg-Gly-Asp) and a potential recognition motif for β-1,3-linkage of polysaccharides were observed in LGBP

sequence. RT-PCR analysis showed that LGBP gene expresses in haemocyte and hepatopancreas only, but not in other tissues. Capillary electrophoresis RT-PCR method was used to quantify the variation of mRNA transcription level during artificial infection with heat-killedVibrio anguillarum and Staphylococcus aureusin. A significant enhancement of LGBP transcription was appeared at 6 h post-injection in response to bacterial infection. These results have provided useful information to understand the function of LGBP in shrimp.

【题目】Molecular cloning and characterisation of prophenoloxidase (ProPO) cDNA from Fenneropenaeus chinensis and its transcription injected by Vibrio anguillarum

【中文关键词】无

【英文关键词】Cloning; Expression; Prophenoloxidase; Fenneropenaeus chinensis

【中文摘要】无

【英文摘要】The prophenoloxidase(ProPO) gene was cloned from haemocytes of Chinese shrimpFenneropenaeus chinensis by Rapid Amplification Complementary DNA Ends (RACE) method. The full-length cDNA of prophenoloxidase gene consists of 3040 bp with a 2061 bp Open Reading Frame (ORF), encoding 686 amino acids. Phylogenetic analysis revealed that it belongs to insect-type invertebrate prophenoloxidase gene family. To understand ProPO reaction for pathogeny ’s challenge in shrimp, the expressions of ProPO in different tissues were studied by real-time PCR after challenged by Vibrio anguillarum. The results showed that the expression level of ProPO gene in haemocytes was highest among three studied tissues including haemocytes, lymphoid organ and hepatopancreas. The time-course change of ProPO mRNA levels in challenge experiment showed that ProPO mRNA transcripts had the biggest change extent in lymphoid organ.

【题目】Molecular cloning and characterization of a Class II ADP ribosylation factor from the shrimp Marsupenaeus japonicus

【中文关键词】无

【英文关键词】Shrimp; WSSV; ADP ribosylation factor; Defense

【中文摘要】无

【英文摘要】In shrimp, small GTPases in the Ras superfamily can regulate hemolytic phagocytosis against WSSV infection. However, the ADP ribosylation factors (Arfs), also belonging to the regulatory GTP-binding proteins and playing a central role in membrane trafficking, have not been reported yet in shrimp and their relationship with WSSV infection is completely unknown to date. Here, a novel class II Arf (designated as MjArf4) was cloned and characterized from the shrimp Marsupenaeus japonicus. Like other Arfs, MjArf4 contains an N-terminal myristoylated site, a p loop, switch regions, as well as an interswitch region. In High Five cells, when MjArf4 was in its GDP-bound form, it dispersed into the whole cell, whereas in the GTP-bound form it promoted formation of a punctuate Golgi-like structure, indicating that the MjArf4 distribution was dependent on its GDP/GTP binding. After challenge with WSSV, the mRNA level of MjArf4 was up-regulated significantly as WSSV propagated. Thus, a member of the Arf family was characterized for the first time in shrimp and found to be involved in WSSV infection.

【题目】Molecular Cloning and Characterization of Proliferating Cell Nuclear Antigen (PCNA) from Chinese Shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Fenneropenaeus chinensis; Haematopoietic tissue; PCNA; Vibrio challenge; WSSV challenge
【中文摘要】无
【英文摘要】The proliferating cell nuclear antigen gene was cloned from Fenneropenaeus chinensis (FcPCNA). The full-length cDNA sequence of FcPCNA encodes 260 amino acids showing high identity with PCNAs reported in other species. FcPCNA expressed especially high in proliferating tissues of shrimp such as haematopoietic tissue (HPT) and ovary. In order to understand the response of HPT to bacteria and virus challenge, mRNA level of FcPCNA in HPT was analyzed after shrimp were challenged by Vibrio anguillarum and white spot syndrome virus (WSSV). FcPCNA expression in HPT of shrimp was responsive to WSSV and Vibrio challenge, but different expression profiles were obtained after challenge by these two pathogens. The data provide additional information to understand the defense mechanisms of shrimp against virus and bacteria.

【题目】Molecular cloning and expression analysis of crustin—like gene from Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Crustin-lik gene; Fenneropenaeius chinensis; molecular cloning; expression analysis; microbe challenge
【中文摘要】无
【英文摘要】A new member of antimicrobial protein genes of the Crustin family was cloned from haemocytes of the Chinese shrimp Fennero-penaeus chinensis by 3'and 5' RACE.The full-length cDNA of Crustin-like gene contains a 390 bp open reading frame,encoding 130 amino acids.The deduced peptide contains a putative signal peptide of 17 amino acids and mature peptide of 113 amino acids.The molecular mass of the deduced mature peptide is 12.3 ku.It is highly cationic with a theoretical isoelectric point of 8.5.The deduced amino acids sequence of this Crustin showed high homology with those of Penaeus (Litopenaeus) setferus.Northern blotting showed that the cloned Crustin gene was mainly expressed in haemocytes,gill,intestine,and RNA in situ hy-bridization indicated that the Crustin gene was constitutively expressed exclusively in haemocytes of these tissues.Capillary elee-trephoresis RT-PCR analysis showed that Crustin was up-regulated dramatically from 12 to 48 h after a brief decrease of mRNA during first 6 h in response to microbe infection.The level of Crustin mRNA began to restore at 72 h post-challenge.This indica-ted that Crustin gene might play an important role when shrimps are infected by bacterial pathogen.

【题目】Molecular cloning and expression of NOS in shrimp, Litopenaeus vannamei
【中文关键词】无
【英文关键词】NOS; Litopenaeus vannamei; Expression; LPS; Poly I:C
【中文摘要】无
【英文摘要】The importance of the nitric oxide synthase (NOS) gene family is demonstrated by many studies in recent years. However, the lack of sequence information and clones of shrimp NOS cDNA limits further study on its characterization and function in this species. In this report, the cDNA of NOS contained full-length ORF was cloned from the Pacific white shrimp, Litopenaeus vannamei. It was of 4680 bp, including a 5′-terminal untranslated region (UTR) of 278 bp, a 3′-terminal UTR of 862 bp, which contained 5 ATTTA repeats, and an open reading frame (ORF) of 3540 bp encoding a polypeptide of 1179 amino acids. It contained a typical NO synthase domain at the N-terminal, next to a flavodoxin 1 domain, a flavin adenine dinucleotide (FAD) binding domain, respectively, and a conservative nicotinamide adenine dinucleotide (NAD) binding domain structure at the C-terminal. Quantitative real-time reverse transcription PCR analysis revealed L. vannamei NOS (LvNOS) to be expressed in most shrimp tissues, with highest expression in the hepatopancreas and weakest expression in skin. The expression of LvNOS after challenge with LPS and poly I:C was tested in hemocytes, hepatopancreas and nerve. The results indicated that the NOS transcript level could be induced in hemocytes by injection with LPS. The highest expression was in the hemocyte, with 8.8 times (at 3 h) as much as that in the control ($p < 0.05$). However, sharp down-regulation of NOS was found in hepatopancreas and nerve after LPS and poly I:C injection ($p < 0.05$). These results suggested that NOS might play an important role in shrimp's defense against pathogenic infection.

【题目】Molecular cloning, characterization and expression analysis of a putative C-type lectin (Fclectin) gene in Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】C-type lectin; Cloning; Expression profile; Primary cell culture; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Lectin is regarded as a potential molecule involved in immune recognition and phagocytosis through opsonization in crustacean. Knowledge on lectin at molecular level would help us to understand its regulation mechanism in crustacean immune system. A novel C-type lectin gene (Fclectin) was cloned from hemocytes of Chinese shrimp Fenneropenaeus chinensis by 3′ and 5′ rapid amplification of cDNA ends (RACE) PCR. The full-length cDNA consists of 1482 bp with an 861 bp open reading frame, encoding 287 amino acids. The deduced amino acid sequence contains a putative signal peptide of 19 amino acids. It also contains two carbohydrate recognition domains/C-type lectin-like domains (CRD1 and CRD2), which share 78% identity with each other. CRD1 and CRD2 showed 34% and 30% identity with that of mannose-binding lectin from Japanese lamprey (Lethenteron japonicum), respectively. Both CRD1 and CRD2 of Fclectin have 11 amino acids residues, which are relatively invariant in animals' C-type lectin CRDs. Five residues at Ca2+ binding site 1 are conserved in Fclectin. The potential Ca2+/carbohydrate-binding (site 2) motif QPD, E, NP (Gln-Pro-Asp, Glu, Asn-Pro) presented in the two CRDs of Fclectin may support its ability to bind galactose-type sugars. It could be deduced that Fclectin is a member of C-type lectin superfamily. Transcripts of Fclectin were found only in hemocytes by Northern blotting and RNA in situ hybridization. The variation of mRNA transcription level in hemocytes during artificial infection with bacteria and white spot syndrome virus (WSSV) was quantitated by capillary electrophoresis after RT-PCR. An exploration of mRNA expression variation after LPS stimulation was carried out in primarily cultured hemocytes in vitro. Expression

profiles of Fclectin gene were greatly modified after bacteria, LPS or WSSV challenge. The above-stated data can provide us clues to understand the probable role of C-type lectin in innate immunity of shrimp and would be helpful to shrimp disease control.

【题目】Molecular cloning, expression of a peroxiredoxin gene in Chinese shrimp Fenneropenaeus chinensis and the antioxidant activity of its recombinant protein
【中文关键词】无
【英文关键词】Peroxiredoxin (Prx) gene; Expression profile; Vibrio anguillarum infection; Immune response; Recombinant protein; Activity; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Peroxiredoxin (Prx) is known to be an antioxidant protein that protects the organisms against various oxidative stresses and functions in intracellular signal transduction. A Prx gene was firstly isolated in the crustacean, Chinese shrimp Fenneropenaeus chinensis. The full-length cDNA consists of 942bp with a 594bp open reading frame, encoding 198 amino acids. The molecular mass of the deduced amino acid is 22041.17Da with an estimated pI of 5.17. Sequence comparison showed that Prx of F. chinensis shares 76%, 73% and 72% identity with that of Aedes aegypti, Branchiostoma belcheri tsingtaunese and Drosophila melanogaster, respectively. Northern blot analysis revealed the presence of Prx transcripts of F. chinensis in all tissues examined. Real-time PCR analysis indicated that the Prx showed different expression profiles in shrimp hemocytes and hepatopancreas after artificial infection with Vibrio anguillarum. In addition, a fusion protein containing Prx was produced in vitro. LC-ESI-MS analysis showed that four peptide fragments of the recombinant protein were identical to the corresponding sequence of F. chinensis Prx. And the purified recombinant proteins were shown to reduce H(2)O(2) in the presence of dithiothreitol.

【题目】Multiple forms of alpha-2 macroglobulin in shrimp Fenneropenaeus chinesis and their transcriptional response to WSSV or Vibriopathogen infection
【中文关键词】无
【英文关键词】Diversity; Immune challenge; Splicing variant; Lymphoid organ; Hemocyte; Catalytic histidine; Gene expression; Real-time RT-PCR
【中文摘要】无
【英文摘要】Alpha-2macroglobulin (A2M) is a non-specific protease inhibitor involved in host defense. By full length cloning and sequencing we identified three distinct cDNAs for A2M in Chinese shrimpFenneropenaeuschinesis, designated FcA2M-1, FcA2M-2 and FcA2M-3, respectively. Expression profiles in normal tissues as well as tissues after challenge by white spot syndrome virus (WSSV) andVibrio pathogen were conducted for FcA2M-1 and FcA2M-2. The FcA2M-1 and FcA2M-2 cDNAs encode proteins with 1501 or 1502 amino acids, respectively, containing the typical conserved domain architecture of A2M. Similar to complement component C3, FcA2M-2 has a catalytic histidine, which may confer opsonic properties on this shrimp A2M. Six variants in the bait region were found in FcA2M-2responding differently to Vibrio challenge, thereby widening the spectrum of inhibition and the diversity of immune recognition. FcA2M-1 and FcA2M-3, as well as most other protostomia invertebrate A2Ms identified so far, have a

serine residue in the catalytic histidine position instead of the conserved asparagine residue found in vertebrate A2Ms. This, as inferred from a carp C3 molecule in which the catalytic histidine is substituted by a serine, suggests A2Ms in lower invertebrates possibly bear C3-like opsonic activity. These FcA2Ms showed much lower similarity to each other than to the A2Ms in other shrimp species, further supported by pylogenetic analysis. FcA2M-1 was found to be expressed most highly in hemocytes and lymphoid organ, while FcA2M-2 was expressed most highly in the heart and lymphoid organ, with the lowest expression in hemocytes. Challenge by WSSV or Vibrio pathogen increased the FcA2M-1 mRNA level in both hemocytes and lymphoid organ. After challenge, FcA2M-2showed up-regulation in lymphoid organ but not in hemocytes. These expression features indicate that the different types of A2M in F. chinesis carry out different functions and that they are not simply functionally redundant.

【题目】Novel function of QM protein of shrimp (Penaeus japonicus) in regulation of phenol oxidase activity by interaction with hemocyanin

【中文关键词】无

【英文关键词】White spot syndrome virus ; QM, RNAi ; Phenoloxidase ; Innate immunity

【中文摘要】无

【英文摘要】Since it was proposed to be a tumor suppressor in 1991, the QM protein has attracted intensive studies in plants, animals and fungi. Up to date, however, the function of QM protein remains unknown. In this investigation, it was found that the shrimp QM gene (designated as PjQM) was significantly up-regulated in virus- resistant shrimp, suggesting that the PjQM was involved in shrimp immunity. The GST pull-down assays showed that the PjQM protein interacted with shrimp hemocyanin and myosin, indicating that the PjQM protein might participate in prophenoloxidation (proPO) activation system of shrimp immunity. As revealed by RNAi assays, it was demonstrated for the first time that the QM protein could regulate the activity of phenol oxidase, a key enzyme in the proPO activation system of invertebrate immunity. This discovery showed a novel aspect of QM protein in arthropod immune response, which contributed a better understanding to the still poorly understood molecular events involved in innate immunity of arthropods.

【题目】Proteomic analysis of differentially expressed proteins in lymphoid organ of Fenneropenaeus chinensis response to Vibrio anguillarum stimulation

【中文关键词】无

【英文关键词】2-DE; Fenneropenaeus chinensis; Lymphoid organ; Vibrio anguillarum; Proteomics

【中文摘要】无

【英文摘要】To gain an insight into the function of shrimp lymphoid organ at protein level, we analyzed the proteome of lymphoid organ in healthy Chinese shrimp Fenneropenaeus chinensis (F. chinensis) through two-dimensional gel electrophoresis (2-DE) based proteomic approach. A total of 95 spots representing 75 protein entries were identified by liquid chromatography tandem mass spectrometry (LC – MS/MS) with both online and in-house database. According to Gene Ontology (GO) annotation of biological process, the identified proteins were classified into 13 categories. Among them, approximately 36% of proteins related to cytoskeleton

are noticeable. Then, a comparative proteomic approach was employed to investigate the differentially expressed proteins in lymphoid organ of Vibrio anguillarum-challenged F. chinensis. At 24 h post-injection (hpi), 17 differentially expressed protein spots were successfully identified, including 4 up-regulated protein spots (represent 4 proteins: cathepsin L, protein similar to squid CG16901-PC, protein kinase C and protein similar to T-complex Chaperonin 5 CG8439-PA), and 13 down-regulated protein spots (represent 9 proteins: actin, beta-actin, cytoplasmic actin CyII, alpha tubulin, beta tubulin, protein similar to proteasome delta, vacuolar ATP synthase subunit B, elongation factor 2, carboxypeptidase B). These data may help us to understand the function of lymphoid organ and the molecular immune mechanism of shrimp responsive to pathogen infection.

【题目】Purification and primary identification of haemocyanin in the Chinese shrimp, Fenneropenaeus chinensis (Decapoda, Penaeoidea)

【中文关键词】无

【英文关键词】Fenneropenaeus Chinensis; Haemocyanin; LC-ESI-MS

【中文摘要】无

【英文摘要】We here report the isolation of haemocyanin, the crustacean oxygen transporter, from the haemolymph of the Chinese shrimp, Fenneropenaeus chinensis. We employed a Superdex 75 column, and the purified protein was demonstrated as homogeneous by Native-PAGE. The molecular mass of the purified haemocyanin was estimated to be 450 kDa using SDS-PAGE. The subsequent 2-DE suggested that it would be composed of three different subunits of 75-76 kDa each. Primary structure determination was performed by LC-ESI-MS and the data obtained were compared with the NCBI database. The result showed that these three subunits are identical to a partial fragment of haemocyanin from Litopenaeus vannamei. This research could be relevant to obtain pure haemocyanin, and will be helpful for further study on the structure and function of this large molecule.

【题目】Ran GTPase regulates hemocytic phagocytosis of shrimp by interaction with myosin

【中文关键词】无

【英文关键词】shrimp; Ran GTPase; protein interaction; antiviral phagocytosis; RNAi

【中文摘要】无

【英文摘要】Ran GTPases, one family of small G protein superfamily, have been widely demonstrated to be involved in the transport system between cytoplasm and the nucleus. However, the function of Ran GTPase in immunity remains unclear. In our study, it was found that the Ran GTPase (designated as PjRan) was up-regulated in virus-resistant shrimp, indicating that the PjRan might be implicated in the innate immune system against virus infection. On the basis of protein interactions, it was found that the PjRan interacted with myosin, a crucial protein in the process of phagocytosis to form a protein complex. The RNAi and mRNA assays showed that the PjRan could regulate shrimp hemocytic phagocytosis. Further data evidenced that the depletion of PjRan by RNAi caused a significant increase of virus copies, and the overexpression of PjRan resulted in a significant decrease of virus copies, suggesting that the PjRan participated in the antiviral immunity by regulating phagocytosis. Therefore, our study revealed a completely novel aspect of Ran GTPase in phagocytosis by the direct interaction with the cytoskeleton protein and presented a novel pathway concerning

to antiviral immunity, which will help to better understand the molecular events in immune response against virus infection in invertebrates.

【题目】Rapid, sensitive detection of Vibrio anguillarum using loop-mediated isothermal amplification
【中文关键词】无
【英文关键词】Loop-Mediated Isothermal Amplification(LAMP); detection assay; empA gene; Vibrio anguillarum
【中文摘要】无
【英文摘要】Vibrio anguillarum is an important bacterial pathogen of aquatic organisms and a significant problem in aquatic farming.The rapid detection and identification of V.anguillarum,and other pathogens that infect marine organisms,is crucial to effective disease management.In this study,we developed a loop-mediated amplification(LAMP)assay to detect V.anguillarum in an hour in a single tube without the need for thermal cycling.Conserved regions of the metalloproteinase(empA)gene of V.anguillarum served as the targets for primer design.A fragment of the empA gene was amplified at 65°C in the presence of the primer mixture and Bst DNA polymerase.In the optimized LAMP assay,6.7 pg of V.anguillarum DNA could be detected.Six strains of V.anguillarum and 17 strains of non-V,anguillarum bacteria were used in this study to evaluate the species specificity of the primers.The six V.anguillarum strains gave a positive result in the LAMP assay.This method was also validated in V.anguillarum-infected fish.This LAMP method is more sensitive than PCR in the detection of V.anguillarum and shows good species specificity.The LAMP assay is therefore an effective method for the quick detection of V.anguillarum both in the laboratory and in the field.

【题目】Regulation of phagocytosis against bacterium by Rab GTPase in shrimp Marsupenaeus japonicus
【中文关键词】无
【英文关键词】Rab GTPase; Phagocytosis; RNAi; mRNA overexpression; Shrimp immunity
【中文摘要】无
【英文摘要】Rab GTPases, members of the Ras superfamily, play important roles in phagosome formation and maturation. However, the involvement of Rab protein in phagocytosis against invading pathogens in crustacean remains unknown. In the present study, the RNAi and mRNA overexpression assays were conducted to elucidate the function of shrimp Rab gene (designated as PjRab) in hemocytic phagocytosis against bacterium. The results indicated that the phagocytic percentage and phagocytic index using FITC-labeled Vibrio parahemolyticus were significantly decreased when the PjRab gene was silenced by sequence-specific siRNA, suggesting that the PjRab protein was essential in hemocytic phagocytosis. On the other hand, the overexpression of PjRab gene leaded to the increase of phagocytic percentage and phagocytic index. The findings indicated that the PjRab protein was involved in the regulation of hemocytic phagocytosis of shrimp. Our report on the regulation of phagocytosis by Rab GTPase would contribute a better clue to realize the still poorly understood molecular events involved in shrimp as well as crustacean immune response.

【题目】Requirement for shrimp caspase in apoptosis against virus infection
【中文关键词】无
【英文关键词】Virus; Apoptosis; PjCaspase; Innate immunity
【中文摘要】无
【英文摘要】Caspases are central effectors in apoptosis. In this investigation, a novel caspase gene (designated as PjCaspase) obtained from the marine shrimp Marsupenaeus japonicus was found to be significantly upregulated in survivors of WSSV-challenged shrimp, suggesting that it might be involved in shrimp antiviral immunity. As revealed by RNAi assays, when the PjCaspase gene was silenced by gene-specific siRNA, the WSSV-induced apoptosis was significantly inhibited. The results showed that the PjCaspase gene was essential in the virus-induced apoptosis of shrimp. Based on the quantitative PCR detection, it was shown that the PjCaspase gene silencing resulted in the increase of virus copies, indicating that apoptosis played a key role in antiviral process of shrimp. As well known, caspase-3 and -8 are crucial caspases in apoptosis. The discovery of PjCaspase in this study would contribute another essential caspase involved in apoptosis against virus infection, which might reveal an ancient mechanism of caspase activation in invertebrate immunity against viruses.

【题目】Reviews on The Immunological Function of Tetraspanins
【中文关键词】Tetraspanins,免疫,病毒,四跨膜蛋白超家族(TM4SF),无脊椎动物
【英文关键词】Tetraspanins; immunity; virus; transmembrane 4 superfamily; invertebrate
【中文摘要】Tetraspanins 属于四跨膜蛋白超家族(transmembrane 4 superfamily,TM4SF),能跨膜连接蛋白,促进细胞间及细胞内信 号转导,参与某些病毒的细胞识别和侵染.Tetraspanins 成员之间相互关联,并与其他蛋白质形成一个巨大的 tetraspanins 网 络,在免疫反应中发挥着重要作用.作为一大类进化上保守的细胞膜蛋白,它们在无脊椎动物中也行使复杂多样的功能.将重点阐述在 tetraspanins 的结构、识别病毒的机制、在免疫系统中的作用研究方面取得的进展,并对无脊椎动物 tetraspanins 在先天性免疫系统中的重要意义进行讨论.
【英文摘要】Tetraspanins belongs to the transmembrane 4 superfamily(TM4SF). They can be as a bridge to connect the proteins outside or inside the cell membrane. A tetraspanins web is formed by the tetraspnins-proteins complex, and the web is believed to involve in fundamental functions of immunity system, and consequnently, signaling between cells and inside cells, regulating cell activation and adhesion, participating in the identification and infection of some virus. As a family of conservative transmembrane proteins, tetraspanins play multiplex roles in invertebrate. It was described how tetraspanin microdomains might have functions in the immune system, and how they contact with virus. In addition, the important role of tetraspanins in the innate immune system of invertebrate were discussed.

【英文摘要】Plasma, as a major component of hemolymph, plays important physiological functions in Chinese shrimp Fenneropenaeus chinensis immunity. However, it is difficult to analyze plasma proteome by 2-DE because plasma is a complicated and dynamically changing system, consisting of different types and abundant proteins. In this study,SDS-PAGE pre-fractionation combined with LC-MS/MS (liquid chromatography-tandem mass spectrometry) was applied to achieve more comprehensive proteome profiles of plasma proteins. 66 non-redundant proteins were identified in this research. By means of bioinformatics, the identified proteins was classified in terms of functions in transcription, structural and cytoskeletal, signal transduction, protein synthesis, protein folding-sorting-degradation, immunity, growth performance, energy metabolism, cell cycle, carbohydrate metabolism, calcium homeostasis, antioxidant and amino acid, and lipid me-tabolism, which shall enhance our understanding on the immunity mechanisms of Chinese shrimp.

【题目】The complete mitochondrial genomes of two common shrimps (Litopenaeus vannamei and Fenneropenaeus chinensis) and their phylogenomic considerations
【中文关键词】无
【英文关键词】Decapoda; Penaeidae; Phylogenomics; Phylogenetics; Complete mitochondrial genome
【中文摘要】无
【英文摘要】Complete mitochondrial genomes have proven extremely valuable in helping to understand the evolutionary relationships among metazoans. However, uneven taxon sampling may lead to unclear or even erroneous phylogenetic topologies. The decapod crustaceans are relatively well-sampled, but sampling is still uneven within this group. We have sequenced the mitochondrial genomes of two shrimpsLitopenaeus vannamei and Fenneropenaeus chinensis. As seen in other metazoans, the genomes contain a standard set of 13 protein-coding genes, 22 transfer RNA genes, two ribosomal RNA genes and an AT-rich non-coding region. The gene arrangements are consistent with the pancrustacean ground pattern. Both the pattern of gene rearrangements and phylogenomic analyses using concatenated nucleic acid and amino acid sequences of the 13 mitochondrial protein-coding genes strengthened the support that Caridea and Palinura are primitive members of Pleocyemata. These sequences, in combination with two previously published penaeid mitochondrial genomes, suggest that genera within the family Penaeidae have the following relationship: (((Penaeus + Fenneropenaeus) + Litopenaeus) + Marsupenaeus). The analyses of nucleic acid and amino acid sequences of the mitochondrial genomes also strongly support the monophyly of Penaeidae, Brachyura and Pleocyemata. In addition, the analyses of the average Ka/Ks in the 13 mitochondrial protein-coding genes of penaeid shrimps indicated a strong purifying selection within this group.

【题目】The lysosome and lysozyme response in Chinese shrimp Fenneropenaeus chinensis to Vibrio anguillarum and laminarin stimulation.
【中文关键词】无
【英文关键词】Fenneropenaeus chinensis; haemocyte; laminarin; lysosome; lysozyme; neutral red retention assay; Vibrio anguillarum
【中文摘要】无
【英文摘要】The lysosome and lysozyme response in Chinese shrimp Fenneropenaeus chinensis to Vibrio anguillarum and laminarin stimulation | Fenneropenaeus chinensis; haemocyte; laminarin; lysosome; lysozyme; neutral red retention assay; Vibrio anguillarum | The effect of laminarin and Vibrio anguillarum on neutral red retention (NRR) time of lysosome and lysozyme activity in blood cells was investigated in Chinese shrimp, Fenneropenaeus chinensis. In addition the variation, of total haemocyte counts (THC) and differential haemocyte counts (DHC) were dtermined simultaneously The. results showed that the lysosome membrane stability was significantly elongated with the longest NRR time for 180 min at 3 h after lamianrin injection, ($p<0.05$). The lysozyme activity of haemocytes showed a moderate increase simultaneously. THC also increased and with a highest percentage of semi-granular cell counts at 3 h after laminarin injection. However, the NRR time sharply decreased with the shortest NRR time for 13 min at 1.5 h after V. anguillarum injection. Compared to the control group, the lysozyme activity obviously increased after injection, which was demonstrated at 1.5 h though the THC decreased. The percentage of hyaline cells increased obviously after V. anguillarum injection ($p<0.05$). The results suggested that the shrimp immune status could be evaluated by using lysosome membrane stability and lysozyme activity. (C) 2008 Elsevier B.V. All rights reserved.

【题目】The mitochondrial manganese superoxide dismutase gene in Chinese shrimp Fenneropenaeus chinensis
【中文关键词】无
【英文关键词】Mitochondrial MnSOD(mMnSOD); Cloning; WSSV; Immune response; Expression; Enzyme assay; Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Manganese superoxide dismutase (MnSOD) plays an important role in crustacean immune defense reaction by eliminating oxidative stress. Knowledge on MnSOD at molecular level allows us to understand its regulatory mechanism in crustacean immune system. A novel mitochondrial manganese superoxide dismutase (mMnSOD) was cloned from hepatopancreas of Chinese shrimp Fenneropenaeus chinensisby 3′ and 5′ rapid amplification of cDNA ends (RACE) PCR. The full-length cDNA consists of 1185 bp with a 660 bp open reading frame, encoding 220 amino acids. The deduced amino acid sequence contains a putative signal peptide of 20 amino acids. Sequence comparison showed that the mMnSOD of F. chinensis shares 88% and 82% identity with that of giant freshwater prawn Macrobrachium rosenbergiiand blue crab Callinectes sapidus, respectively. mMnSOD transcripts were detected in hepatopancreas, hemocytes, lymphoid organ, intestine, ovary, muscle and gill by Northern blotting. RT-PCR analysis indicated that mMnSOD showed different expression profiles in shrimp hemocytes and hepatopancreas after artificial infection with white spot syndrome virus (WSSV). In addition, a fusion protein containing mMnSOD was produced in vitro. LC – ESI – MS analysis

showed that two peptide fragments (-GDVNTVISLAPALK- and -NVRPDYVNAIWK-) of the recombinant protein were identical to the corresponding sequence of M. rosenbergii mMnSOD, and the enzyme activity of the refolded recombinant protein was also measured.

【题目】Three tetraspanins from Chinese shrimp, Fenneropenaeus chinensis, may play important roles in WSSV infection
【中文关键词】无
【英文关键词】WSSV, tetraspanins, TM4SF, Fenneropenaeus chinensis
【中文摘要】无
【英文摘要】Three members of the tetraspanin/TM(4)SF superfamily were cloned from Chinese shrimp, Fenneropenaeus chinensis. The deduced amino acid sequences of the three proteins have typical motifs of the tetraspanin/TM(4)SF superfamily. Phylogenetic analysis of the proteins, together with the known tetraspanins of invertebrates and vertebrates, revealed that they belong to different tetraspanin subfamilies: CD9, CD63 and tetraspanin-3. The three cloned genes of CD9, CD63 and tetraspanin-3 showed apparently different tissue distributions. The CD9 gene (FcCD9) was specifically expressed in the hepatopancreas. While for the CD63 gene (FcCD63), the highest expression was detected in nerves, epidermis and heart, with low expression in haemocytes, ovary, gill, hepatopancreas and stomach and no expression in intestine, muscle and lymphoid organ. Compared with FcCD9 and FcCD63, the tetraspanin-3 gene (FcTetraspanin-3) was more broadly expressed and its highest expression was detected in the intestine. Its expression in nerves was lower than in the intestine, but was higher than in other tissues. Expression in haemocytes, ovary and muscle was much lower than in other tissues. The expression profiles of FcCD9, FcCD63 and FcTetraspanin-3 in different tissues, including haemocytes, lymphoid organ and hepatopancreas, were compared by real-time PCR when shrimp were challenged by live white spot syndrome virus (WSSV) and heat-inactivated WSSV. All three tetraspanins were markedly up-regulated in the live WSSV-challenged shrimp tissues. The data suggested that the three cloned members of TM(4)SF superfamily in Chinese shrimp may play a key role in the route of WSSV infection.

【题目】抑制性消减杂交技术结合cDNA MICROARRAY技术在中国明对虾WSSV感染后差异表达基因研究上的应用
【中文关键词】中国明对虾;消减文库;基因芯片
【英文关键词】Fenneropenaeus chinensis; SSH library; Microarray
【中文摘要】以中国明对虾WSSV感染6h的头胸部组织为实验材料,提取总RNA分别进行正反向抑制性PCRcDNA消减杂交,消减杂交后的PCR产物经纯化并克隆到T载体,进而转化成正反向消减文库。消减文库库容分别为:正向库,3.7×10^4;反向库,1.2×10^4。利用消减文库的克隆构建了cDNA表达谱芯片,共有1536个靶点,其中正、反向文库各768个。使用该cDNA芯片对WSSV感染后6h的对虾组织进行了表达谱分析,对其中80个出现明显表达调控变化的阳性克隆进行了测序。结果显示,在WSSV感染后6h,病毒基因开始大量表达,而宿主糖酵解,嘌呤、嘧啶代谢以及精氨酸代谢等代谢途径的关键基因出现明显下调。这表明病毒已在宿主体内大批量复制并开始抑制宿主代谢。病毒上调表达的WSV482可能与病毒毒力的增强有关,而宿主蛋白的管家基因如Actin,EFQ的下调表达提示:在利用基因表达技术研究WSSV病毒的实验中,管家基因的选择要十分慎重。此外,根据作者已有的研究结果,TPI基因是比较好的候选管家基因。而WSV414、WSV215和

WSV482是对WSSV进行RNA干涉实验较好的候选靶标基因。

【英文摘要】After challenged with WSSV for 6h, forward and reverse SSH (suppression subtractive hybridization) were performed by mRNA of cephalothorax of Chinese shrimp, Fenneropenaeus chinensis. The PCR products of SSH were cloned into a T vector, and then transferred into plasmid libraries. The titers of the two libraries were, forward library at 3.7 * 10~4, and reverse library at 1.2* 10~4. A total of 1536 randomly-selected cDNA clones of the SSH libraries (768 each) were stained on a glass slide to construct cDNA microarray. The gene expression profiles of cephalothorax of the shrimp 6h after WSSV injection were examined in microarray. Eighty significantly differential expression clones were sequenced. The results reviewed that, 6h after WSSV injection, the WSSV genes were expressed at a high mRNA level while the processes of host glycolysis and metabolism of purine, pyrimidine, and arginine kinase were observably down regulated. The results indicated that the up regulation of WSV482 might result in the virulence of WSSV. The down regulation of house keeping genes includes Actin and Efalpha reminded us that we should carefully choose the inter-stander in such experiments. Besides, we believe that TPI is a good candidate of inter-stander based on our previously experiments. WSV414, WSV215 and WSV482 can be good candidates of target of RNA interference.

【题目】中国明对虾Rel(NF—kB)家族基因在弧菌刺激下的表达

【中文关键词】中国明对虾; 基因表达; 弧菌刺激

【英文关键词】Rel/NFkappa; B; Fenneropenaeus chinensis; Rel/NF-kappaB; Gene expression; Vibrio challenge

【中文摘要】利用RT-PCR和RACE技术获得了中国明对虾Rel/NF-kappaB家族成员FcRel基因的部分cDNA片段,并研究了该基因在弧菌刺激条件下的转录表达变化。结果表明,该cDNA编码320个氨基酸,包含一个完整的RHD结构域和部分IPT-NFkappaB结构域。FcRel基因的RHD结构域与其它物种的RHD结构域的分子系统学分析表明,中国明对虾的FcRel与果蝇的Relish聚在一起,然后与疟蚊、烟草天蛾等其它节肢动物的Relish聚为一类。在弧菌刺激时,FcRel在血细胞和淋巴器官中的转录表达显示出不同的变化模式。在弧菌注射后3h和5h,血细胞中FcRel的转录表达出现明显下调;而弧菌注射引起淋巴器官中FcRel基因明显的上调表达。说明FcRel基因的表达与弧菌刺激密切相关,提示Relish可能参与了对虾抗菌反应的信号转导通路。

【英文摘要】Rel/NF-kappaB is a group of nuclear transcription factors, and very important in mediating innate immune reactions in animals. RT-PCR and RACE techniques were applied in this study to produce partial cDNA fragments of FcRel-a member of Rel/NF-kappaB family from Chinese shrimp Fenneropenaeus chinensis. The cDNA fragment encoded 320 amino acids, including a whole RHD domain and a partial IPT-NFkappaB domain. Phylogenetic analysis on RHDs from different species shows that FcRel is categorized with the Relish of Drosophila melanogaster first, and then joined the Relish of Aedes aegypti and Bornbyx mori. Real-time PCR analysis revealed different expression profiles of FcRel gene between hemocytes and lymphoid organ of shrimp when they were challenged by Vibrio. The transcription of FcRel in hemocytes showed down-regulation 3h and 5h post-challenge, while that of FcRel in lymphoid organ showed apparent up-regulation post-challenge. It was indicated that the expression of FcRel was closely related to Vibrio challenge. Therefore, it is deduced that Relish may be involved in the signal transduction pathway of antibacterial response in shrimp.

【题目】Cloning of a Novel Pyrethroid Hydrolase Gene from Sphingobium sp.JZ-1 and characterization of the Gene Product

【中文关键词】拟除虫菊酯;生物降解;Sphingobium wenxiniae JZ-1;基因克隆和表达;PytH;手性选性

【英文关键词】Pyrethroid pesticides; Biodegradation; Sphingobium wenxiniae JZ-1; Gene clone and expression; PytH; Isomer selectivity

【中文摘要】通过构建基因组DNA文库,成功地从菊酯降解菌株Sphingobium wenxiniae JZ-1中克隆到一个新的菊酯水解酶基因,命名为pytH。该基因含840个碱基,编码280个氨基酸,G+C mol%含量为66.55%,没有信号肽序列。通过和PDB(Protein Data Bank)数据库中的氨基酸序列比对结果发现,PytH和α/β-水解酶折叠蛋白家族中的一些成员相似性最高:和来源于巴西橡胶树中的羟基乙腈裂解酶(PDB:2G4LA)有24%同源性;和来源于大肠杆菌羧酸酯酶BioH(PDB:1M33A)有23%同源性;和来源于金杆菌属的γ-内酰胺酶(1HKHA)有23%同源性;和来源于詹森菌属的咔唑水解酶(1J1IA)有20%的同源性,并具有α/β-水解酶家族蛋白的典型三联体催化活性位点Ser-His-Asp/Glu(Ser78、Asp202和His230)以及该家族蛋白的特征序列标签GXSXG(GHSLG从76位到80位)。通过PCR定点突变的方法对PytH可能的三联体催化位点和特征序列进行突变,突变体(Ser78Thr、Asp202Asn、His230Ile、Gly76Ser和Gly80Cys)酶活性完全丧失。因此推测PytH为α/β-水解酶折叠蛋白家族中的一个新成员。以pET29a为载体,构建表达质粒pET29a-pytH,实现了PytH蛋白在E. coli Rosseta (DE3)和E. coli BL21 (DE3)中的融合表达,并用镍离子亲和层析柱对融合蛋白PytH实现了纯化。PytH是分子量为31 kD,等电点(pI)为4.85的单体酶。0.5 mmol/L的Ag+、Ni2+、Cu2+、Hg2+和Zn2+;10 mmol/L的表面活性剂SDS和Tween80;0.5 mmol/L的丝氨酸蛋白酶抑制剂PMSF,组氨酸变性剂DEPC以及巯基试剂pCMB和碘乙酰胺都能强烈的抑制PytH的活力。10 mmol/L的Triton X-100能抑制大约20~30%的酶活。10 mmol/L的金属离子螯合剂EDTA和1, 10-二氮菲对酶抑制作用小于10%。菊酯的分子结构显著影响菊酯水解酶PytH对菊酯的降解效率,菊酯分子结构中酯键附近空间位阻越大,降解速率越慢。PytH对测定的菊酯降解速率顺序为:氯菊酯>甲氰菊酯>氯氰菊酯>功夫菊酯>氰戊菊酯>溴氰菊酯>联苯菊酯。PytH能水解短链的对硝基苯酚羧酸酯,其中对硝基苯酚乙酸酯的水解速率最高。随着羧酸链的增长,酶对底物催化效率不断下降。对超过6个碳原子的羧酸与对硝基苯酚形成的酯,PytH对其完全失去催化活力。由于脂肪酶更倾向于水解长链脂肪酸酯,而酯酶更倾向于水解短链羧酸酯,所以PytH为酯酶,而不是脂肪酶。PytH对氯氰菊酯、氯菊酯的降解没有顺反异构选择性,对甲氰菊酯有两种立体异构体(αR-, αS-)氰戊菊酯有四个立体异构体(αS, 2R-, αR, 2R-, αS, 2S-, αR, 2S-)也没有手性选择性,这不同于以往报道的菊酯水解酶。

【英文摘要】A novel esterase gene, pytH, encoding a pyrethroid-hydrolyzing carboxylesterase was cloned from Sphingobium sp. JZ-1. The gene contained an open reading frame of 840 bp encoding for a protein of 280 amino acids. The G+C mol%content was 66.55%. No potential signal sequence was found. The deduced protein was compared with the known enzymes available from the Protein Data Bank (NCBI database). PytH showed the highest homology with some α/β-hydrolase fold proteins, e.g., a hydroxynitrile lyase from Hevea brasiliensis (24% identity), a carboxylesterase BioH from E. coli (23% identity), an (-) γ-lactamase from Aureobacterium sp. (23% identity), and a hydrolase from Janthinobacterium sp. (20% identity). PytH contains the typical catalytic centers Ser-His-Asp/Glu and highly conserved pentapeptide GXSXG of α/β-hydrolase fold proteins. The mutant enzymes Ser78Thr,Asp202Asn and His230Ile (catalytic centers Ser-His-Asp mutations), and Gly76Ser and Gly80Cys (highly conserved pentapeptide GXSXG mutations) did not show any specific activity against pyrethroids at all. Thus, the enzyme PytH was proposed to be a novel member of α/β-hydrolase fold proteins.PytH was expressed in Escherichia coli BL21 (DE3) and Escherichia coli Rosseta (DE3), and was purified using Ni-nitrilotriacetic acid affinity chromatography. PytH was a monomeric structure with a molecular mass of approximately 31 kDa and a pI of 4.85. No cofactors were required for enzyme activity. The enzyme was strongly inhibited by many metal ions (Ag+, Ni2+, Cu2+, Hg2+ and Zn2+; 0.5 mM), the surfactants SDS and Tween 80 (10 mM), the Ser protease inhibitor PMSF, His modifier DEPC (0.5 mM), and thiol reagent pCMB and iodoacetamide (0.5 mM); while Triton X-100 (10 mM) showed only slight inhibition (20-30% inhibition), and chelating agents EDTA and 1, 10-phenanthroline (10 mM) had little effect on the enzyme activity (less than 10% inhibition).PytH was capable of hydrolyzing all of the pyrethroids tested, and hydrolysis efficiencies were dependent on the pyrethroid molecular structure, with the hydrolysis rates descending as follows: permethrin > fenpropathrin > cypermethrin > cyhalothrin > fenvalerate > deltamethrin > bifenthrin. PytH showed the highest activity with p-nitrophenyl acetate, and the activities decreased with the increase of the aliphatic chain length. No lipolytic activity was observed with esters containing an aliphatic chain length longer than six carbon atoms, indicating that PytH was an esterase and not a lipase. The specific activities for trans- and cis-permethrin (or cypermethrin) were found to be relatively similar, and stereoisomers of fenpropathrin or fenvalerate were hydrolyzed at an approximately equal rate, indicating that PytH lacked isomer selectivity for pyrethroid pesticides.

【题目】Junyi Gai, Han Xing. Association analysis of vegetable soybean quality traits with SSR markers
【中文关键词】无
【英文关键词】vegetable soybean — association mapping —linkage disequilibrium — population structure — markertrait associations
【中文摘要】无
【英文摘要】AbstractAssociation mapping is a useful alternative to linkage mapping for the detection of marker-phenotype associations. The main objective of this study is to identify simple sequence repeat (SSR) markers associated with the vegetable soybean quality traits of 100-pod weight, 100-seed weight, sucrose content and free amino acid content. The four quality traits were evaluated in 323 soybean cultivar accessions from China, and the 323 accessions were genotyped with 101 SSR markers. Analysis of population structure revealed two subgroups in the population. The mean linkage disequilibrium (LD) value (D ¢) for all statistically significant loci pairs was 0.258. The decay of the LD based on the D ¢ value showed little change with the increasing genetic distance between pairs. A total of 79 marker – trait associations related to the four traits were identified, involving 44 different SSR markers. According to the results, the association analysis approach in this study can be an effective method for quantitative trait loci mapping and can help breeders to develop new strategies for improving vegetable soybean quality.

【题目】Sphingobium faniae sp. nov., a pyrethroid-degrading bacterium isolated from activated sludge treating pyrethroid-manufacturing wastewater
【中文关键词】拟除虫菊酯农药;生物降解;Sphingobium faniae sp. nov.;水解酶PytH
【英文关键词】pyrethroids; biodegradation; Sphingobium faniae sp. nov.; hydrolase PytH
【中文摘要】采用富集培养方式从菊酯农药厂废水中分离到一株以甲氰菊酯为唯一碳源进行生长的细菌JZ-2,经16S rDNA基因序列系统分析,将其初步鉴定到鞘酯菌属(Sphingobium sp., GenBank Accession No. FJ373058),因为与该属内其他模式菌株相比,菌株JZ-2与Sphingobium cloacae JCM 10874T和Sphingobium ummariense CCM 7431T 同源性最高,分别为98.3%和97.1%,与其余的模式菌株同源性也在94.8 – 96.9%之间。菌株JZ-2主要的非极性脂肪酸是18:1ω7c,主要的2-羟基脂肪酸是14:0 2-OH,主要的醌是Q-10,所含极性酯主要为:双磷脂酰甘油、磷脂酰单甲基乙醇胺、卵磷脂、磷脂酰甘油、磷脂酰乙醇胺和鞘糖脂。主要的多胺是亚精胺,G+C含量为63.8±0.8 mol%。JZ-2和Sphingobium cloacae JCM 10874T,Sphingobium ummariense CCM 7431T的DNA-DNA杂交同源性分别为34%和23%。通过对拟除虫菊酯降解菌JZ-2表型(生理生化特征比较、多胺、极性酯成分、醌)、基因型(G+C mol%含量以及DNA-DNA杂交分析)和系统发育特征分析,发现菌株JZ-2为鞘酯菌属中的一个新种,命名为樊氏鞘酯菌Sphingobium faniae sp. nov. (=CGMCC 1.7749T =DSM 21829T)。该菌部分生物学特性如下:该菌株在pH7.0生长最好,最适生长温度为30 °C,装液量40 ml/150 ml时,生长量最大,随着装液量的增加生长呈下降趋势。在10~15 g · l-1的盐浓度范围生长较好,以葡萄糖为碳源、以有机氮为氮源的培养基中生长较好。对氨苄青霉素、链霉素有抗性。
【英文摘要】A bacterial strain capable of degrading pyrethroid, designated JZ-2T, was isolated from activated sludge treating pyrethroid-contaminated wastewater. Phylogenetic analysis based on 16S rRNA gene sequences indicated that strain JZ-2T belongs to the genus Sphingobium. It showed the highest levels of 16S rRNA gene sequence similarity to Sphingobium cloacae JCM 10874T (98.3 %) and Sphingobium ummariense CCM 7431T (97.1 %), and 94.8 – 96.9% similarity to the type strains of other members of the genus Sphingobium. Strain JZ-2T contained C18 : 1v7c as the predominant fatty acid, C14 : 0 2-OH as the major 2-hydroxy fatty acid,

ubiquinone Q-10 as the main respiratory quinone, diphosphatidylglycerol, phosphatidylglycerol, phosphatidylcholine,phosphatidylmonomethylethanolamine, phosphatidylethanolamine and two sphingoglycolipids as the predominant polar lipids and spermidine as the major polyamine. DNA – DNA hybridization results showed that strain JZ-2T had low genomic relatedness with S. cloacae JCM 10874T (34 %) and S. ummariense CCM 7431T (23 %). Based on the phenotypic, genotypic and phylogenetic data presented, strain JZ-2T is considered to represent a novel species of the genus Sphingobium, for which the name Sphingobium faniae sp. nov. is proposed. The type strain is JZ-2T (5CGMCC 1.7749T 5DSM 21829T).

【题目】Biodegradation of Ethametsulfuron-Methylby Pseudomonas sp. SW4 isolated from contaminated soil.

【中文关键词】胺苯磺隆;硝酸还原假单胞菌SW4;代谢途径;生物检测;土壤修复

【英文关键词】Ethametsulfuron-Methyl; metabolic pathways; Pseudomonas nitroreducens SW4; bioassay; bioremediation

【中文摘要】对胺苯磺隆降解菌株Pseudomonas nitroreducens SW4 的生长特性与降解特性作了详细的研究。发现SW4 在C/N 2-8 范围内生长都较好,以C/N 8 生长最好,最适碳源为葡萄糖,最适氮源为有机氮,其中有机氮以蛋白胨为最好。通过对其他磺酰脲类除草剂的降解谱试验后发现,SW4 可以利用胺苯磺隆、烟嘧磺隆、吡嘧磺隆、甲磺隆、噻磺隆、为唯一氮源生长,却不能利用苯磺隆、氯磺隆、氯嘧磺隆。SW4 的最适生长温度为30℃,最适pH 为8,菌株生长与装液量成负相关。静息细胞在25℃时对胺苯磺隆降解效果最好,温度过高或过低都会显著影响降解效果。静息细胞在pH 值6-10 范围内对胺苯磺隆都有很好的降解效果,环境pH<5 时显著抑制静息细胞的降解活性。运用HPLC 和LC-MS 的手段分析了菌株SW4 在以胺苯磺隆为唯一氮源的液体培养基中代谢胺苯磺隆时产生的代谢物,在对代谢物结构的分析基础上推测了SW4 降解胺苯磺隆的途径,结果表明SW4 降解胺苯磺隆时存在两条代谢途径,其中一条为胺苯磺隆的脲桥断裂;另一条为胺苯磺隆的三嗪环侧链发生N-脱甲基作用,生成N-脱甲基胺苯磺隆,继而发生O-脱乙基作用,生成N-脱甲基-O-脱乙基胺苯磺隆,最后发生三嗪环的开环及其他作用后生成了methyl 2-[[[[[amino[(aminocarbonyl)imino]methyl]amino]carbonyl]amino]sulfonyl]benzoate。

【英文摘要】The optimum carbon sources for SW4 were glucose, sucrose and maltose, and the optimal nitrogen source was organic nitrogen, and the most optimal C/N (mol atom) ratio was 8/1. It grew well under conditions of 25°C-37°C and pH 8.0. Its resting cells degraded ESM well at 25°C-30°C and pH6-10 . Besides ESM, SW4 could also grow on Nicosulfuron, Pyrazosulfuron-Ethyl, Metsulfuron-methyl, and Thifensulfuronmethy using as sole nitrogen sources. The degradation products of ESM in the culture medium extracts were isolated and identified by LC/MS. Five metabolites of ESM degradation were detected. Based on the identified products, strain SW4 seemed to degrade ESM following two separate and different pathways: One route includes the cleavage of the sulfonylurea bridge, yielding the corresponding sulfonamide and heterocyclic amine. The other route implicates the loss of the alkyl from the triazine portion of ESM and yielding the N-desethyl Ethametsulfuron-Methyland N-desmethyl-O-desethyl Ethametsulfuron-Methyl, the later was further transformed to methyl 2-[[[[[amino[(aminocarbonyl)imino]methyl] amino]carbonyl]amino]sulfonyl]benzoate due to the cleavage of triazine ring.

【题目】Proteomics study of changes in soybean lines resistant and sensitive to Phytophthora sojae

【中文关键词】无
【英文关键词】Phytophthora sojae;soybean lines;plant-oomycete in teractions
【中文摘要】无
【英文摘要】AbstractBackground: Phytophthora sojae causes soybean root and stem rot, resulting in an annual loss of 1-2 billion US dollar s in soybean production worldwide. A proteomic technique was use d to deter mine the effects on soybean hypocotyls of infect ion with P. sojae .Results: In the present study, 46 differentially expressed proteins were identified in soybean hypocotyls infected with P. sojae , using two-dimension alelectrophoresis and matrix-assisted laser desorption/ionization tandem time of flight (MALD I-TOF/TOF). The expression levels of 26 proteins were significantly affected at various time points in the tolerant soybean line, Yudou2 5, (12 uregulated and 14 down-regulated). In contrast, in the sensitive soybean line, NG6 255, only 20 proteins were significantly affected (11 up-regulated and 9 down-regulated). Among these proteins, 26% were related to energy regulation, 15% to protein destination and storage , 11% to defense against disease, 11% to metabolism, 9% to protein synthesis, 4% to secondary metabolism, and 24% were of unknown function. Conclusion: Our stud y pro vides important information on the use of proteomic methods for studying protein regulation during plant-oomycete interactions.

【题目】Cre/lox System and PCR Based Genome Engineering in Bacillus subtilis.
【中文关键词】枯草杆菌、重组系统、基因的框内删除(in-frame deletion)、Cre/loxP
【英文关键词】Bacillus subtilis, Cre/loxP,in-frame deletion
【中文摘要】现有的枯草芽孢杆菌遗传操作系统依赖于载体的构建和枯草芽孢杆菌自身的重组系统,耗时长、效率低。本文将Cre/loxP定点重组系统和重叠延伸PCR技术结合建立了一套快捷高效的枯草芽孢杆菌基因组操作方法。用重叠延伸PCR技术代替载体构建快速地将目标敲除位点的上下游同源臂和抗性标记盒融合起来,用Cre/loxP定点重组系统代替菌体自身的重组系统高效的删除抗性标记,整个操作过程可以在2天内完成,大大提高了效率。应用该方法实现了枯草芽孢杆菌的基因敲除、基因的框内删除(in-frame deletion)以及基因组大片断的删除。该方法还适用于基因组的重排(genome rearrangement)和大规模的基因敲除。
【英文摘要】We have developed a fast and accurate method to engineer the Bacillus subtilis genome that involves fusing by PCR two flanking homology regions with an antibiotic resistance gene cassette bordered by two mutant lox sites (lox71 and lox66). The resulting PCR products were used directly to transform B. subtilis, and then transient Cre recombinase expression in the transformants was used to recombine lox71 and lox66 into a double-mutant lox72 site, thereby excising the marker gene. The mutation process could also be accomplished in 2 days by using a strain containing a cre isopropyl- -D-thiogalactopyranoside (IPTG)-inducible expression cassette in the chromosome as the recipient or using the lox site-flanked cassette containing both the cre IPTG-inducible expression cassette and resistance marker. The in vivo recombination efficiencies of different lox pairs were compared; the lox72 site that remains in the chromosome after Cre recombination had a low affinity for Cre and did not interfere with subsequent rounds of Cre/lox mutagenesis. We used this method to inactivate a specific gene, to delete a long fragment, to realize the in-frame deletion of a target gene, to introduce a gene of interest, and to carry out multiple manipulations in the same background. Furthermore,it should also be applicable to large genome rearrangement.

【题目】A study on relative importance of additive, epistasis and unmapped QTL for Aluminium tolerance at seedling stage in soybean
【中文关键词】无
【英文关键词】Soybean;recombinant inbred line;aluminium tolerance;sand culture;additive quantitative trait locus;epistatic quantitative trait locus pair;collective unmapped quantitative trait locus
【中文摘要】无
【英文摘要】The relative importance of quantitative trait locus (QTL) types controlling aluminium (Al) tolerance in a recombinant inbred line population of soybean was assessed under greenhouse sand culture in 2 years. Three growth-related indicators for Al-tolerance, namely relative total plant dry weight (RTDW), relative shoot dry weight (RSDW) and relative root dry weight (RRDW) were analysed for genetic architecture. RTDW showed relatively higher correlations and shared marker regions with RSDW and RRDW. Four additive QTL, four epistatic QTL pairs and collective unmapped QTL were identi fi ed for RTDW, with respective contributions of 22.30%, 14.86% and40.64%, in a total genetic contribution of 77.80% to phenotypic variation, while QTL • Environment contribution was relatively negligible. Similar results were found for RSDW and RRDW. Altogether, seven additive QTL, eleven epistatic QTL pairs and collective unmapped QTL were involved with Al-tolerance. Among them, one major QTL linked to marker region GMKF046-Sat_128 on B1 was shared by the three traits. The results imply that the three QTL types are all relevant and should be comprehensively utilized for the improvement of Al-tolerance in soybean.

【题目】Degradation of pyrethroid by Sphingobium sp. JZ-2 and the purification and characterization of a novel pyrethroid hydrolase
【中文关键词】拟除虫菊酯农药;生物降解;Sphingobium faniae sp. nov.;水解酶PytH
【英文关键词】pyrethroids; biodegradation; Sphingobium faniae sp. nov.; hydrolase PytH
【中文摘要】采用富集培养方式从菊酯农药厂废水中分离到一株以甲氰菊酯为唯一碳源进行生长的细菌JZ-2,经16S rDNA基因序列系统分析,将其初步鉴定到鞘酯菌属(Sphingobium sp., GenBank Accession No. FJ373058),因为与该属内其他模式菌株相比,菌株JZ-2与Sphingobium cloacae JCM 10874T和Sphingobium ummariense CCM 7431T 同源性最高,分别为98.3%和97.1%,与其余的模式菌株同源性也在94.8 – 96.9%之间。对菌株JZ-2的降解特性研究结果显示,该菌可在含菊酯的无机盐平板上产生透明圈,降解的最适pH值为8.0,最适温度为30 °C,接种量在2%以下时,甲氰菊酯的降解速率与初始接种量呈正相关,在浓度为20~100 mg · l-1范围内,甲氰菊酯能迅速降解。JZ-2不仅能够很好地降解甲氰菊酯,还能降解氯菊酯、氯氰菊酯、氰戊菊酯、溴氰菊酯、功夫菊酯和联苯菊酯等多种拟除虫菊酯类杀虫剂。Sphingobium faniae JZ-2对菊酯的降解没有手性选择性。菌株JZ-2降解甲氰菊酯的可能代谢途径如下:JZ-2首先将甲氰菊酯水解为甲氰菊酸和3-苯氧基苯甲醛,后者可被进一步氧化为3-苯氧基苯甲酸,3-苯氧基苯甲酸经3-苯氧基苯甲酸双加氧酶生成原儿茶酸和苯酚,原儿茶酸经3,4-双加氧酶而开环降解,苯酚先被氧化形成邻苯二酚,然后通过邻位途径开环降解。初步研究了Sphingobium faniae JZ-2在实验室模拟条件下对水体中的低浓度甲氰菊酯的降解情况。当补加无机盐时,该菌株72 h内能够有效降解50 μg · l-1池塘水体和污泥中的甲氰菊酯,解除甲氰菊酯对水生生物的毒害。这说明JZ-2在降解水体中的菊酯残留方面有很大潜力。基于粗酶液可以在含有甲氰菊酯的磷酸盐(PBS)平板上产生水解圈而建立了一种新的定性检测甲氰菊酯水解酶活性的方法。该菌株的甲氰菊酯水解酶主要存在于细胞内,为胞内酶,同时水解酶也是组成酶。通过硫酸铵沉淀、Sephadex G-75凝胶层析和PAGE切胶回收电洗脱等纯化手段,将菊酯水解酶(PytH)纯化了108.5倍,最终得率为10.2%。该水解酶是单体酶,分子量大小约31±1 kDa,等电点4.8,水解甲氰菊酯的最适反应温度为40 °C,最适pH值为7.5,在10 °C~50 °C温度范围内比较稳定。Ag+, Cu2+, Hg2+, Ni2+, Zn2+, 甲基对硫磷和对氯汞苯甲酸强烈抑制水解酶的酶活。苯甲磺酰氟完全抑制水解酶的酶活,说明该酶可能是丝氨酸酯酶。PytH的最适底物是甲氰菊酯,酶的比活达到42.31 U · mg-1,还能水解氯菊酯、氯氰菊酯、氰戊菊酯、溴氰菊酯和联苯菊酯等。该酶的最大降解速率Vmax为7.536 nmol · min-1, 米氏常数Km为0.05 nmol · ml-1。经艾德曼降解反应测得NH2-氨基酸十个氨基酸残基 (NH2 MTVTDIILIH)。该序列与已报道菊酯水解酶EstP和来源于哺乳动物和昆虫的菊酯

水解酯酶均无同源性。由于在上述诸方面与已报道菊酯水解酶有很多不同,PytH可能是一个新的酯酶。

【英文摘要】JZ-2 could grow on the agar mineral medium supplemented with fenpropathrin and show the transparent zones by degradation of fenpropathrin on the plate. The optimal pH for degrading fenpropathrin by the strain JZ-2 was pH8.0, the optimal temperature was 30°C. The rate of degrading fenpropathrin was related positively to initial inoculum size when it ' s below 2%. The strain could degrade fenpropathrin rapidly (initial concentration: 20~100 mg · l-1). In addition to fenpropathrin, JZ-2 was capable of degrading various pyrethroids, including permethrin, cypermethrin, fenvalerate, deltamelthrin, cyhalothrin and bifenthrin. No isomer selectivity was observed to the biodegradation of pyrethroid isomers. The proposal metabolic pathway was deduced as follows: JZ-2 metabolized fenpropathrin to 2,2,3,3-tetramethylcyclopropanecarboxylic acid and 3-phenoxybenzaldehyde by hydrolysis, then 3-phenoxybenzaldehyde were further oxidized to 3-phenoxy benzoate, 3-phenoxy benzoate was metabolized to protocatechuate and phenol by 3-phenoxybenzoate dioxygenase; protocatechuate were degraded by protocatechuate-3,4-dioxygenase, whereas phenol was transformed to catechol and then metabolized by ortho cleavage pathway. JZ-2 was used preliminarily to study biodegradation effects on low concentration fenpropathrin in pond water, which was simulated to natural condition. When supplemented with MSM liquid medium, JZ-2 could effectively degrade 50 μg · l-1 fenpropathrin in pond water and sediment after 72h, toxicity of fenpropathrin to aquatic organisms was eliminated. The results indicated that strain JZ-2 has potential use for bioremediation of pyrethroid-contaminated water.Based on crude enzymes of strain JZ-2 could show transparent halos on PBS plate supplemented with fenpropathrin,a novel qualitative analysis of pyrethroid-hydrolyzing enzyme activitiy was established. The fenpropathrin hydrolase in the bacterium was an endoemzyme, as well as a constituted enzyme. The hydrolase (PytH) was purified 108.5-fold to apparent homogeneity with 10.2% overall recovery by ammonium sulfate precipitation, gel filtration chromatography and PAGE extraction. It was a monomeric structure with a molecular mass of 31±1 kDa, a pI of 4.8, and the enzyme activity was optimal at 40°C and pH7.5, respectively. The enzyme was stable over a range from 10°C to 50°C. The pyrethroid hydrolyzing activity was strongly inhibited by Ag+, Cu2+, Hg2+, Ni2+, Zn2+, methyl parathion and ρ – chloromercuribenzoate. The hydrolase was completely inhibited by phenylmethylsulfonyl fluoride, indicating that PytH seems a serine esterase. The most preferred substrate of PytH was fenpropathrin, specific activity was 42.31 U · mg-1, permethrin, cypermethrin, fenvalerate, deltamelthrin and bifenthrin was also hydrolyzed. The Vmax for the degradation of fenpropathrin was 7.536 nmol · min-1. And the Michaelis-Mentn ' constant (Km) was 0.05 nmol · ml-1.The amino acid sequences of the N terminus of the enzyme (NH2 MTVTDIILIH) were determined by automated Edman degradation. There was no homology with the previously described EstP pyrethroid hydrolase or with other recognized hydrolases that have been isolated from mammals and insects. Different from those previously reported pyrethroid-hydrolyzing enzyme above the properties, PytH may be a novel esterase.

【题目】Discovery of genes involved in defense-immunity functions in a haemocytes cDNA library from Fenneropenaeus chinensis by ESTs annotation

【中文关键词】无
【英文关键词】Fenneropenaeuschinensis; Haemocytes; ESTs; Immune factors

【中文摘要】无

【英文摘要】Crustacean haemocytes play important roles in the host immune response including recognition, phagocytosis, melanization, cytotoxicity and inter-cellular signal communication. Expressed sequence tags (ESTs) analysis is proved to be an efficient approach not only for genediscovery, but also for geneexpression profiles performance. In order to further understand the innate immune system and defensemechanisms of Chinese shrimp at molecular level, complementary DNA library is constructed from the haemocyte tissue of Fenneropenaeuschinensis.A total of 2371 cDNA clones are successfully sequenced and the average sequence length is 460 bp. About 50% are identified as orthologs of knowngenes from other organisms by BLASTx and BLASTn program. By sequences comparability and analysis, 34 important genes including 177 ESTs are identified that may be involved in defense or immune functions in shrimp based on the known knowledge. These genes are categorized into five categories according to their putative functions in shrimp immune system: 13 genes are different types of antimicrobial

peptides (AMP, penaeidin, anti-lipopolysaccharide factor, etc.), and their proportion is about 38%; 11 genes belong to prophenoloxidase system (prophenoloxidase, serine proteinase, serine proteinase inhibitor, etc.), and their proportion is about 32%; five genes have high homology with clotting protein (lectin, transglutaminase, etc), and their proportion is about 15%; three genes may be involved in inter-cell signal communication (peroxinectin, integrin), and their proportion is about 9%; two genes have been identified to be chaperone proteins (Hsc70, thioredoxin peroxidase), and their proportion is about 6%. These EST sequences enrich our understanding of the immune genes of F. chinensis and will help further experimental research into immune factors and improve our knowledge of the immune mechanisms of shrimp.

【题目】Enhancement of shrimp antiviral immune response through caspase-dependent apoptosis by small molecules

【中文关键词】无

【英文关键词】Immunostimulant; Target protein; Apoptosis; Shrimp; Virus

【中文摘要】无

【英文摘要】Epidemic diseases cost large amount of economic loss in the shrimp aquaculture. To control the epidemic diseases, it is a very efficient approach to enhance the shrimp immunity by immunostimulants. In aquaculture, however, the applications of the available immunostimulants are very limited due to the lack of information about the roles of these immunostimulants in animal immunity. In the present study, a caspase protein (PjCaspase), required in shrimp antiviral apoptosis, was used as the target protein to screen for small molecules which would enhance the shrimp immunity. Based on screening using the EGFP-PjCaspase fusion protein in insect cells, four small molecules could enhance the activity of PjCaspase protein. Among them, IL-2 and evodiamine were further evidenced to enhance the apoptotic activity of shrimp hemocytes in vivo, suggesting that the small molecules improved the activity of apoptosis through the activation of the PjCaspase protein. The results indicated that the enhancement of apoptotic activity effectively inhibited the white spot syndrome virus (WSSV) infection in shrimp, which further led to the decrease of mortalities of WSSV-infected shrimp. Therefore, our study, for the first time, presented that the strategy using the key proteins in immune responses of aquatic organisms as the target proteins was a very efficient approach for the screening of immunostimulants to prevent the aquatic organisms from pathogen infections.

【题目】Comamonas zonglianii sp. nov., isolated from phenol-contaminated soil

【中文关键词】苯酚耐受菌;新种;多相分类研究;丛毛单胞菌属

【英文关键词】phenol tolerant strain; novel species; research on polyphasic taxonomy; the genus of Comamonas

【中文摘要】本文从长期受到苯酚污染的土壤中分离得到一株耐受苯酚菌株,命名为BF-3T,其对苯酚的最高耐受浓度为1000mg · L-1。经形态观察、生理生化鉴定和16S rRNA序列分析,将其鉴定为丛毛单胞菌属(Comamonas sp.)。但BF-3T的系统发育分析同时表明,BF-3T与丛毛单胞菌属模式菌株构建的进化树上形成了一个独立的分枝,它与最近的模式菌株Comamonas aquatica LMG 2370T的同源性仅为96.8%,低于了新种的阈值97%,这些分析都明显指出了BF-3T是一新种的可能性。于是,我们利用多相分类技术对该菌及同源性最近的3个菌株 (C. aquatica LMG 2370T、C. nitrativorans DSM 13191T 和 C. odontotermitis LMG 23579T)进行了分类学地位的研究。经研究可知,菌株BF-3T菌体呈短杆状(0.6-0.8 × 0.9-1.5 μm),革

兰氏染色阴性,无鞭毛。在30°C培养2d后,菌落呈浅黄色,圆形,半透明,中间突起,边缘平整。BF-3T好氧生长且最适生长条件为25 – 35°C,0 – 1% NaCl,pH 7 – 8。BF-3T接触酶、氧化酶、精氨酸双水解酶、脲酶、明胶水解呈阳性,可以利用吐温40、吐温80、葡萄糖酸盐、癸酸盐、己二酸盐及柠檬酸盐等碳源。BF-3T对氨苄青霉素、庆大霉素、青霉素G、利福平及链霉素均有抗性。BF-3T脂肪酸含量的主要成分为16:0、18:1/18:1ω7c、17:0 cyclo 及 summed feature 3(16:1ω7c and/or 15:0 iso 2-OH),其中17:0 cyclo含量高于其他模式菌株。BF-3T DNA G+C mol%含量为65.2±1%。其与同源性最近的3个菌株的DNA – DNA杂交率为25.4% – 28.7%,小于了新种认定的阈值(70%以下)。生理生化实验、系统发育分析、脂肪酸含量及DNA – DNA杂交等实验,表明了菌株BF-3T(=CCTCC AB 209170T =DSM 22523T)为丛毛单胞菌属的一个新种的模式菌株,命名为Comamonas zonglianii sp. nov.。

【英文摘要】A bacterial strain, designated BF-3T was isolated from phenol-contaminated soil. It can endure 1000 mg · L-1 phenol. Based on morphological, biochemical tests and analysis of 16S rRNA gene sequence, BF-3T was identified as Comamonas species. But phylogenetic analysis based on 16S rRNA gene sequences showed that strain BF-3T formed a monophyletic branch at the periphery of the evolutionary radiation occupied by the genus Comamonas; it showed the highest sequence similarity to Comamonas aquatica LMG 2370T(96.8%). This low sequence similarity (less than 97%) indicated that strain BF-3Tcould be clearly differed from other Comamonas species. So BF-3T with other three closely related species (C. aquatica LMG 2370T、C. nitrativorans DSM 13191T and C. odontotermitis LMG 23579T) were investigated by polyphasic taxonomic approach in our study.Cells of strain BF-3T are aerobic, Gram-negative, non-sporulating, non-motile and short rod (0.6-0.8 × 0.9-1.5 μm). Colonies on LB agar are circular, semi-transparent, pale yellow and convex after 2d incubation at 30°C. The optimum growth is observed at 25 – 37°C, 0 – 1% NaCl and pH 7 – 8. Strain BF-3T shows positive results for oxidase, catalase, arginine dihydrolase, urease, hydrolysis of gelatin, assimilation of Tween 40, Tween 80, gluconate, caprate, adipate and citrate reactions. Cells are resistant to ampicillin, gentamicin, rifampicin, penicillin G and streptomycin. The major fatty acids of BF-3T are 16:0, 18:1/18:1ω7c, 17:0 cyclo and summed feature 3 (16:1ω7c and/or 15:0 iso 2-OH). The value of 17:0 cyclo is greater than other species of Comamonas. The DNA G+C content of strain BF-3T is 65.2±1 mol%. And strain BF-3T showed relatively low DNA – DNA relatedness to other three closely related species(25.4% – 28.7%), these values well below the threshold of 70% recommended for the delineation of bacterial species.According to the phylogenetic analysis, DNA – DNA hybridization, whole-cell fatty acid composition as well as biochemical characteristics, strain BF-3T (=CCTCC AB 209170T =DSM 22523T) was clearly distinguished from all recognized Comamonas species and should be classified as a novel species of the genus Comamonas, for which the name Comamonas zonglianii sp. nov. is proposed.

【题目】Meat quality is associated with muscle metabolic status but not contractile myofiber type composition in premature pigs.

【中文关键词】李晓

【英文关键词】Pork quality; Energy metabolism; MyHC; AMPK; PGC-1α; Glucocorticoid receptor

【中文摘要】无

【英文摘要】Longissimus muscles were sampled from Erhualian (EHL) and Pietrain (PIE) pigs at 20 kg of body weight. No breed differences were detected in either the proportions or the mRNA/protein expression of respective MyHC isoforms, or the mRNA expression of PGC-1α (all P > 0.10). However, meat quality traits were already divergent between breeds, and were associated with distinct energy metabolic status, as reflected by dramatically lower AMPK activity yet higher CK and LDH activities (all P < 0.01) in longissimus muscle of EHL pigs. Moreover, mRNA expression of glucocorticoid receptor (GR) was found to be higher (P < 0.05) in longissimus muscle of EHL pigs. These results indicate that the differences in meat quality traits occur early in premature pigs, and these are attributed to skeletal muscle energy metabolism and not contractile myofiber type composition. Breed-specific GR expression in muscle may be related to the pattern of energy metabolism and meat quality, yet the mechanism awaits further investigation

【题目】Maternal low-protein diet programs offspring growth in association with alterations in yolk leptin deposition and gene expression in yolk sac membrane, hypothalamus and muscle of developing Langshan chicken embryos.
【中文关键词】饶开晴
【英文关键词】Maternal low-protein diet: Eggs: Yolk-sac membrane: Hypothalamus: Muscle: Corticosterone: Leptin: Thyroid hormone: Gene
expression: Chickens
【中文摘要】无
【英文摘要】The present study was aimed to investigate the mechanism underlying the influence of maternal low-protein (LP) diet on offspring growth in thechicken. One hundred and twenty Chinese inbred Langshan breeder hens were allocated randomly into two groups fed diets containing low (10 %,LP) or normal (15 %) crude protein levels. Low dietary protein did not affect the body weight of hens, but significantly decreased the laying rateand egg weight. The yolk leptin content was significantly lower in eggs laid by LP hens, while no differences were detected for yolk contents ofcorticosterone, tri-iodothyronine (T3) or thyroxine. Despite significantly lower hatch weight, the LP offspring demonstrated obviously higher serumT3concentration, which is in accordance with the faster post-hatch growth rate achieving significantly heavier body weight and pectoralis majormuscle weight 4 weeks post-hatching. Expression of 20-hydroxysteroid dehydrogenase (20-HSD) mRNA in the yolk-sac membrane was signifi-cantly down-regulated at embryonic day 14, whereas that of transthyretin and leptin receptor (LepR) was not altered. Moreover, hypothalamicexpression of 20-HSD, glucocorticoid receptors, thyrotropin-releasing hormone and LepR mRNA was significantly up-regulated in the LPgroup compared with their control counterparts. In the pectoralis major muscle, significantly higher expression of insulin-like growth factor(IGF)-I and IGF-I receptor mRNA was observed in LP embryos. The present study provides evidence that maternal LP diet programmes post-hatchgrowth of the offspring. The associated alterations in yolk leptin deposition as well as in yolk-sac membrane, fetal hypothalamus and muscle geneexpression may be involved in mediating such programming effect in the chicken.

【题目】Layer and broiler chicks exhibit similar hypothalamic expression of orexigenic neuropeptides but distinct expression of genes related to energy homeostasis and obesity.
【中文关键词】袁丽霞
【英文关键词】Chicks
Hypothalamus
Neuropepti des
Glucocor ticoid receptor
Fat mass and obesi ty
associated gene
Layer and broiler
【中文摘要】无
【英文摘要】Layer and broiler chickens demonstrate striking differen ces in body weight and bodycomp osition. However, the m echanism underly ing such difference is el usive.Hypothalamus – pituitary – adrenal (HPA) axis regulates energy homeo stasis and body sizein mammals, but informati on in birds is scarce. Here we test the hypothesis that such breeddifference is more associated with

hypothalamic expression of genes relate d to HPA axis,rather than orexi genic neuropeptides. Broiler chicks exhibit significantly higher body weightand food intake at day (D) 7 posthatchi ng, but the food intake rel ative to body weight gainwas actually lower. No breed differen ces were observed for hypothalamic expression ofneuropeptide Y (NPY), agouti-related protein (AGRP), proopiomelano cortin (POMC), orexin(ORX), leptin recept or (LEPR), acetyl-CoA carboxylase (ACC) or fatty acid synthase (FAS).However, broiler chicks expressed signif icantly higher glucocorticoid receptor (GR) mRNA(P < 0 .0 5) a nd pr ot ei n (P < 0 .0 1) in hypothalamus compared to layer chicks,which isassociated with lower corticotro pin-releasing hormon e (CRH) mRNA (P < 0.05) yet higheraccumulation of CRH peptid e in hypothala mus, suggesting an augme nted GR-me diatednegative feedback regulation of CRH trans cription and release in broiler chicks.Furthermore , fat mass and obesity associated (FTO) gene was also more highly expressedin hypothala mus of broiler chicks (P < 0.05). These results suggest that the genes related toenergy homeostasis and obesity, such as GR, CRH and FTO, rather than orexigenic neuropeptides, are impacted by the genetic selecti on practices and play a role in breed-specific body weight setpoint regulation in the chicken.

【题目】Effects of ligustrum licidum fruits on performance, antioxidation and meat quality in Arbor Acres broilers.
【中文关键词】陈鹏
【英文关键词】Broilers, Ligustrum lucidum , Performance, Antioxidation, Meat Quality
【中文摘要】无
【英文摘要】This study was conducted to evaluate the effects of Ligustrum lucidum (LL) on growth performance, antioxidation, and meat quality in broilers. 270 birds (1 d old) were allotted to 3 treatments with 6 replicates per treatment. The feeding progra m included a starter diet from d 1 to 21 of age and a grower diet from d 22 to 42 of age. The birds were give n a basal corn-soybean meal die t supplemented with 0 (the control), 5 or 10 g of LL/kg, respectively. The results showed that in the starter, grower and overall phase, broilers fed with 5 or 10 g of LL/kg had better ($p<0.01$) average daily gain, but there were no differences in feed: gain between treatments. In the starter and overall phase, average daily feed intake of LL groups was greater ($p<0.05$) than that of the control, but this difference was not observed in the grower phase. Supplementation of LL significantly increased ($p<0. 05$) superoxide dismutase activity and total antioxidant capability in serum of chickens. In breast muscle, birds fed 5 g of LL/kg had an increase ($p<0.05$) in sup eroxide dismutase activity. The LL supplementation significantly decreas ed ($p<0.05$) malondialdehyde contents. Adding 5 or 10 g of LL/kg to the diet significantly increased pH value and reduced drip loss of meat ($p<0.05$). The results of this study indicated that diet ary LL could improve growth performance, increase pH value and reduce drip loss of meat by decr easing lipid peroxidation and by improving antioxidative status in broilers.

【题目】Hepatic Lipolysis in Broiler Chickens with Different Fat Deposition during Embryonic Development.
【中文关键词】赵苏梅
【英文关键词】Broilerchicken; Hepaticlipolysis; Embryonicdevelopment; Real time RT-PCR
【中文摘要】无

【英文摘要】The aim of this study was to explore the hepaticlipolysis in broilerchickens with differentfatdeposition during embryonicdevelopment. The mRNA expression of CPT-1 (carmitine palmtoyltransferase-1), PPAR α (peroxisome proliferator-activated receptor alpha) and LPL (lipoprotein lipase) genes were determined using Real time RT-PCR. The start of incubation was called day 1 (E1) and after hatching called day 1 (H1). On incubation days 9 (E9), 14 (E14) and 19 (E19) as well as at hatching (H1), samples of liver were collected. Blood samples were obtained during days 14 (E14) and 19 (E19) of embryonicdevelopment and at hatching. This study showed that serum TG (triglycerol) decreased and TC (total cholesterol) and NEFA (non-estered fatty acid) increased during embryonicdevelopment. The expression of CPT-1, PPAR α and LPL genes exhibited different developmental changes. For example, little LPL gene was expressed at hatching and PPAR α gene expression peaked before hatching. However, CPT-1 gene exhibited no significance during the embryonicdevelopment. Our results showed that expression of these genes in Arbor Acres (AA) broilers was significantly higher than that in San Huang (SH) broilers. Therefore, this study suggested that hepaticlipolysis in broilerchickens exhibited developmental changes during embryogenesis and breed difference which may be one of the factors in the fatdeposition difference between fat line and lean line broilers during embryonicdevelopment.

【题目】The effect of dehydroepiandrosterone on cell viability and hepatic lipid lipogenic gene mRNA expression in primary cultured chicken hepatocytes.
【中文关键词】唐雪
【英文关键词】Cell survival;Cultured primary chicken hepatocytes;Dehydroepiandrosterone (DHEA);Lipogenic genes
【中文摘要】无
【英文摘要】The effects of dehydroepiandrosterone (DHEA) on lipogenic gene mRNA expression were examined using cultured primary chicken hepatocytes. Cell samples were equilibrated to culture conditions for 24 h and then exposed to DHEA (1, 10 and 100 μM) dissolved in DMSO. The expression of sterol regulatory element-binding protein-1 (SREBP-1) mRNA in cultured primary hepatocytes did not vary with time, except for a significant decrease in gene expression when cells were treated with 10 or 100 μM DHEA for either 1 or 2 h. A similar tendency toward decreased gene expression was evident for acetyl CoA carboxylase. The expression of peroxisome proliferator-activated receptor (PPAR) and carnitine palmitoyl transferase I mRNA was dramatically enhanced subsequent to treatment with 10 or 100 μM DHEA for periods of time from 6 to 48 h, while there was a decrease in the expression of PPAR in the presence of 10 μM DHEA after 1 and 2 h of exposure, and in the presence of 100 μM DHEA after 2 h of exposure. Hepatocytes treated with 10 or 100 μM DHEA contained more mitochondria and mitochondria with a higher electron density than did untreated hepatocytes. Furthermore, cell survival was significantly inhibited by treatment with 100 μM DHEA at 24, 48 and 72 h. In contrast, 1 μM DHEA administration significantly increased cell survival after 72 h; however, 10 μM DHEA treatment had no pronounced effect on cell survival. Overall, the results reported here indicate that DHEA accelerates lipid catabolism by direct regulation of hepatic gene expression and by induction of changes in hepatocyte mitochondria.

【题目】Dehydroepiandrosterone activates cyclic adenosine 3’,5’ – monophosphate protein kinase A signalling and suppresses sterol regulatory element-binding protein-1 expression in cultured primary chicken hepatocytes.

【中文关键词】唐雪
【英文关键词】Dehydroepiandrosterone: Hepatic lipid metabolism: Lipogenesis: Cultured primary chicken hepatocytes
【中文摘要】无
【英文摘要】Dehydroepiandrosterone (DHEA), a steroid hormone that is secreted by the adrenal cortex in mammals, has an array of biological actions, includ-ing inhibition of fat synthesis, decreasing the number of adipocytes, and a reduction in mammalian metabolic efficiency. Recent studies showed that DHEA may decrease fat deposition in poultry, but the mechanism of action is unclear. In the present study, we demonstrate that DHEA stimulates intracellular cyclic adenosine 30,50-monophosphate (cAMP) accumulation in chicken hepatocytes during a 30 min incubation period.Increases in intracellul ar cAMP are evoked by as low as 0・1 m M -DHEA. The cAMP induced by DHEA, while suppressing cAMP-specific phos-phodiesterase activity, also activates cAMP-dependent protein kinase A (PKA) in chicken hepatocytes. In addition, the activation of PKA leads to down-regulation of sterol regulatory element-binding protein-1 (SREBP-1). These findings demonstrate that direct action by DHEA leads to activation of the cAMP/PKA signalling system in the modulation of lipid metabolism by repressing SREBP-1, thereby providing a novel explanation for some of the underlying effects proposed for DHEA in the prevention of fat deposition in poultry

【题目】Effects of selenium and methionine supplementation of breeder hen diets on selenium concentration and oxidative stability of lipids in the thigh muscles of progeny.
【中文关键词】王曾广
【英文关键词】breeders, dietary supplementation, lipid stability, methionine, selenium
【中文摘要】无
【英文摘要】The effects of dietary supplementation to female chickens with selenium (Se) and methionine (Met)on the next generation were studied. Lang-shan breeding hens (450) were obtained at 52 wk of age and randomlyallotted to 9 treatments; 5 replicates of each treatment were carried out. The breeders were fed a basal corn – soybeanmeal diet (0.13 mg Se/kg) supplemented with 0, 0.30, or 0.60 mg/kg Se from Sel-Plex and 0.32%, 0.40%, or 0.54% Met for the 30-d adapting period and 70-d experiment period. Se and glutathione (GSH) concentrations, glutathioneperoxidase (GSH-Px) activity, and the oxidative stability of muscular lipids of 90-d progeny were determined by test-ing the TBARS values. When breeders received the highest levels of Met or Se, GSH-Px activity was decreased, the Se concentration and the oxidative stability of muscular lipids were increased with the supplementation of Se or Met.When breeder hens were given a Met-deficient diet, supplementing with Se decreased the Se deposition in progenythigh. With regard to lipid oxidation, 0.3 mg/kg maternal dietary Se supplementation decreased the oxidative stabil-ity of muscle lipid and 0.6 mg/kg Se supplementation showed no difference from the control. When breeders werefed a Se-deficient diet, the GSH-Px activity was increased significantly and the oxidative stability of progeny muscleswas decreased with the supplementation of Met. It was concluded that supplementation of the maternal diet withhigher Se and Met can increase Se deposition in progeny muscle and lead to more effective protection against lipidoxidation in progeny thighs.

【题目】Methionine and selenium yeast supplementations of the hen diets affect antioxidant and gel properties in the chick myofibrillar protein.
【中文关键词】王曾广
【英文关键词】maternal , selenium yeast , methionine , color , water-holding capacity
【中文摘要】无
【英文摘要】Four hundred fifty 52-wk-old Lang-shan breeding hens (dual-purpose type, an indigenous poul-try breed of China) were randomly divided into 9 treat-ments with 5 replicates each treatment. They were fed corn-soybean diets with 0, 0.30, and 0.60 mg of Se/kg from Se yeast and 3.2, 4.0, and 5.4 g of dl-Met/kg, respectively. After incubation, 250 chickens each treatment were randomly divided into 5 replicates and fed the same diet. At 21 d old, 10 male chicks in each treatment were slaughtered. There results were as fol-lows. (1) The Se content significantly increased with the increase of Se yeast supplementation ($P < 0.01$). (2) The carbonyl content of the myofibrillar protein significantly decreased with the increase of Met supple-mentation ($P < 0.01$) and the carbonyl content of the 0 mg of Se/kg treatment was higher than the 0.3 mg of Se/kg treatment ($P < 0.01$). (3) Selenium supple-mentation at 0.30 and 0.60 mg/kg significantly de-creased malondialdehyde content compared with that of 0 mg of Se/kg ($P < 0.01$) and 4.0 and 5.4 g of Met/kg supplementation significantly decreased malondial-dehyde content compared with that of 3.2 g of Met/kg ($P < 0.01$). (4) Supplementation of Met at 5.4 g/kg significantly increased International Commission on Illumination a* value compared with 3.2 and 4.0 g of Met/kg ($P < 0.01$). Supplementation of Se at 0.6 mg/kg significantly increased a* value compared 0 and 0.3 mg of Se/kg ($P < 0.01$) and 0 mg of Se/kg significantly increased b* value compared with 0.30 and 0.60 mg of Se/kg ($P < 0.01$). (5) Selenium supplemented at 0.30 and 0.60 mg/kg decreased drip loss compared with 0 mg of Se/kg and 4.0 and 5.4 g of Met/kg decreased drip loss compared with 3.2 g of Met/kg, respectively. The conclusion was drawn that Met and Se yeast supple-mentation of the maternal diets could improve color, water-holding capacity, and oxidative stability of male offspring meat to an extent.

【题目】Sterol regulatory element binding transcription factor 1 expression and geneticpolymorphism significantly affect intramuscular fat depositionin the longissimus muscle of Erhualian and Sutai pigs
【中文关键词】陈杰
【英文关键词】association, intramuscular fat content, mutation, messenger ribonucleic acid expression, pig, sterol regulatory element binding transcription factor 1
【中文摘要】无
【英文摘要】Two experiments were performed to elucidate the role of sterol regulatory element binding transcription factor 1 (SREBF1) in i.m. fat (IMF) depo-sition in pigs. In Exp. 1, LM samples were removed from 4 male and 4 female Erhualian piglets at 3, 20,and 45 d of age, and SREBF1mRNA expression level and IMF content were measured. Intramuscular fat content and expression of SREBF1mRNA was greater ($P < 0.05$) in females than males at all 3 stages of age,providing initial evidence that the level of SREBF1 mRNA expression is related to IMF deposition in mus-cle of suckling pigs. Additionally, in Exp. 2 there was a positive correlation between theSREBF1mRNA level and IMF content ($r = 0.67$, $P < 0.01$) in 100 Sutai finish-ing pigs, a synthetic line produced by crossing Erhua-lian and Duroc pigs. Single-strand conformation poly-morphism (SSCP) analysis of the reverse transcription PCR products of the SREBF1gene revealed 3 genotypes in Sutai pigs with frequencies of 50% for AA, 36% for AB, and 14% for BB, respectively. Both SREBF1mRNA level and IMF content in muscle were greater ($P < 0.05$) in AB and BB animals than in AA animals, whereas no difference in backfat thickness was observed among the 3 genotypes. Sequencing analysis identified 2 SNP at T1006C and C1033T within the open reading frame of the SREBF1gene (NM_214157). Although both are silent mutations, they affected the secondary structure of SREBF1mRNA. These results suggest that SREBF1 might play an important role in regulation of muscle fat deposition during postnatal growth of pigs. The SNP identified in the SREBF1gene suggest that it could be used as a genetic marker to improve IMF content in pigs.

【题目】Growth- and Breed-related Changes of Fetal Development in Cattle.
【中文关键词】毛卫华
【英文关键词】Breed, Body Composition, Cattle, Fetal Growth, Gestation
【中文摘要】无
【英文摘要】Breed differences in adult animals are determined during fetal development. If interventions are to be developed that influence growth of muscle and fat, it is important to know at which time during gestation breed diff erences appear and are fixed. The objective of this study was to characterize fetal development in cattle of different breeds. Pregnant cows of 4 cattle breeds with different growth impetus and muscularity were slaughtered under normal pr ocessing conditions and th e fetuses were removed. German Angus, a typical beef cattle; Galloway, a smaller, environmentally resistant beef type; Holstein Friesian, a dairy type; and Belgian Blue, an extreme type for muscle growth were used. Fetuses of each breed were investigated at 3, 6, and 9 mo of gestati on. Fetuses were weighed and dissected into carcass, organs, and muscles. Body fat weight was obtained using the Soxhlet extraction method. Fetal weight

increased most rapidly in the third trimester of gestation mainly due to the accelerated muscle and fat deposition. The organ w eight to body weight (BW) ratios decreased and the muscle and fat weight to BW ratios increased. At 3 mo of gestation, Galloway fetuses had the ignificantly smallest BW, half-carcass we ight, leg weight, organ weight, muscle weight and shortest leg length. In contrast, Holstein fetuses had the significantly greatest BW, liver, kidney, and l ung weights and significantly longest leg length among the 4 breeds, but no differences between Holstein Friesian and Belgian Blue were detected in half-carcass and leg weight. Indeed, Belgian Blue fetuses had the significantly greatest half-carcass weight, leg weight, and muscle weight at 9 mo of gestation, and Galloway had a significantly greater body fat to BW ratio than Holstein Friesian and Belgian Blue. These differences were not evident at 3 and 6 mo of gestation. These data show that the profound increase of tissue and organ weights occurred in la ter gestation in cattle fetuses even thoug h breed differences were evident as early as 3 mo of gestation. Depending on the tissue of interest, impacting fetal growth likely need s to occur early in gestation before the appearance of breed-specific differences.

【题目】Leptin is Involved in the Effects of Cysteamine on Egg Laying of Hens, Characteristics of Eggs, and Posthatch Growth of Broiler Offspring.

【中文关键词】胡艳

【英文关键词】cysteamine, laying performance, maternal effect, leptin, broiler chicken

【中文摘要】无

【英文摘要】Cysteamine has been reported to modu -late energy homeostasis and exert significant growth-promoting effects in broiler chickens. However, little is known concerning its effects on egg production of hens and the growth rate of their offspring. In the present study, 67-wk-old broiler breeders were allotted at ran -dom to control and cysteamine-supplemented (400 mg/kg) groups for 8 wk. The hatchlings were fed under the same condition until 6 wk of age. Cysteamine signifi -cantly increased the average laying rate by 2.24% (P < 0.01), decreased dramatically the percentage of the broken eggs by 40.55% (P < 0.01), and increased that of the abnormal eggs by 20.15% (P < 0.05). Cysteamine did not alter the egg weight, egg quality, fertility, or hatch -ability but significantly increased eggshell weight (P < 0.05) and decreased albumin weight (P < 0.05). Serum concentrations of total thyroxine (P < 0.01) and leptin (P < 0.01) were significantly lower in cysteamine-treat -ed hens, whereas total triiodothyronine (T3), free T3, and glucagon were not affected. Western blot analysis with leptin-specific antibody detected a band of approx -imately 15 to 16 kDa in egg yolk and albumin extracts as well as in liver homogenates of hens. Cysteamine did not affect the yolk content of T3, thyroxine, estradiol, or glucagon, but significantly increased leptin content in liver of hens (P < 0.05), as well as in yolk (P < 0.05) and albumin (P < 0.05) of eggs. These changes were accompanied by a significant downregulation of leptin receptor mRNA expression (P < 0.05) in the yolk sac of d-12 embryos. Female offspring hatched from cysteam -ine-treated eggs demonstrated significantly lower body weight at hatching (P < 0.01) and 42 d of age (P < 0.01). The results indicate that cysteamine improves laying performance of hens and affects the early posthatch growth of broiler offspring, in a sex-specific fashion. The modified leptin secretion and egg deposition, to -gether with altered yolk sac leptin receptor expression, may be involved in such an effect.

【题目】Alterations in methylation and expression levels of imprinted genes H19 and Igf2 in diabetic fetuses.
【中文关键词】邵伟娟
【英文关键词】embryonic day
【中文摘要】无
【英文摘要】The study aimed to reveal alterations in expression and methylation levels of the growth-related imprinted genes H19 and Igf2 in fetuses of diabetic mice. Diabetes was induced in female mice by intraperitoneal injection of streptozotocin. DNA and total RNA were extracted from fetuses obtained from diabetic and control dams on embryonic day (E) 14. Real-time RT-PCR analysis revealed that the mRNA expression of Igf2 in fetuses from diabetic mice was 0.65-fold of the control counterparts. Bisulfite genomic sequencing demonstrated that the methylation level of the H19 – Igf2 imprint control region was 19.1% higher in diabetic fetuses than in those of control dams. In addition, the body weight of pups born to diabetic dams was 26.5% lower than that of the control group. The results indicate that maternal diabetes can affect fetal development by means of altered expression of imprinted genes. The modified genomic DNA methylation status of imprinting genes may account for the change in gene expression.

【题目】Effects of dehydroepiandrosterone on growth performance, lipid metabolic hormones and parameters in broilers.
【中文关键词】马海田
【英文关键词】dehydroepiandrosterone (DHEA); growth performance; carcass composition; lipid metabolic hormones and parameters; broiler
【中文摘要】无
【英文摘要】One hundred and eighty (180) day-old broiler chickens were used to investigate the effects of dehy-droepiandrosterone (DHEA) on growth performance, carcass composition, and the serum concentrations of severallipid metabolic hormones and metabolic parameters (indicators). The broilers received the same basal diets, withDHEA added at 0 (control), 5 and 20 mg/kg feed. During the experimental period, broilers fed DHEA exhibitedlower levels of triglycerides (TG), total serum cholesterol (TC), high density lipoprotein-cholesterol (HDL-C) andnon-esterified fatty acids (NEFA) as compared to the control animals, but a marked increase in lipoprotein lipase(LPL) activity. Adding DHEA to the diet significantly decreased serum concentrations of thyroxine (T4), serumfree triiodothyronine (FT3), and serum free thyroxine (FT4), but significantly increased the serum leptin (LEP)and glucogon (GLU) levels in male broiler chickens. However, female broiler chickens showed pronounced differ-ences in LEP, FT3 and FT4 only, while there were no differences in the other three metabolic hormones (T3, T4 andGLU). Overall, these results indicate that DHEA improves lipid metabolism through the regulation of metabolichormones and metabolic parameters, while not adversely affecting growth performance in broiler chickens.

【题目】Effect of early feed restriction on myofibre types and expression of growth-related genes in the gastrocnemius muscle of crossbred broiler chickens.
【中文关键词】李月

【英文关键词】Feed restriction: Myosin heavy chain: Myofibre types: Gene expression: Chicken
【中文摘要】无
【英文摘要】The purpose of this study was to investigate the immediate and long-term effects of early feed restriction (ER) on morphology and gene expression of lateral gastrocnemius muscle. Newly hatched crossbred broiler chickens were allocated into control and ER groups, the latter being free-fed on alternate days from hatch to 14 days of age (14 d), followed by ad libitumfeeding as the control group until 63 d. The lateral gastrocnemius muscle was taken at 14 and 63 d, respectively for myofibre typing by both myosin ATPase staining and relative quantification of myosin heavy chain (MyHC) mRNA for slow-twitch (SM), red fast-twitch (FRM) and white fast-twitch (FWM) myofibres. The body weight and lateral gastrocnemius weight were significantly lower in the ER group, accompanied by significantly reduced serum triiodothyronine. The ER group exhibited signifi-cantly higher SM and FRM MyHC expression at 14 d, but lower SM expre ssion at 63 d. Myosin ATPase staining revealed a similar pattern. The percentage of SM was higher at 14 d while lower at 63 d in the ER group. These morphological changes were accompanied by changes of mRNA expression for growth-related genes. The ER group expressed lower insulin-like growth factoar I (IGF-I) and higher IGF-I receptor (IGF-IR) at 14 d, yet significantly increased growth hormone receptor and IGF-IR mRNA at 63 d. These result s indicate that ER may delay the slow to fast myofibre conversion as an immediate effect, but would result in a lower percentage of slow fibres owing to compensatory growth in the long term,which involves changes of mRNA expression for the growth-related genes in the muscle.

【题目】Effect of Dietary Daidzein on Egg Production, Shell Quality and Gene Expression of ER- α , GH-R and IGF-IR in Shell Gland of Laying Hens.
【中文关键词】倪迎冬
【英文关键词】Daidzein; egg laying performance; shell gland; gene expression; ISA hens
【中文摘要】无
【英文摘要】Our previous studies demonstrated that dietary daidzein improves egg production in ducks during the late period of the laying cycle. The present study was aimed to investigate the effect of daidzein in laying hens, with more focus on eggshell quality. The expression of ER- R, GH-R, and IGF-IR mRNA in shell glands was determined to identify the target genes of daidzein action and to reveal the relationship between shell quality and profiles of gene expression in shell glands of laying hens.1000 ISA hens, at 445 days of age, were allotted at random to two groups and given the basal diet with or without 10 mg of daidzein per kg diet for 9 weeks. Daidzein supplement significantly increased the egg laying rate and the feed conversion ratio. The eggshell thickness increased, while the percentage of cracked eggs decreased in daidzein-treated hens. Serum E 2 and phosphate concentrations were not altered, but the level of serum Ca 2+ and the tibia bone mineral density were significantly increased in the daidzein-treated group compared with their control counterparts. In parallel with the significant increase of oviduct weight, significant down-regulation of GH-R and IGF-IR mRNA and a trend of decrease in ERR mRNA expression in shell glands were observed in daidzein-treatedhens. The results indicate that dietary daidzein improves egg laying performance and eggshell quality during the late (postpeak) laying stage of hens, which is associated with modulations in gene expression in the shell gland.

【题目】Exposure of Preimplantation Embryos to Insulin Alters Expression of Imprinted Genes
【中文关键词】邵伟娟
【英文关键词】E, embryonic day; Igf2, insulin-like growth factor 2; PCR, polymerase chain reaction
【中文摘要】无
【英文摘要】Insulin promotes early embryonic development, but whether this action affects postimplantation fetal development and alters the expression of imprinted genes remain to be determined. This study analyzed the expression and methylation levels of the growth-related imprinted genes H19 and insulin-like growth factor 2 (Igf2) in fetuses exposed to insulin before implantation. We cultured 2-cell embryos in either 0 or 0.25 μg/ml insulin until the blastocyst stage and then transferred them into pseudopregnant recipient mice. The number of embryos developing to blastocysts after insulin exposure was 16.4% higher than that of the control, and the birth body weight of the insulin-exposed group was 17.8% higher than that of the control group. Real-time reverse transcription – polymerase chain reaction analysis revealed that exposure of preimplantation embryos to insulin increased the mRNA expression of both Igf2 and H19 in embryonic day (E) 14 fetuses. Bisulfite genomic sequencing demonstrated that the methylation level of the H19 – Igf2 imprint control region was 19.3% lower in insulin-exposed E14 fetuses than in controls. The present study indicates that insulin exposure during the preimplantation stage alters the expression of imprinted genes and affects fetal development.

【题目】Tissue-specific Effect of Dietary Cysteamine on Expression of Adiponectin Receptors in Rats.
【中文关键词】许金先
【英文关键词】Adiponectin; adiponectin receptors; cysteamine; rat
【中文摘要】无
【英文摘要】Adiponectin is synthesized by adipocytes and affects glucose and lipid metabolism by binding to its receptors, AdipoR1 and AdipoR2. Cysteamine, a naturally existing intermediate metabolite of sulfur amino acid, has been reported to modulate metabolism and growth in various species of animals;however, whether the action of cysteamine involves adiponectin and its receptors is unknown. The objective of the present study was therefore to investigate the effect of dietary cysteamine on the expression of AdipoR1/R2 in different tissues, in association with the alterations in endocrine and metabolic status. Rats were fed either of the diets supplemented with 0 or 700 mg/kg cysteamine feed additive (containing 30% of cysteamine hydrochloride) for 4 weeks, and the expression ofadiponectin and its receptors in adipose tissue, AdipoR1 and AdipoR2 in liver, gastrocnemius, and soleus muscle was determined, in association with the growth performance and serum concentrations of hormones and metabolites. A temporal trend of increase in growth rate and the ratio of feed consumption relative to body weight gain was observed in the second week of cysteamine supplementation. Serum concentrations of insulin and TNF- R increased, while serum levels oftriglycerides, FFA, and total cholesterol decreased significantly 4 weeks after cysteamine treatment. Leptin and GH remained unaffected. Cysteamine supplementation increased mRNA expression of AdipoR1 in adipose tissue, gastrocnemius, and soleus muscle as well as that of AdipoR2 in soleus muscle and adipose tissue. Nevertheless, hepatic expression of AdipoR1 and AdipoR2 was not influenced. Despite a numeric increase, no significant alteration in adiponectin mRNA expression in adipose tissue was observed. In conclusion, dietary supplementation of cysteamine modulates the endocrine and metabolic status of rats, which may involve the tissue-specific responses of adiponectin receptors at the level of mRNA transcription.

【题目】Hepatic and muscle expression of thyroid hormone receptors in association with body and muscle growth in large yellow croaker, Pseudosciaena crocea (Richardson).
【中文关键词】杨晓静
【英文关键词】Large yellow croaker; Thyroid hormone receptors; Cloning; Expression; Thyroid hormones
【中文摘要】无
【英文摘要】The role of thyroid hormone (TH) and its receptors (TRs) in the regulation of body growth and muscle accretion is well establis hed inmammals and birds, whereas the involvement of THs and TRs in W sh growth, especially during the muscle accretion period of juvenile-adult transition, is unknown. This study describes the cloning of the partial cDNA sequences of TR and TR in large yellow croaker,Pseudosciaena crocea (Richardson) and the patterns of TR and TR mRNA expression in liver and muscle of 1- and 2-year-old large yellow croaker, associated with changes in body mass and muscle characteristics. Two TR isoforms (TR 1, TR 2) and TR were identi-W ed in large yellow croaker. The deduced amino acid sequences showed high homology to the TRs of human and other teleosts. Hepatic TR mRNA expression was markedly lower in 2-year-old large yellow croaker compared with the 1-year-old, while no signi W cant agedi Verence was observed for hepatic TR mRNA expression. Muscle expression of TR mRNA was signi W cantly higher in 2-year-oldlarge yellow croaker, whereas TR exhibited no signiW cant age di Verence. Meanwhile, serum concentration of T 4 was signi Wcantlydecreased in 2-year-old large yellow croaker, but no change was observed for T3 . The body mass, fork length and body height of 2-year-old large yellow croaker were 4.7, 1.6 and 1.7 times greater, respectively compared with that of 1-year-old. Average diameters of skeletal muscle in 2-year-old large yellow croaker were remarkably larger than that in 1-year-old with no signi Wcant di Verence in muscle crude fat content. The down-regulation of hepatic TR expression was associated with the decrease in general growth rate and the increase in mus-cle expression of TR was accompanied with muscle accretion and myo Wber hypertrophy, implicating the diVerent roles of TRs in the regulation of growth in large yellow croaker.

【题目】Muscle type-specific responses of myoD and calpain 3 expression to recombinant porcine growth hormone in the pig
【中文关键词】杨晓静
【英文关键词】calpain 3, MyHC, MyoD, pigs, rpGH
【中文摘要】无
【英文摘要】Sixteen castrated male Large White 3 Landrace pigs were employed to investigate the muscle type-specific changes of geneexpression in response to recombinant porcine growth hormone (rpGH) administration. Pigs were injected intramuscularly withrpGH (4 mg/day, n 5 8) or saline (n 5 8) for 28 days. Semi-quantitative reverse transcription-polymerase chain reaction (RT-PCR)was used to determine the mRNA abundance of genes related to muscle growth in longissimus dorsi (LD) and semitendinosus (ST) muscles. Myofibre-type composition was characterised by the ratio of the expression of myosin heavy chain (MyHC) 1, 2a or 2b relative to 2x. The results showed that the relative myofibre-type composition of neither LD nor ST was affected by rpGH administration. rpGH administration did not induce significant changes in the abundances of myostatin and myogenin mRNA in both types of muscle. MyoD and calpain 3 mRNA were significantly increased after rpGH treatment in ST muscle, whereas the difference was not significant in LD muscle. A tendency of down-regulation was observed for PGC-1a mRNA expression in STmuscle of rpGH-treated group (P 5 0.16). These results suggest that myoD, calpain 3 and probably PGC-1a may be involved in the mechanism of exogenous GH action on skeletal muscle growth; rpGH up-regulates mRNA expression of myoD and calpain 3 in a muscle type-specific manner, being more remarkable in ST than in LD, whereas no influences of rpGH on the mRNA expression of myostatin and myogenin were detected.

【题目】Developmental changes of FSH-R, LH-R, ER-_ and GnRH-I expression in the ovary of prepubertal ducks. (Anas platyrhynchos)
【中文关键词】倪迎冬
【英文关键词】FSH receptor; LH receptor; Estrogen receptor-beta; GnRH-I; Gene expression; Prepuberty; Ovary; Duck
【中文摘要】无
【英文摘要】Normal ovarian development is dependent on stimulation of the gonadotropic hormones, follicle-stimulating hormone (FSH) and luteinizing hormone (LH), as well as some regulatory factors locally produced in ovary, e.g. 17beta-estradiol (E2) and gonadotropin-releasing hormone (GnRH), mediated by their respective receptors. In order to elucidate the potential roles of LH, FSH, E2 and GnRH-I during early follicular development in prepubertal ducks, mRNA expression of LH-R, FSH-R, ER- and GnRH-I in ovaries of 1-day-old (D1), 30-day-old (D30), 60-day-old (D60) and 90-day-old (D90) ducks was measured with semi-quantitative RT-PCR using -actin as an internal standard. The ovary index (the ratio of ovary weight/body mass) did not change from D30 to D90, while the ovary weight and serum E2 levels rose pro-gressively, indicating the prepubertal development of the ovary. Ovarian expression of FSH-R, LH-R, ER- and GnRH-I mRNA changed greatly during this period. Abundance of FSH-R and ER- mRNA went up gradually from D1 to D60, followed by a decline on D90. LH-R and GnRH-I mRNA expression increased from D1 to D90, reaching a peak at D90. These results indicate that the developing ovary is highly responsive to the regulation of FSH during the early stage, while close to the onset of sexual maturation, the ovary is likely more responsive to LH. In addition, the expression of GnRH-I and ER- mRNA in the ovary suggest that GnRH-I and E2 are involved in the regulation of prepubertal follicular development in the ovary of ducks.

【题目】Effect of Chicken Egg Yolk Antibody against Adipocyte Plasma Membranes on Carcass Composition and Lipogenic Hormones and Enzymes in Pigs
【中文关键词】姜锦鹏
【英文关键词】Yolk antibody (IgY); Adipose tissue plasma membrane (APM); Carcass composition; Pigs
【中文摘要】无
【英文摘要】Chicken egg yolk antibody against pig adipose tissue plasma membranes (AIgY) was raised and used in the present experiment to ev alu ate t he effe ct of di et ar y AI gY s upp l eme nt at io n on pi g gro wt h an d car ca s s co mp os it io n. 160 cr oss bre d (D uro c – Jersey × Landrace · Meishan) pigs, with initial live body weight of 27.5 ± 2.4 kg, were treated with AIgY or non-immunized control egg yolk powder (NIgY) at the inclusion level of 75 mg/kg diet. Following a 104-day trial, the pigs were slaughtered for analyzing the carcass and meat quality traits. The perirenal, mesenteric and subcutaneous fat depots were weighed and the diameter of adipocytes from different fat depots was measured with histological methods. Serum concentrations of insulin and leptin as well as the activities of malic enzyme (ME) and lipoprotein lipase (LPL) in adipose tissue were measured. Dietary supplementation of AIgY enhanced average daily ga in an d f e e d e ff ic ie nc y b y 1 3 .03 % (P b 0.01) and 7.49%, respectively, with no influence on feed consumption. AIgY increased the lean mass by 10.3% (P b 0.01) without affecting the dressing percentage. Backfat thickness at 6th – 7th rib and the weights of perirenal,mesenteric and subcutaneous fat depots were reduced by 24.14% (P b 0.01), 27.27% (P b 0.05), 20.42% (P b 0.01) and 29.21% (P b 0.01), respectively. Dietary supplementation of AIgY reduced the size of adipocytes in all the three fat pads (P b 0.05). The meat color was improved whereas the marbling score, the intramuscular fat content, and pH 45 of the longissimus muscle remained unaffected.Serum concentration of non-esterified fatty acids (NEFA) was significantly increased (P b 0.01) while urea-N content was reduced (P b 0.05). No alterations were detected for the serum levels of triacylglycerides (TG) and glucose. Serum concentrations of insulin and leptin were decreased by 26.19% (P b 0. 05) a nd 26 .53 % (P b 0.05), respectively. LPL activity in adipose tissue was depressed significantly (P b 0.05) without affecting ME activity. This study demonstrates that dietary supplementation of AIgY can effectively improve growth and carcass composition of pigs and the changes of serum insulin and leptin levels as well as the tissue LPL activity may be involved in the acting mechanism.

【题目】Effects of In Ovo Administration of DHEA on Lipid Metabolism and Hepatic Lipogenetic Genes Expression in Broiler Chickens During Embryonic Development.
【中文关键词】赵苏梅
【英文关键词】Lipid metabolism mRNA Liver
Broiler DHEA
【中文摘要】无
【英文摘要】In order to study the mechanism of DHEA (Dehydroepiandrosterone) in reducing fat in broiler chickens during embryonic development, fertilized eggswere administrated with DHEA before incubation and its effect on lipid metabolism and expression of hepatic lipogenetic genes was investigated. The mRNA levels ofacetyl CoA carboxylase (ACC), fatty acid synthase (FAS),malic enzyme (ME), apolipoprotein B100 (apoB100) and sterol regulator element binding protein-1c (SREBP-1c)were determined using real time quantitative PCR. Sam-ples of livers were collected from the chickens on days 9,14, and 19 of embryonic development as well as at hatching. Blood samples were extracted on days 14, 19 of incubation and at hatching. The results showed that

DHEA decreased the concentration of triacyglycerol in the blood and the content in liver, and the mRNA levels of ACC, FAS, ME, SREBP-1c and apoB. This suggested that DHEA decreased the expression of hepatic lipoge-netic genes and suppressed triglycerols transport, by which it reduced the deposition of fat in adipose tissue in broiler chickens during embryonic development and hatching.

【题目】Effects of Dehydroepiandrosterone (DHEA) on Hepatic Lipid Metabolism Parameters and Lipogenic Gene mRNA Expression in Broiler Chickens.
【中文关键词】马海田
【英文关键词】Dehydroepiandrosterone (DHEA) Hepatic lipid metabolism Lipogenic genes Broilers
【中文摘要】无
【英文摘要】The aim of the present study was to identify the effects of dehydroepiandrosterone (DHEA) on hepatic lipid metabolism parameters and lipogenic gene mRNAexpression in broiler chickens. A total of 72 1-day-old broiler chicks received a common basal diet with DHEA added at either 0 (control), 5 or 20 mg/kg feed. In the present study, the hepatic triglyceride (TG) concentration was significantly lower in male and female broilers that had bed administered DHEA than in control birds. In contrast,DHEA administration caused a marked rise in the hepatic non-esterified fatty acid (NEFA) concentration in both male and female broilers and also increased lipase (HL) activity in male broilers, while in female birds, no signif-icant differences were observed in HL activity. The expression of peroxisome proliferators-activated receptora (PPAR a) and carnitine palmitoyl transferase I (CPTI) mRNA was decidedly enhanced following treatment withDHEA, and a similar tendency was also observed in the expression of acyl-Coenzyme A oxidase 1 (ACOX1).However, no significant differences were observed in theexpression of either sterol regulatory element binding protein-1c (SREBP-1c) or acetyl CoA carboxylase (ACC) mRNA, except for a decline in the expression of ACC in females treated with 5 mg DHEA/kg. Numerous peroxi-somes without a core and an increased number of peroxisomes were evident during morphological observations of broiler livers, in animals that had been treated with DHEA. Overall, the results of the present study indicated that DHEA accelerated lipid catabolism bydirect regulation of hepatic lipid metabolism and by induction of relevant gene expression.

【题目】Enhancement of Mucosal Immune Responses in Chickens by Oral Administration of Cysteamine.
【中文关键词】杨倩
【英文关键词】cysteamine, mucosal immunity, immunoglobulin A-positive cell, intestinal intraepithelial lymphocyte,somatostatin-positive cell
【中文摘要】无
【英文摘要】Somatostatin, a tetradecapeptide originally isolated from the hypothalamus, can exert an inhibitory effect on the secretion of growth hormone by the anterior pituitary gland. In addition to endocrine organs, somatostatin is also present in the digestive tract and immune organs. In lymphoid tissues, somatostatin appears to play a role in the modulation of the immune response. Cysteamine (CS) is a sulfhydryl reducing agent that is known as a depletory agent of somatostatin. To evaluate its effects on chicken mucosal immune responses, CS was administrated orally to 1-wk-old broilers (40 mg/kg) that were immunized orally with Newcastle

disease attenuated vaccine (NDV). The number of IgA-positive cells and intestinal intraepithelial lymphocytes (iIEL) in duodenum and jejunum were examined at 3-, 5-, and 7-wk posttreatment and immunization. The number of somatostatin-positive cells and relative amounts of somatostatin mRNA were also examined in the duodenum. The number of somatostatin-positive cells in the duodenum was reduced ($P < 0.05$) after CS treatment. In broilers receiving CS and NDV treatment (CS+NDV) the level of IgA-positive cells and iIEL in the duodenum and jejunum was increased ($P < 0.05$) at 3 and 5 wk posttreatment. The expression of somatostatin mRNA increased ($P < 0.05$) compared with that of the control group at 5 wk after immunization in broilers receiving CS+NDV or NDV alone. The results suggest that CS can induce proliferation and differentiation of IgA-positive cells and iIEL in the intestinal mucosa of chickens by reducing the number of somatostatin-positive cells.

【题目】Effect of compound mucosal immune adjuvant on mucosal and systemic immune responses in chicken orally vaccinated with attenuated Newcastle-disease vaccine.
【中文关键词】张晓飞
【英文关键词】Compound mucosal immune adjuvant; Mucosal immune response; Systemic immune response; Attenuated Newcastle-disease vaccine; Chicken
【中文摘要】无
【英文摘要】In order to compare the adjuvant activity of compoundmucosalimmuneadjuvant (cMIA), two novel compoundadjuvants (cMIA I and cMIA II) were prepared and mixed with Newcastle-disease (ND) vaccine, respectively, to vaccinate 7-day-old chickens, taking the non-adjuvantvaccines and PBS as controls. Serum were sampled on weeks 1 – 7 and tissues on weeks 3, 5 and 7 after vaccination, respectively. The humoral and cellular immuneresponses were determined by means of hemagglutination inhibition test, enzyme linked immunosorbent assay, semi-quantitative RT-PCR, immunohistochemical examination and histological examination. The results showed that two compoundadjuvants could promote CD3+ T lymphocytes, IgA secreting cells, intestinal intraepithelial lymphocytes (iIEL) and Mast cells formation and enhance serum and content antibody titer. The best adjuvant activity of cMIA II in promoting cellular immunity and cMIA I in enhancing humoral immunity occurred in whole immune period. Based on good synergistic effects of their components, two cMIAs would be expected as new-type mucosalimmuneadjuvants for mucosalimmune.

【题目】Use of green fluorescent protein tomonitor Lactobacillus in the gastro-intestinal tractof chicken
【中文关键词】庾庆华
【英文关键词】green fluorescent protein; gastro-intestinal tract; Lactobacillus ; chicken.
【中文摘要】无
【英文摘要】Lactobacilli, like other gut commensal bacteria, are well known for their use inindustrial food fermentations and for their probiotic properties. However, little isknown about the interaction of these microorganisms with the gastro-intestinalepithelia when administered in vivo . To specifically monitor the passage oflactobacilli after oral administration, the gfp gene was cloned downstream

fromthe constitutive L-lactate dehydrogenase promoter (pldhL) in the experiment. Therecombinant expression vector pLEM415:: gfp was electroporated into differentlactobacilli isolated from chicken. Green fluorescent protein (GFP) was expressedsuccessfully in Lactobacillus delbrueckii ssp. lactis D17 (D17-GFP) andLactobacillusfructosus C2 (C2-GFP). Moreover, oral administration of D17-GFP in chickensallowed us to trace it in the gastro-intestinal tract. Six hours after ingestion, D17-GFP was detectable in all luminal contents (stomach, jejunum, ileum and caecum).At 42 h post-administration the microorganism was present throughout theintestine with maximum concentrations about 105.5in all intestinal sections. Nofluorescent lactobacilli were detected in the spleen or liver of chickens at any time.Using fluorescence microscopy, it became apparent that the D17-GFP were mainlyembedded in the mucus, localized close to the epithelial surface of the intestine andscattered in the intestine lamina propria.

【题目】Effect of early feed restriction on metabolic programming and compensatory growth in broiler chickens.
【中文关键词】占秀安
【英文关键词】feed restriction, lipid metabolism, compensatory growth, metabolic programming, broiler chicken
【中文摘要】无
【英文摘要】The effect of early feed restriction on meta-bolic programming and compensatory growth was stud-ied in broiler chickens. A total of 480 female 1-d-oldbroiler birds (Aconred) were randomly allocated to adlibitum and feed-restricted groups, each of which wasreplicated 6 times with 40 birds per replicate. Broilerswere provided commercial diets. Feed-restricted broilerswere deprived of feed for 4 h per day from 1 to 21 d ofage. Effects of treatments were determined at 21 and 63d of age. In feed-restricted birds at 21 d of age, BW,average daily gain and average daily feed intake, breastmuscle ($P < 0.01$), carcass yield ($P < 0.05$), and abdominalfat ($P < 0.05$) were decreased. Ether extract content inbreast muscle was increased ($P < 0.01$), whereas CP con-tent was slightly decreased. Triiodothyronine ($P < 0.01$)and thyroxine ($P < 0.05$) were decreased in serum. Freefatty acid and very low density lipoprotein were slightlyincreased in serum, whereas triglyceride and glucosewere decreased ($P < 0.01$). Activities of NADPH-generat-ing enzymes in liver including malic dehydrogenase, iso-citrate dehydrogenase, and glucose-6-phosphate remained unchanged in ad libitum birds, whereas hor-mone-sensitive lipase activity was increased ($P < 0.01$).In feed-restricted birds at 63 d of age, BW, average dailygain, average daily feed intake, carcass yield, breast mus-cle yield, and serum triiodothyronine and thyroxine re-mained as ad libitum birds, whereas abdominal fat yieldwas increased ($P < 0.05$). Ether extract content in breastmuscle was decreased ($P < 0.01$), whereas CP contentwas increased ($P < 0.05$). Activities of NADPH-generatingenzymes were significantly increased, except abdominalmalic dehydrogenase and hormone-sensitive lipase activ-ity was decreased ($P < 0.01$) in liver and abdominal fat.Lipoprotein lipase activity was increased ($P < 0.05$) inabdominal fat. In summary, feed restriction severely af-fected growth performance and lipid metabolism in broil-ers in the early period. Because there was no statisticaldifference among the final BW, near full compensatorygrowth was achieved. In addition, early feed restrictionmight have induced prolonged metabolic programmingin chicks and led to adult obesity.

【题目】Effects of different selenium source on selenium distribution, loin quality and antioxidant status in finishing pigs.
【中文关键词】占秀安

【英文关键词】Se; Selenomethionine; Sodium selenite; Pig; Meat color; Drip loss; GSH-Px; MDA
【中文摘要】无
【英文摘要】The experiment was conducted to study the effects of different selenium source on selenium distribution, loin quality and antioxidant status in finishing pigs. A total of 108 castrates (Duroc × Landrace × Yorkshire) at average body weight (BW) of 60 kg were allotted to three treat-ments, each of which was replicated three times with 12 pigs per replicate (four per pen). The control groups received the basal diet containing 0.045 mg Se/kg. A 0.3 mg Se/kg in forms of sodium selenite or selenomethionine was added to the basal diet for the experimental groups. The total test period was 40 d. Results showed that selenomethionine-treatment increased the Hunter a (redness) value of meat color during 45 min, 8 and 16 h measurement period ($P<0.05$) and decreased the drip loss of loin mus-cle during 8 and 16 h measurement period ($P<0.05$), while sodium selenite-treatment only elevated the Hunter a value of meat color during 0.75 h measurement period ($P<0.05$) and had no significant effects on drip loss of loin muscle tissues. Both selenomethionine and sodium selenite-treatment increased the Se content in serum, muscle, liver, pancreas and kidney tissue ($P<0.05$), the level was substantially higher in muscle, liver and pancreas ($P<0.05$) in the selenomethionine treated group. In addition, both selenomethionine and sodium selenite-treatment increased glutathione peroxidase (GSH-Px) activity ($P<0.05$) and decreased the malondialdehyde (MDA) content in the liver and muscle ($P<0.05$) when compared with control group, but the level of magnitude was higher when selenomethionine was fed.The present study suggests that compared with sodium selenite, selenomethionine is more effective in depositing Se in tissues, enhances the antioxidant status, thus decreasing the volume of drip loss and stabilizing the meat color.

þ
-K
þ
-ATPase, IGF-1R, somatostatin.
【中文摘要】无
【英文摘要】The present study was conducted to investigate the effects of ghrelin on gastric acid and pepsin secretion, as well asthe mRNA expression of gastrin, somatostatin (SS) and receptors for growth hormone (GH) and insulin-like growthfactor-1 (IGF-1) in gastric mucosal cells in vitro. Gastric mucosal cells were isolated from 5-week-old weanling pigletsand exposed for 4 h to 3 £ 10 22,3 £ 102 1,3,3 £ 10 and 3 £ 102nmol/l of h-ghrelin, respectively after 30-h incubation inDMEM/F-12. Pepsin activity in culture medium, cell viability and H þ -K þ -ATPase activity, as well as mRNA expression ofgastrin, SS, GHR and IGF-1R in gastric mucosal cells were determined as response criteria. The experiment wasrepeated three times. Ghrelin significantly (P , 0 · 05) increased H þ -K þ -ATPase activity of gastric mucosal cells at3 £ 1021, 3 and 3 £ 10 nmol/l of h-ghrelin. However, no significant changes were observed either in pepsin activity orthe cell viability after ghrelin treatment. The mRNA expression of gastrin and SS was significantly increased in gastricmucosal cells exposed to h-ghrelin at 3 £ 1021and 3 nmol/l (P , 0 · 05). H-ghrelin significantly increased IGF-1R but notGHR mRNA expression at 3 £ 102 1, 3 and 3 £ 10 nmol/l of h-ghrelin (P , 0 · 05). Ghrelin acts on gastric mucosal cellsfrom weanling piglets to regulate the H þ -K þ -ATPase activity and mRNA expression of gastrin, SS, and IGF-1R in vitro .

【题目】Computer image analysis of intramuscular adipocytes and marbling in the longissimus muscle of cattle.
【中文关键词】杨晓静
【英文关键词】adipocyte, cattle, computer image analysis, longissimus muscle, marbling
【中文摘要】无
【英文摘要】The deposition of fat in muscle, recog-nized by the consumer as marbling, is an important meat quality trait. The objective of the study was to provide additional insights into the quantitative extent of marbling by means of computer image analysis. Fifty-one F2 generation German Holstein and Charolais crossbreed cattle, 18 mo of age, were used to determine relationships among marbling traits, adipocyte size, and the amount of adipose tissue in different depots. Differences were recorded among the size of i.m. adipo-cytes in different groups of marbling flecks, divided according to the location in the muscle cross-section andto the size of the marbling flecks. The results showed positive correlation between i.m. adipocyte size and the weight of s.c. fat, intestinal fat, omental fat, and perire-nal fat (r = 0.50, 0.61, 0.70, and 0.63, respectively, P <0.001). The i.m. adipocyte size was correlated with i.m.fat content, number of marbling flecks, proportion of marbling fleck area, and total length of marbling flecks (r = 0.71, 0.44, 0.62, and 0.55, respectively, P < 0.01).The number of marbling flecks was also correlated withi.m. fat content, proportion of marbling fleck area, and total length of marbling flecks (r = 0.58, 0.62, and 0.91,P < 0.01, respectively). The ventral marbling flecks had a 5-fold larger fleck area, 4-fold more adipocytes, and larger adipocytes (P < 0.001). Larger marbling flecks contained larger adipocytes (P < 0.001). Moreover, com-pared with the small marbling flecks, there was a 48-fold larger fleck area and 26-fold more adipocytes in the large marbling flecks. The results indicate that i.m.fat deposition increases concurrently with the other fat depots but is still independent. Furthermore, the i.m. fat is preferentially deposited in the ventral area of LM. Although the i.m. adipocyte size has an important effect on the traits of marbling flecks, cell number plays a greater role in i.m. fat deposition than cell size.

【题目】肉种鸡饲养方式对子代胚肝蛋白表达谱的影响
【中文关键词】肉鸡;饲养方式;2D-PAGE
【英文关键词】无
【中文摘要】挑选4O周龄体况良好的产蛋三黄肉种鸡200只,随机分为对照组(笼养)和试验组(平养),饲喂相同的肉 种鸡日粮。收集受精种蛋各300枚并孵化,分别取9、14、19胚龄和出壳时的肝脏,经2D-PAGE分离后,对经胶体 考马斯亮蓝G-250染色的图像用PDquest7.3软件进行差异表达分析,取差异表达的蛋白质斑点进行胶内酶切和 MALDI-TOF-MS分析。结果表明,试验组和对照组在9、14和19胚龄时,胚质量和肝质量均无显著差异;出壳时, 试验组胚质量、肝质量均显著小于对照组(P<O.05)。蛋白表达谱分析发现29个在试验组和对照组间表达量存在 两倍以上差异的蛋白斑点,其中22个得到鉴定。在这些被鉴定的蛋白中,大多涉及到机体内基础代谢的酶、能量 产生及信号传导等。
【英文摘要】Forty—week healthy Sanhuang(SH)broilers were randomly divided into floor~reared (treatment)and cage—reared groups(contro1),and feed with the same diet.During the experi~ mental period,300 fertile eggs were randomly collected from each group and directly incubated in an electric forced~draft incubator.Livers were collected on day一9,14,19 of incubation and the hatching,respectively.Proteins were extracted and separated by 2D-PAGE and stained with col一 1oidal Coomassie Brilliant Blue.Then,the stained gels were scanned and analyzed using PDQuest7.3 software.The differential protein spots with in—gel trypsin digestion were subse— quently identified by MALDI—TOF—MS.The results indicated that the embryo and absolute liver weight of floor—reared group was significantly lower than that of the control at hatching,although no significant differences were observed in both embryo and absolute liver weight between the floor—reared group and the control on day 9,14 and 1 9 of embryonic development.The result of offspring broiler liver protein profiles showed that twenty~nine proteins had expressed at least 2.0-fold variance compared to the control during embryonic development and twenty—tWO of them were identified.Most of these proteins were highly related to carbohydrate metabolism,energy production and signal transduction.

【题目】早期限饲对肉鸡肌肉生长及肌纤维类型的影响
【中文关键词】早期限饲;腓肠肌;肌纤维类型;肌球蛋白重链
【英文关键词】无
【中文摘要】采用隔日限饲的方式对l~l4日龄三黄肉鸡仔鸡进行早期限饲处理,后恢复自由采食直至63日龄试验结束,以分析早期限饲对肉鸡肌肉生长和肌纤维类型的影响。分别于l4和63日龄随机选取对照组和早期限饲组肉仔鸡各2O羽,屠宰后采样,记录腓肠肌外侧头重量并采用相对定量RT-PCR的方法检测其不同类型肌纤维肌球蛋白重链mRNA基因表达。结果表明,早期限饲组体重及腓肠肌外侧头重均低于对照组(P《o.05,n=20)。14日龄早期限饲组慢肌及快红肌肌球蛋白重链mRNA表达水平显著高于对照组(分别为P<0.01和P<0.05,n=10),快白肌肌球蛋白重链基因表达显著低于对照组(P<0.05,n—lO)。63日龄早期限饲组慢肌肌球蛋白重链mRNA基因表达显著低于对照组(P<0.05,n=10),快红肌和快白肌肌球蛋白重链与对照组相比均无差异(P>o.05,n=10)。结果提示:(1)早期限饲阻碍了肌纤维类型的转化,延缓了肌肉的发育及增重,最终引起整体体重的下降;(2)早期限饲对肌肉肌纤维成分具有持久影响,其影响一直持续到63日龄上市。

【题目】断奶前后仔猪小肠不同肠段胰高血糖素原mRNA的表达
【中文关键词】:仔猪;断奶;小肠上皮;胰高血糖素样肽.2
【英文关键词】无
【中文摘要】研究表明,成年猪的肠上皮细胞大约2~4 d更新1次,而 新生仔猪肠上皮细胞7—10 d才能完成1次更新。仔猪的胃肠 道功能发育迟缓,使其不能适应生产上早期断奶的需要,出 现食欲不振、腹泻,甚至死亡。仔猪断奶后小肠的功能发生相 当大的改变(Boudry et a1.,2004)。但这个转变的内在机制目前 还不清楚。 胰高血糖素样肽.2(GLP.2)是由小肠L细胞分泌的一种 33个氨基酸组成的小肽,与小肠上皮生长关系密切(Petersen et a1.,2002)。对GLP.2的研究发现其可能在动物断奶前后小 肠结构与功能的变化中起重要作用,然而,断奶前后仔猪小 肠上皮更新缓慢是否与编码GLP.2的基因胰高血糖素原(proglucagon)的时空特异性表达有关,尚未见文献报道。因 此,本实验采用相对定量RT—PCR方法研究proglucagon mRNA在仔猪断奶前后不同肠段粘膜的表达模式。

【题目】不同蛋白水平日粮对狼山鸡卵黄中激素沉积及子代生长的影响.
【中文关键词】狼山鸡;日粮:卵黄;激素沉积;生长
【英文关键词】Langshan chickens,Diet,Yolk,Hormone deposition,Growth
【中文摘要】选取狼山鸡种母鸡160羽,随机分成三个组,分别饲喂粗蛋白水平为10%(低)、15% (对照)和20%(高)的日粮,21d后收集种蛋。每组随机选择10枚种蛋用于放免测定卵黄中母源 性甲状腺激素和胰高血糖素,其余孵化后在相同条件饲养至28d,并测定生长性能.。分别与1日龄和 28日龄每组各选10羽雏鸡进行屠宰测定。结果:(1)试验前后母鸡体重各组间均没有变化,低蛋白组 产蛋率和蛋重显著下降(p<O.05),高蛋白组蛋重显著高于对照组;(2)三组种蛋的卵黄中T3、胰高血 糖素水平均没有显著性差异,而高蛋白组卵黄中T4水平显著高于对照组和低蛋白组(p<0.05),低蛋 白组1d后代血清中T3水平显著高于对照组,而高蛋白组血清T4水平显著高于对照组(p<0.05); (3)出雏重与蛋重呈正相关(R2=0.9275,p<0.01),出雏后高、低蛋白组子代均表现出较高的生长速度, 28d低蛋白组子代鸡体重和相对胸肌重显著高于对照组(p<O.05),高蛋白组体重与对照组相比有增 加趋势,但差异不显著(p=0.08)。结论:母鸡饲喂不同蛋白水平日粮可以改变卵黄中母源性激素的沉 积并能显著影响子代的生长
【英文摘要】160 Langshan breeder hens were randomly divided into 3 groups,fed with 10%(1ow),15% (contro1)and 20%(high)crude protein(CP)diet,respectively for21days.Fertile eggs were colected 10 days after the dietary treatment.10 eggs each group were used to determine the yolk deposition of maternal thyroid hormones and glucagon with radioimmunoassay,and the remaining eggs were incubated. Newly hatched chickens were raised under the same condition until 28 days of age and the growth performance of the offspring was recorded.1 0 chicks from each group were sacrificed on day 1 and day 28,respectively for sampling.Results:Dietary protein level showed no significant effect on body weight of the hens,yet the egg laying rate and egg weight decreased markedly in the low-CP diet group(p<O.05). Egg weight in the high-CP diet group is significantly higher than the controls.Yolk contents of T3 and glucagon didn t show differences among groups,while that of T4 in the high—CP diet group was significantly higher than the other two groups(p<O.05).At hatching,serum levels of T3 in the low—CP group and T4 in the high—CP diet group were significantly higher than the controls(p<0.05).Strong positive relationship was found between hatch weight and fertile egg weight(R2=0.9275,p<O.o1).Both high—and low—CP diet group showed higher growth rate after hatching.Relative breast muscle weight and body weight in the low—CP diet group were markedly higher than that in the control group on 28 days(p< O.05),whereas that in the high-CP group showed a Bend of increase,compared with that of the control group(p=0.08).Conclusion:Dietary protein level in hens could significantly change the yolk deposition of maternal hormones and offspring growth.

【题目】大豆黄酮对母鸡蛋品质及后代仔鸡肉品质的影响.
【中文关键词】大豆黄酮;蛋品质;子代;肌肉品质;肉种鸡
【英文关键词】daidzein;egg quality;offspring;meat quality;broiler breeders
【中文摘要】本文旨在研究添喂大豆黄酮对母鸡蛋品质及后代仔鸡肉品质的影响。试验选取产蛋后期肉种鸡480只, 随机分为2组,每组设8个重复。试验组在基础日粮中添喂10 mg/kg的大豆黄酮,第5周后收集种蛋,每组随机 取3O枚做蛋品质分析,剩余种蛋按正常程序孵化,出雏后饲养至63日龄,宰杀取肌肉做肉品质分析。结果表明: 母鸡饲喂大豆黄酮后,蛋壳厚度和蛋壳比重分别增加了0.03 mm(P<0.01)和0.45 (P<0.05);蛋白的Haugh 单位增加了4(P<0.05);入孵蛋出雏率和受精蛋出雏率分别降低了l1.5%和8.3%(P<0.05)。添喂大豆黄酮 对后代仔鸡生长无显著影响,但显著降低了雌仔鸡肌肉比重和肌肉的蒸煮损失率(P<0.05),显著降低雄仔鸡肌 肉的滴水损失率(P<0.05);显著增加胸肌黄度(P<0.05);但对腿肌的快慢肌纤维比例、纤维密度以及快慢肌 纤维的横截面积均无显著影响(P>0.05)。以上结果提示:10 mg/kg剂量的大豆黄酮应慎用于种蛋禽上,而在商 品蛋禽上则具有良好的应用前景。
【英文摘要】The effects of dietary daidzein on broiler breeders during the late periods of the laying cycle on egg quality,hatching rate and meat quality of the offspring chickens were studied.Broil— er breeders feed a basal-diet(n一240,8 replicates,contro1)or the basal diet supplemented with 10 mg/kg daidzein(n一240,8 replicates,daidzein).The laying rate was increased over the whole investigation with the daidzein treatment.Egg quality analysis showed that eggshell thickness and relative weight of eggshell to the whole egg increased 0.03 mm(P<0.01)and 0.45 (P <0.05),respectively,in daidzein group.Compared with the control group,egg Haugh unit in— creased significantly in daidzein group by 4 units(P< 0.05).The hatching rate of fecundated eggs and hatched eggs were decreased by 1 1.5 and 8.3%after daidzein supplementation,re— spectively(P<0.05).Although postnatal growth of the offspring chickens from 1 to 63 days of age was not significantly affected,maternal daidzein supplementation tended to reduce the muscle mass of female chicken.As the breast muscle and leg muscle,the rate of cooking lOSS24 and drip loss24 were significantly decreased,and the yellowness of breast muscle was significantly in— creased by daidzein treatment(P<0.05),while the ratio of myofiber types were not changed.The results suggested that maternal diet supplemented with 10 mg/kg daidzein during late periods of the lay-ing cycle of broiler breeders affect egg quality and meat quality of the offspring chickens.

【题目】孵化早期蛋内注射大豆黄酮对仔鸡生长与血液指标的影响.
【中文关键词】胚胎发育;大豆黄酮;生长;代谢;肉鸡
【英文关键词】无
【中文摘要】为探讨胚胎发育早期接触大豆黄酮(Da)对仔鸡生长的影响,在孵化7 d(7胚龄)的种蛋内注射0 l 和100 l白油以及100 l 1 mg/ml、10 mg/ml的大豆黄酮白油溶液,分别作为空白对照(C)、溶剂对照(O)、低剂 量(d)和高剂量(D)大豆黄酮组。结果表明,蛋内注射大豆黄酮显著降低出雏率(P<0.05),但不影响出壳重;与 O组相比,D组1日龄仔鸡肝重和肝体比分别提高12.8%和13.4%(P<0.05);7日龄时,d组体重显著高于O 组,此差异一直保持至20日龄,而D组体重与对照组无显著差异;20日龄时,d组和D组的肝体比与O组相比分 别降低了25.7%和21.8%(P<0.05);大豆黄酮对20日龄仔鸡血清生化指标的影响表现出明显的性别差异,对 母鸡无显著影响,而D组仔公鸡的总胆固醇含量显著高于O组(P<0.05);d组和D组仔公鸡的低密度脂蛋白和

高密度脂蛋白含量均显著高于C组和O组,并呈现剂量效应(P<0.05);葡萄糖、甘油三酯、总胆固醇与高密度脂 蛋白的比例及低密度脂蛋白与高密度脂蛋白的比例均未见显著差异;放射免疫方法测定结果表明,1日龄d组和 D组仔鸡血清中游离T1(FT)水平显著低于C组和O组(P<0.05),而T1和T4水平无显著差异;20日龄D组仔 鸡血清中的丌 与O组相比显著上升(P<0.05),T1和T 水平均无显著差异(P>0.05)。综上可见,早期蛋内 注射低剂量大豆黄酮对出雏后仔鸡生长有显著促进作用,而高剂量大豆黄酮对代谢相关的激素和生化指标的影 响较为显著,提示不同剂量大豆黄酮的作用机制可能有所不同。

【题目】Isolation and Characterization of Metsulfuron-methyl Degrading Bacteria Methylopila sp. S113.
【中文关键词】甲磺隆;生物降解与修复;甲磺隆水解酶;降解特性
【英文关键词】metsulfuron-methyl; biodegradation and bioremediation,The characteristics of metsulfuron-methyl hydrolase
【中文摘要】从长期受甲磺隆污染的土壤中分离筛选获得一株能够高效降解甲磺隆的菌株S113。根据S113的表型特征、生理生化特性,16S rDNA同源性比较,系统进化分析将其鉴定为噬甲基菌Methylopila sp.。该菌能够能以甲磺隆为唯一碳源生长,72h对50mg L-1甲磺隆的降解率达98%以上。S113的最适生长温度30°C,最适生长初始pH7.0。装液量小于100mL/250mL时,S113生长旺盛。在供试的几种无机碳源中,S113对丁二酸钠和淀粉利用较好。S113以有机氮为氮源生长较好,在供试的无机氮源中,S113对NH4NO3利用最好。降解谱实验结果表明,S113还可以降解噻吩磺隆,苄磺隆,胺苯磺隆,降解率都在95%以上。但在同样条件下,S113不能降解绿磺隆,吡嘧磺隆。S113降解甲磺隆的最适pH值为7.0。S113对甲磺隆的降解率和起始接种量呈正相关。改变通气量对S113降解甲磺隆没有显著影响。加入蛋白胨和酵母膏可以促进S113对甲磺隆的降解。在室内条件下对S113的水解酶进行了研究,发现该酶为胞内酶、非诱导酶。建立了甲磺隆水解酶的酶促反应体系:2830 μL Na2HPO4- NaH2PO4缓冲液(0.2 mol L-1,pH7.0),150 μL甲磺隆(1000mg L-1),20 μL粗酶液(约1.2 μg粗蛋白),30°C水浴30min。甲磺隆水解酶pH稳定范围为6-9,最适pH为8。水解酶热不稳定,45°C处理30min,酶活下降59.22%,70°C处理

30min可完全灭活。测定了8种金属离子对水解酶的作用,发现1mmol L-1的Ca2+对酶活有促进作用。

【英文摘要】A bacterium S113 capable of degrading metsulfuron-methyl was isolated from metsulfuron-methyl contaminated soil. Based on the morphology, physiological and biochemical characteristics, and the homology analysis of its 16S rDNA sequence,S113 was identified preliminarily as Methylopila sp.。. S113 was capable of utilizing metsulfuron-methyl as the sole carbon source for its growth. This bacterium could degrade 98% of 50mg L-1 metsulfuron-methyl within 72h. Biological properties of S113 were studied. The optimal growth temperature and initial pH are 30°C, 7.0 respectively. The aeration had little effect on the growth of S113. The optimal medium for the growth of strain S113 was amylum as carbon source and organic nitrogen as nitrogen source. S113 could also degrade thifensulfuron-methy, bensulfuron, ethametsulfuron, but could not degrade chlorsulfuron and pyrazosulfuron. The optimal pH of S113 for degrading metsulfuron-methyl was 7.0. The degradation rate of metsulfuron-methyl by S113 was related positively to initial amount of inoculation. The aeration has little effect on degrading ability of S113。 The speed of degradation of metsulfuron-methyl by S113 was related positively to initial amount of inoculum size. Peptone and yeast extract at certain concentration could promote the degradation of the strain.Metsulfuron-methyl hydrolase from metsulfuron-methyl degrading strain S113 was studied. The hydrolase in the bacterium was endoemzyme. The enzymatic reaction system was found as follows: Na2HPO4-NaH2PO4 buffer 2830 μ L, metsulfuron-methyl (1000 mg L-1) 150 μ L, crude enzyme 20 μ L (about 1. 2 μ g crude protein), 30°Cwater bathing 30 min. The characteristics of metsulfuron-methyl hydrolase were determined. The pH suitable for keeping enzyme was 6-9, with the optimum pH 8. 0. The activity of enzyme was down to 59. 22% and zero when treated at 45°C for 30 min and 70°C for 30min respectively. Eight metal ions were chosen to study their effects on the metsulfuron-methyl hydrolase activity, and the results showed that 1 mmol L-1 Ca2 + could enhance the enzyme activity.

【题目】Isolation of a chlorpyrifos-degrading bacterium, Sphingomonas sp. strain Dsp-2, and cloning of the mpd gene.

【中文关键词】毒死蜱降解菌;mpd基因的克隆和表达;定向进化;生物修复

【英文关键词】Chlorpyrifos-degrading bacteria; Cloning and expression of mpd gene; Direct-evolution; Bioremediation

【中文摘要】采用以毒死蜱为唯一碳源的选择性培养基,从毒死蜱污染的环境样品中分离到七株毒死蜱降解菌,分别命名为Dsp-1~Dsp-7。经生理生化鉴定和系统发育分析,七株菌属于5个不同的属。菌株Dsp-2鉴定为Sphingomonas sp.,菌株Dsp-4为Stenotrophomonas sp.,菌株Dsp-7为Brevundimonas sp.,菌株Dsp-6为Bacillus sp,其他菌株为Pseudomonas sp.。其中从Sphingomonas sp.和Brevundimonas sp.分离到毒死蜱农药降解菌尚属首次报道。对分离的毒死蜱降解菌进行基于16S rDNA序列的系统发育分析,对染色体ERIC-PCR指纹图谱扩增及对降解特性进行比较研究,结果表明七株降解菌在遗传、生理和降解能力等方面表现出丰富的多样性。不同菌株对毒死蜱的降解能力有很大差异,其降解谱也表现出一定的差异。降解菌株Dsp-1~Dsp-4对多种有机磷类农药具有降解能力,与其他菌株相比,菌株Dsp-2在液体培养基中拥有最快的降解速率,12h几乎完全降解100 mg · L-1的毒死蜱,并且能降解有机磷农药丙溴磷。菌株Dsp-1在自然环境中对毒死蜱的降解效果最好。而菌株Dsp-5和Dsp-7只能降解毒死蜱农药,而不能降解其他有机磷农药。七株菌降解毒死蜱的中间产物均为3,5,6-三氯-2-吡啶酚(TCP),且积累TCP。根据已报道的有机磷水解酶基因序列设计引物,通过PCR的方法从降解菌Dsp-1~Dsp-4中克隆到了有机磷水解酶mpd基因,mpd结构基因共有996个碱基,编码331个氨基酸序列。通过序列比较发现,在基因水平上,四株降解菌的有机磷水解酶基因可以分为3种亚型,相互之间的同源性为99%;在氨基酸水平上,四株降解菌的有机磷水解酶可以分为3种亚型,相互之间的同源性为92%。将四株降解菌的mpd结构基因分别连接到表达质粒载体pET29a上,在E. coli BL21实现了基因的高效表达。通过致突变PCR对野生型的mpd基因进行定向进化,获得了5个毒死蜱降解能力增强的突变体。其中突变子Mn7,突变了5个氨基酸位点(N271T,I275S,G277S,A280V,P304S),其水解毒死蜱的动力学参数kcat和kcat/Km比原始MPH分别提高10和118倍,水解3种供试的有机磷底物的相对活力都有明显的增强。通过定点突变的方法,对这些突变位点的作用进行进一步的研究。酶动力学参数的测定结果表明,单位点突变体N271I的kcat/Km比原始MPH提高了15倍,A280V的kcat/Km比原始MPH提高了32倍,是导致毒死蜱催化能力增强的重要位点。而F196I则使kcat/Km下降了1倍,这可能与该位点是MPH酶作用的关键位点有关。对突变体的Mn7三维结构进行模拟分析表明,这些位点的突变并未对酶的三维结构产生明显的影响,但其二级结构分析表明α-螺旋和β-折叠的含量有所增加,这可能使得蛋白的构象更加稳定,从而提高了酶的水解活力。研究了菌株Dsp-1的最适生长条件,菌株Dsp-1的最适温度为30°C;最适生长初始pH在7左右;装液量小于

150 mL/250 mL时,生长旺盛;Dsp-1生长不需要NaCl,无特殊生长因子要求。在供试的几种碳源中,Dsp-1对葡萄糖利用最好;在以葡萄糖为碳源时,以有机氮为氮源生长较好,在供试的几种无机氮源中,Dsp-1对NH4NO3利用最好;该菌株对多种常用抗生素敏感。在发酵培养基中,经过16h达到稳定期,菌体生长良好(>1011CFU · mL-1),能较好的满足后续试验的要求。降解菌剂的应用试验表明,在消除土壤和蔬菜毒死蜱残留的试验中,菌株Dsp-1对毒死蜱表现了较强的降解能力。人工接种毒死蜱降解菌Dsp-1到毒死蜱污染的三种不同的土壤(红粘土、灰潮土、高沙土),Dsp-1在3种土壤中都能有效降解毒死蜱,Dsp-1在pH中性的灰潮土中降解毒死蜱的速率最快,酸性的红粘土中降解效果较差,而碱性的高沙土中毒死蜱的自然降解作用也较明显;说明土壤pH值对降解效率的影响十分显著。相对较高的有机氮的含量也有利于毒死蜱的降解。在1~100 mg · kg-1的浓度范围内Dsp-1都能有效降解土壤中的毒死蜱,对低浓度的毒死蜱降解率更高,达到90%以上。该结果显示了菌株Dsp-1具有对毒死蜱污染的土壤进行实地修复的潜力。应用Dsp-1分别对冬季和春季栽培的温室小青菜的毒死蜱残留进行降解试验,在环境条件适宜,使用推荐农药用量时,施用含1010 CFU · mL-1 活菌的降解菌剂可以发挥良好的作用,7天的降解效率达到80%以上,加快了毒死蜱的降解进程,从而保证在安全间隔期内达到国家的残留标准(0.1 mg · kg-1)。

【英文摘要】A highly effective chlorpyrifos-degrading bacterium strain Dsp-2 was isolated from the polluted treatment system of a chlorpyrifos manufacturer.This strain was preliminarily identified as Sphingomonas sp. based on its morphological, physiological and biochemical tests as well as 16S rDNA analysis. It utilized chlorpyrifos as its sole source of carbon for growth, by hydrolyzing chlorpyrifos to 3,5,6-trichloro-2-pyridinol (TCP). It could also utilize parathion, parathion-methyl, fenitrothion and profenofos, but not phoxin and triazophos. Bioremediation of chlorpyrifos-contaminated soil was examined using Dsp-2. Dsp-2 addition to soil treated with 100 mg kg 1 chlorpyrifos resulted in a higher degradation rate than control soils without inoculation. The moderate pH, moisture and inoculum density could have promoted degradation. The gene encoding the chlorpyrifos hydrolytic enzyme was cloned by PCR. Although BLAST sequence search results indicated that this gene has 99% similarity to mpd (a gene encoding the parathion-methyl hydrolyzing enzyme in Plesiomonas sp. M6), its hydrolytic efficiency for chlorpyrifos was significantly greater than the wild-type mpd from strain M6.

【题目】Genetic components and major QTL confer resistance to bean pyralid (Lamprosema indicata Fabricius) under multiple environments in four RIL populations of soybean

【中文关键词】无
【英文关键词】Keywords: Soybean [Glycine max (L.) Merr.], Bean pyralid (Lamprosema indicata Fabricius), Recombinant inbred line (RIL), Resistance to insects, Genetic components, QTL mapping

【中文摘要】无

【英文摘要】Bean pyralid (BP; Lamprosema indicata Fabricius) is one of the major leaf-feeding insects that affect soybean crops in central and southern China. Four recombinant inbred line populations (KY, WT, XG and SX) were tested during 2004 – 2006 in Nanjing, China, to identify quantitative trait loci (QTL) for resistance to BP on the basis of data for rolled lea fl et percentage under fi eld infestation conditions. The mapping was performed using QTL Network V2.0 and checked with Windows QTL Cartographer V2.5 and IciMapping V2.2. The results showed that 81 – 92 % of the phenotypic variation was accounted for by additive QTL (27 – 43 %), epistatic QTL pairs (5 – 13 %), and collective unmapped minor QTL (38 – 58 %). In total, 17 QTL were detected on 11 linkage groups, of which two had additive effects, six had both additive and epistatic effects, and nine had only epistatic effects. Eight epistatic QTL pairs were observed, of which three pairs involved two QTL with additive effects, one involved one QTL with additive effect, and four involved no QTL with additive effects. Different genetic structures for BP resistance were found among the populations. Eight QTL (fi ve additive and three epistatic pairs) were detected in KY, ten QTL (four additive and fi ve epistatic pairs) were detected in WT, and only one additive QTL was detected in both the XG and the SX populations. BP12-1 and BP1-1 are major QTL, with the former accounting for 15, 31, and 50 % of the total genetic variation (including epistasis) in KY, WT, and XG, respectively, and the latter accounting for 13 and 32 % of the total genetic variation in KY and SX, respectively. The additive 9 year and epistasis 9 year interaction effects were negligible, indicating that the QTL were stable over the years. Because 41 – 68 % of the total genetic variation could not be accounted for by these QTL, the use of both identi fi ed QTL and unmapped minor QTL in breeding for BP resistance should be

considered.

【题目】香蕉物流过程中品质指标动态预测研究
【中文关键词】香蕉;品质指标;物流过程;动态预测
【英文关键词】banana (Musa nana cv. Baxi);quality;logistics;sequential forecast
【中文摘要】摘 要:以“ 巴西 ”香蕉(Musa nana cv. Baxi)为材料,研究不同温度物流贮运条件下呼吸强度、乙烯释放量和色度预测香蕉品质指标的变化。结果表明:以香蕉果肉软化作为品质特征指标,低温贮运香蕉在第6d 发生冷害,其果肉软化与 L 值变化相关,r2 为0.9301;常温贮运香蕉后熟过程和高温贮运香蕉第8d 出现的“ 青皮熟 ”劣变与h值变化相关,h 值与果肉相关系数分别为0.9018 和0.9264;贮运过程香蕉的呼吸强度和乙烯释放量与其果肉软化无线性相关性。色度变化可作为香蕉品质评判指标体系有效监控香蕉贮运期间品质变化。
【英文摘要】Abstract :The potential forecast factors of bananas (Musa nama) during logistics storage at 5, 20 and 35 °C were studied. Thechanges in respiration, ethylene production, chromatic value (L and h) and firmness of pulp over storage were investigated.During storage, the change in peel colour from green to yellow is gradual for the samples stored at 20 and 35 °C, whereas the samplesat 5 °C remaining green for the first 6 days and then changing to darkness. While the flesh texture of bananas stored at 5 and 35°C softens quite rapidly at the end of storage, there were little changes in the flesh hardness values of the samples stored at 25°C. There is linear relationship between flesh hardness and chromatic values as sequential forecast factor, nevertheless therespiration and ethylene production are not be effective factors to forecast the change of quality of banana during storage.

【题目】环境温度对紫花芒果后熟及感官品质的影响
【中文关键词】芒果;环境温度;感官品质;后熟
【英文关键词】mango (Mangifera indica cv.Zihua); ambient temperature;sensory quality;ripening
【中文摘要】摘 要:以 0.1%的乙烯利处理“ 紫花 ”芒果(Mangifera indica cv. Zihua),研究环境温度对其后熟进程和感官品质的影响。结果表明:30°C促进了芒果的后熟进程,第 4d 果实达到完熟,而在 20°C条件下需要 6d;20°C贮运环境有利于芒果果皮叶绿素降解,表现为其果皮 h 值降低,果实均匀饱满,果肉可溶性固形物升高,保持合适的糖酸比,口感较佳。在 20°C催熟芒果中检测出 36种呈香物质,并含有更多种类的醇、酮、酯等芳香物质,高于30°C催熟芒果的 26种。综合比较后熟芒果的感官品质指标,20°C贮运环境促进了催熟芒果的内源生化反应,更有利于芒果后熟。
【英文摘要】Abstract:A comparative analysis of the sensory quality was carried out at postharvest of “ Zihua ” mango under different ripening temperatures. The L value, h value, chlorophyll content of mango pericarp decrease but the total soluble solid in pulp increases gradually as fruit ripens. Compared with mango ripening at 30 °C, more violate aromatic compounds in mango ripening at 20 °C are found,which is associated with the sensory modification of “ Zihua ” fruit consistently. It suggested that 20 °Cambient temperature benefical to ripening of “ Zihua ” mango with better appearance, pleasant taste and morefragrant smell.

【题目】宰后成熟过程中冷却牛肉、猪肉色泽和嫩度的变化
【中文关键词】牛肉;猪肉;宰后成熟;小片化指数
【英文关键词】beef;pork;postmortem aging;myofibril fragmentation index
【中文摘要】摘 要:本实验比较研究了冷却牛肉和猪肉在宰后 120h 内色泽和剪切力的变化。分别从牛屠宰厂和猪屠宰厂选取牛、猪各 4 头,按规范工艺屠宰后取背最长肌,分切成 8 个肉块,经简易包装后在 0~4℃下 18、48、96、120h,之后测定肉色、剪切力值及其他相关指标。结果表明,牛肉和猪肉的 pH 值、肉色(L*、a*、b*)、水分含量、剪切力值等指标存在显著差异(p< 0.05)。随着成熟时间延长,亮度增加、红度下降、剪切力下降;宰后 120h内,猪肉嫩度的变化比牛肉更明显。
【英文摘要】Abstract :The study was designed to track the changes of meat color and tenderness of chilled beef and pork within the first postmortem 120 h. The results showed that there are significant differences in pH value, L*, a* and b* values, moisture content and shear force value between the beef and the pork. As the aging time prolonging, the meat lightness rises, but the redness and shear force value decline. Under the same conditions, the pork has a greater change in shear force than the beef within postmortem 120 h.

【题目】Effect of high oxygen atmosphere storage on quality, antioxidant enzymes, and DPPH-radical scavenging activity of Chinese bayberry fruit
【中文关键词】none
【英文关键词】Chinese bayberry; high O2 atmosphere; antioxidant enzymes; antioxidant activity; fruit decay
【中文摘要】none

【英文摘要】Abstract:The in fl uence of high O2 atmosphere on postharvest decay, quality, total phenolic, total anthocyanin contents, antioxidant enzymes activity, and antioxidant activity of Chinese bayberry fruit was investigated. Freshly harvested Chinese bayberry fruits were placed in jars and ventilated continuously with air or with 80 and 100% O2 for up to 12 days. Samples were randomly selected initially and at 3-days interval during storage. The fruit exposed to high O2 was resistant to decay, had high levels of total soluble solids, titratable acidity and ascorbic acid contents, and also reduced the increment of pH value. High O2 treatment was less stressful as re fl ected by having the signi fi cantly lower malonaldehyde contents and higher catalase, ascorbic acid peroxidase, and peroxidase activities during storage. Both 80% and 100% O2 treaments had also retained the bioactive contents and 1,1-diphenyl-2-picrylhydrazyl radical scavenging activity during storage. These results indicate that elevated O2 levels may improve the ability of the antioxidative defense mechanism in Chinese bayberry and result in a better control of fruit decay.

【题目】Methyl jasmonate reduces chilling injury and enhances antioxidant enzyme activity in postharvest loquat fruit
【中文关键词】none
【英文关键词】Loquat fruit; Methyl jasmonate; Chilling injury; Antioxidant enzyme; Lipoxygenase; Fatty acids
【中文摘要】none
【英文摘要】Abstract:Loquat fruit were pre-treated with 10 μ mol/l methyl jasmonate (MeJA) for 24h at 20 ° C, and then stored at 1 ° C for 35days to investigate the effect of MeJA treatment on chilling injury and changes in the anti-oxidant system. Loquat fruit developed chilling injury, manifested as increased fruit firmness, decreased extractable juice rate and internal browning during storage. These chilling injury symptoms were significantly reduced by MeJA treatment. MeJA also markedly delayed the increases in O2 production rate and H2O2 content. Meanwhile, the MeJA-treated fruit exhibited significantly higher activities of superoxide dismutase, catalase and ascorbate peroxidase, and lower activity in lipoxygenase than control fruit during the storage. The ratio of unsaturated/saturated fatty acid in MeJA-treated fruit was also significantly higher than that in control fruit. These results suggest that the reduction in chilling injury by MeJAmay be due to enhanced antioxidant enzyme activity and higher unsaturated/saturated fatty acid ratio.

【题目】Effects of short-term N2 treatment on quality and antioxidant ability of loquat fruit during cold storage
【中文关键词】none
【英文关键词】Loquat fruit; Methyl jasmonate; Chilling injury; Antioxidant enzyme; Lipoxygenase; Fatty acids
【中文摘要】none
【英文摘要】Abstract:BACKGROUND: Loquat fruit is susceptible to microbial decay and quality deterioration during postharvest distribution. In this study, in a search for effective alternatives to methods currently used for quality maintenance, the effects of short-term pre-storage N2 treatment on the quality and antioxidant ability of loquat fruit were investigated.RESULTS: Loquat fruits were exposed to 100% N2 for 6 h at 20°C and then stored at 5°C for 35 days. Short-term N2 treatment significantly delayed the increase in fruit decay rate and decreases in total soluble solid and titratable acidity contents,thereby maintaining better eating quality and extending the storage life of fruits. It also markedly delayed increases in membrane permeability, malondialdehyde content and

superoxide anion production rate. In addition, N2-treated fruitsexhibited significantly higher superoxide dismutase and catalase activities and lower lipoxygenase activity than control fruits.CONCLUSION: Short-term pre-storage N2 treatment effectively reduced fruit decay and maintained quality in loquat fruits during cold storage. The reduction in fruit decay and quality deterioration by the treatment was correlated with enhanced antioxidant ability and reduced lipid peroxidation.

【题目】Low-temperature conditioning combined with methyl jasmonate treatment reduces chilling injury of peach fruit
【中文关键词】none
【英文关键词】peach fruit; low-temperature conditioning; methyl jasmonate; chilling injury
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Peaches are sensitive to low temperature and develop chilling injury (CI) symptoms during refrigerated storage.This CI reduces consumer acceptance of peaches and limits the potential postharvest market life of the fruit. To develop a suitable technique to reduce CI, the effect of a combination of low-temperature conditioning (LTC) and methyl jasmonate (MJ) treatment on CI of peach fruit was investigated in this study.RESULTS: Freshly harvested firm-mature peaches were treated with a combination of LTC at 10 or 20°C and 1 μ mol L-1MJ and then stored at 0°C for 5 weeks. The fruits developed CI during storage, manifested as internal browning and flesh mealiness. The combined treatment significantly reduced these CI symptoms and maintained higher fruit quality. The activities of polyphenol oxidase and peroxidase were significantly inhibited while those of superoxide dismutase, catalase and ascorbate peroxidase were induced by the combined treatment. In addition, the activities of phenylalanine ammonia-lyase and polygalacturonase and the level of total phenolics were enhanced by the combined treatment.CONCLUSION: The combination of LTC and MJ treatment could be a useful technique to reduce CI and maintain quality in peach fruit during cold storage.

【题目】Methyl jasmonate reduces decay and enhances antioxidant capacity in Chinese bayberries
【中文关键词】none
【英文关键词】Chinese bayberry; methyl jasmonate; decay; antioxidant capacity
【中文摘要】none
【英文摘要】Abstract:The effects of methyl jasmonate (MeJA) on postharvest decay and antioxidant capacity in harvested Chinese bayberry fruit were investigated. Chinese bayberries were treated with 0, 1, 10, 100, or1000 μ mol L-1 MeJA at 20 ° C for 6 h and then stored at 0 ° C for 12 days. MeJA at 10 μ mol L-1 was most effective in reducing fruit decay; quality parameters including pH value, total soluble solids, and titratable acidity were not significantly affected by MeJA treatment. Fruit treated with 10 μ mol L-1 MeJA exhibited significantly higher phenylalanine ammonia-lyase activity and higher levels of total phenolics, flavonoids, and anthocyanins as well as individual phenolic compounds than control.These fruits also maintained significantly higher antioxidant activity as measured by scavenging capacity against 1,1-diphenyl-2-picrylhydrazyl, superoxide, and hydroxyl radicals and by the reducing power test compared to the control. These results indicate that MeJA can effectively reduce fruit decay and improve antioxidant capacity of Chinese bayberry fruit.

【题目】Effect of methyl jasmonate on quality and antioxidant activity of postharvest loquat fruit
【中文关键词】none
【英文关键词】loquat fruit; methyl jasmonate; quality; phenolics; flavonoids; antioxidant activity
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Loquat fruit is rich in natural antioxidants and has shown a remarkably high antioxidant activity. To search for an effective method for maintaining or even improving antioxidant activity during postharvest storage, we investigated the effect of 10 μ mol L-1 methyl jasmonate (MeJA) treatment on levels of major individual sugars and organic acids, total phenolics, total carotenoids, total flavonoids and antioxidant activity in loquat fruit during storage at 1°C for 35 days.RESULTS: The MeJA-treated fruit exhibited significantly lower levels of respiration rate, ethylene production, phenylalanine ammonia-lyase and polyphenol oxidase activities, and higher levels of sugars, organic acids, total phenolics and total flavonoids than control fruit. Meanwhile, the treatment also maintained significantly higher antioxidant activity as measured by the scavenging capacity against 1,1-diphenyl-2-picrylhydrazyl (DPPH), superoxide and hydroxyl radicals, and by the reducing power test compared to the control. There was a significant positive linear relationship between total phenolic content and DPPH radical scavenging activity.CONCLUSION: MeJA treatment can improve the quality and functional properties of harvested loquat fruit by maintaining a higher level of antioxidants and enhancing antioxidant activity.

【题目】Effects of 1-methylcyclopropene on oxidative damage, phospholipases and chilling injury in loquat fruit
【中文关键词】none
【英文关键词】1-MCP; loquat; chilling injury; oxidative damage; phospholipase
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Low-temperature storage is commonly used for loquat (Eriobotrya japonica Lindl.) fruit to inhibit decay and extend postharvest life, but it also increases the severity of chilling injury (CI) in red-fleshed fruit. 1-Methylcyclopropene (1-MCP) has been used to reduce the development of CI in cold-stored loquat. However, the effects of 1-MCP on changes in antioxidant system and phospholipase activity and their relation to CI have not been investigated. The objective of this study was to determine whether the 1-MCP-induced modification in antioxidant system and phospholipase activity is linked to the reduced CI in cold-stored loquat fruit.RESULTS: 1-MCP treatment significantly alleviated CI in ‘ Fuyang ’ loquat fruit. The treatment markedly inhibited the accumulation of malondialdehyde, superoxide radicals and hydrogen peroxide and the increase in electrolyte leakage. In addition, 1-MCP-reated fruit exhibited significantly higher catalase activity and lower lipoxygenase (LOX) and phospholipase C (PLC) activities than control fruit during storage.CONCLUSION: These results suggest that LOX and PLC are associated with the induction of CI in loquat fruit. 1-MCP might reduce CI by inhibiting LOX and PLC activities and alleviating oxidative damage.

【题目】Effect of 1-methylcyclopropene treatment on chilling injury, fatty acid and cell wall polysaccharide compositions in loquat fruit
【中文关键词】none
【英文关键词】Loquat; 1-MCP; chilling injury; fatty acid; cell wall polysaccharide
【中文摘要】none
【英文摘要】Abstract: Loquat fruit was treated with 2.32 nmol L-1 1-methylcyclopropene (1-MCP) for 24 h at 20 ° C, and then stored at 1 ° C for 35 days to investigate the effect of 1-MCP treatment on chilling injury (CI) and fatty acid and cell wall polysaccharide composition. Loquat fruit developed CI, manifested as increased fruit firmness, internal browning and decreased extractable juice. These CI symptoms were reduced by 1-MCP treatment. 1-MCP-treated fruit exhibited higher levels of linoleic and linolenic acid and a higher unsaturated/saturated fatty acid ratio than control fruit during storage.The treatment also markedly delayed increase in alcohol insoluble residue, i.e. hemicellulose and cellulose. Meanwhile, the level of water- and CDTA-soluble pectins in treated fruit was higher than that in control. Our result suggested modifications of fatty acid and cell wall polysaccharide composition are associated with CI develpoment in loquat and 1-MCP treatment modulates the changes that seem to regulate the strength of cell wall and so to alleviate CI.

【题目】热处理对冷藏枇杷木质化及相关酶活性的影响.
【中文关键词】枇杷果实,热处理,低温贮藏,木质化
【英文关键词】loquat fruitss, heat treatment, low temperature storage, flesh leatheriness
【中文摘要】摘要:为阐明热处理对冷藏枇杷果实木质化败坏的影响及其机理,该研究先将枇杷果实用 38℃热空气处理 5 h,然后在(1±1)℃下贮藏 35 d,并每隔 7 d 测定果实硬度、出汁率、苯丙氨酸解氨酶(PAL)、过氧化物酶(POD)、多酚氧化酶(PPO)和多聚半乳糖醛酸酶(PG)等木质化相关酶活性及果胶和木质素含量的变化。结果表明,热处理可以有效控制果实硬度的上升和出汁率的下降,抑制 PAL、POD 和 PPO 活性的上升及 PG 活性的下降,减少原果胶和木质素的积累,保持较高的水溶性果胶含量,从而减轻冷藏枇杷果实的木质化症状,保持较好的食用品质。这些结果表明,热处理减轻冷藏枇杷果实木质化败坏的机理与其抑制木质素的合成和促进果胶物质的降解有关。
【英文摘要】The study was conducted to investigate the effects of heat treatment on flesh leatheriness of cold-stored loquat fruitsand the possible mechanisms. Freshly harvested loquat fruits were pre-treated with hot air at 38℃ for five hours and thenstored at (1±1)℃ for 35 days. Fruits firmness, extractable juice rate, the activities of phenylalanine ammonium-lyase (PAL),peroxidase (POD), polyphenol oxidase (PPO) and polygalacturonase (PG) that were related to flesh leatheriness, and contentsof lignin and pectin were analyzed at seven-day intervals during storage. The results indicated that heat treatment significantlydelayed the increase of fruits firmness and the decrease of extractable juice rate, inhibited the increase of PAL, POD and PPOactivities and the decrease of PG activity. Meanwhile, heat treatment reduced the accumulation of lignin and protopectin andmaintained higher content of water soluble pectin, thereby prevented the development of flesh leatheriness and maintained thequality of cold-stored loquat fruits. These data suggest that the reduction of flesh leatheriness by heat treatment may be relatedto the inhibition of lignin synthesis and the enhancement of pectin solubilization.

【题目】采收成熟度对冷藏水蜜桃果实品质和冷害的影响
【中文关键词】水蜜桃;成熟度;低温贮藏;冷害;品质
【英文关键词】juicy peach; harvest maturity; cold storage; chilling injury; quality
【中文摘要】摘要:【目的】研究不同采收成熟度对南方软质型水蜜桃在低温下的贮藏效果及抗冷性,以探索适宜的果实采收成熟度,为软质型水蜜桃低温贮藏提供依据。【方法】以7-8成熟和9成熟2种不同采收成熟度的“湖景蜜露”水蜜桃为材料,测定在1℃28d贮藏期间果实腐烂指数、硬度、可溶性固形物、可滴定酸、VC含量、呼吸强度、乙烯释放速率、相对电导率、褐变指数和SOD、POD等品质及生理生化指标。【结果】7-8成熟的水蜜桃在冷藏过程中果实硬度增加,出汁率在7d后开始下降,不能正常后熟,出现明显的冷害症状,果实的品质降低;而9成熟的水蜜桃在冷藏期间果实硬度缓慢下降,出汁率平稳增加,能正常后熟,未出现明显的冷害症状,保持了较高的商品价值。与7-8成熟的水蜜桃果实相比,9成熟的水蜜桃在冷藏期间褐变指数较小,可溶性固形物和VC含量较高,乙烯释放量和呼吸强度较大,SOD和POD活性较高。【结论】9成熟的水蜜桃具有较好的抗冷性,适宜于低温贮藏。
【英文摘要】Abstract: 【Objective】 This research investigated the effects of different harvested maturities on quality attributes and chilling injury of peach fruit (Prunus persica L. Batsch cv. Hujingmilu) in low temperature storage, and further explore the optimal harvested maturity, which is useful for guiding storage technique of soft peaches in south China. 【Method】 Changes in rotten rate, flesh firmness, total soluble solids (TSS), titratable acidity (TA) and ascorbic acid, respiration rate, relative leakage rate, browning index,superoxide dismutase (SOD) and peroxidase (POD) of ‘Hujingmilu’ peaches were investigated at 1℃ for 28 days.【Result】 As compared to the fruits with 7-8 maturity-degree at 1℃, the fruits with 9maturity-degree showed a stronger tolerance to cold stress,and kept better quality during low temperature storage periods. In addition, the fruits with 9 maturity-degree showed an increase in activities of SOD and POD, reducing accumulation of free radical and alleviating chilling injury. 【Conclusion】 Thus, 9 maturity-degree should be suggested as the best harvest maturity of juicy peaches in low temperature storage.

【题目】鲜带鱼不同贮藏温度的货架期预测模型
【中文关键词】动力学模型,贮藏,品质控制,带鱼,货架期
【英文关键词】kinetic models;storage;quality control; Trichiurus haumela;shelf life
【中文摘要】摘 要:为了研究鲜带鱼在冷链流通中的品质变化与货架期,通过不同温度下的贮藏试验研究了鲜带鱼的货架期预测模型。将鲜带鱼贮藏在268、273、278、283和293 K条件下,测定了鲜带鱼的总菌落数、总挥发性盐基氮(T-VBN)、鲜度指标(K值)与感官品质指标的变化。在Arrhenius动力学方程基础之上,建立了菌落总数、总挥发性盐基氮和鲜度指标(K值)与贮藏时间及贮藏温度之间的动力学模型。试验表明一级化学反应动力学模型和Arrhenius方程对总菌落数、总挥发性盐基氮(T-VBN)及鲜度指标(K值)的变化具有较高的拟合精度。菌落总数变化预测模型中的活化能(EA)及速率常数(k0)分别为:71.26 kJ/mol和3.987×1013,挥发性盐基氮变化的活化能(EA)及速率常数(k0)分别为:68.86 kJ/mol和2.159×1012,鲜度指标(K值)变化的活化能(EA)及速率常数(k0)分别为:41.26 kJ/mol和2.539×107。结果表明,鲜带鱼的总菌落数、总挥发性盐基氮(T-VBN)、鲜度指标(K值)随着贮藏时间的延长而增加,且随着贮藏温度的升高而增加迅速,其感官品质指标随着贮藏时间的延长而下降,且随着贮藏温度的升高而下降迅速。该试验建立的带鱼货架期预测模型所获得货架

期预测值准确率达到±10%以内,可根据菌落总数、T-VBN 值及 K 值在 268~293 K 范围内,对带鱼的剩余货架期进行预测。

【英文摘要】Abstract:To study quality changes and shelf life in cold chain circulation, kinetic models were developed to predict the shelf-life of fresh Trichiurus haumela at different temperatures during storage. Total Viable Count(TVC), Total-Volatile Basic Nitrogen (T-VBN) value, K value and sensory evaluation at different storage temperatures (268, 273, 278, 283 and 293 K) were accessed to investigate the relation between the shelf-life and temperature. The kinetic models of TVC, T-VBN value and K value with respect to storage time and temperature were developed based on Arrhenins equation. The high regression coefficients(R2〉 0.9) indicated the acceptability of the first order reaction and Arrhenius model for predicting the changes of TVC, T-VBN value and K value of Trichiurus haumela. Activation energies(EA) and rate constants(k0) of TVC, T-VBN value, K value were obtained. They were 71.26 kJ/mol, 3.987× 10^13, 68.86 kJ/mol, 2.159×10^12 and 41.26 kJ/mol, 2.539×10^7, respectively. The results indicate that TVC, T-VBN value and K value increase with the increase of storage time and temperature. It is observed that the evaluation of sensory quality decrease with storage time and increasing temperature. It shows from the reliability assessment between predicted and observed shelf-life that relative error is within +10% calculated by the prediction model for the shelf-life of Trichiurus haumela. The remaining shelf-life of Trichiurus haumela can be predicted at the storage temperature from 268 K to 293 K based on TVC, T-VBNvalue and K value.

【题目】鲳鱼货架期预测模型的电子鼻评价与研究

【中文关键词】鲳;电子鼻;动力学模型;挥发性盐基氮;总菌落数
【英文关键词】Pampus argenteus ; electronic nose ; kinetic model ; total volatile base-nitrogen ; total viable count

【中文摘要】摘要:利用电子鼻对鲳在不同贮藏温度与贮藏时间下的挥发性气味变化进行了分析,并对电子鼻测定获得的数据进行了主成分分析(PCA)与判别因子分析(DFA)。将电子鼻PCA与DFA分析获得的鲳的气味变化突变点作为气味变化的切分点与理化品质指标值(菌落总数)相结合,建立了鲳在273~283K下的Q加货架期预测模型。结果表明,电子鼻PCA与DFA分析能很好地将贮藏于273、283与293K下的鲳随着贮藏时间变化的气味进行区分。贮藏于不同温度条件下的鲳的TVBN与菌落总数值回归拟合方程均符合一级化学动力学模型(R^2〉0.95)。基于电子鼻PCA与DFA分析获得的283K与293K下的气味变化切分点与相同温度下理化品质指标变化具有较好的对应关系,采用Arrhenius动力学模型推导公式求得鲳在273—283K与283~293K温度段内菌落总数的Q10值,并结合283K与293K温度下电子鼻PCA与DFA分析获得的气味变化货架期切分点,从而得到鲳在273~283K与283~293K温度段内的Q10货架期预测模型为:SL(275~283K)=3×3.008 283-τ/10与SL(283-293K)=1.5×3.423 283-τ/10。上述模型预测的货架期与实测值的相对误差均小于10%。所获得的两个温度段下的货架期预测模型能很好地对273~283K与283~293K温度段下鲳的货架期进行预测。

【英文摘要】
Abstract:In this paper, an application of the electronic nose was used to evaluate the freshness quality difference of the pomfret(Pampus argenteus) fillet under different storage periods and storage temperatures.
The raw data of the pomfret fillet of the electronic nose analysis was analyzed by principal compounds analysis (PCA) and discriminate factorial analysis (DFA). The Q10 model of the pomfret fillet by applying both chemical assays and olfactometric (e-nose) method was developed. The result showed that the sample stored at 273 K, 283 K and 293 K could be well discriminated by 18 Metal Oxide Sensors. Changes in total volatile base-nitrogen (TVBN) and total viable count (TVC) of pomfret fillet with respect to different storage time and temperature conformed to the first kinetic model with high regression coefficients (R^2 〉 0.95). Using PCA and DFA analysis of Alphasoft 11. 0 and Arrhenius kinetic model, the Q10(273~283K) and Q10(283-293 K) model of shelf-life of pomfret fillet was SL(275~283K)=3×3.008 283-τ/10 and SL(283-293K)=1.5×3.423 283-τ/10. It was shown from the reliability assessment between predictive and observed shelf-life that relative error was within 10% calculated by the prediction model for the shelf-life of pomfret fillet. The remaining shelf-

life of pomfret fillet could be predicted at the storage temperature from 273 K to 283 K and 283 K to 293 K based on the Q10(273 -283 K) and Q10(283 -293 K) model.

【题目】鲳鱼品质变化动力学模型的实验研究
【中文关键词】鲳鱼;动力学模型;反应级数;感官评定
【英文关键词】pore fret ; kinetics model ; reaction order ; sensory evaluation
【中文摘要】摘要:通过不同温度下的贮藏实验研究了鲳鱼的菌落总数、挥发性盐基氮(TVI谢)、鲜度指标K和感官指标随贮藏时间的变化规律.通过相应的品质能级函数分析,确定鲳鱼的K符合零级化学反应动力学模型,TVBN、总菌落数值符合一级化学反应动力学模型,且化学反应动力学方程的相关系数均大于0.9,具有较高的拟合精度.利用Arrhenius方程对活化能E和温度系数Q10进行计算,并对照感官评定得到鲳鱼在268~278K,273~283K和283~293K温度段内任何一点温度丁的货架期预测模型分别为θs(T)=5.8×2.009^(278-T)/10,θs(T)=3.0×1.948^(283-T)/10和θs(T):1.7×2.407^(298-T)/10,θs(T)为货架寿命.并模拟得到了鲳鱼经历不同温度、时间流通后的品质损失量和货架寿命余量.
【英文摘要】Abstract: Total viable count (TVC), total volatile base-nitrogen (TVBN) value, K-value and sensory evaluation of pomfret at different storage temperatures were assessed to investigate the relation between shelf life and temperature. Analyzing the chemical kinetics of quality, it is concluded that K-value is conformed to the zero order model, meanwhile, TVBN and TVC follow the first order model. The activation energy Es and Q10 were calculated according to the Arrhenius model. By means of sensory evaluation, during 268~278 K, 273~283 K and 283~293 K, the functions for shelf-life prediction at any temperature are θs(T)=5.8×2.009^(278-T)/10, θs(T)=3.0×1.948^(283-T)/10 and θs(T):1.7×2.407^(298-T)/10, θs(T) respectively. It is shown from the reliability assessment that the basic error between predictive remaining shelf life and observed shelf life is within 20 % and the system can predict the freshness and remaining shelf life of pomfret rapidly and reliably.

【题目】Effect of methyl jasmonate on cell wall modification of loquat in relation to chilling injury after harvest
【中文关键词】none
【英文关键词】Loquat fruit;Chilling injury;Methyl jasmonate;Lignin;Cell wall polysaccharides
【中文摘要】none
【英文摘要】Abstract:Loquat fruit were pretreated with 10 μM methyl jasmonate (MeJA) for 24h at 20 ° C, and then stored at 1 ° C for 35 days to investigate the effect of MeJA treatment on cell wall modification in relation to chilling injury. Loquat fruit developed chilling injury, manifested as increased fruit firmness and internal browning, decreased extractable juice during storage. These chilling injury symptoms were significantly reduced by MeJA treatment. MeJA also markedly delayed the increases in lignin, alcohol insoluble residues, hemicellulose and cellulose. Meanwhile, the MeJA-treated fruit exhibited significantly lower activities of phenylalanine ammonia lyase, peroxidase, polyphenol oxidase and higher polygalacturonase activity than the control during storage. The levels of water- and CDTA-soluble pectins in MeJA-treated fruit were also significantly higher than that in the control. These results suggest that the reduction in chilling injury by MeJA may be due to inhibited lignin accumulation and enhanced cell wall polysaccharides solubilisation.

【题目】Effects of heat treatment on internal browning and membrane fatty acid in loquat fruit in response to chilling stress
【中文关键词】none
【英文关键词】loquat fruit; heat treatment; internal browning; fatty acid; chilling stress
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Chilling injury (CI) limits the storage period and shelf-life of red-fleshed loquat fruit (Eriobotrya japonica Lindl.),which leads to a remarkable loss after cold storage. To develop an effective technique to reduce CI, the effects of a 38°C heat treatment in air for 5h, plus storage at 1°C for 35days, on internal browning (IB) and membrane fatty acid composition of the loquat cv. Jiefangzhong were investigated.RESULTS: Heat treatment delayed the occurrence of IB and inhibited the increase of IB index in ‘ Jiefangzhong ’ loquat fruit.Heat treatment maintained lower levels of electrolyte leakage and malondialdehyde content, and inhibited the increases in phospholipase D and lipoxygenase activities compared with the control fruit. Meanwhile, heat treatment inhibited the increases in palmitic, stearic and oleic acid levels and delayed the decreases in linoleic and linolenic acid contents, thus maintaining higher unsaturated/saturated fatty acid ratio than the control.CONCLUSION: These results suggest that the reduction of IB in chilled loquat fruit by heat treatment might due to maintenance of membrane integrity and higher unsaturated/saturated fatty acid ratio.

【题目】Quality and physiological responses of Chinese bayberry fruit to storage temperature
【中文关键词】none
【英文关键词】none
【中文摘要】none
【英文摘要】SUMMARY: The effects of storage temperature on quality and physiological responses in Chinese bayberry fruit (Myrica rubra Sieb. and Zucc. cv. Wumei) were investigated. Freshly harvested bayberries were stored at 20 ° C, 10 ° C, or 1 ° C for 60h,5d, or 14d, respectively. The rates of respiration and ethylene production, fruit firmness, total sugars, organic acids,and total soluble solids (TSS) contents, total titratable acidity (TA), pH, relative electrical conductivity (REC), and polyphenol oxidase (PPO) activity of fruit were measured during storage. The results showed that the rates of respiration and ethylene production decreased during storage, and that their values were lowered significantly by decreasing the storage temperature. Low temperatures maintained higher TSS contents, TA, and fruit firmness and inhibited any increases in pH, REC, and PPO activity in bayberry fruit. There was a significant decline in citric acid and sucrose contents during storage, with a more rapid decrease occurring at higher temperatures. The data obtained indicate that cold storage is an effective way to maintain quality and chemical components in Chinese bayberry fruit.

【题目】Effect of hot air treatment on postharvest mould decay in Chinese bayberry fruit and the possible mechanisms
【中文关键词】none
【英文关键词】Chinese bayberry;Hot air treatment;Fruit decay;Quality;Disease resistance
【中文摘要】none
【英文摘要】Abstract: The effect of hot air treatment (HAT) on reducing natural fungal decay and green mould decay caused by Leptographium abietinum on postharvest Chinese bayberry fruit and the possible mechanisms were investigated. Freshly harvested Chinese bayberry fruit were firstly pretreated with hot air at 36 – 60 ° C for 1 – 3h, and then stored at 20 ° C for 3d or at 1 ° C for 12d to investigate the optimum condition of hot air treatment (HAT) for inhibiting decay development. Results demonstrated that HAT at 48 ° C for 3h was the most effective in reducing natural decay without impairing quality. This treatment also enhanced the resistance of Chinese bayberry fruit against green mould rot caused by L. abietinum and reduced the severity of the disease. The activities of defense-related enzymes including chitinase, β-1, 3-glucanase, peroxidase and polyphenol oxidase were significantly enhanced by HAT. In addition, the in vitro experiment showed that HAT significantly inhibited spore germination, germ tube elongation and mycelial growth of L.abietinum. These results indicate that HAT can effectively reduce fruit decay possibly by directly inhibiting pathogen growth and indirectly inducing disease resistance.

【题目】Effect of 1-methylcyclopropene on anthracnose rot caused by Colletotrichum acutatum and disease resistance in loquat fruit
【中文关键词】none
【英文关键词】loquat fruit; 1-MCP; anthracnose rot; senescence
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Loquat (Eriobotrya japonica Lindl.) fruit are susceptible to fungal decay during postharvest storage at ambient temperature. The control of postharvest diseases of loquat is based primarily on the use of synthetic fungicides. To look for an alternative method for disease control, we investigated the effect of 1-methylcyclopropene (1-MCP) on controlling anthracnose rot caused by Colletotrichum acutatum of loquat fruit.RESULTS: 1-MCP treatment significantly reduced decay incidence of loquat fruit. The treatment markedly inhibited accumulation of superoxide radicals and hydrogen peroxide and maintained higher superoxide dismutase, catalase and ascorbate peroxidase.Meanwhile, 1-MCP treatment induced higher activities of two defense-related enzymes – chitinase and β-1,3-glucanase – during 6 days ' storage. Furthermore, the treatment inhibited increases in fruit firmness and internal browning index, and maintained higher extractable juice rate, total soluble solids and titratable acidity contents, thereby delaying the development of senescence. CONCLUSION: 1-MCP was effective in reducing decay and might have enhanced the disease resistance in loquat fruit by increasing chitinase and β-1,3-glucanase, and maintained natural resistance by delaying senescence development.

【题目】Effect of methyl jasmonate in combination with ethanol treatment on postharvest decay and antioxidant capacity in Chinese bayberries
【中文关键词】none
【英文关键词】Chinese bayberries; methyl jasmonate; ethanol; decay; antioxidant capacity
【中文摘要】none
【英文摘要】Abstract: The effects of methyl jasmonate (MeJA) in combination with ethanol (EtOH) treatment on green mold rot caused by Penicillium citrinum, natural decay, and antioxidant capacity in harvested Chinese bayberries were investigated. MeJA at 10 μ mol L-1 in combination with EtOH at 22.32 μ mol L-1 was most effective in reducing green mold rot and natural decay. This combined treatment also significantly inhibited spore germination and germ tube elongation of the pathogen in vitro compared with MeJA alone or control. Meanwhile, the combination-treated bayberries exhibited highest reducing power, scavenging activities against superoxide, hydroxyl, and 1,1-diphenyl-2-picrylhydrazyl radicals,and contents of total phenolics, flavonoids, and anthocyanins as well as individual phenolic compounds.Fruit quality parameters were not significantly affected by these treatments. These results suggest that the combination of MeJA and EtOH had an additive effect in reducing postharvest decay and improving antioxidant capacity in Chinese bayberries.

【题目】A combination of hot air treatment and nano-packing reduces fruit decay and maintains quality in postharvest Chinese bayberries
【中文关键词】none
【英文关键词】Chinese bayberry; hot air treatment; nano-packing; decay; quality
【中文摘要】none
【英文摘要】Abstract: BACKGROUND: Chinese bayberry is susceptible to microbial decay during postharvest handling and storage. To search for effective alternatives to currently used fungicides for disease control, the efficacy of hot air (HA) treatment at 48°C for 3h alone or in combination with nano-packing (NP) containing nano-TiO2 and nano-Ag in controlling green mould decay caused by Penicillium citrinum and natural decay, and their effects on fruit quality in harvested Chinese bayberries were investigated in this study.RESULTS: The combined treatment of HA and NP resulted in a remarkably improved control of green mould and natural decay in Chinese bayberries compared with treatment of HA or NP alone. The in vitro growth of P. citrinum was significantly inhibited by individual HA or NP. In addition, HA in combination with NP showed interactive effect on inhibiting fruit respiration, ethylene production and membrane lipid peroxidation, and maintained higher fruit firmness and DPPH radical scavenging activity.CONCLUSION: These results suggest that a combination of HA treatment and NP may be a useful technique to reduce fruit decay and maintain quality in Chinese bayberries during postharvest storage and retail conditions.

【题目】Improved control of postharvest decay in Chinese bayberries by a combination treatment of ethanol vapor with hot air
【中文关键词】none
【英文关键词】none
【中文摘要】none
【英文摘要】Abstract: The effect of ethanol vapor treatment (EVT, 250 or 500 mL L-1 for 3h) alone or in combination with hot air treatment (HAT, 48 C for 3 h) on postharvest decay and microbial loads in Chinese bayberries was investigated. Treatment with ethanol vapor or hot air alone both resulted in significantly lower decay incidence caused by Verticicladiella abietina, Penicillium citrinum or Trichoderma viride compared with the control. The combined treatment of 500 mL L-1 ethanol vapor with hot air showed the lowest incidence of fruit decay caused by these pathogens. This treatment also significantly inhibited spore germination and germ tube elongation of the pathogens in vitro than EVT or HAT alone. Meanwhile, the combined treatment exhibited the lowest natural decay incidence and microbial loads on Chinese bayberries without impairing fruit quality. These results suggest the usefulness of the combined treatment for reducing fruit decay in Chinese bayberries.

【题目】Chinese bayberry fruit extract alleviates oxidative stress and prevents 1, 2-dimethylhydrazine-induced aberrant crypt foci development in rat colon carcinogenesis
【中文关键词】none
【英文关键词】Chinese bayberry;Colon carcinogenesis;Oxidative damage;DMH;ACF
【中文摘要】none
【英文摘要】Abstract: The effects of Chinese bayberry fruit extract (CBFE) ingestion on hepatic and colonic oxidative stress and 1,2-dimethylhydrazine (DMH)-induced intestinal aberrant crypt foci (ACF) development in rats were investigated. Rats were administered DMH (35 mg/kg body weight) and were supplemented with CBFE(50 or 500 mg/kg body weight every day) for 16 weeks. Results showed that DMH consumption induced intestinal ACF development and adenoma or adenocarcinoma formation, which were significantly reduced with CBFE supplement. The CBFE treatments increased reduced glutathione levels and activities of superoxide dismutase, catalase and glutathione reductase, in both hepatic and colonic tissues; how- ever, the activities of glutathione-S-transferase and glutathione peroxidase were inhibited. These results indicate that CBFE, rich in phenolic compounds, effectively inhibits DMH-induced ACF and colonic tumour development by alleviating oxidative stress.

【题目】基于乙醇质量分数的草莓果实腐烂指数预测模型
【中文关键词】无损检测;乙醇;腐烂;预测模型;草莓果实
【英文关键词】nondestructive detection ; ethanol ; decay ; prediction model ; strawberry fruit
【中文摘要】摘要:为应用电子鼻快速检测草莓物流过程中果实腐烂状况,建立了一种基于乙醇质量分数的果实腐烂指数预测模型。将草莓果实贮藏于不同温度(273、278、283、288、293和298K)下,测定其腐烂指数和乙醇质量分数的变化。首先,基于Arrhenius动力学方程建立了草莓果实乙醇质量分数与贮藏时间和温度之间的动力学预测模型;其次,基于零级反应

方程式建立了腐烂指数与贮藏时间和温度之间的动力学预测模型;最后,根据果实腐烂指数和乙醇质量分数变化的线性关系,进一步建立了基于乙醇质量分数的果实腐烂指数预测模型。在275、280、285、290、295和300K贮藏温度下对上述3个预测模型进行验证,预测的相对误差(RE)分别为0.76%、5.89%和7.08%,预测精度较高。将基于果实乙醇质量分数的腐烂指数预测模型与传统的腐烂指数动力学预测模型进行比较,发现二者的预测精度无显著差异。因此,基于乙醇质量分数的腐烂指数预测模型可以较好地预测在273~300K贮藏温度下草莓果实的腐烂状况,从而为应用电子鼻无损检测果实品质提供理论依据。

【英文摘要】Abstract: For the purpose of fast detection of fruit decay in strawberry fruit during postharvest distribution by gas sensor array,a prediction model for decay index based on ethanol content was developed in this study.Freshly harvested strawberries were stored at different temperatures(273,278,283,288,293 and 298 K).Changes in decay index and ethanol content of strawberry fruit were determined during storage.Firstly,a kinetic model of ethanol content with respect to storage time and temperature was developed based on the Arrhenius equation.Secondly,a kinetic model of decay index with respect to storage time and temperature was also developed based on the zero order equation.Finally,a prediction model for decay index based on ethanol content was further developed according to the linear relationship between decay index and ethanol content.The three models were then verified with the strawberry fruit stored at 275,280,285,290,295 and 300 K.The relative prediction errors were found to be 0.76%,5.89%,7.08% respectively,and the prediction accuracy was acceptable.There was no significant difference in prediction accuracy between the kinetic model of decay index and prediction model for decay index based on ethanol content.The results suggest that decay index of strawberry fruit can be accurately predicted at the storage temperature from 273 to 300 K by the prediction model for decay index based on ethanol content,which lays the foundation for the non-destructive real-time measurement of fruit quality using gas sensor array.

【题目】基于绿熟番茄果实L值的番茄红素含量预测模型
【中文关键词】番茄果实;明度;番茄红素含量;动力学模型
【英文关键词】tomato fruit;L value;lycopene content;kinetic models
【中文摘要】摘要:为了研究绿熟番茄果实贮藏期间颜色和番茄红素含量变化的关系,通过不同温度下的贮藏实验研究基于果实明度(L* 值)的番茄红素含量预测模型。将绿熟番茄果实贮藏在 283.15、288.15、298.15K 条件下,测定了果实L* 值和番茄红素含量的变化。采用指数函数和Gomportz函数分别对不同贮藏温度下番茄果实L*值和番茄红素含量进行曲线拟合,建立了果实 L* 值和番茄红素含量与贮藏时间和贮藏温度之间的动力学模型。实验表明,指数函数和Gomportz函数分别对番茄果实L*值和番茄红素含量的变化具有较高的拟合精度(R2>0.95)。在Arrhenius动力学方程基础上得到绿熟番茄果实贮藏期间L*值和番茄红素含量变化的活化能(Ea)分别为48.09kJ/mol和67.06kJ/mol,复相关系数分别为0.9644和0.9815。建立的基于果实L*值变化的番茄红素含量的预测模型所获得的番茄红素预测值与实测值之间的平均相对误差为 8.74%,小于 10%。这表明,在 283.15~298.15K(10~25℃)的贮藏温度范围内,可根据番茄果实采后 L* 值的变化对番茄红素的含量进行预测。
【英文摘要】Abstract:A kinetic model was developed to predict the lycopene content as a function of the luminosity (L) of mature green tomatoes stored at different temperatures. The L value and lycopene content of mature green tomatoes stored at 283.15, 288.15,296.15 K or 298.15 K were determined. The kinetic models of L value and lycopene content with respect to length of storage and storage temperature were developed based on exponential function and Gomportz function, respectively. The high regression coefficients (R2>0.95)indicated the acceptability of the exponential function and Gomportz function for predicting the changes of L value and lycopene contentin tomato fruits. Activation energies (Ea) and multiplecorrelation coefficients for L value and lycopene content were obtained based on the Arrhenius equation: 48.09 kJ/mol and 67.06 kJ/mol, 0.9644 and 0.9815, respectively. The average relative error between the predicted and measured values of lycopene content was 8.74% (within ± 10%). These results suggest that lycopene content in mature green tomato fruits stored at a storage temperature from 283.15 to 298.15 K may be accurately predicted based on L value.

【题目】Characterization and molecular mechanism of a naturally occurring metsulfuron-methyl resistant strain of Pseudomonas aeruginosa
【中文关键词】甲磺隆;生物降解与修复;抗药性;基因克隆
【英文关键词】metsulfuron-methyl; biodegradation and bioremediation; herbicides resistance; gene cloning
【中文摘要】从长期受甲磺隆污染的土壤中分离,纯化了2株甲磺隆的抗性菌L6、L36。经形态、生理生化特性测定、16S rDNA序列同源性比较、系统进化树的分析和细胞脂肪酸分析,将甲磺隆抗性菌L6、L36鉴定为铜绿假单孢菌(Pseudomonas aeruginosa)。甲磺隆对铜绿假单孢菌敏感菌株PAO1及抗性菌株L6、L36的有效中浓度(Medium Effective Concentration, EC50)分别为0.36、2.75、2.89mM;最低抑制浓度(Minimal Inhibition Concentration, MIC)分别为1.31、6.03、6.03mM。L6、L36 的EC50值分别是PAO1的EC50值的7.63、8.03倍。甲磺隆的抗性菌株与普施特无交互抗性。测定了甲磺隆对Pseudomonas aeruginosa敏感菌株PAO1及抗性菌株L6、L36的乙酰乳酸合酶(Acetolactate synthase,ALS)的抑制作用。发现抗性菌株L6、L36的ALS活性均显著低于敏感菌株PAO1的ALS活性,如在不加甲磺隆处理的情况下,PAO1、L6、L36的ALS活性分别为391.4、122.8、120.4U。同时发现L6、L36的ALS对甲磺隆抑制作用不敏感,如400nM甲磺隆对PAO1的ALS活性的

抑制率为75.5%,而对L6、L36的ALS活性无抑制作用。与PAO1相比,L6、L36的ALS活性对PH敏感,pH为8.5时抗性菌株ALS酶活显著降低。PAO1、L6、L36的ALS对温度的敏感性无显著差异。ALS酶抑制剂Val对PAO1、L6、L36的ALS酶都有反馈抑制作用,500nM的Val对PAO1、L6、L36的抑制率分别为68.6%,45.3%,46.2%。通过PCR扩增的方法,得到了编码Pseudomonas aeruginosa乙酰乳酸合酶的两个亚基(ilvI, ilvH)的基因全序列,ilvI,ilvH基因序列全长分别为1725bp、492bp,分别编码含有575、164个氨基酸残基的多肽链。其中IlvI,IlvH亚基氨基酸序列在Pseudomonas sp.及其它许多生物中的保守性较高。通过序列比较,在IlvH亚基中未发现氨基酸突变,而在抗性菌株L36,L6的IlvI亚基中同时发现了单个氨基酸突变,高度保守的Ala29(GCC)变异为Val29(GTC)。通过功能互补实验,将含有这一突变的抗性菌株L36的ilvI基因与广宿主载体pBBR1-MCS5连接,通过三亲接合导入Pseudomonas aeruginosa的敏感菌株PAO1,结果转化子对甲磺隆产生抗性。实验结果证实了发生在ALS的IlvI亚基中的Ala29变异为Val29突变是导致Pseudomonas aeruginosa对甲磺隆产生抗药性的原因。

【英文摘要】Two metsulfuron-methyl resistant strains, L6 and L36 were isolated from metsulfuron-methyl contaminated soil. Based on the homology analysis of its 16S rDNA sequence, morphology, physiological and biochemical characteristics, the L6, L36 were identified as Pseudomonas aeruginosa . Medium effective concentration (EC50) of metsulfuron-methyl against the growth of wild-type isolate PAO1 and resistant isolates L6, L36 were 0.36,2.75, 2.89mM respectively; and the minimal inhibition concentrations (MICs) were 1.31mM, 6.03mM, 6.03mM respectively. The metsulfuron-methyl resistant strains showed no cross resistance with imazethapyr.Inhibition by metsulfuron-methyl of acetolactate synthase (ALS) activities of Pseudomonas aeruginosa wild-type isolate PAO1 and two resistant strains were assayed. The ALS activities of PAO1、L6、L36 were 391.4、122.8、120.4U respectively, the results showed ALS activities of resistant strains were significantly lower than that of PAO1. The activity of PAO1 ALS was inhibited 75.5% by 400nM SM, whereas the ALS produced by the resistant strains was not affected, which suggested that the occurrence of metsulfuron-methyl resistance were related to the decreased sensitivity of ALS to it. The ALS of L6 and L36 were not sensitive to metsulfuron-methyl. The ALS of L6 and L36 were sensitive to pH compared with that of PAO1.There was no difference among the sensitive of ALS produced by the SM sensitive or resistant strains to temperature. The ALS of PAO1, L6 and L36 were inhibited 68.6%,45.3%,46.2% by 500nM Val.The complete nucleotide sequences of two subunits (IlvI, IlvH) of acetolactate synthase (ALS) were cloned by PCR amplification. The entire nucleotide sequences of ilvI, ilvH were 1725bp, 492bp in length, which encoded two polypeptides of 575, 164 amino acid residues respectively. The IlvI and IlvH subunits were highly conserved not only in Pseudomonas sp., but also in other organisms. By sequence blasting, an amino acid mutation Ala29(GCC) →Val29(GTC)in IlvI was found in L6 and L36, which might confer resistance of Pseudomonas aeruginosa to metsulfuron-methyl. The mutant ilvI gene from a resistant strain L36, containing the Ala29(GCC) →Val29(GTC)mutation, was cloned by PCR amplification. The mutant ilvI gene was then ligated into vector pBBR1-MCS5, and shown to confer metsulfuron-methyl resistance in Pseudomonas aeruginosa when transfer into the wild-type sensitive strain PAO1. It was confirmed that the substitution of Ala to Val in the IlvI of ALS conferred metsulfuron-methyl resistance to Pseudomonas aeruginosa.

【题目】Biodegradation of synthetic pyrethroids (SPs) by Ochrobactrum tritici strain pyd-1

【中文关键词】生物降解、菊酯杀虫剂、Ochrobactrum tritici pyd-1、立体异构性、降级代谢途径
【英文关键词】Biodegradation, Synthetic pyrethroids, Ochrobactrum tritici pyd-1, Isomer selectivity, Degradation pathway

【中文摘要】从处理农药厂农药废水的活性污泥中分离筛选获得一株能够高效降解菊酯类农药的的菌株pyd-1。根据该菌的表型特征、生理生化特性,16S rDNA同源性比较,系统进化分析将其鉴定为噬甲基菌Ochrobactrum tritici。对该菌的生物学特、降解特性进行了深入研究,该菌的降解谱非常广,能降解甲氰菊酯、氯氰菊酯、氰戊菊酯等多种菊酯类杀虫剂,对该菌降解聚酯类杀虫剂的降解代谢途径进行了深入研究。

【英文摘要】A synthetic pyrethroid (SP)-degrading bacterium, designated pyd-1, was isolated from Spcontaminated soil. Based on its phenotypic and genotypic properties, the strain was identified as Ochrobactrum tritici. Strain pyd-1 was able to degrade a wide range of SPs, and its degradation efficiencies were dependent on the molecular structure of the SP. Interestingly, the strain degraded cisand trans-permethrin (cypermethrin) at nearly the same rate and possessed approximately equal hydrolysis activities toward the two

enantiomers of fenpropathrin. These results suggest that different isomers of SPs are degraded with equal efficiency by strain pyd-1. We studied the metabolic pathway of fenpropathrin degradation in strain pyd-1 by metabolite identification and enzymatic analysis. Fenpropathrin is degraded by hydrolysis of the carboxylester linkage to yield 2,2,3,3-tetramethylcyclopropanecarboxylic acid and 3-phenoxybenzaldehyde, which is converted to 3-phenoxybenzoic acid (PBA). PBA is further metabolized to 4-hydroxy-3-phenoxybenzoic acid (4-hydroxy-PBA). 4-Hydroxy-PBA is oxidized to protocatechuate and p-hydroquinone. Protocatechuate is further oxidized through an ortho-cleavage pathway, and p-hydroquinone is degraded via 1,2,4-benzenetriol.

【题目】乙羧氟草醚降解菌Pseudomonas sp. YF1的分离、鉴定及降解特性
【中文关键词】乙羧氟草醚;假单胞菌;生物降解;降解特性
【英文关键词】Fluoroglycofen-ethyl; Pseudomonas; biodegradation; degradation characteristics
【中文摘要】从生产乙羧氟草醚工厂的污水处理池污泥中分离到一株乙羧氟草醚降解细菌,命名为YF1. 根据表型特征、生理生化特性和16S rDNA序列系统发育分析,将其鉴定为假单胞菌属(Pseudomonas sp.). 接种量为5%时,菌株YF1在含200 mg/L乙羧氟草醚的基础盐液体培养基中降解乙羧氟草醚,7 d后降解率约80%. 加大接种量和外加营养碳氮源可以促进乙羧氟草醚的降解. 该菌株降解乙羧氟草醚的最适pH为7.0,最适温度为30 °C. 菌株YF1能利用苯酚、邻苯二酚、对苯二酚、苯甲酸、龙胆酸、对硝基苯酚和邻氯苯酚为底物生长,不能利用3-苯氧基苯甲酸为碳源生长,菌株YF1细胞内邻苯二酚1,2-双加氧酶受到乙羧氟草醚或其代谢产物的诱导.
【英文摘要】The use of organofl uorine compounds has been increased in recent years, and some of the compouds are now ubiquitous environmental contaminants. Although generally viewed as recalcitrant because of their lack of chemical reactivity, a lot of fl uorinated organisms are biologically active. The pesticides containing fl uorine is now the hot spot of research and development. Fluoroglycofen-ethyl is one kind of herbicides having been widely used recently. A bacterial strain designated as strain YF1, capable of degrading f luoroglycofen-ethyl efficiently, was isolated from sludge in a wastewater treatment installation that had long been used to treat fluoroglycofen-ethyl polluted water. Strain YF1 was identified preliminarily as Pseudomonas sp. based on its physiological and biochemical characters and the result of the 16S rDNA homologue sequence analysis. This bacterium could degrade 80% of 200 mg/L fluoroglycofen-ethyl in 7 d. Large initial inoculum size and additional nutrients could promote the degradation. The optimal pH and temperature for fluoroglycofen-ethyl degradation were 7.0 and 30 °C, respectively. Strain YF1 used phenol, catechol, hydroquinol, benzoic acid, gentisic acid, p-nitrophenol and o-chlorophenol, but not 3-phenoxybenzoate as sole carbon sources. Catechol 1,2-dioxygenase, but not catechol 2,3-dioxygenase and gentisic acid 1,2-dioxygenase, was induced by fl uoroglycofen-ethyl in strain YF1 cells

【题目】氟铃脲降解菌FLN-1的分离鉴定及降解特性
【中文关键词】氟铃脲;生物降解;红球菌FLN21;酶的定域
【英文关键词】hexaflumuron; biodegadation; Rhodococcus sp. FLN21; enzyme distribution
【中文摘要】从农药厂废水处理池的活性污泥中分离到1株能降解氟铃脲的菌株,命名为FLN21. 根据表型特征、生理生化特性及16S rDNA 序列同源性分析,将FLN21初步归类为红球菌属(Rhodococcus sp.) . 研究结果表明,该菌能在含氟铃脲

(50mg · L - 1)的基础盐液体培养基中降解氟铃脲,5d降解率达85% ,降解最适pH为6. 0~9. 0,最适温度为25~40℃,降解速率随初始接种量的增加而增大; 100mg · L - 1的葡萄糖、酵母膏和蛋白胨对菌株降解氟铃脲具有促进作用. 酶的定域试验表明,降解氟铃脲的酶为胞内酶.

【英文摘要】A hexaflumuron2degrading bacterium, FLN21, was isolated from activated sludge collected from the wastewater2treatment system of a pesticide factory. Based on the analysis of its 16S rDNA, morphology and physiological characteristics, strain FLN21 was identified as Rhodococcus sp. This strain could degrade 85% of 50 mg · L - 1 hexaflumuron within 5 days. The op timum pH and temperature ranges for the degradation were 6. 0~9. 0 and 25~30°C, respectively. The degradation efficiencywas positively correlated to initial inoculum size. Addition of 100 mg · L - 1 yeast extract, glucose or pep tone could enhance the hexaflumuron degradation rate. Enzyme distribution experiment results indicated that the hexaflumuron degrading enzyme of strain FLN21 was an endoenzyme.

【题目】两株抗乙酰羟酸合酶类除草剂克雷伯氏菌的分离及其AHAS基因ilvIH的克隆

【中文关键词】乙酰羟酸合酶抑制剂类除草剂;除草剂抗性细菌;乙酰羟酸合酶;ilvIH

【英文关键词】AHAS inhibitor herbicide; herbicide-resistant bacterium; acetohydroxyacid synthase; ilvIH

【中文摘要】乙酰羟酸合酶(AHAS)是磺酰脲类、咪唑啉酮类、三唑嘧啶类、磺酰胺类和嘧啶水杨酸类等乙酰羟酸合酶抑制剂类除草剂的作用靶标,获得能抗此类除草剂的AHAS突变基因资源具有非常重要的理论和应用价值. 本文从长期使用磺酰脲类除草剂的农田土壤中分离到2株抗性细菌HR9和HR11,根据其表型特征、生理生化特性和16SrDNA序列系统发育分析,初步鉴定为克雷伯氏菌(Klebsiella sp.). 菌株HR9和HR11对甲磺隆的最高耐受浓度分别达到9 600 μmol/L和8 200 μmol/L,且对各种乙酰羟酸合酶抑制剂类除草剂具有交叉抗性. 利用PCR技术从HR9、HR11和实验室保存的一株除草剂敏感型克雷伯氏菌LB-2的总DNA中克隆到编码AHAS的基因ilvIH,其中ilvI编码大亚基即催化亚基,ilvH编码小亚基即调节亚基. 比对结果表明,菌株HR11与菌株HR9的ilvI有6个位点的氨基酸存在差异,HR9、HR11与LB-2的ilvI各有20和16个位点的氨基酸存在差异.

【英文摘要】Acetohydroxyacid synthase (AHAS) is a target for sulfonylurea, imidazolinone, triazolopyrimidine and other AHAS inhibitor herbicides. Resistant mutations of this enzyme have theoretical value and potential application in plant transgenetic engineering. Two strains resistant to AHAS inhibitor herbicides, HR9 and HR11, were isolated from farmland soil that had been exposed to sulfonylurea herbicides for many years. Based on the analysis of 16S rDNA, and their morphological and physiological characteristics, these two strains were identifi ed preliminarily as Klebsiella sp. In M9 medium with 4 g/L glucose as carbon source, HR9 and HR11 could endure 9 600 μmol/L and 8 200 μmol/L metsulfuron-methyl respectively, and showed cross resistance to sulfonylurea, imidazolinone and triazolopyrimidine. The acetohydroxyacid synthase genes ilvIH were cloned from the genome DNA of the two strains and herbicides sensitive strain LB-2. The alignment result of the ilvI amino acid sequenceshowed that strains HR9 and HR11 differed from strain LB-2 by 3.5% (20 substitutions) and 2.7% (16 substitutions) respectively,while strain HR9 differed from strain HR11 by 1.0% (6 substitutions).

【题目】Molecular cloning and functional analysis of cathepsin B in nutrient metabolism
【中文关键词】无
【英文关键词】Meretrix meretrix,Larvae,Cathepsin B,Nutrient metabolism
【中文摘要】无
【英文摘要】Seed rearing is an important part in large scale clam culture industry. Since the nutritional history affects early development in bivalve, the condition of larval nutrition plays a key role in successful seed rearing. So far, the molecular mechanism of nutrient uptake in bivalve larvae is unclear. As one of the important proteolytic enzymes, cathepsin B of several organisms has been reported to be involved in digestion. We intended to analyze whether cathepsin B is involved in larval nutrient metabolism in the economic bivalve,clam Meretrix meretrix. The full length of M. meretrix cathepsin B (MmeCB) cDNA was cloned, which is 1647 bp with an open reading frame of 1014 bp. The deduced amino acid sequence encoded a preproenzyme of 337 residues with Cys-114, His-282 and Asn-302 composing cathepsin B activity center. The temporal and spatial expressions of MmeCB mRNA were examined from trochophore to post larva stages by whole mount in situ hybridization. In trochophore stage, no detectable signal was found. In the later three stages, MmeCB mRNA was detected in the digestive gland, suggesting a possible role of MmeCB in digestion. Moreover, MmeCB mRNA was also observed in the epidermal cells in D-veligers. Cathepsin B specific inhibitor (CA074 methyl ester) was applied to block the activity of cathepsin B in unfed larvae. The average shell lengths of treated larvae were smaller than that in control groups. The results of mRNA epidermal distribution and inhibitor treatment in D-veligers indicated that MmeCB may be also associated with other pathway of nutrient metabolism in larval epidermis. The overall results in this paper revealed that MmeCB might play a role in larval nutrient metabolism.

【题目】3 个杨树无性系蒸腾耗水特性研究
【中文关键词】杨树无性系;蒸腾速率;蒸腾量;环境因子
【英文关键词】poplar tree clone; transpiration rate; transpiration quantity; environmental factors
【中文摘要】采用Li-6400光合系统测定仪分别于5 月、7 月、8 月、10月对南林895、I-69 、皖林 1 号3 个杨树无性系蒸腾特性进行了测定。结果表明,3 个供试杨树无性系蒸腾速率日变化和日均值的年变化均趋势大致相同,5月和10月为单峰型,7月和8 月为双峰型,各个杨树无性系蒸腾速率均于7 月达到一年中的最高值,5 月为最低值。各月蒸腾速率日均值分别为I-69(1.87 、7.61 、2.52 和3.34 mmol · m-2 · s-1> 南林895(1.71 、5.57 、1.79 和2.71 mmol · m-2 · s-1>皖林1 号(1.13、3.55 、1.4和1.96 mmol · m-2 · s-1。相关系数及直接通径系数表明,环境因子对蒸腾速率均具有不同程度的影响,除 10月的南林895和I-69 为Gs>Ta>RH>PAR 外,其余均为 Ta>RH>Gs>PAR。3 个无性系标准木单株日蒸腾量分别是南林895 为42 020.84 g ,I-69 为61 866.03 g ,皖林1 号为23 346.43 g 。
【英文摘要】The characteristics of transpiration of 3 popl ar clones which are NL 895, I-69 and WL1 were measured by LI-6400 portable photosynthesis system in May, July, August and October. The result indicated that the daily variation and annual variation of daily aver age transpiration rates of the 3 tested poplar tree clones were approximately the same, displaying single peak in May and October, and double-peak in July and August. The maximum and minimum values of their transpiration rates appeared in July and May. The monthly order of the daily average transpiration rates in each month were as follows: I-69 (1.87, 7.61, 2.52 and 3.34 mmol · m-2 · s-1> NL895 (1.71, 5.57, 1.79 and 2.71 mmol · m-2 · s-1> WL1(1.13, 3.55, 1.4 and 1.96 mmol · m-2 · s-1. Correlation coefficient and direct path coefficient showed that all clones ’ transpiration rates had different degree correlation with environmental factors. The factors which affect transpiration rates are of the following order: Ta (air temperature) >RH(relative humidity) >Gs (stomatal conductance) >PAR(photosynthetic active radiation), in exception to NL895 and I-69 varieties in October, which is in the order of Gs>Ta>RH>PAR . The daily total transpiration quantities for single plant of three clone standard woods were listed as: NL 895,42 020.84g; I-69 , 61 866.03 g; WL1 , 23 346.43 g.

【题目】Isolation of a Methylobacillu s sp. that degrades microcystin toxins associated with cyanobacteria
【中文关键词】微囊藻毒素降解;菌株J10;细胞壁;氧
【英文关键词】microcystin degradation; strain J10; cell wall; oxygen
【中文摘要】用微囊藻毒素提取物对无锡太湖梅梁湾打捞的蓝藻淤泥中的微生物进行驯化培养。从中分离到能够降解MC-RR和MC-LR的菌株J10,鉴定为 Methylobacillus sp.。进一步研究表明接种 17小时后,菌株J10能够将添加到培养基中的MC-LR 和MC-RR完全降解,并且降解过程可能需要氧的参与。在菌株 J10细胞的不同组分中,我们发现了与MC降解活力相关的多种不同的酶,这些酶有依赖氧和不依赖氧的。然而,主要负责降解MC的酶是依赖氧的,并且很可能位于细胞壁或细胞膜外。
【英文摘要】Sludge from cyanobacteria-salvaged yard in Meiliang Bay, Lake Taihu in Wuxi, China was cultured and acclimated by inoculating microcystins (MCs) extract. Strain J10 was isolated by degrading the MC-RR and MC-LR and was identified as Methylobacillussp. Further research showed that both MC-LR and MC-RR could be completely degraded at 17 h after inoculation of J10, and the degradation probably was mediated by oxygen. Different enzymes, oxygen-dependent as well as oxygen-independent, with MC-degrading activity were found in the different fractions of J10 culture. However, the enzymes mainly responsible for MC degradation by J10 were oxygen-dependent and were probably bound to cell wall or outside the cytoplasmic membrane.

【题目】乙酰羟酸合成酶同工酶基因ilvBN、ilvGM 和ilvIH 的表达及对除草剂抗性的比较
【中文关键词】AHAS 抑制剂类除草剂, 乙酰羟酸合酶同工酶, ilvBN, ilvGM, ilvIH, 除草剂抗性
【英文关键词】AHAS-inhibitor herbicides, AHAS isozymes, ilvBN, ilvGM, ilvIH, herbicides-resistance
【中文摘要】乙酰羟酸合成酶(AHAS)是磺酰脲类和咪唑啉酮类等AHAS 抑制剂类除草剂的作用靶标。获得抗此类除草剂的AHAS 突变基因资源具有非常重要的理论和应用价值。本研究从抗甲磺隆菌株Klebsiella sp. HR11 和甲磺隆敏感菌株Klebsiella pneumoniae MGH 78578 中分别克隆到AHAS 三种同工酶基因ilvBN、ilvGM 和ilvIH。抗性菌株和敏感菌株AHAS 三种同工酶基因在氨基酸水平上差异位点主要集中在ilvBN 和ilvGM 的大亚基上。将2 株菌的ilvBN、ilvGM 和ilvIH 分别构建到表达载体pET29a(+)中, 在Escherichia coli BL21(DE3)中进行表达, 测得只有含菌株HR11 ilvBN 和ilvGM 的转化子细胞破碎液AHAS 对各类AHAS 抑制剂类除草剂具有较强的抗性, 而含菌株HR11 ilvIH 和菌株MGH78578 ilvBN、ilvGM 和ilvIH 的转化子细胞破碎液AHAS 对各类AHAS 抑制剂类除草剂敏感。
【英文摘要】Acetohydroxyacid synthase (AHAS) catalyses the first reaction in the pathway for synthesis of the branched-chain amino acids. AHAS is the target for sulfonylurea, imidazolinone and other AHAS-inhibitor herbicides. Herbicides-resistant AHAS genes have potential application in plant transgenetic engineering and development of new generation herbicide. The AHAS isozyme genes ilvBN, ilvGM and ilvIH were cloned from metsulfuron-methyl resistant strain Klebsiella sp. HR11 and metsulfuron-methyl sensitive strain Klebsiella pneumoniae MGH 78578. Homologous sequences comparison indicated that the differences in AHAS isozyme genes at amino acid levels between strain HR11 and strain MGH 78578 were mainly on the large subunits of ilvBN and ilvGM. The three AHAS isozyme genes from HR11 and MGH 78578 were ligated into the expression vector pET29a(+) and expressed in Escherichia coli BL21, respectively. The results of enzyme inhibition assay showed that only ilvBN and ilvGM from strain HR11 showed strong resistance to AHAS-inhibitor herbicides, while ilvIH from strain HR11 and ilvBN, ilvGM and ilvIH from strain MGH78578 were sensitive to AHAS-inhibitor herbicides.

【题目】3-苯氧基苯甲酸降解菌BA3的降解特性及基因工程菌的构建
【中文关键词】3-苯氧基苯甲酸;生物降解;鞘脂菌;菊酯水解酶基因;基因工程菌
【英文关键词】3-phenoxybenzoic Acid ; biodegradation; Sphingobium sp.; pyrethroid hydrolase gene (pytH); genetically engineered microorganism
【中文摘要】从石油污染土壤中分离到1株能以3-苯氧基苯甲酸(3-PBA)为唯一碳源的细菌BA3。根据其生理生化特征和16S rDNA序列相似性分析,将该菌鉴定为鞘脂菌属(Sphingobium sp.)。该菌株在60h内对100mg L-13-苯氧基苯甲酸降解率达到99%。降解3-苯氧基苯甲酸的最适温度为30℃,pH值为7.0,降解速率与初始接种量呈正相关。拟除虫菊酯类杀虫剂pytH水解酶基因为研究发现的一个新的菊酯水解酶基因, 通过PCR 从菊酯降解菌株JZ-2 总DNA 扩增了pytH,将pytH 定向克隆到pBBRMCS-5 载体上,构建重组质粒pPYTH,在辅助质粒pRK600的帮助下,通过三亲接合将pPYTH转移到3-PBA降解菌株Sphingobium sp.BA3 中,获得的工程菌Sphingobium sp.BA3-pytH可以快速降解菊酯类杀虫剂及其中间产物3-PBA;BA3-pytH对菊酯的降解效率较出发菌株JZ-2高。该基因工程菌应比野生菌株JZ-2在菊酯污染环境的生物修中具有优势。
【英文摘要】A bacterium capable of utilizing 3-phenoxybenzoic Acid as sole carbon source was isolated from petroleum-contaminated soil. This bacterium, designated as BA3, was identified as Sphingobium sp. according to its physiological & biochemical characteristic and the similarity analysis of its 16S rDNA sequence. Strain BA3 was able to degrade 99% of 100mg L-1 3-phenoxybenzoic Acid in 60h. The optimal pH and temperature for the degradation were 7.0 and 30 °C, respectively. The degradation efficiency was related positively to initial inoculum size.The pyrethroid hydrolase gene e (pytH) gene was cloned by the method of shotgun cloning , and the sequences were determined and analyzed. PytH gene was amplified from the genomic DNA of Sphingobium sp. JZ-2 by PCR. Recombinant plasmids pPYTH was constructed by ligating pytH gene into broad host vector pBBRMCS-5.With the help of plasmid RK600 , pPYTH was transferred into Sphingobium sp. BA3 to constructBA3-pytH. BA3-pytH can degrade The selected genetically engineered microorganisms(GEM) can degrade Permethrin and 3-PBA simultaneously. BA3-pytH.showed higher degrading ability than the original strain JZ-2. All these results indicate that BA3-pytH. was a promising GEM in bioremediation of pyrethroid contaminated environment.

【题目】Lysis of Microcystis aeruginosa with Extracts from Chinese Medicinal Herbs
【中文关键词】中草药;铜绿微囊藻;蓝藻细菌;裂解
【英文关键词】Chinese medicinal herbs; Microcystis aeruginosa; cyanobacteria; lysis
【中文摘要】通过SAO(琼脂糖覆盖)方法,对66个中草药沸水提取物的杀藻(绿铜微囊藻)活性进行了筛选。结果表明16种材料的提取物可以抑制该细菌生长。在这些具有杀藻活性的样品中,8个样品显示出了极低的最小抑制浓度(MIC),其中4个的MIC值在1-6mg/mL间,4个的MIC 值小于1 mg/mL ,这个浓度(小于1 mg/mL)恰好被认为可以在蓝藻的繁盛出现以前抑制蓝藻的爆发。进一步的研究表明MIC值小于1mg/mL的3个样品,在其MIC浓度处理蓝藻,7天后诱导了叶绿素的降解。这些结果表明杀藻物质具有高效的抑制蓝藻活性。最终结果表明由于这三个提取物(Malaphis chinensis、Cynips gallaetinctoriae、Fructus mume)具有显著杀藻活性,有可能将其开发成为杀藻剂。

【英文摘要】1. Boiling water extracts of 66 selected Chinese medicinal herbs were screened for their anticyanobaterial activity against Microcystis aeruginosa by the soft-agar overlayer (SAO) method. Results indicated that extracts from 16 materials could inhibit the growth of this bacterial species. Among these anticyanobacterial samples, eight extracts showed low minimum inhibitory concentrations (MIC), including four extracts with MICs between 1 and 6 mg/mL, and four extracts with MICs < 1 mg/mL which could be considered useful to prevent the outbreak of cyanobacteria before the appearance of cyanobacterial blooms. Further study showed that three extracts with MIC values < 1 mg/mL induced intensive chlorophyll-a lysis within 7 days at the MIC. The results suggested that highly efficient anticyanobacterial compounds must be involved in the inhibitory activities. The final results indicated these three extracts (from Malaphis chinensis, Cynips gallaetinctoriae and Fructus mume) had the potential to be developed as algicides due to their remarkably anticyanobacterial activities.

【题目】Cloning, characterization and expression of ferritin subunit from clam Meretrix meretrix in different larval stages
【中文关键词】无
【英文关键词】Ferritin subunit,Larval shell,Meretrix meretrix,Bivalve,Iron
【中文摘要】无
【英文摘要】Shell formation is one of the important events during larval development and metamorphosis in bivalves. However, the molecular mechanisms and environmental cues regulating shell initiation and growth are unclear. Here, we report that ferritin, a principal protein for biological iron storage and metabolism, might play a role in larval shell development of the bivalve mollusk Meretrix meretrix. A full-length ferritin subunit cDNA, named as MmeFer, was cloned and characterized. The MmeFer mRNA expression in different developmental stages, from trochophore to post larvae, was analyzed by real-time reverse transcription polymerase chain reaction (RT-PCR). MmeFer mRNA expression in larvae of later developmental stages increased at least 8-fold following trochophores. Moreover, the temporal and spatial expressions of MmeFer mRNA were examined by whole mount in situ hybridization. In the trochophore stage, MmeFer was detectable where it was supposed to be for shell initiation. In the later developmental stages, MmeFer was found near digestive glands and mantle that secret larval shell. MmeFer expression was also detected in larvae cultured in artificial seawater with different iron concentrations ranging from 0 to 100 μM. These results suggest that ferritin may play a role in the shell formation of mollusks.

【题目】Sphingobium sp. JZ-1对菊酯类农药的降解特性研究
【中文关键词】菊酯类农药;生物降解;鞘氨醇杆菌属;手性选择
【英文关键词】pyrethroid ; biodegradadtion; Sphingobium; isomer selectivity
【中文摘要】研究了菊酯降解菌株Sphingobium sp. JZ-1及其粗酶液对菊酯类农药的降解特性。结果表明该菌能降解目前使用的各种菊酯类农药,降解速率顺序为:氯菊酯>甲氰菊酯≈氯氰菊酯>功夫菊酯>氰戊菊酯>溴氰菊酯>联苯菊酯;Sphingobium sp. JZ-1对菊酯的降解没有手性选择性;高效液相色谱检测结果表明Sphingobium sp. JZ-1对氯氰菊酯降解的初始反应是在菊酯水解酶的催化下羧酸酯键断裂生成二氯菊酸和3-苯氧基苯甲醛,3-苯氧基苯甲醛进一步氧化成苯氧基苯甲酸。Sphingobium sp. JZ-1细胞中菊酯水解酶酶活不需要菊酯的诱导。

【英文摘要】The degradation characteristics of the pyrethriod degradation strain Sphingobium sp. JZ-1 and its crude enzyme were investigated in this experiment. The strain was capable of degrading a wide range of pyrethroid pesticides, with the degradation rates descending as follows: permethrin > fenpropathrin ≈ cypermethrin > cyhalothrin > fenvalerate > deltamethrin > bifenthrin. No isomer selectivity was observed to the biodegradation of pyrethroid isomers. In Sphingobium sp. JZ-1, cypermethrin was hydrolyzed by breaking the ester linkage to yield equimolar amounts of dichloroving acid (DCVA) and 3-phenoxybenzaldehyde, which was then oxidized to 3-phenoxybenzoic acid. The pyrethroid hydrolase in Sphingobium sp. JZ-1 was constracted expressed without pyrethroid induction.

【题目】菊酯类杀虫剂降解菌JZL-3 (Arthrobacter sp.)的分离鉴定与降解特性研究
【中文关键词】环境生物学;菊酯类杀虫剂;生物降解;节杆菌属;立体异构选择性
【英文关键词】environmental biology; pyrethroid; biodegradation; Achromobacter sp.; cis-trans isomer selectivity
【中文摘要】自农药厂废水中分离到一株广谱菊酯类杀虫剂降解菌JZL-3,经过形态、生理生化实验及16S rDNA 序列分析,鉴定其属于节杆菌属(Arthrobacter sp.)。该菌能降解目前市场上使用的七种主要菊酯类杀虫剂,降解速率由高到低为:氯菊酯、甲氰菊酯、氯氰菊酯、氰戊菊酯、联苯菊酯、功夫菊酯、溴氰菊酯。对氯氰菊酯的最适降解温度、pH为30 °C、7.0,初始接种量在一定范围内(1 %-5 %)与降解率呈正相关。菌株JZL-3对氯菊酯和氯氰菊酯顺反异构体的降解没有显著的差异,本实验结果不同已有的关于菊酯类杀虫剂生物降解具有显著立体异构选择性的结论。

【英文摘要】The degradation characterizatics of pyrethroid pesticides-degrading bacterium JZL-3, which was isolated from activated sludge collected from wastewater-treating system of a pesticide manufacturer, was studied. The strain was identified as Arthrobacter sp. according to its physiological & biochemical characteristic and the similarity analysis of its 16S rDNA sequence and was able to degrade about 90% cypermethrin (100mg/L) in 72 hours. Strain JZL-3 was capable of degrading a wide range of pyrethroid pesticides, including fenpropathrin, permethrin, cypermethrin, fenvalerate, deltamelthrin, cyhalothrin and bifenthrin. Fenpropathrin was the most preferred substrate, permethrin, cypermethrin and fenvalerate were degraded slower than fenpropathrin, while much faster than bifenthrin, cyhalothrin and deltamethrin. Bifenthrin was the most persistent. These results indicated that substitutions of methyl with α -cyano group, dichloroethylene or chloridben had little influence on the degradation efficiencies, while the substitutions of chloroyl with bromovinyl, fluoro, on the chrysanthemic acid and the replacement of the 3-phenoxybenzyl with a biphenyl significantly reduced the degradation efficiencies. The optimal temperature and pH for the degradation was 30 °C and 7.0, respectively. The degradation efficiency was related positively to initial inoculum size (1%-5%). When the initial inoculum size was more than 7%, the degradation efficiency was not been effected. The strain could degrade cypermethrin rapidly when initial concentration was 20-50mg/L, while the degradation rate was significantly reduced when initial concentration was more than 100mg/L. No cis-trans isomer selectivity was observed to the biodegradation of permethrin and cypermethrin; this feature is different from reported results. The results of degradation characterizatics to pyrethroid pesticides indicated that strain JZL-3 has potential use for bioremediation of pyrethroid-contaminated soils and waters.

【题目】Inhibition of fengycins on the production of fumonisin B1 from Fusarium verticillioides
【中文关键词】fengycins; FUM1; FUM8; 伏马菌素B1; 串珠镰刀菌; 抑制
【英文关键词】fengycins; FUM1; FUM8; fumonisin B1; Fusarium verticillioides; inhibition
【中文摘要】目标:明确fengycins对串珠镰刀菌产生伏马菌素(FB1)的调控作用。方法和结果:为了确定fengycins处理后伏马菌素(FB1)的产生量,我们测定了FBI和菌丝体的质量比。结果表明,每单位重量的菌丝体产生的FB1比对照组(未经fengycins处理)下降了28%。fengycins悬浮液处理菌丝体的结果也表明, fengycins能显著影响伏马菌素(FB1)的产生。使用RT-PCR进行基因表达分析,显示fengycins处理后FUM1 和FUM8(编码FB1基因的酶)的转录本下调了。结论: fengycins可以下调与FB1产量相关的某些关键基因的表达,进而影响串珠镰刀菌体内FB1的合成。本研究的意义和影响:本研究有助于加深我们采用fengycins控制农作物和食品中FB1污染的认识。
【英文摘要】1. Aim: To understand the role of fengycins in regulating the fumonisin B1 (FB1) production of Fusarium verticillioides.Methods and Results: The mass ratio of FB1 to mycelia was determined in order to identify the effect of fengycins on FB1 production. It was shown that the amount of FB1 produced by unit mass mycelia decreased to 28% of the control. Results from mycelia resuspension with fengycins also demonstrated that fengycins had a potent impact on FB1 production. Gene expression patterns using quantitative reverse-transcription PCR (RT-PCR) revealed that the transcriptional levels of both FUM1 and FUM8 (coding enzymes for the gener-ation of FB1) were down-regulated with fengycin treatment.Conclusions: Fengycins could down-regulate the transcription of some key genes involved in the production of FB1, and impair FB1 synthesis by F. verti-cillioides.Significance and Impact of the Study: These results further improved our understanding of fengycins as the potential candidates to control FB1 contamination in crops and food.

【题目】Polymorphic microsatellite loci for population studies of the razor clam, Sinonovacula constricta
【中文关键词】无
【英文关键词】Sinonovacula constricta, Genetic diversity, Microsatellite
【中文摘要】无

【英文摘要】"The razor clam (Sinonovacula constricta) is an important aquacultured bivalve in China. The natural populations of this species are decreasing quickly. To facilitate studies on genetic diversity and population structure of wild populations, microsatellites were isolated from a CA enriched genomic library. Eight microsatellite loci were polymorphic in 30 individuals from Chongming in Shanghai, China. The number of alleles per polymorphiclocus varied from 6 to 13 and the values of observed heterozygosity and expected heterozygosity ranged from 0.350 to 1.000 and from 0.602 to 0.902, respectively. These microsatellites are being used in studying population differentiation and genetic diversity for effective conservation and management genetic resources of S. constricta."

【题目】蓝藻发酵沼液对青菜生物学特性和品质影响初探
【中文关键词】蓝藻;沼液;青菜;产量;品质
【英文关键词】Blue-green algae; Biogas slurry; Chinese cabbage; Yield; Quality
【中文摘要】以青菜为材料,研究了蓝藻沼液不同施用量和化肥组对青菜生物量、品质的影响以及MC-LR在青菜体内积累状况。结果表明,沼液的使用可有效增加青菜的生物量和株高,其中以中量沼液处理效果最好,与化肥组的没有显著差异;同样沼液的使用可以显著改善青菜的品质,使可溶性糖和维生素C含量增加,亚硝酸盐含量降低,其中以中量沼液处理最为明显,而化肥组虽然生物量最高,但是品质相对较差;单位鲜重青菜体内MC-LR含量和生物富集系数在低量沼液处理下,没有检测到,随着沼液处理量的增加,单位鲜重青菜体内MC-LR含量和生物富集系数增加。说明沼液中的MC-LR可被作物吸收并进行积累,对人类的健康存在潜在的威胁。
【英文摘要】The Chinese cabbage seedlings were treated with various concentrations of biogas slurry fermented by blue-green algae. The effects of biogas slurry on the biomass, quality and situation of MC-LR accumulation in Chinese cabbage were studied in this paper. The results showed that the biomass and plant height were significantly increased by the utiliztion of biogas slurry. Especially, medium amount of biogas slurry revealed the best effect, whereas it did not show marked difference as compared with the chemical fertilizer. At the same time, the quality of Chinese cabbage was improved remarkably by the biogas slurry, the application of biogas slurry (especially meduim amount of biogas slurry) made the soluble sugar and vitamin C content increase, and made the nitrite reduce. Although the biomass was the highest in the treatment of chemical fertilizer, the quality of Chinese cabbage was lower. The MC-LR content in Chinese cabbage and bio-concentration factor (BCF) were not found in the treatment of low amount of biogas slurry. However, the MC-LR content in Chinese cabbage and BCF increased along with the increase of application rate of biogas slurry. The results showed that MC-LR in the biogas slurry could be absorbed and accumulated by the plant, which was a potential risk for people's health.

【题目】Bacillus subtilis fmbR抗菌物质的分离和纯化
【中文关键词】枯草芽孢杆菌(Bacillus subtilis fmbR); 抗菌物质; 分离; 鉴定;
【英文关键词】Bacillus subtilis fmbR; Antimicrobial substance; Isolation; Identification;
【中文摘要】【目的】对Bacillus subtilis fmbR产生的抗菌物质进行分离和鉴定研究,以确定抗菌物质的组成和结构。【方法】采用HPLC和TLC层析对Bacillus subtilis fmbR抗菌物质进行分离纯化,通过ESI-MS和MALDI-MS分析对抗菌物质的组成和结构进行初步鉴定。【结果】HPLC层析表明了Bacillus subtilis fmbR抗菌物质含有保留时间与surfactin相似的成分。

TLC层析和原位酸解证明了Bacillus subtilis fmbR抗菌物质含有闭合肽键类的物质,其中之一为相对迁移率Rf与标样surfactin相近的组分。采用ESI-MS分析检测到Bacillus subtilis fmbR抗菌物质含有分子量与surfactinA相同的m/z1009.1、m/z1023.2和m/z1037.0等3种同系物;通过MALDI-MS分析获得[M+H]+为m/z 3403.95抗菌物质,该物质分子量与Bacillus subtilis 168产生的细菌素subtilosin的m/z3403.3相同。【结论】Bacillus subtilis fmbR抗菌物质由C13~C15的3种surfactinA同系物和一种羊毛硫抗生素subtilosin组成。

【题目】抗微生物脂肽体外抗PRV和PPV的研究
【中文关键词】抗微生物脂肽;PRV;PPV;抗病毒作用;
【英文关键词】Antimicrobial lipopeptide;Pseudorabi es virus;Porcine parvovirus;Antiviral effect;
【中文摘要】本试验研究了枯草芽孢杆菌fmbJ株产生的抗微生物脂肽(Antimicrobiallipopeptide,AMI)的体外抗伪狂犬病病毒(Pseudorabiesvirus,PRV)、猪细小病毒(Porcineparvovirus,PPV)南京株活性并对其可能的机理进行了初步探讨。结果表明该抗微生物脂肽对猪肾(PorcineKidney,PK-15)细胞的半数中毒浓度(MedianToxicosisDose,TD50)和最大无毒浓度(TD0)分别为47.57mg/L、18.9mg/L;对PRV株、PPV南京株所致细胞病变效应(CytopathicEffects,CPE)有明显的抑制作用,可使细胞存活率显著升高;但不能抑制PRV株、PPV南京株在PK-15细胞上的感染和复制。由此可知,该抗微生物脂肽可以直接作用于PRV株、PPV南京株,从而抑制其对PK-15细胞的感染作用,其作用效果显著低于抗病毒药物阿昔洛韦(Acyclovir,ACV),但由于其对PK-15细胞毒性较弱,可作为一种抗病毒药物进行进一步开发研究。

【题目】Identification of Immune Genes of the Agamaki Clam (Sinonovacula constricta) by Sequencing and Bioinformatic Analysis of ESTs
【中文关键词】无
【英文关键词】Sinonovacula constricta,cDNA library,Expressed sequence tags (ESTs),Immune gene
【中文摘要】无
【英文摘要】The Agamaki clam (Sinonovacula constricta) is an economically important shellfish in Asia. However, genomic research on this species is still in its infancy, and genomic resources are largely unavailable. The objective of this study was to generate expressed sequence tags (ESTs) from a normalized liver complementary DNA library and to identify genes that function in immune defense. A total of 5,296 ESTs were sequenced, from which 540 contigs and 3,473 singletons were identified. BLAST homology analysis

indicated that only 20.7% of these ESTs were homologues of known genes while the remaining 79.3% appeared to be novel sequences. Based on sequence similarities, 43 putative immune genes were identified that encode proteases and protease inhibitors, adhesive proteins,stress proteins, lysosomal enzymes, and signal transduction regulators. Our study thus provides both a large collection of novel transcripts and a detailed annotation of immune genes for an important bivalve species.

【题目】Identification and characterization of the pathogenic effect of a Vibrio parahaemolyticus-related bacterium isolated from clam Meretrix meretrix with mass mortality
【中文关键词】无
【英文关键词】Vibrio parahaemolyticus,Meretrix meretrix,Pathogen,TEM
【中文摘要】无
【英文摘要】A mass mortality of clam, Meretrix meretrix, occurred in Jiangsu Province of China in the late September of 2007. Of the isolates obtained from the diseased clams, MM21 had the strongest virulence to the clam in the virulence test, with a LD50 value of 6 106 CFU ml 1. MM21 was identified as Vibrio parahaemolyticus by the VITEK 2 Compact system and 16S rDNA sequencing. Detection of virulence-associated genes by PCR indicated that MM21 was positive for toxR and tlh, and negative for tdh. Compared with control group, histiocytes from MM21-infected clams displayed a variety of cytopathological changes by transmission electron microscopy examination, which included increased lipid droplets in hepatocytes, deposition of granules in the mantle, excessive secretion in the gill. The results of our study suggested that MM21 may have been an etiological element in the mass mortalities of hard clam (M. meretrix) in Jiangsu Province of China in 2007.

【中文摘要】从连云港海域潮间带采集的样品中筛选得到1株产广谱、高活性抗菌物质的放线菌GB-2。该菌对藤黄微球菌、蜡样芽孢杆菌、金黄色葡萄球菌等5种革兰氏阳性菌,大肠杆菌、荧光假单胞菌等4种革兰氏阴性菌及扩展青霉、黄曲霉、点青霉、犁头霉、番茄灰霉、小麦赤霉病菌、香蕉炭疽病菌、棉花枯萎病菌、稻瘟病菌等18种真菌有显著拮抗作用。根据其形态特征、培养特征、生理生化特性和16S rRNA序列分析结果,确定其为弗氏链霉菌变种。菌株GB-2所产抗菌物质的稳定性研究表明,该物质在121℃pH 1和pH 12条件下抑菌活性均不变;紫外线照射不影响其抗菌活性。结果揭示该菌在生防、食品及医药方面有潜在的应用价值。

【题目】Generation, annotation, and analysis of ESTs from hemocyte of the bloody clam, Tegillarca granosa
【中文关键词】无
【英文关键词】Tegillarca granosa,Bloody clam,Hemocyte,cDNA library,Expressed sequence tags,Immune response
【中文摘要】无
【英文摘要】Tegillarca granosa, bloody clam are valuable resource and extensive culture bivalve in China. In contrast to other cultured mollusca, very few genomic resources are available in this species. In an effort to identify clam genes involved in immunity, growth and hemoglobins, a normalized full-length cDNA library were constructed from hemocytes of the bloody clam. 2278 ESTs from 50 ends of the cDNA clones representing 1501 unigenes with an average length of 459 bp were obtained from library. Cluster analysis of these ESTs identified 1501 unique sequences containing 173 contigs and 1328 singletons. Among the sequences that matched known genes, based on comparisons with the NCBI non-redundant database, the unigene were clustered into six categories, 142 (29.0%) were related to metabolism, 128 (26.3%) were related to cell structure/motility, 94 (19.2%) were related to gene/protein expression, 61 (12.5%) were related to cell signaling/communication, 50 (10.2%) were related to cell/organism immune, and 14 (2.8%) were related to cell division. All contigs and singlets were compared to the public protein database using BLASTx, and annotations and descriptions of interested genes related to immunity, growth or hemoglobin. These genome resources provide a significant number of ESTs for gene discovery and development of microarrays for gene expression.

【题目】密度、氮肥基追比例对不同穗型小麦产量的影响
【中文关键词】小麦; 密度; 氮肥基追比例;多穗型;大穗型;产量
【英文关键词】Wheat; density; proportion of nitrogen Dressing; multi-spike type; Big Ear; yild
【中文摘要】以烟农19和兰考矮早8为材料,研究密度和氮肥基追比例对多穗型和大穗型小麦品种产量及其构成因素的影响。结果表明,播种密度提高有利于不同穗型小麦品种单位面积穗数的增加,而穗粒数与千粒重随播种密度的加大而减小

。氮肥基追比例增加与不同穗型小麦品种的千粒重间均呈正相关,而与不同穗型小麦品种的穗粒数间呈负相关,氮肥基追比例增加对不同穗型小麦品种单位面积穗数影响未达显著差异水平。烟农19以中密度、氮 肥基追比例5:5处理产量最高,兰考矮早8以高密度、氮肥基追比例7:3处理产量最高 根据密度、氮肥基追比例组合与产量结果建立二元回归模型,烟农19的氮肥基追比例5:5最佳,优化密度为328.4×104hm-2 基本苗,其优化产量可达8 725.3 kg.hm-2,兰考矮早8的氮肥基追比例7:3最佳,优化密度为421.2×104hm-2。基本苗,其优化产量可达7 441.1kg.hm-2。

【题目】芽胞杆菌发酵液中抗菌脂肽的定量检测方法及应用
【中文关键词】抗菌脂肽;表面活性素;芬荠素;效价;
【英文关键词】antimicrobial lipopeptides;surfactin;fengycin;titer;
【中文摘要】抗菌肽(Antimicrobial Peptides)是生物体内经诱导产生的生物界中广泛存在的一类生物活性小肽,是两性分子,常带正电荷。根据来源不同,可分为动物体来源、植物体来源和微生物来源。抗菌脂肽是芽孢杆菌属产生的微生物来源的抗菌肽,具有抗细菌、真菌、病毒和支原体的功能,在抗菌的同时又不破坏动物体内的正常细胞,对人体安全,在生物医药方面具有重要的应用价值。此外,脂肽作为一种生物表面活性剂在石油工业、食品、化妆品和农业上有着广泛的应用价值。本文着重研究了抗菌脂肽的高效液相色谱定量检测方法,为抗菌脂肽的应用奠定基础。本研究包括以下四方面内容:1.用管碟法建立了青霉素效价的标准曲线Y=0.0057x+2.6048,相关系数达到0.9955。重复3次制作标准曲线,曲线间的相对标准偏差小于4%。以此标准曲线测定得1g抗菌脂肽粗样效价达到0.93×106IU。2.建立了一种以高效液相色谱测定发酵液中表面活性素(surfactin)含量的新方法。采用COSMOSIL 5C18-AR-Ⅱ(4.6×250mm)色谱柱,以乙腈(含0.1%三氟乙酸)和水(含0.1%三氟乙酸)为流动相,流速0.84mL/min梯度洗脱,210nm紫外检测,在20min内检测到surfactin。结果表明,运用本方法在1~100mg/L范围内surfactin浓度与积分面积之间具有良好的相关性(r=0.9998),精密度为1.5%,检出限为1mg/L,回收率达到96.59%。3.自制了芬荠素(fengycin)相对纯品,并且建立了一种以高效液相色谱测定发酵液中fengycin含量的新方法。采用COSMOSIL 5C18-Ms-Ⅱ(4.6×250mm)色谱柱,以乙腈(含0.1%三氟乙酸)和水(含0.1%三氟乙酸)为流动相,流速0.8mL/min梯度洗脱,230nm紫外检测,在30min内检测到fengycin。结果表明,运用本方法在5~300mg/L范围内fengycin浓度与积分面积之间具良好的相关性(r=0.9921),精密度为2.74%,检出限2 mg/L。4.对抗菌脂肽的效价及应用作了研究。用双层琼脂法计算得1g抗菌脂肽粗样的效价达到1.1×106IU;以抗菌脂肽粗样配合山梨酸钾和乙二胺四乙酸二钠(EDTA)对常温下酸奶的保鲜作用做了研究,结果表明,25℃条件下,以抗菌脂肽0.5g/kg、山梨酸钾0.2g/kg、EDTA0.13g/kg配比时能显著抑制酸奶中微生物的繁殖,使酸奶在常温下的保质期达到10d以上。

【题目】金属粒子掺杂的多壁碳纳米管气敏性研究
【中文关键词】多壁碳纳米管; 掺杂; 气敏传感器
【英文关键词】mult-i w alled carbon nanotubes; doping; gas senso r
【中文摘要】碳纳米管作为一种新材料自1991 年被发现以来 , 其物理化学性质和应用得到了广泛的研究, 丰富的孔隙结构、大的比表面积和很高的表面能使其成为有前景的气敏材料. 碳纳米管对无机气体敏感性的研究报道很多, 如单壁碳纳米管(sing le-w alledcar bon nanotubes, SWCNTs) 对O2、NO2、NH3 的气敏性, 以及多壁碳纳米管(mult-i w alled carbon nano tubes, MWCN Ts) 对NO2、H2、NH3 的气敏性. 碳纳米管在挥发性有机化合物(volatile org anic compounds, VOCs) 检测中的应用也有报道. Penza 等人利用碳纳米管作为气敏材料, 采用声表面波(surface aco ust ic w ave, SAW) 、石英微天平(quart z crystal micr obalance, QCM) 和特制光纤(specialty opt ical f iber, SOF) 等原理制作气敏传感器, 对VOCs 的检测具有很好的效果. 基于SAW、QCM、S OF 等原理的碳纳米管传感器对制作和测试工艺要求较高, 在实际使用时具有一定的局限性. 此外, 对于其他许多气体而言, 碳纳米管的敏感度仍显较差 , 需要通过物理或者化学的手段进行改性以提高碳管与待测气体间的相互作用.
【英文摘要】Pd and Cu part icles w ere doped into the mult-i walled carbo n nanotubes (MWCN Ts) preprocessedusing a mixture of H2SO4 and HN O3 by means o f chemical react ion method and elect rochemist rymethod r espect ively. Amperomet ric sensors w ere fabricated using the original and doped MWCNTs. Theresponses to formaldehyde, benzene, toluene and x ylene w ith dif ferent vo lume fractions w er e tested usingan elect rochemical analy zer . Hig h sensitiv ity and reproducibility of these senso rs indicate the feasibleVOCs detect ion at ro om temperature. Metal part icles doping result s in gr eat chang e of sensit ivity and selectivity.T he main impact s on the g as sensing pro perty include: the str uctural defects of MWCN Ts, theinteract ion of g as molecules and metal clusters, and the cataly tic act ive site formed by metal par ticles.

【题目】A Carbon Nanotube Gas Sensor Fabricated by Dielectrophoresis and Its Application for NH3 Detection
【中文关键词】none
【英文关键词】none
【中文摘要】Multi-walled carbon nanotubes(MWNTs) were successfully manipulated by dielectrophoresis (DEP) to form electrical connection netween interdigitated gold electrodes (IDEs) and were demonstrated to serv as gas sensor for NH3 detection. The MWNTs were suspended in ethanol and depasited on the IDEs. The electrical conductivity of the DEP-fabricated MWNTs sensor decreased when exposed to NH3 at room temperature. There is a good linear correlation between the decreasing amplitude of

conductance and the NH3 concentration, and the detection limit of 10ppm NH3 could be achieved.
【英文摘要】Multi-walled carbon nanotubes (MWNTs) weresuccessfully manipulated by dielectrophoresis (DEP) to formelectrical connection between interdigitated gold electrodes(IDEs) and were demonstrated to serve as gas sensor for NH3detection. The MWNTs were suspended in ethanol anddeposited on the IDEs under the effect of DEP. After theevaporation of ethanol, the MWNTs remained between the gapsof the IDEs. The electrical conductivity of the DEP-fabricatedMWNTs sensor decreased when exposed to NH3 at roomtemperature. There is a good linear correlation between thedecreasing amplitude of conductance and the NH3concentration, and the detection limit of 10ppm NH3 could beachieved.

【题目】生物系统中随机共振现象及其应用

【中文关键词】生物系统 噪声 随机共振 神经元
【英文关键词】Biosystem Noise Sto chastic r eso nance (SR) Neur on
【中文摘要】对于传统信号检测和传输而言, 噪声通常被认为是有害的。但是, 随着近二十几年来对非线性系统的深入研究和实验验证, 人们发现噪声对微弱信号能起到一种增强或者优化作用。这种作用被称为随机共振(Stochastic resonance, SR) 效应。随机共振的概念最初由Benzi 等[1] 于1981 年提出。直到Mc-Namara 等于1988 年在一次激光器实验中展示了随机共振现象后, 随机共振才引起研究者们的广泛关注。目前, 随机共振在工程系统、量子物理学、化学、医学系统和生物系统等领域中得到了展示。其中,研究生物系统中存在的随机共振效应对生物医学工程的发展意义重大, 并已取得令人鼓舞的进展。随机共振机制可以用小球在两个坑之间跃迁的系统来形象地描述。在此系统中, 驱动系统做来回运动的周期或非周期的微小力所引起的系统扰动作为携带信息的微弱输入信号, 此力不足以引起小球的跃迁事件; 驱动系统做左右倾斜运动的力所引起的系统扰动作为噪声。系统的信号输出为小球的跃迁事件。在适当的噪声强度下, 信号和噪声的协同作用能引起小球偶尔出现跃迁事件。随机共振理论认为该跃迁事件与微弱信号是相关的。因此, 随机共振效应就是噪声和微弱输入信号之间的协同作用所引起的对微弱信号的增强或优化效应。
【英文摘要】Stochast ic r eso nance (SR) is g iven to a phenomeno n that is manifest in nonlinear systems wherebygenerally feeble input info rmatio n can be am plified and o pt imized by the assistance of noise. Fir st, the basic concept sand the character istic quantities o f SR are intr oduced in t his paper. Second, SR in bio log ical system and its applicationsare rev iewed in detail. At last, a summary is presented and the fut ur e researches o n SR a re prospect ed.

【题目】Estimation of genetic parameters for growth traits in cultured clam Meretrix meretrix (Bivalvia: Veneridae) using the Bayesian method based on Gibbs sampling
【中文关键词】无
【英文关键词】Meretrix meretrix, genetic parameter,heritability, Bayesian inference
【中文摘要】无
【英文摘要】"The aim of this study was to estimate the genetic parameters of the growth performance of clam Meretrix meretrix. As part of the breeding programme, 25full-sib families nested within eight half-sib families were produced, planted out and tested to assess the heritability of the total body weight (TW), shell length (SL), shell height (SH) and shell width (SW) at di ¡ erent growth stages. Method of analysis was implemented using the Bayesian method based on the Multiple Trait using Gibbs Sampling under Animal Model program, which was used to estimate the (co)variance components of the traits and conductgenetic analysis. A total of 25 full-sib families, each with 30^35 individuals within family, were used for the analysis. Signi ¢ cant positive genetic and phenotypic correlations between SL, SW, SH and TW with each other were observed. The growth traits showed high-magnitude heritabilities, with values ranging from 0.64 to 0.85, which indicates that these traits should respond to selection and therefore should be included in genetic improvement programmes."

【题目】Complete mtDNA of Meretrix lusoria (Bivalvia: Veneridae) reveals the presence of an atp8 gene, length variation and heteroplasmy in the control region
【中文关键词】无
【英文关键词】Meretrix lusoria,mtDNA,atp8,D-loop,VNTR,Heteroplasmy
【中文摘要】无
【英文摘要】"The complete nucleotide sequence of the mitochondrial genome of the clam Meretrix lusoria (Bivalvia: Veneridae) was determined. It comprises 20,268 base pairs (bp) and contains 13 protein-coding genes,including ATPase subunit 8 (atp8), two ribosomal RNAs, 22 transfer RNAs, and a non-coding control region.The atp8 encodes a protein of 39 amino acids. All genes are encoded on the same strand. A putative control region (CR or D-loop) was identified in the major non-coding region (NCR) between the tRNAGly and tRNAGln.A 1087 bp tandem repeat fragment was identified that comprises nearly 11 copies of a 101 bp motif and accounts for approximately 41% of the NCR. The 101 bp tandem repeat motif of the NCR can be folded into a stem – loop secondary structure. Samples of eight individuals from Hainan and Fujian provinces were collected and their NCR regions were successfully amplified and sequenced. The data revealed a highly polymorphic VNTR (variable number of tandem repeats) associated with high levels of heteroplasmy in the D-loop region. The size of the CR ranged from 1942 to 3354 bp depending upon the copy number of the repeat sequence."

【题目】Low power research and design in plant eco-physiological monitoring system based on zigbee.
【中文关键词】none
【英文关键词】wireless sensor network, ZigBee, low power,Z-Stack
【中文摘要】none
【英文摘要】ZigBee wireless sensor network usually works in a complex environment, and the energy of sensor node is very limited, so energy consumption is a big problem in ZigBee wireless sensor network,especially in the multi-sensor system. Plant eco-physiological monitoring system is a typical multi-sensor system. There are many kinds of sensors in this system. These sensors, as well as ZigBee module and some peripheral components need different power supplying, so the system should provide various power supplying. But it is very difficult in the limited energy condition, especially in a low power required system. This paper investigates power reduction in plant eco-physiological monitoring system, and low power strategy on both the hardware designing and software controlling is presented. The test results about the performance of the plant eco-physiological monitoring system are given, which demonstrates that the system is reliable. This designing will provide a good reference for the multi-sensor network based on ZigBee technology for the low power designing.

【题目】基于ZigBee的数据透明传输系统的设计
【中文关键词】ZigBee, 透明传输,监测
【英文关键词】ZigBee, transparent transmission,monitoring
【中文摘要】ZigBee是一种新兴的无线传感网络技术可以广泛的应用于工农业的监测和控制当中,但其协议栈较为复杂,给ZigBee技术的开发应用带来了一定的难度。本文以TI的SoC芯片CC2430为硬件核心设计了基于ZigBee技术的数据透明传输终端,用户避免了繁复的ZigBee协议应用开发,只需将要传输的数据交给终端就能实现数据的无线传输,只要在ZigBee网络覆盖的范围内就能实时传递监控设备采集的数据,通过ZigBee网络将现场监控设备和上位机建立连接,方便地实现远程环境的监测和控制。
【英文摘要】ZigBee is a rising wiress network technology, which is used widely in industry and agriculture monitor and test.But the complex Z-stack makes the development and application of the ZigBee technology difficult.The paper finished the design of the data transparent transmission system based on ZigBee,the hardware core of the system is the SoC chip CC2430 produced by TI.User avoids the developing of the complex Z-stack, only needs to send the data to the terminal then the data will be sent to the destination device. The data collected by the test and monitor device will be sent to the PC in real time in the ZigBee network coverage area. The PC connected with the local test and monitor device by the ZigBee network, implemented the environment remote test and monitor very conveniently..

【题目】Research on ZigBee Wireless Sensors Network Based on Modbus Protocol
【中文关键词】none
【英文关键词】ModBus Protocol1; ZigBee Stack2;Monitoring3;
【中文摘要】none
【英文摘要】The information transmission is transparent for the user in the ZigBee wireless sensors network, which are lack of interactivity and self-constrain. The information in the ZigBee wireless sensors network can not be viewed in a real time by a friendly interface. Modbus protocol is embedded into ZigBee stack, in this way, we can implement interaction well and the information can be viewed in a friendly interface. The paper present the measures to embed the Modbus protocol into the ZigBee stack provided by Chipcon company, which contains address bound mechanism, information centralized storage, and flexible monitoring, by which we can monitor the real time information from the ZigBee wireless network and use some instructions to control the remote device in a friendly interface, which can be used well in the middle and small ZigBee monitoring wireless sensors network. We implement it in the plant physiological ecology monitoring system.

【题目】Design of plant eco-physiology monitoring system base on embedded technology
【中文关键词】none
【英文关键词】plant eco-physiology monitor system, embedded technology, MODBUS Protocol
【中文摘要】none
【英文摘要】A real time system has been developed to collect plant's growth information comprehensively. Plant eco-physiological signals can be collected and analyzed effectively. The system adopted embedded technology: wireless sensors network collect the eco-physiological information. Touch screen and ARM microprocessor make the system work independently without PC. The system is versatile and all parameters can be set by the touch screen. Sensors ’ intelligent compensation can be realized in this system. Information can be displayed by either graphically or in table mode. The ARM microprocessor provides the interface to connect with the internet, so the system support remote monitoring and controlling. The system has advantages of friendly interface, flexible construction and extension. It ’s a good tool for plant ’s management.

【题目】An Improved Design of ZigBee Wireless Sensor Network
【中文关键词】none
【英文关键词】ZigBee; Wireless Sensor Network; CC2430;
【中文摘要】none
【英文摘要】ZigBee is a low rate, low power consumption wireless communication technology, which can be widely used in the Wireless Sensor Network (WSN). WSN is composed of hundreds of nodes, all of the sensor nodes information in the network will be sent to the coordinator, so the coordinator usually undertake the task to collect sensor data information, conserve the information, process the information, and also as the interface of the network with the user. The coordinator should communicate with the host computer by the upper protocol, so the coordinator carry too much load, especially in the large scale wireless sensor network, which

will have an bad effect on the network communication. The effect showed bad real-time, data packet loss, and stability decrease. The paper presents an improved design of ZigBee Wireless Sensor Network. In the network the coordinator only deal with the task on the ZigBee network, the rest tasks will be processed by another processor. The processor connected with the Coordinator by RS-232 interface. All data information will be sent to the processor though the serial port. So the processor undertakes the task to deal with data, conserve the network information, and communicate with the host computer. At last we tested the improved ZigBee wireless network and verification the effect.

【题目】亚洲棉再生体系研究进展
【中文关键词】亚洲棉;基因组学;再生体系
【英文关键词】Gossypium arboreumL.;genomics; regeneration system
【中文摘要】亚洲棉具有优良的遗传学特性,是进行棉属基因组学和遗传工程研究的主要材料,但其作为遗传工程基础的再生体系目前尚未完善。虽然早在20世纪70年代已开展了许多研究,但是由于亚洲棉自身特点其再生体系很难建立,仅停留在愈伤组织的诱导阶段,直至最近才取得了少量突破性的进展,获得了再生植株。亚洲棉愈伤组织是四个栽培种中较容易诱导的,但是诱导出的愈伤组织生长状态不佳,其分化和再生困难,解决的办法主要是调整激素的种类与浓度,适当改变培养方法和培养条件。
【英文摘要】The diploid cotton species provide more valuable genetics characters for the agronomicallydesirable cultivated than the tetraploid cultivars.G. arboreumL. also offers better material to study gene structure and function. The regeneration system ofG. arboreumL. is very important to study genetics engineering and genomics. But the regeneration system is difficult to be constituted because of the genotype of diploid cotton. Since 1970 ’ s, many researches have been done, but the regeneration system has not been completely established. Up to now, several important progresses have been made and the plantlets have been obtained. It is easier to induce the callus culture ofG. arboreumL. thanother cotton species. However the state of the callus is worse than other species and the callus is difficult to induce somatic embryo. The major ways to overcome this difficulty is not only to adjust proportion of auxins and cytokinins, but also to change culture methods and environmental conditions.

【题目】冬季饥饿再投喂对菲律宾蛤仔生长、存活和生化组成的影响
【中文关键词】菲律宾蛤仔; 冬季; 饥饿; 生长; 存活; 生化组成
【英文关键词】Ruditapes philippinarum; winter; starvation; growth; survival; body biochemical composition
【中文摘要】2007年12月—2008年4月,在冬季低温(水温3.0℃~4.2℃、盐度25~27、pH7.90~8.16)条件下,采用饥饿时间不等、恢复投喂时间相同的方式,研究了饥饿再投喂对不同规格菲律宾蛤仔生长、存活及体组分的影响.结果表明:在冬季低温条件下,各试验组菲律宾蛤仔生长性状的差异不明显;其对饥饿的耐受能力随着蛤仔规格的增大而升高;存活率随着饥饿时间的延长而降低,但整个试验过程中未出现不可逆点.从较大规格菲律宾蛤仔(壳长7mm)的体组分上看:菲律宾蛤仔水分、脂肪含量随着饥饿时间的延长而下降;蛋白质含量在饥饿前期随着脂肪的消耗而上升,后期因脂肪的过度消耗开始被利用而下降;灰分含量在整个试验过程中的变化不显著. 更多还原
【英文摘要】From December 2007 to April 2008,a laboratory experiment was conducted to study the effects of various starvation periods followed by the same refeeding period on the growth,survival,and biochemical composition of different size Ruditapes philippinarum at water temperature 3.0 ℃-4.2 ℃,salinity 25-27,and pH 7.90-8.16. No significant differences in the growth characteristics of R. philippinarum at low temperatures were observed among different size groups. The tolerance to starvation increased with increasing size,while the survival rate decreased with increasing starvation period. the point-of-no return (PNR50) was not observed during the study period. For the larger size group (7 mm),the body moisture and lipid concentrations generally decreased

with increasing starvation period. During starvation,the body protein content increased initially as a result of lipid being utilized for energy,but decreased thereafter when the lipid was depleting. Ash content remained unchanged during the study period,and was not affected by starvation or refeeding

【题目】降低棉花胚性愈伤褐化研究
【中文关键词】棉花;组织培养;胚性愈伤;胚状体
【英文关键词】Gossypium hirsutum; tissue culture; embryo callus;embryoid
【中文摘要】在棉花组织培养中,诱导出的胚性愈伤组织转到继代培养基上时,经常出现褐化现象,需要经过3~4次继代培养才能诱导出正常绿色胚状体。实验通过激素和氮源对诱导绿色胚状体的效应研究,认为氮源配比不合适是褐化现象的主要诱因,与KT、6-BA、IAA等激素关系不明显;经过对MS培养基的改良,一次继代就可以获得绿色胚状体,从而缩短了组织培养周期近2个月
【英文摘要】In cotton tissue culture, normal green embryoid is usually obtained after 3 or 4 rounds sub-cultures. But the callus usually turns brown in the subculture from embryogenic callus to somatic embryogenesis. Our research suggests that the brown-turning mainly results from the improper ratio of nitrogen. It also indicated that the content of KT、6-BA and IAA had no significant effect on embryo tissue brown-turning. The normal green embryoid is produced only by once subculture after improvement of MS culture medium, shorten its cycle about two months.

【题目】泥蚶(Tegillarca granosa) GT 微卫星位点的筛选和性质鉴定
【中文关键词】微卫星, 磁珠, 泥蚶
【英文关键词】Microsatellite (SSR); Magnetic bead; Tegillarca granosa
【中文摘要】采用磁珠富集法, 利用生物素标记的(GT)15 寡核苷酸探针从泥蚶基因组DNA Sau3A1 酶切的500—1000bp 片段中筛选GT/CA 微卫星位点。洗脱的杂交片段克隆到PMD18-T 载体上构建富集微卫星基因组文库后, 通过PCR 筛选检测出阳性克隆进行测序。在139 条序列中有115 条序列包含有重复次数不少于5 次的微卫星位点, 阳性序列比例达到82.7%。其中perfect 类型微卫星最大的重复次数为35 次。在112 条非冗余序列中, 共有100 条(88.5%)微卫星重复序列两端有侧翼序列能够进行引物设计。
【英文摘要】Although microsatellite marker (SSR) has been widely used in population genetics and genetic map construction,problems still exist in the application of sequence information and primer design on flanking regions. In this experiment, magnetic bead hybridization method is used to enrich the microsatellite loci in Tegillarca granosa, being more efficient than that of the traditional way. Genomic DNA was digested by restriction endonuclease Sau3A1 and electrophored on agarose gel, DNA fragments of 500—1000bp was recovered and ligated to Sau3A1 adaptor. Purified, adaptorligated fragments were hybridized to biotin-labelled (GT)15 probe and captured by Streptavidin-coated magnetic beads. Target fragments were eluted and PCR amplified, then the purified PCR products were inserted to PMD18-T vector and transformed into DH5α component cell. Positive clones in the enriched genomic DNA bank were screened out through PCR method and sequenced. Of 139 positive clones, 115 sequences contained repetition that repeated no less than 5 times, 3 redundant sequences were found after the multiple sequence alignment analysis, and the

rest 112 non-redundant microsatellite-contained sequences of which about 82.7% contained positive sequence, and the largest repeat number of perfect type microsatellite was 35. Among the 112 non-redundants, 100(or 88.5%) had enough flanking region (80—100bp), which is enough to design microsatellite primer pairs, and will be used to design primer and test polymorphism in further research.

【题目】我国棉田生态系统立体污染及其防治对策
【中文关键词】棉田;生态系统;农业污染;农药;化肥;地膜
【英文关键词】cotton field; ecological system; agricultural pollution; pesticide; fertilizer; plastic mem-
brane
【中文摘要】棉花的农药、化肥和地膜使用量在我国主要农作物中均占据首位且居高不下,棉田生态系统受到从水体、土壤、生物到大气的交叉性“立体污染”。农膜的大量使用及高残留破坏土壤结构,影响土壤的透气性,并导致土壤质量下降;同时残膜降解过程中产生的有毒物质,阻碍种子根系生长,影响产量;过量施用化学肥料加之施用方法不妥,导致了严重的生态环境污染并危及人类健康;棉花病虫害防治高度依赖高毒、剧毒化学农药,导致药害,天敌和有益生物遭受毁灭性杀伤。农药、化肥成份残留于土壤中,或者被无节制地排放到水体环境,或随意散逸到大气中。从四个角度提出了相应的综合防治对策。对污染源头实施技术性控制。从生态系统平衡化和植物营养利用最优化着手,研究组建我国三大棉区棉田生态型IPM技术体系,形成棉田病虫害防治技术标准及棉田平衡施肥技术标准。改进施药施肥方法,创新棉花栽培和耕作措施,研制可降解环保棉田专用农膜。建立棉田生态系统污染修复技术体系。大力发展生物技术,提高生物防治水平。
【英文摘要】Cotton stands first constantly in the using of pesticide, fertilizer and plastic film comparing to the other crops in China. Presently, the negative effects have emerged severely and have been embodied in the agricultural tri-dimension pollution (ATriP) from water, soil and organism to the air in the ecological system in cotton field. This paper firstly analyzed three key factors of ATriP of ecological system in cotton field and summarized the present situation of the AtriP. First, plastic film remained in the soil largely. These remnants destroyed the soil structure, blocked the ventilation and thus resulted in the bad soil quality. Meanwhile, during the

decomposition, these remnants producedpoisonous matters and then inhibited the root growth and reduced production. Secondly, while the over-fertilization and the incorrect ways led to the seriously ecological environment pollution and endanering human health badly. Thirdly, the controls of diseases, pests and weeds in cotton crop were highly depended on pesticide of strong toxicity. On one hand, it was liable to arouse the pesticide scathe; on the other hand, some natural enemies of pests were subjected to fatal poison during the malign recycle of anti-pesticide and increasing using quantity and toxicity of pesticide. Consequently, it broke the ecological balance. Especially, the lower utilization and misuse of pesticide and fertilizerhave made poisonous matters remain in the soil, released into water environment or escaped into the atmosphere. These poisonous remnants certainly contributed to the ATriP from water, soil to the air after long time of accumulation and cooperation, and accordingly had deep effects on the crop quality,world climate and human health. On the basis of AtriP states in the ecological system of cotton field,we put forward the corresponding control tactics from four aspects. First is to control the source of A-triP by means of effective techniques, and constitute IPM technology system so as to reduce the chemical control and to realize the balanceable fertilization. Second is to found an AtriP-preventing technology system by way of researching and generalizing environment-friendly pesticide and slow-releasingfertilizer and improving the means of applying pesticide and fertilization; establishing an environment-friendly and efficient planting and cultivation measures; developing a type of biomaterial and decomposable multi-function agricultural membrane. Third is to found an AtriP-renovating technology system. A quick-diagnosis information database should be established firstly based on the AtriP distribution situation and the AtriP mechanism. Researches should be intensified to realize the bio-decomposition or bio-elimination of the plastic membrane remainders and poisonous remnants of pesticide and fertilizer. As to the transgenic insect-resistant cotton, it is necessary to set up a technology norm fordetecting and monitoring the remaining and decomposition regularly. The last tactic is to cultivate newvarieties of high quality and multiple fastnesses, such as insect-resistance, disease-resistance,drought-resistance, salt and alkali-tolerance and high fertilizer-efficiency by biotechnology so that wecan elevate the bio-control level in the cotton field.

【题目】泥蚶(Tegillarca granosa)6 个微卫星引物的分离和鉴定

【中文关键词】泥蚶, 微卫星, 等位基因

【英文关键词】Blood clam Tegillarca granosa, Microsatellite, Allele

【中文摘要】应用6 个微卫星标记在奉化泥蚶种群上进行扩增, 以检测其遗传信息。扩增结果表明, 引物所扩增出的等位基因数目变化从3 个到7 个, 平均等位基因数目为5.4。引物的多态性信息含量范围为0.111—0.814。最大的观察杂合度Ho为0.690, 最小为0.121。期望杂合度He 范围为0.117—0.848。位点TMP22 显著偏离了哈代-温伯格平衡。6 个引物在18 个马来西亚泥蚶上进行扩增, 结果只有TMP18 和TMP36 在马来西亚模板上有扩增产物。

【英文摘要】Six microsatellite loci were isolated and then used to investigate the genetic diversity of blood clam (Tegillarca granosa) collected form Fenghua, Zhejiang Province. The microsatellite primers were first screened in a polymerase chain reaction through a temperature gradient to determine best annealing temperature. The functional primers were then selected for population amplification. PCR was performed in a 25 μl reaction system as follows: 1×PCR buffer, 2.0mm MgCl2, 0.2mm dNTPs, 10pmol per primer, 0.65U Taq polymerase, and 10ng genomic DNA. Reaction took place in a PCR amplifier (Mastercycler Eppendorf) in program of: 5min at 94°C for denaturation, 30 cycles of 94°C 1min, 30 s at annealing temperature, 72°C extension for 45s, and a final extension for 7min at 72°C. The PCR products were afterwards electrophoresed on 8% polyacrylamide gel and detected in silver staining method. Polymorphic information content (PIC) was calculated with CERVUS 2.0 software. The expected heterozygosity (He) and observed heterozygosity (Ho) was estimated with GENEPOP 4.0.7. The allele number per loci varied from 3 to 7, PIC value was 0.111 to 0.814. The mean Ho and He varied from 0.121 to 0.690 and 0.117 to 0.848, respectively. Primer amplification showed that some microsatellite loci isolated from the samples of continental China were absent in those of Malaysia.

【题目】基于几何参数模型和OpenGL的油菜花朵可视化研究
【中文关键词】油菜; 几何参数模型; 可视化; OpenGL
【英文关键词】rapeseed ; geometric parameter models ; visualization ; OpenGL
【中文摘要】为构建可视化油菜生长系统, 本研究以油菜花朵为研究对象,通过对 2种氮肥水平下 3种油菜品种的盆栽试验数据进行统计分析, 建立了油菜花柄和花蕾的几何参数模型。在此基础上, 进一步探讨了油菜花朵组件三维建模技术, 构建了基于组件形态特征参数的花柄与花萼几何模型, 其中,以圆柱体模拟花柄, 12×9个四边形模拟花萼曲面; 通过组合多个几何图元的方式构建了花瓣和花蕊模型, 其中, 以平面梯形和半圆模拟花瓣,椭球体和圆柱体模拟雄蕊, 球体和圆柱体模拟雌蕊, 球体模拟蜜腺。然后,基于 OpenGL图形库, 绘制了油菜花朵各组件三维形态, 并进行了颜色渲染。最后,以 VC++ 定时器为驱动变量,通过 OpenGL旋转、 缩放及平移命令耦合油菜花朵拓扑结构模型, 实现了油菜花朵开放过程的动态模拟。

【英文摘要】To construct the visual growth system for rapeseed (Brassica napus L.), rapeseed flower was taken as object to develop the growth models of flower stalk and flower bud by statistical analysis of datas from two-nitrogen-level pot experiment for three rapeseed cultivars. The geometric models of rapeseed flower component(including submodels for flower stalk and flower calyx) with architecture parameters were developed using the 3D technologies of modeling rape flower components , a cylinder and 12×9 quadrangles used for simulating flower stalk and the camber of calyx , respectively . Further more , submodels for petals , pistil, stamen and nectar were also constructed by the combination of geometric graphic elements of plane trapezium and semicircle , ellipsoid and cylinder , sphere and cylinder , and sphere . The rapeseed flower components were drawn by the 3D pattern and colored with the help of OpenGL. The timer in VC++ serving was taken as the driving variable , and the model of topog raphic structure for rapeseed flower were integrated by the command of rotation , scale and translation in OpenGL.The dynamic simulation of the blossom of rape flowers was obtained with better real .

【题目】生育期对小麦全株青贮发酵品质的影响
【中文关键词】全株青贮; 小麦; 生育期; 发酵品质; 饲用品质
【英文关键词】whole-crop silage ; wheat ; maturity ; fermentation quality ; feeding value ;
【中文摘要】【目的】探讨不同生育期全株小麦发酵品质和饲用价值的优劣。【方法】用3个小麦品种(新麦18、周麦22和淮麦22)袋贮比较了乳熟期和蜡熟期全株青贮的发酵品质和饲用品质差异。【结果】乳熟期和蜡熟期小麦均适宜全株青贮利用,但全株小麦青贮的发酵品质和青贮饲料的饲用价值存在显著的生育期间差异(P〈0.05)。乳熟期小麦全株青贮饲料的pH、挥发性脂肪酸(volatile fatty acid,VFA)和总氮中氨态氮(NH3-N/TN)的含量显著低于蜡熟期,乳酸(lactic acid,LA)的含量显著高于蜡熟期,发酵品质较好;蜡熟期小麦全株青贮饲料的纤维成分(中性洗涤纤维(neutral detergent fiber,NDF)和酸性洗涤纤维,(acid detergentfiber,ADF))、可溶性碳水化合物(water soluble carbohydrates,WSC)和粗蛋白(crude protein,CP)的含量显著低于乳熟期,淀粉的含量显著增加,饲用品质较好。【结论】乳熟期小麦全株青贮的发酵品质因WSC含量高而显著优于蜡熟期;但蜡熟期青贮饲料的饲用品质则因种子比重增加,淀粉含量的增加而优于乳熟期。
【英文摘要】【Objective】 The changes in fermentation quality and feeding value of whole crop silage of wheat at different maturity stages were studied.【Method】Three wheat cultivars(Xinmai 18,Zhoumai 22,and Huaimai 22) were ensiled by polyethylene bag at milk and dough ripening stages to test the fermentation quality and feeding value.【Result】Whole crop of wheat ensiled at two maturation stages both provided good silage,but the fermentation quality and feeding value of the silages were significantly different between the maturity stages(P〈0.05).The pH,volatile fatty acid(VFA) including acetic acid(AA),prop ionic acid(PA),and butyric acid(BA) concentrations in the silage ensiled at milk ripening stage were significantly lower than that at dough ripening stage,while the lactic acid(LA) content was significantly higher.It indicates that fermentation quality of silage ensiled at the milk ripening stage was better than that at the dough ripening stage.The concentration of neutral detergent fiber(NDF),acid detergent fiber(ADF),water soluble carbohydrates(WSC) and crude protein(CP) of the silage ensiled at dough ripening stage were significantly lower than that at milk ripening stage,but the starch content was significantly higher.Then,feeding value of whole crop silage of wheat at dough ripening stage was better.【Conclusion】At the milk ripening stage,the fermentation quality of whole crop silage was better owing to the higher WSC content,while at the dough ripening stage,the feeding value of whole crop silage was better owing to seeds increasing and starch accumulation.

【题目】PEG胁迫方法评价棉花幼苗耐旱性研究
【中文关键词】棉花;PEG胁迫;耐旱性;成活率
【英文关键词】cotton; PEG water-stress; drought tolerance; survival rati
【中文摘要】分别选用8个陆地棉、2个海岛棉、2个亚洲棉品种作为材料进行耐旱水平试验,以PEG6000作为水分胁迫剂,对棉花种子萌发期、芽期、子叶期和真叶期材料分别进行处理,得出了耐旱水平变化曲线,结果验证棉花耐旱性鉴定关键时期应在3~6片真叶幼苗。用不同浓度PEG6000对具有3~6片真叶的棉花幼苗进行12 h连续处理后,统计其成活率。研究表

明:PEG6000溶液浓度为17%(W/V)时,棉花幼苗的成活率与田间旱棚鉴定结果有较高的一致性。此方法简单、快速,易操作,基本可用于棉花品种的耐旱性评价与鉴定工作,并将为棉花耐旱分子生物学研究奠定基础。

【英文摘要】This experiment was conducted with eight cultivars of upland cotton, two of island cotton and three of Asian cotton as types of different levels in drought tolerance. Cotton materials during germination, budstage, cotyledon-stage and real-leaf stage were exposed to osmotic adjustments of PEG6000 for 12 hours in order to imitate the drought circumstance. After the 12-hours osmotic menace,calculated the survival ratio of various materials,then through statistical method,curves of the mutative level of drought tolerance were obtained, proving that the 3~6-leaf stage is the key stage on drought tolerance of cotton seedlings. With different PEG6000 concentration, the ratios which 3~6-leaf seedlings recovered were calculated to compare with the results in real drought situation. And the results revealed that: With 17%(W/V) PEG6000 treatment,the ratio which seedlings recovered corresponded with the results in drought-shed. The above results suggested that osmotic adjustments could be used to evaluate simply the drought tolerance of cotton, though the cotton after PEG-treated differed slightly in physiology with cotton after drought-treated. The method with osmotic adjustments of PEG is simple, fast and easy operated, could be used to evaluate the drought tolerance of cotton in principle, and will establish foundations for study on cotton drought-tolerance molecular biology.

【题目】基于形态参数和AFLP 标记的文蛤(Meretrixmeretrix)不同地理群体遗传变异分析

【中文关键词】文蛤, 地理群体, 遗传多样性, 形态变异, AFLP

【英文关键词】Meretrix meretrix, Geographical population, Genetic diversity, Morphological variance, AFLP

【中文摘要】"应用方差分析和Tukey 多重比较对文蛤的辽宁(LN)、山东(SD)、江苏(JS)、广西(GX)4 个自然地理群体的7 个壳形态参数进行了研究, 结果发现, SD 和JS 群体间差异不显著, LN 和GX 群体差异不显著, GX群体与SD和JS 群体间差异显著(P<0.05)。利用4 对引物组合对这4 个群体进行了AFLP扩增, 共得到236 个位点, 其中特有位点14 个, 这些特有位点可作为群体鉴别的特征性标记。遗传多样性分析表明, 4 个文蛤群体的遗传多样性水平均较高, 而以GX 群体最高, Nei’s 基因多样性指数和Shannon’s 多样性指数分别达到0.2636、0.3961, SD 群体最低, 分别为0.2308、0.3462。从群体间遗传距离和NJ 法构建的亲缘关系谱系图来看, LN 和SD 群体的遗传距离最近(0.0394), 首先聚在一起, 而GX 群体与其他3 个群体间都较远(0.1271—0.1586), 单独分出一支, 这说明GX 群体已发生了明显的遗传分化, 用它与其他3 个群体杂交可望较大幅度地提高遗传多样性水平。"

【英文摘要】"The genetic diversity of four geographical populations of Meretrix meretrix, i.e. Liaoning (LN), Shandong (SD), Jiangsu (JS) and Guangxi (GX), was analyzed using morphological parameters and AFLP markers. Shell traits were measured and seven shell parameters were used for Tukey’s multiple comparison among the four populations. The results showed no significant difference between the SD and JS, between the LN and GX populations, but significant difference in GX population to SD and JS populations. Four AFLP primer combinations were applied to analyze genetic diversities andrelationships among the four populations. Fourteen population-specific bands were found in 236 detected bands, 11 bands in GX population, 2 in LN population and 1 in SD population. The proportion of polymorphic loci were 72.02%, 67.43%, 74.65% and 76.92%, the genetic similarity indexes within each population were 0.7818, 0.8114, 0.7792, and 0.7582, Nei’s gene diversity indexes were 0.2603, 0.2308, 0.2554 and 0.2636, and Shannon’s information indexes were 0.3881, 0.3462, 0.3830, and 0.3961 for LN, SD, JS and GX population, respectively. The results showed that GX population had highestgenetic diversity and SD had the lowest. The genetic distance analysis showed that LN, SD, and JS populations were closer to each other than GX population to each of them. In addition to the genetic similarity indexes and distance matrixes among populations, the results of cluster analysis with NJ method showed that the LN and SD population were clustered together first and then clustered with JS population, and GX population was an independent cluster."

【题目】花粉管通道法获得棉花转基因株系主要农艺性状变异分析
【中文关键词】棉花;花粉管通道法;转基因;农艺性状;变异
【英文关键词】cotton(Gossypium hirsutumL.);pollen-tube pathway;transgenenic;agronomic traits;variations
【中文摘要】通过对花粉管通道法获得的38个棉花转基因株系稳定后代T5代主要农艺性状的变异进行分析发现,外源基因的导入可引起受体植株后代农艺性状可遗传的非靶标变异,且变异广泛,多个农艺性状出现了显著性变异。叶长和叶宽均有变短的趋势,但裂叶缺刻深浅变异方向不定,说明部分叶片变得更加皱缩。株高变异方向不定。与对照相比,吐絮期提前,单株结铃数增加,使皮棉和子棉产量均增加。纤维品质变异也很大,如比强度增大、麦克隆值变大、纤维长度也显著增加;短纤维指数变异方向不定。
【英文摘要】Variations of main agronomic traits in selected lines from transgenic cotton obtained bytransformed insect resistant genes into cotton line Zhong 99668 through pollen tube pathway method were investigated. Introducing of foreign genes resulted in stable hereditable non-target-gene variation of agronomic characteristics in the descents. The analysis of T5generation of transgenic lines revealed that variations occurred in many agronomic traits. Most of the transgenic lines showed an increasing trend for the yield, the number of plant branches and rolls. However, the reverse trend was also observed. The leaves became smaller and the generational period became shorter. A lot of variations in fiber qualities were also found such as fiber strength, micronaire value fiber length, fiber index, degree of uniformity etc.

【题目】ERF转录因子对生物胁迫的反应及对棉花抗性改良的意义
【中文关键词】ERF(乙烯应答因子),转录调控,棉花抗病性,分子改良
【英文关键词】ERF(ethylene responsive factor),Transcriptional regulation,Cotton disease resistance,Molecular improvement

【中文摘要】大量研究表明植物中ERF(ethylene responsive factor)类转录因子广泛参与外界环境胁迫应答基因表达的调控。它编码的蛋白能够特异结合GCC-box元件,从而调控启动子含有GCC-box的病程相关蛋白基因的表达,在植物抗病反应中发挥重要的调控作用。棉花中ERF基因表达受生物和非生物胁迫诱导,并在乙烯、茉莉酸和水杨酸信号传导途径中发挥一定的作用。一些ERF基因在转基因植物中的超表达表现出了一定的广谱抗性,因而在棉花分子育种中具有较为广阔的应用前景。本文主要论述了棉花等植物中ERF的结构与功能特征,当前相关研究进展,及其对棉花抗病性分子遗传改良的意义。

【英文摘要】Numerous studies have shown that transcription factor ERF(ethylene responsive factor)plays a crucial role in regulating plant genes that response to environmental stress.ERF is a subfamily of AP2/ERF,which could specifically bind the GCC-box presenting in the promoter of many PR genes and modulate their expression,consequently plays an important role in disease resistance signal pathway.Cotton ERF genes are induced by biotic and abiotic stresses,and involved in ethylene,jasmine and salicylic signal pathway.Over-expression of ERF genesshowed the broad-spectrum pathogen resistance in transgenic plants,which suggests a potential application of ERF genes in cotton molecular breeding.This paper summarized the structure and function of the ERF transcription factors in cotton and other plants,and discussed the significance in enhancing cotton disease resistance and molecular genetic improvement based on the current research progress.

【题目】广西文蛤(Meretrix)的fAFLP 及ITS 分析

【中文关键词】文蛤, fAFLP, ITS, PCR-RFLP, 遗传结构, 亲缘关系

【英文关键词】Meretrix, fAFLP, ITS, PCR-RFLP, Genetic structure, Genetic relationship

【中文摘要】利用fAFLP 标记技术和PCR-RFLP 技术, 对采集于广西的形态和壳色变异很大的2 个文蛤群体(G、W)以及山东文蛤(S)群体进行了遗传结构和亲缘关系研究。fAFLP 分析显示:在457 个总扩增位点中存在53 个W 群体的特异性位点(其中9 个为100%显性)、21 个G 群体的特异性位点、14 个S 群体的特异性位点, 这些位点可作为群体鉴别的特征性标记; 通过计算群体间相对遗传距离和聚类分析, 发现S 和G 间的遗传距离最小(0.0424), 在系统树上首先聚在一起, 而W 与S、G 的相对遗传距离均很大(0.2308 和0.2305), 单独分出一支。对文蛤核糖体ITS 的PCR-RFLP 结果显示: W的三个不同壳色类群(WX、WC、WH)的酶切结果完全一致, 而与G 和S 群体差别较大; G 和S 群体基本一致, 但也稍有差别。进一步的ITS 序列

分析显示: W 的ITS 序列长度为1266—1269bp, 而G和S 分别为1614bp 和1520bp; W 群体内部序列比较保守, 而与G 和S 群体之间在ITS1 和ITS2 开始和结尾处均存在多处插入/缺失; 在依据序列构建的系统树上, WX、WC、WH 三个类群聚在一起, S和G 聚为另一支, 两支相距甚远。本研究结果表明, fAFLP 标记分析、PCR-RFLP 分析和ITS 序列分析结果一致, W 群体和G、S 群体的差异较大, 已超出种内群体间的遗传变异, S 和G 尽管存在遗传分化, 但仍应同属Meretrix meretrix 一个物种。
【英文摘要】"The taxonomy of genus Meretrix has been in argument over several discrepancies among scientists in the world for a long while. Two groups of Meretrix clam (G & W) existed much variance on shell shape, color and pattern were collected from Beihai, Guangxi Province. One kind of Meretrix clam (G) is similar in shell color and pattern to Meretrix meretrix widely distributed in China costal region, another (W) is white color and convex in shell width. Genetic relationship between G and W was addressed by the fAFLP and PCR-RFLP compared with that of Shandong population of M. meretrix. The results of fAFLP analysis showed that each group had their own specific bands (loci) in which there were 53 unique loci in Group W, 21 unique loci in Group G, and 14 unique loci in S group. These unique loci could be taken for molecular markers to classify and distinguish other groups. The genetic distance matrix between Groups S and G was 0.0424, but the genetic distance matrix of W group between population S or G were 0.2308 or 0.2305 in respectively. Thephylogenetic trees by the methods of Neibour-Joining (NJ) indicated that Groups S and G were more closely related, but Group W was much independently clustered among groups. The result of PCR-RFLP suggested that W group was different from Groups G and S. The internal transcribed spacer (ITS) region was sequenced. The results show that the size of ITS ranged 1266—1269bp in W group, and 1614bp in Group G and 1520bp in S group. The sequences of W group were conserved, but obviously different from Groups G and. Phylogenetic trees by NJ method showed that Group G was more closely related to Group S, but Group W was much independent cluster. The results fully reveal that Group G belongs to M. meretrix, and Group W is an independent species. But we still could not classify Group W to M. lusoria or M. larmarckii, even a new species of genus Meretrix. More researches shall be carried out in the future."

【题目】四个杨树品系夏季光合作用日变化
【中文关键词】杨树品系;光合作用;日变化
【英文关键词】Populus;photosynthesis;diurnal variation
【中文摘要】树种(品系)选择和栽培措施的制定是农田防护林建设的重要内容。通过对‘I-69’、‘I-72’、‘I-63’、‘南林895’这4个在沿淮地区防护林建设中得到广泛应用的杨树品系的光合指标进行测定和分析。结果表明:从光合能力的差异来看,无论是日最大净光合速率还是日均净光合速率4,个品系中的排列顺序都是:‘南林895’〉‘I-69’〉‘I-63’〉‘I-72’。这说明‘南林895’较其他3个品系具有较强的光合能力;从影响光合作用的有关生理生态因子来看,4个

品系的光合能力强弱与蒸腾作用、叶表面温度、细胞间CO2浓度、气孔导度等生理生态因子都存在一定的相关性,并且在各生理生态因子中蒸腾速率对4个杨树品系光合作用的影响最为显著,其次是叶面温度,而细胞间CO2浓度和气孔导度对光合作用的影响相对较小。通过对这些光合生理学特性的分析,为沿淮地区农田防护林的建设提供一定的理论依据。

【英文摘要】The selection of species(strain) and the development of cultivation measures is an important part for establishing farmland shelterbelt.In this study,we selected four Populus strains('I-69'、'I-72'、'I-63' and 'Nanlin 895'),which have been widely planted in the Huaihe River,to analysis their photosynthetic characteristics.The results showed that: Whether maximum net photosynthetic rate in a day or daily average net photosynthetic rate,The photosynthetic capacity in four strains could be arranged from high to low as: 'Nanlin 895''I-69''I-63' 'I-72'.This indicated that 'Nanlin 895' had strong photosynthetic capacity compared with other strains;Concerning the impact of physiological and ecological factors on photosynthesis,the net photosynthetic rate of four strains had a certain correlation with the transpiration rate,intercellular CO2 concentration,leaf surface temperature and stomatal conductance.Among them,the most significant factor was transpiration rate,the next was leaf surface temperature.The influence of intercellular CO2 concentration and stomatal conductance was relatively small.Through the analysis of photosynthetic and physiological characteristics,a theoretical basis for the construction of farmland shelterbelt along the Huaihe River was provided

【中文摘要】体细胞胚胎的诱导是大多数植物组织培养中的关键环节。在愈伤组织分化胚性愈伤组织的过程中,随着细胞功能的转变,细胞内部基因的差异表达,引起了植物体内蛋白质组分、酶组分与活性、激素等各方面的变化,这些变化一直是组织培养研究中的热点。本文对体细胞胚胎的氨基酸变化、标记性蛋白、基因的差异表达、同工酶变化、激素动态和高体细胞胚胎发生率的材料遗传与选育等方面的研究进展作了综述。

【英文摘要】Induction of embryogenic callus (EC) is a key course of the whole plant regeneration process of plant tissue culture. Recent progresses in plant somatic embryogenesis, including the dynamic change of amino acid, enzyme and phyto hormones, protein marker and gene different expressions,and the heritability of regeneration capacityin vitroplant were reviewed. In the process of inducing callus to EC by tissue culture, the changes would happen to protein components, enzyme activity,phyto-hormone contents with cell functions transforming, and a series of genes expressing in plant,and how these affect the induction were the hot point of tissue culture researches. The research results of the increased content of nucleic acid, amino acid, and protein of EC were applied into the improvement of culture medium which was added more amino acids like Arg and Glu. It was proved thatPOD, APase and Esterase Isoenzymes played important roles in the differentiation of EC. In the same time, High ABA among of phyto-hormone was benefit to increase the ability of EC differentiation with low PEP. The study on differentia expression of gene was just at the initial stage, in which the common sequencings of protein of 35~55 kD was found as the marker of EC. The differentia expression gene had never been cloned. The researches on proteomics, which should be enhanced, were so far at initial research period of isoenzyme and protein marker. In genetics researches, though the genotype limitation existed in most of plants, the materials with high differentiation rates were only selected in few crops. So it is necessary to further search for the main genes of embryogenic callus and to select the high differentiation materials rapidly.

【题目】棉花体细胞胚胎发生的研究进展
【中文关键词】棉花,影响因素,体细胞胚胎发生,组织培养
【英文关键词】cotton,factors,somatic embryogenesis,tissue culture
【中文摘要】经过30多年的发展,已经在多个不同的棉花品种中获得了体细胞胚,并再生成苗。但由于体细胞胚胎发生往往受多种因素影响,如何从愈伤组织高效率地转化为胚性愈伤组织依然是限制棉花组织培养与遗传转化的关键问题之一。本文概述了棉花体细胞胚胎发生的研究进展,分别从棉花体细胞胚胎发生的起源、影响棉花体细胞胚胎发生的内外因素以及寻找棉花体细胞胚胎发生特异表达基因等几方面进行综述,并对研究中存在的问题进行了讨论。
【英文摘要】Over the past 30 years,somatic embryogenesis induction and plant regeneration has been successful in many different cotton cultivars.However,the efficient conversion of callus into embryogenic callus is still a restricting step during cotton tissue culture and genetic transformation,because embryogenic callus induction is affected by many fac tors.This paper reviews the research into cotton embryogenic callus in terms of the origin,intrinsic and extrinsic factors affecting callus differentiation,as well as the techniques used to investigate the differential gene expression in the conversion process.We also discuss the problems encountered during the research.

【题目】文蛤(Meretrix meretrix)幼虫发育过程中细胞凋亡和Caspase 功能分析
【中文关键词】文蛤幼虫, 细胞凋亡, Caspase, 发育, 变态
【英文关键词】Meretrix meretrix larvae, Apoptosis, Caspase, Development, Metamorphosis
【中文摘要】"以文蛤为研究对象, 利用TUNEL 技术(Terminal-deoxynucleotidyl transferase mediated dUTPNick End Labeling)检测了文蛤各发育阶段的幼虫中细胞凋亡的部位, 利用Caspase 原位标记分析了有活性的Caspase 在幼虫中的分布情况, 用Caspase 抑制剂Z-VAD-FMK 处理受精后4 天和5 天的变态前幼虫, 同时以抑制剂的有机溶剂DMSO(Dimethyl sulfoxide)作对照, 根据其对幼虫变态的影响,分析Caspase 在文蛤幼虫变态中的作用。细胞凋亡检测结果显示, 幼虫发育过程中发生细胞凋亡的部位主要在壳顶幼虫的面盘, 说明细胞凋亡可能是文蛤幼虫变态过程中面盘退化的主要机制; 在担轮幼虫至壳顶幼虫中都检测到有活性的Caspase, 说明整个幼虫形态变化过程中都有Caspase 的参与;用Caspase 特异性抑制剂处理变态前幼虫, 发现处理组幼虫变态率均显著低于对照组(P<0.05), 说明Caspase 在变态早期和晚期都有重要作用, 同时发现DMSO 对幼虫变态有诱导作用, 可以在生产中加以利用。"
【英文摘要】"Apoptosis plays an important role in larval development of species. Taking clam Meretrix meretrix as an example, to the apoptosis and function of caspase in bivalve larvae development and metamorphosis were studied. Apoptosis was detected in larvae at different stages with TUNEL labeling (Terminal-deoxynucleotidyl transferase mediated dUTP Nick End Labeling). The distribution of activated caspase in larvae was examined with CaspACETM FITC-VAD-FMK In Situ Marker. The pan-caspase inhibitor (Z-VAD-FMK) was used to analyze the function of caspase in 4-day-old and 5-day-old larvae post fertilization. Dimethyl sulfoxide (DMSO), the solvent of the inhibitor, was added to seawater as control. According to the effect on metamorphosis, the function of caspases in larvae was analyzed. The results reveal that the main apoptosis event occurred in the velum of pediveliger before metamorphosis, indicating that the degradation of velum might be the process of apoptosis. The activated caspases were observed in the larvae from trochophore to pediveliger, suggesting the caspases are involved in the whole developmental process. Having detected no signal in the velum, we proposed that the apoptosis in velum might be caspase-independent. The 4-day-old and 5-day-old larvae under treatment of caspase inhibitor showed significant lower metamorphosis rates than that in the DMSO control group (P<0.05). The results indicate that the caspases had functioned in early and later stages of metamorphosis, and also that DMSO couldbe an inducer in larvae metamorphosis."

【题目】基于生物量的水稻根系生长动态模型
【中文关键词】水稻根系;生物量;生长模型
【英文关键词】rice root system;biomass;model
【中文摘要】为了建立水稻根系生长动态模型,实现根系可视化,该研究以两优108(Val,杂交籼稻)、86优8(Va2,杂交粳稻)和南粳43(Va3,常规粳稻)为材料,采用塑料桶土培,设施肥(每盆N 3.6 g,P:O,0.8 g、KO 3.6 g),与不施肥(基土同施肥处理)两个水平,分析并建立水稻根系根长、根体积以及根表面积与根干重的最适关系模型。结果显示:根长、根体积及根表面积与根干重间的动态关系符合幂函数y=ax6;2008年根长、根体积及根表面积的模拟值与观测值的根均方差(RMSE)每株分别为358.138 l cm、2.089 1 em3和136.325 2 cm2,2009年的每株分别为42.993 7 em、0.314 9 cm3和14.072 8 cm2,检验结果为该模型可靠性较好。表明所建水稻根系生长动态模型具有一定的解释性和通用性,为功能-结构水稻模型研究及水稻可视化奠定了基础,对水稻理想株型设计、结构与功能关系研究及水稻生长系统的可视化和数字化均有一定的参考价值。
【英文摘要】To build the dynamic model for rice root system according to the geometry parameters and to achieve visualization of the root system in combination with computer graphics,three rice cultivars,Liangyoul08(hybrid long-shaped rice,Val),86you8(hybrid round-shaped rice,Va2)and Nanjing43(round-shaped rice,Va3),were planted in pots.There are two different levels of fertilizer:fertilizer(N 3.6 g,P205 0.8 g,KO 3.6 g),and no fertilizer(with loamy soil).Based on the experimental observations,the relationships between the root dry weight and root length,root volume,and root surface area were analyzed,respectively.The power function Y=axb was showed to describe above relationships.The RMSEs between the simulation values and the observation values of the root length per plant,the root volume per plant,and the root surface erea per plant were 358.138 1 cm,2.089 1 cm3,and 136.325 2 cm2 in2008 respectively,and42.993 7 cm,0.314 9 cm3.and 14.072 8 cm2 in 2009 respectively。which revealed that the model established was reliable,accountable and universal.This research would lay a basis for developing function-structure rice models.

【题目】菲律宾蛤仔(Ruditapes philippinarum)大连群体家系建立及生长比较
【中文关键词】菲律宾蛤仔, 野生群体, 家系, 生长
【英文关键词】Ruditapes philippinarum, Wide population, Family, Growth
【中文摘要】于2008 年6 月, 以大连野生型蛤仔为材料, 采用巢式设计即1 个雄性亲本与3 个雌性亲本交配的方式建立了菲律宾蛤仔15 个半同胞家系(A, B, …, O)和45 个全同胞家系(A1, A2, A3, …, O1, O2,O3)。对各家系的壳长、壳宽、壳高、鲜重等各项指标进行了方差分析和多重比较。结果表明, 3、4、5月龄, 菲律宾蛤仔45 个全同胞家系的表型性状具有显著差异, 且各月龄的差异趋势基本一致。5 月龄时, 从其生长性状上看, 家系F2、G2、G3表现出明显的生长优势, 壳长分别提高28.43%、24.72%、30.53%,壳宽分别提高21.14%、22.3%、25.58%, 壳高分别提高30.88%、26.96%、25.25%, 鲜重分别提高50.00%、68.42%、44.12%。从其存活上看, 家系E3的四个表型性状在全同胞家系中最小, 但存活数量最多为2269粒, 表现出很强的抗逆性; 具有生长优势的家系F2 存活个数最少仅为43 粒, 抗逆性相对最差。从其产量上看, 家系N3、I1、E3、C1、N1、G2 产量较高, 分别比平均产量提高了77.8%、75.61%、75%、69.45%、53.96%、50.19%。综合以上各项指标家系G2、G3、N3、E3、I1、C1、N1 可作为优良的家系育种材料, 在下一步育种工作中可以利用家系选择及家系杂交的方法对7 个家系进行遗传改良。
【英文摘要】Fifteen half-sib families and 45 full-sib families were established by using the nest design of ♂: ♀ = 1 : 3, in June 2008. Phenotypic growth traits, such as shell length, shell width, shell height, and fresh weight, were compared among different families by using the ANOVA. The results show that the shell length was significantly different among 45 full-sib families at the age of 3, 4, 5 months; however, the growth tendency of those 3-month-old ones were nearly the same. The growth traits of the 5-month ones showed strong enhancement in F2, G2, G3 having the shell length increased by 28.43%, 24.72%, and 30.53%, the shell width by 21.14%, 22.3%, and 25.58%; the shell height by 30.88%, 26.96%, and 25.25%; the fresh weight by 50.00%, 68.42%, and 44.12%, respectively. E3 is best in anti-adversity having the smallest phenotypic growth traits and the largest survival rate among all the 45 full-sib families; while F2 was the poorest in anti-adversity. The yields of family systems N3, I1, E3, C1, N1, and G2 were improved with 77.8%, 75.61%, 75%, 69.45%,53.96%, 50.19%, respectively. The results suggest that G2, G3, N3, E3, I1, C1, and N1 are good candidates of breed.

【题目】来源于耐旱荒漠植物蛋白CkND对棉花黄萎病的抑制作用及其抗旱性研究
【中文关键词】牛心朴子;蛋白CkND;棉花黄萎病;抗旱性
【英文关键词】Cynanchum komarovii;CkND protein;Verticillium dahliaeKleb;drought-resistant
【中文摘要】利用蛋白组学策略分离了荒漠植物-牛心朴子(Cynanchum komarovii)抗病、抗旱功能相关蛋白CkND。以棉花黄萎病菌为供试菌株,研究了蛋白CkND对棉花黄萎病的抑制作用。结果表明:蛋白CkND对棉花黄萎病菌菌丝生长及孢子萌发具有较好的抑制作用。离体试验中,100 mg·L-1的蛋白CkND对棉花黄萎病菌菌丝生长抑制效果在24 h、48 h、72 h分别为79.53%、83.01%、87.50%,35 mg·L-1的蛋白CkND对孢子萌发抑制率为100%;活体试验中,蛋白CkND对棉花黄萎病具有显著的防治效果。另外,本研究将CkND基因构建到pCAMBIA1304表达载体CaMV35S启动子下游,将pCAMBIA1304-CkND通过农杆菌介导转化法转入野生型拟南芥植株中。将33个株系的转pCAMBIA1304-CkND的T2代拟南芥和21株转pCAMBIA1304的T2代拟南芥,同时进行抗旱性试验。结果显示,转pCAM-BIA1304的T2代拟南芥14个株系枯死,而转pCAMBIA1304-CkND的T2代拟南芥有24个株系的转基因植株存活,且叶片保持绿色,植株生长良好,根系、须根发达,须根数目明显增多。转pCAMBIA1304-CkND拟南芥株高增加了30%,显著提高了植物抗旱性。
【英文摘要】Protein CkND, a novel disease-resistant and drought-resistant protein, was extracted formthe roots of Cynanchum Komaroviiby method of proteomics. In this study, we tested the fungicidalactivities and resistance of protein CkND againstVerticillium dahliae. The results showed that short protein CkND may have a good inhibition on the spore germination and mycelial growth ofVerticilli-um dahliae. In vitro test suggested that 100 mg·L-1of protein CkND on mycelial growth at 24 h, 48h, 72 h was 79.53%, 83.01% and 87.50%, respectively ,and 35 mg·L-1of protein CkND on sporegermination ofVerticillium dahliaewas 100%.In vivotest showed that protein CkND had good in-hibitory effects againstVerticillium dahliae. In addition, theCkNDgene was constructed into the downstream of the CaMV35S promoter of the pCAMBIA1304 expression vector and transfer of pCAMBIA1304-CkNDwas transferred intoArabidopsisthalianamediated by Agrobacteriumtume faciens. We take33 pCAMBIA1304-CkNDT2transgenic plants and 21 pCAMBIA1304 T2transgenicplants into drought-resistant experiments at the same time. The results showed that 14 of the pCAMBIA1304 T2transgenic plants died, but 24 pCAMBIA1304-CkNDT2transgenic plants survived. Theleaves kept green, the plant growed well, roots and fibrous roots developed strongly, and the number of fibrous roots increased obviously. The drought-resistant of pCAMBIA1304 CkNDtransgenic plants increased 30%, which obviously enhance the drought-tolerance of plants.

【英文关键词】Sweet sorghum; Nutritioncomposition; Dry matter yield; Silage
【中文摘要】为探索华东地区甜高粱(Sorghum bicolor (L.) Moench)用作青贮饲料的可能性,丰富该地区饲料作物来源,在相同的大田试验条件和350 kg · hm-2施肥(尿素)水平下,以渝单8号和登海9号玉米(Zea mays L.)为参照,研究了大力士甜高粱(H unnigreen)的干物质产量、饲草品质和青贮饲料品质.大力士甜高粱5月下旬播种,9月初刈割.结果表明:地上部干物质产量达44.0 t · hm-2,显著高于玉米(P<0.05).大力士干物质中粗蛋白质含量为5.11%,和渝单8号相近;粗蛋白质和可消化干物质产量分别达到2.25和20.8 t · hm-2,是玉米的1.4倍和1.6倍.大力士的中性洗涤纤维(NDF)含量与2个玉米品种无显著差异,酸性洗涤纤维(ADF)含量显著高于玉米(P<0.05),但青贮后,大力士ADF含量下降了3.2%.大力士甜高粱青贮发酵品质及青贮饲料品质和玉米相当,因此在华东地区用作青贮作物栽培有较大的利用潜力.

【题目】棉花体细胞胚发生机理的研究进展
【中文关键词】陆地棉;体细胞胚发生;畸形体细胞胚;机理
【英文关键词】Gossypium hirsutumL.;somatic embryogenesis;abnormal somatic embryo;mechanisms
【中文摘要】棉花是一种较难通过体细胞胚发生完成植株再生的作物,而体细胞胚发生是限制棉花基因工程和细胞工程得以广泛应用的主要因素.研究者从不同角度探讨了棉花体细胞胚发生机理并取得了很大的进展,为棉花的遗传转化提供了重要的技术支持,同时成功建立了一些棉花植株再生体系.本文分别从基因型限制、胚胎学、生理生化变化、分子机理等

方面阐述了近年来棉花体细胞发生机制的研究进展,并讨论了本研究领域目前存在的主要问题及相应对策.
【英文摘要】Because it is relatively difficult to obtain somatic embryos and regenerated plants from cotton via tissue culture,somatic embryogenesis is a main factor which limits its extensive application on cotton genetic engineering and cell engineering.Great progresses have been made in different aspects of cotton somatic embryo research,and several research groups have established series of plant regeneration system of cotton,which provide necessary technical support for cotton genetic transformation.This article reviews the progresses in cotton somatic embryogenesis in recent years,mainly in genotype dependence of somatic embryogenesis,embryological studies,physiological and biochemical changes and molecular mechanisms.This article also discusses the existing problems in the studies of cotton somatic embryogenesis and the future works in this field.

【题目】支持向量机在地下水水质评价中的应用
【中文关键词】支持向量机;地下水;水质评价
【英文关键词】SVM;groundwater quality;water quality evaluation
【中文摘要】【目的】针对地下水水质评价中影响因素的模糊性和各因素与评价等级之间的不确定性等问题,采用支持向量机模型进行地下水水质评价研究,改进地下水水质评价方式。【方法】应用非线性支持向量机模型中的分类支持向量机,选用 Gauss核函数,以羊毛湾灌区部分水井的水质资料为研究对象,进行地下水水质评价,并利用综合指数法和BP人工神经网络法对评价结果进行验证。【结果】羊毛湾灌区水质评价结果显示,该区地下水资源已被污染,需要进行保护性开发。3种方法的评价结果较为相似,但相较于综合指数法,支持向量机计算速度较快,易于通过计算机实现;相较于标准BP人工神经网络模型,支持向量机的评价精度较高,收敛速度较快,且所需参数较少。【结论】支持向量机能将复杂的非线性问题转化为线性问题,从而有效地避免过学习问题,并且拥有极大的泛化能力和对小样本问题的处理能力,可有效提高地下水水质评价精度,简化评价过程,为地下水水质评价提供了一条新思路。
【英文摘要】【Objective】Oweing to the fuzziness of the affecting factors and uncertain relationship be-tween the factors and groundwater quality levels,the theory of Support Vector Machine(SVM)is intro-duced to study the groundwater evaluation,so that the groundwater quality evaluation,and the development and utilization of groundwater resources of Yangmaowan Irrigated Area could be improved.【Method】Choosing the Classified-Support Vector Machine(C-SVM)and Gauss kernel function,using the data ofYangmaowan Irrigated Area,groundwater quality is evaluated.And the result is compared with the one ofSynthetical Index Method and BP Artificial Neural Network(BP ANN).【Result】From the result ofgroundwater quality evaluation of Yangmaowan Irrigated Area,we can see that,the groundwater should beprotective development.The results from 3different methods are similar,but comparing with SyntheticalIndex Method,the calculation of SVM is faster and easier to achieve on the computer;and comparing withstandard BP ANN,SVM is more accurate,faster,and need fewer parameters.【Conclusion】The methodbased on SVM can translate nonlinearity to linearity,so it can avoid over-fitting problem.Besides,it alsohas better generalization ability and handling ability with small sample data.Apparently,it can also improvethe accuracy effectively and simplify the calculation.Overall,SVM is a new way to evaluate the groundwa-ter quality.

【题目】基于GIS技术的远程集中用水管理控制系统
【中文关键词】GIS;GSM 通信;历史数据;用水管理;远程控制
【英文关键词】GIS technology; GSM communication; history data; water management; remote control
【中文摘要】该系统是结合 GIS 技术和 GSM 通信技术,实施对农业灌溉用水的远程调度和管理同时合理的对农作物进行灌溉保证了农产品的质量。在系统中充分利用计算机技术和 GIS 技术对各个不同用水点的信息进行可视化的管理。同时利用 GSM 网络覆盖面积广、抗干扰强等特点,实现对数据的远程传输。利用 Visual C++6.0 和 SQL Server 2000 数据库技术来实现对实时数据进行处理。通过对系统中的灌溉和用水历史数据的科学分析,从而达到对灌溉用水的科学使用和管理。通过应用示范,为北京市水利系统提供一套功能完备齐全的用水计量管理系统,达到对北京市地下用水统一管理,统一收费和科学决策的目的。
【英文摘要】To achieve the unification of management, charging and scientific decision-making of Beijing underground water, integrated with GIS and GSM communication technology, this system supervises the agricultural irrigative water remotely to guarantee the quality of agriculture products. Using GIS and computer technology, different water-consuming points could be supervised visually. With the advantages of the GSM internet, such as wide coverage area, powerful property of anti-jamming, the remote data transmission was achieved. Visual C++6.0 and SQL Server 2000 were used to process the remote data. The history data of irrigation must be analyzed scientifically to administer and use the irrigative water reasonably. Through the demonstrative applications, the system provides a fully functional system of water management.

【题目】不同壳型菲律宾蛤仔杂交家系的建立及早期生长发育比较
【中文关键词】菲律宾蛤仔, 壳型, 杂交家系, 生长发育
【英文关键词】Ruditapes philippinarum Shell shape Hybrid family Growth development
【中文摘要】利用3种壳型的菲律宾蛤仔,即壳宽型(H)、中间型(M)和壳扁型(P),采取双列杂交方式,成功建立3种杂交组合(PH、HM和MP),每个杂交组合由4个杂交家系组成,共12个杂交家系。结果表明,不同壳型亲本形态差异显著(P<0.05,n=4);各杂交组合的D形幼虫、附着规格、变态规格和单水管稚贝的大小彼此间差异不显著(P>0.05,n=120)。幼虫浮游期间,3种杂交组合表现出不同程度的生长、存活优势。PH杂交组合表现出明显的生长优势,与HM、MP组幼虫大小差异显著(P<0.05,n=120),生长速度分别为(10.21±0.42)、(9.96±0.52)和(9.29±0.52) μm/d;从存活率上看,9日龄时,PH杂交组合存活率最高,与HM、MP组合差异极显著(P<0.05,n=12)。变态期间,幼虫生长缓慢,PH、HM和MP杂交组合的生长速度分别为(1.72±0.48)、(1.93±0.53)和(2.08±0.39) μm/d,差异显著(P<0.05,n=120);变态率分别为(83.20±8.47)%、(6.45±3.06)%和(10.75±3.70)%,差异极显著(P<0.01,n=12)。稚贝培育期间,3组稚贝的大小差异极显著(P<0.01,n=120),生长速度分别为(16.74±3.06)、(13.08±2.24)和(15.20±2.55) μm/d;本阶段3组存活率均较高,分别为(93.25±2.99)%、(90.75±2.22)%和(87.25±4.86)%,彼此间差异显著(P<0.05,n=12)。
【英文摘要】The twelve hybrid families were obtained by broodstock of different shell shapes including "wide","middle","flat" in October,2007.The experiment consisted of three hybrid categories(PH=0,HM,MP),and each category was made up of four hybrid families,which included twelve hybrid families altogether.The results showed that the morphology of parents was of significant difference,and the size of D-larvae,size at settlement and metamorphosis,and the size of single siphon juveniles were not significantly different.At planktonic stage,the growth and survival of the larvae were different.The size of PH larvae was significantly bigger than HM and MP categories(P<0.05,n=120),and the growth rates were(10.21 ± 0.42),(9.96 ± 0.52),(9.29 ± 0.52) μm/d for these categories,respectively.The survival of 9d larvae of the PH category was significantly higher than the HM and MP categories.At the metamorphic stage,the larvae grew slowly.Larvae of the PH,HM and MP categories showed growth rates of(1.72 ± 0.48),(1.93 ± 0.53),(2.08 ± 0.39) μm /d,respectively,which were significantly different.The metamorphosis rates of these categories were(83.20 ± 8.47)%,(6.45 ± 3.06)%and(10.75 3.70)%,and the difference was extremely significant.At the nursery stage,juveniles of the PH,HM,MP categories showed significant difference in size and their growth rates were(16.74 3.06),(13.08 2.24)and(15.20 2.55) μm/d,respectively.Survival of juveniles was also significantly different between each category,which was(93.25 ± 2.99)%,(90.75 ± 2.22)%and(87.25 ± 4.86)% for PH,HM and MP.

【题目】Genetic structure composed of additive QTL, epistatic QTL pairs and collective unmapped minor QTL conferring oil content and fatty acid components of soybeans
【中文关键词】无
【英文关键词】Soybean [Glycine max (L.) Merr.];Oil and fatty acids;Additive QTL;Epistatic QTL pair; Collective unmapped minor QTL
【中文摘要】无
【英文摘要】The relative importance of various types of quantitative trait locus (QTL) conferring oil content and its fatty acid components in soybean seeds was assessed through testing a recombinant inbred line(RIL) population (derived from KF1 9 NN1138-2) in randomized blocks experiments in 2004 – 2006. The contents of oil and oleic, linoleic, linolenic, palmitic and stearic acids were determined with automatic Soxhlet extraction system and gas chromatography, respectively. Based on the established genetic linkage map with 834 markers, QTLNetwork2.0 was used to detect QTL under the genetic model composed of additive, additive 9 additive (epistasis), additive 9 year and epistasis 9 year effects. The contributions to the phenotypic variances of additive QTL and epistaticQTL pairswere 15.7%(3 QTL) and 10.8%(2 pairs) for oil content, 10.4% (3 QTL) and 10.3% (3 pairs) for oleic acid, 11.6% (3 QTL) and 8.5% (2 pairs) for linoleic acid, 28.5% (7 QTL) and 7.6% (3 pairs)for linolenic acid, 27.0% (6 QTL) and 16.6% (7 pairs) for palmitic acid and 29.7% (5 QTL) and 4.3%(1 pair) for stearic acid, respectively. Those of additive QTL by year interaction were small and no epistatic QTL pair by year interaction was found. Among the 27 additiveQTL and 36 epistaticQTL (18 pairs), three are duplicated between the two QTL types. A large difference was found between the genotypic variance among RILs and the total variance of mapped QTL, which accounted for 52.9 – 74.8% of the genotypic variation, much larger than those of additive QTL and epistatic QTL pairs. This part of variance was recognized as that due to a collection of unmapped minor QTL, like polygenes in biometrical genetics, and was designated as collective unmapped minor QTL. The results challenge the breeders for how to pyramid different types of QTL. In addition, the present study supports themapping strategy of a fullmodel scanning followed by veri fi cation with other procedures corresponding to the fi rst results.

【题目】Isolation and Characterization of an ERF Transcription Factor Gene from Cotton(Gossypium barbadense L.)
【中文关键词】无
【英文关键词】Ethylene-response factor(ERF).Pathogen-inducible.GCC box.Cotton.Gossypium barbadense L.. Transcription activator
【中文摘要】无
【英文摘要】A pathogen-inducible ethylene-responsive factorgene,EREB1,was isolated and characterized in cotton(Gossypium barbadense L.).The deduced amino acidsequence of EREB1 had some typical features of transcriptionfactors including nuclear localization signals,an acidicactivation domain,and a conserved DNA binding domain.As a single copy gene in the cotton genome,the level ofexpression of EREB1 in roots and leaves was significantlyelevated following treatment with Verticillium wilt toxin.Presence of a GCC box-binding ability motif indicated that theEREB1 protein was capable of binding to GCC box elementsin vitro as a

transcriptional activator.In tobacco,overexpres-sion of EREB1 activated pathogenesis-related genes undernormal growth conditions.These results suggested thatEREB1 might play an important role in biotic stress signaltransduction pathways and that the overexpression of EREB1might serve as a viable approach to enhance diseaseresistance t in cotton.

【题目】水稻根系与叶片形态特征的定量分析
【中文关键词】水稻;叶片形态特征;根系形态参数;回归分析
【英文关键词】rice;morphologic character of leaf;morphologic parameter of root;regression analysis
【中文摘要】定量分析拔节一孕穗期间水稻根系形态参数与叶片形态特征间的关系。以江苏省农业科学院培育的高产品种两优108(Vl,杂籼)、86优8(v2,杂粳)和南粳43(V3,常规粳稻)为材料,采用塑料桶土培,设施肥(每盆N 3.6 g、P20,0.8 g、K:0 3.6 g)与不施肥(处理同施肥基土)两个处理,在试验观测的基础上,建立水稻不同处理下根系形态参数与叶片性状间的预测回归模型。研究表明:拔节一孕穗期间水稻根系形态参数与叶片形态特征间的3个预测回归模型的方差分析都达到极显著水平,拟合度较好,单株总根长、总根表面积及总根体积模拟值与实测值的平均绝对误差分别为每株一176.506 cm、8.784 cm2及一1.624 cm3(n=24),差值标准误分别为每株31.542 cm、15.653 cm2和2.117 cm3,相关系数分别为0.913**、0.904**和0.907**。上述拔节一孕穗期间叶片形态特征与根系形态间预测回归模型,为探明水稻地下与地上几何性状的联系提供了借鉴,也为支撑水稻植株地上部与地下部的协同虚拟表达,以及高产株型及栽培措施选择等提供了参考。
【英文摘要】The objectives of this study were to quantify the relationships among morphologic characters of leaf and root system in rice during the period of elongation to booting.Three high yield rice materials of Jiangsu Academy of Agricultural Sciences,Liangyoul08(indica hybrid rice,V1),86you8(japonica hybrid rice,V2),and Nanjing43(japonica rice,V3),were planted in pots with loamy soil.There were two treatments of fertilizer:fertilizer of 3.6 g N,0.8 g P205 and 3.6 gK0 per pot and no fertilizer.Based on the experimental observations,the multifactor linear regression(MLR)models between morphologic parameters of leaf and root system were built.The variance of three MLR models was significant,and the fitness of models was very good.The average absolute deviation between simulated value and measured value of total root length,total root surface and total root volume were 一176.506cm per plant,8.784 cm2 per plant,and一1.624 cm3 per plant(n=24),the corresponding standard error of difference per plant were 31.542cm,15.653cm2,and 2.117cm3,and corresponding correlation coefficients were 0.913**,0.904**and 0.907**,respectively.The MLR models between the characteristic 0f leaf and morphology of root system from elongation to booting would be help to link the research of above-ground part with that 0f root system,cooperate visualizing rice plants above-ground with under-ground,and select high yield plant types and cultivation practices.

【题目】中国蛤蜊的家系建立及早期生长发育
【中文关键词】中国蛤蜊; 家系; 生长; 存活; 变态
【英文关键词】Mactra chinensis Philipi; family; growth; survival; metamorphosis
【中文摘要】采用不平衡巢式设计建立了中国蛤蜊家系(7个父系半同胞家系和21个全同胞家系:A1、A2、A3……G1、G2、G3),并对各家系的卵径、受精率、孵化率及生长、存活和变态等相关指标进行了分析。结果表明,各家系蛤蜊的卵径、受精率、孵化率及D形幼虫大小均无显著差异(P>0.05)。不同发育阶段各家系的个体大小不同,生长速度不同,并受父本

效应、母本效应及雄内雌间作用的影响。幼虫浮游期,G1壳长最大,生长速度为(10.04±1.67) μm/d;A2壳长最小,生长速度为(6.07±1.32) μm/d。幼虫匍匐期,B3生长最快,其生长速度为(29.93±3.67) μm/d;D1生长最慢,其生长速度为(16.72±2.73) μm/d。稚贝期,G3壳长最大,生长速度为(83.14±5.85) μm/d;A2、A3的壳长较小,其生长速度分别为(57.78±5.44) μm/d,(55.86±4.48) μm/d。幼虫浮游期,A2、C1、E3、F2、G1、G2的存活率较高(>85%),B2、D1存活率较低(<35%);稚贝培育期,G1存活率(70.40%)最高;A1(23.40%)、C2(20.90%)、F1(19.30%)的存活率较低。变态期间,各家系的生长速度不同,G1、G3生长速度较快,分别为(7.94±1.53) μm/d、(7.96±1.52) μm/d;D1生长速度最慢,仅为(5.23±0.75) μm/d。各家系的变态率不同,B1、E1、G2变态率均在80%以上,E2(41.24%)、F1(43.25%)变态率较低。各家系的变态规格存在差异,随着变态时间的延长变态规格小型化;G1、G2、G3变态规格最大(240 μm),变态时间最短(13d);D1变态规格最小,仅为(226.65±5.65) μm,变态时间最长(17d)。综合各家系生长、存活等早期表型性状,G3生长最快,F2存活率最高,G1产量最高,可进一步作为中国蛤蜊的育种材料。

【英文摘要】A total of 7 half-sib families and 21 full-sib families(A1,A2,A3…G1,G2,G3) of sunray surf clam Mactra chinensis Philipi were established by using the method of unbalanced nest design in Sept.2007.Phenotypic traits of different families,such as egg-diameter,fertilization rates,hatching rates,and larval and juvenile growth,survival and metamorphosis were analyzed.The results showed that egg-diameter,fertilization rates,hatching rates,and D larval size were non-significantly different among families(P>0.05).Considering growth,growth was varied at different development stages for each family and was influenced by maternal effect,paternal effect and male within female effect.G1 had the largest shell length with the growth rate of(10.04 ± 1.67) μm/d;whereas A2 had the smallest shell length with(6.07 ± 1.32) μm/d during pelagic period of larvae.B3 grew fastest in filial generation of family with(29.93 ± 3.67) μm/d;whereas D1 grew slowest in filial generation of family with(16.72 ± 2.73) μm/d during plantigrade period.G3 had the largest shell length with the growth rate(83.14 ± 5.85) μm/d;whereas A2,A3 of juvenile indoor period had the smallest shell length with growth rate of(57.78 ± 5.44) μm/d,(55.86 ± 4.48) μm/d respectively.Considering survival,A2,C1,E3,F2,G1 and G2 had higher survival rate(> 85%) in filial generation of family,whereas B2,D1 had lower survival rate(< 35%) in filial generation of family during pelagic period of larvae.G1 had the highest survival rate(70.40%) in filial generation of family,whereas A1(23.40%),C2(20.90%),F1(19.30%) had lower survival rate in filial generation of family during juvenile indoor period.Considering metamorphosis,growth rate was varied for each family,the growth rate of G1and G3 was(7.94 ± 1.53) μm/d,and(7.96 ± 1.52) μm/d respectively,but the growth of D1 was only(5.23 ± 0.75) μm/d.B1,E1 and G2 had higher metamorphosis(> 80%) in filial generation of family,whereas E2(41.24%),and F1(43.25%) had lower metamorphosis in filial generation of family.However,as the metamorphic time prolonged,the metamorphic size decreased.G1,G2,G3 had the largest metamorphic size(240 μm) with the shortest metamorphic time(13 d),whereas D1 had the lowest metamorphic size[(226.65 ± 5.65) μm]with the longest metamorphic time(17 d).By summarizing the early phenotypic traits of families,G3,F2 and G1 respectively inherited the excellent traits such as fast growth,strong stress resistance,and high yield,and could further be used as the breeding material for rearing of new sunray surf clam strains. 更多

【题目】Genetic analysis and fine-mapping of a dwarfing with withered leaf-tip mutation in rice

【中文关键词】1

【英文关键词】mutant; dwarf; finemapping; rice

【中文摘要】1

【英文摘要】A dwarf mutant of rice (Oryza sativa L.) by mutagenesis of ethylene methylsulfonate (EMS) treatment from Nipponbare was identified. The mutant exhibited phenotypes of dwarfism and witheredleaftip (dwl1). Based on the internode length of dwl1, this mutant belongs to the dm type of dwarfing. Analysis of elongation of the second sheath and α-amylase activity in endosperm showed that the phenotype caused by dwl1 was insensitive to gibberellin acid treatment. Using a large F2 population derived from a cross between the dwl1 and an indicarice variety, TN1, the DWL1 gene was mapped to the terminal region of the long arm of chromosome 3. Fine-mapping delimited it into a 46 kb physical distance between two STS markers, HL921 and HL944, where 6 open reading frames were predicted. Cloning of DWL1 will contribute to dissecting molecular mechanism that regulates plant height in rice, which will be

beneficial to molecular assisted selection of this important trait.

【题目】Differential gene expression of cotton cultivar CCRI24 during somatic embryogenesis
【中文关键词】无
【英文关键词】Auxin;Cotton;Ethylene;Somatic embryogenesis;Suppression subtractive hybridization
【中文摘要】无
【英文摘要】Regeneration is an essential step for recovery of transgenic plants following genetransfer.However,most cotton cultivars fail to respond to the current regenerationprotocols for cotton.This hinders the use of gene transfer technology to improve thiscrop.Identification of the genes involved in cotton somatic embryogenesis(SE)mayprovide information that will help to improve regeneration protocols.To investigatethe genes expressed during cotton SE,we constructed a suppression subtractivehybridization(SSH)library using cDNA from nonembryogenic callus as driver andthose from embryogenic callus as tester.From this library,368 cDNA clones thathybridized conspicuously to the forward-subtracted and unsubtracted tester probes,but not to the reverse-subtracted or unsubtracted driver probes,were obtained andsequenced.Among the 241 putative unigenes,the functions of 152 genes(63%)couldbe assigned using existing databases.In addition to many previously reportedSE-related genes,some new genes,such as members of ethylene pathway and auxinpathway,were discovered in our library.The expression of eight genes,including anAux/IAA responsive gene,was analyzed by reverse-transcription-polymerase chainreaction and found to be upregulated during the SE.This is in agreement withprevious studies showing that embryogenesis involves auxin signaling.&2009 Elsevier GmbH.All rights reserved.

【英文摘要】Background:Drought is one of the most important environmental factors causing water stressfor cotton,and it greatly limits cotton growth and crop productivity.So far only a few drought tolerance genes have been functionally characterized in details,and most efforts on this topic have been made in model organisms.Therefore,to identify more drought-related genes in cotton plays the underlying mechanisms of drought tolerance as well as utilizingbioengineering techniques to improve the tolerance in this organism.Findings:Here we constructed a subtractive drought-tolerance cDNA library using suppressivesubtractive hybridization(SSH).Through differential screening and bioinformatics analysis,weidentified 392 positive clones with differential expression,corresponding 265 unique genes.ByBLAST search against Genbank,we found that more than half of these EST sequences werehomologous to those previously known drought-related genes and that there were 57 sequenceswith unknown functions,suggesting that many more genes are involved in this complex trait.Moreover,using RT-PCR,we examined the expression of nine representative candidate genes andconfirmed that their expression levels were increased at different levels under drought stress.Conclusion:Our results show that drought tolerance is a complex trait in cotton,which involvesthe coordination of many genes

and multiple metabolism pathways.The candidate EST sequenceswe identified here would facilitate further functional studies of drought-related genes and provide important insights into the molecular mechanisms of drought-stress tolerance and genetic breeding in cotton.

【题目】微囊藻毒素对油菜幼苗生长及抗氧化酶活性的影响
【中文关键词】微囊藻毒素;油菜;生长;抗氧化酶;叶绿素
【英文关键词】microcystins;rape;growth;antioxidant enzymes;chlorophyll
【中文摘要】以‘秦优9号’油菜为材料,研究不同浓度藻毒素(MC)对油菜种子萌发和幼苗生长、叶绿素含量和抗氧化 酶活性的影响,以及并对MC-LR和一RR在幼苗体内的积累进行分析。结果表明:仅5 000 ng/mL MC处理的油菜种子发芽率和发芽势显著低于对照和其余浓度处理,而其他处理及对照间无显著差异;在高浓度(1 000~5 000 ng/mL)MC处理下,幼苗出现植株矮化、叶片呈黄褐色、叶面积减小,以及主根变短、变粗且根系呈现黄褐色等毒害症状;叶绿素含量随着藻毒素浓度的递增表现为先上升后下降趋势,MC对SOD活性具有抑制作用,但对POD的活性具有促进作用,CAT活性随MC浓度的增加表现为先上升后下降的趋势;单位鲜重幼苗体内MC—LR和一RR 含量随MC处理浓度的升高而增加,但MC-LR和一RR的积累率随MC浓度的增加而减小。研究发现,高浓度微囊藻毒素能显著抑制油菜幼苗生长,同时显著改变其体内保护酶活性,且MC可被油菜植株吸收并在其体内积累。
【英文摘要】Effects of different concentrations of microcystins(MC)on the germination percentage,germination energy,the content of chlorophyll,the growth and the activities of antioxidant enzymes of rape(Brassica campestris L.)‘Qinyou 9’and the accumulation of MC—LR and—RR in seedlings were studied.The results showed that the MC had no significant effects on the germination percentage and germinating viability compared with that of the contro1 except the 5000 ng/mL treatment.However,the growth of rape seedlings markedly decreased with the increase of MC concentration.When the rape seedlings were under the higher MC concentrations(1 000~5 000 ng/mL),it was found that the shoots of rape seedlings shortened,the 1eaves had brown spots,the leaf area reduced,and the primary root become shorter and turned brown.The chlorophyl1 content increased under the 1OW concentrations,whereas the chlorophyll content decreased in the higher MC concentration.With the MC treatments the activities of S0D and CAT showed the trend of increase and decrease,but the activity of P0D was induced and increased.The contents of MC—LR and—RR in the seedlings increased with the increase of MC concentration,while the accumulated rates decreased.The results suggested that MC can strongly change the activities of antioxidant enzymes,inhibit the growth,be absorbed and accumulated in rape seedlings.

【题目】不同地理群体菲律宾蛤仔生长发育的比较
【中文关键词】菲律宾蛤仔; 地理群体; 生长; 存活; 变态
【英文关键词】Ruditapes philippinarum; geographical population; growth; survival; metamorphosis
【中文摘要】于2007年6月—11月,对菲律宾蛤仔Ruditapes philippinarum莆田群体(PT)、大连群体(DL)和东京群体(DJ)的生长发育情况进行了比较。结果表明:菲律宾蛤仔3个群体的受精率、孵化率无显著差异(P>0.05);卵径、D形幼虫大小、单水管稚贝大小差异显著(P<0.05);附着规格、亲贝形态,PT群体与DL、DJ群体间差异显著(P<0.05)。浮游期间,幼虫生长速度依次为PT>DJ>DL,分别为(9.37±0.44)、(9.28±0.59)、(8.70±0.51) μm/d,PT、DJ群体与DL群体差异显著(P<0.05);9日龄时

,PT、DL、DJ群体幼虫的存活率分别为(95.08±1.87)%、(85.22±3.34)%、(75.32±3.49)%,彼此间差异显著(P<0.05)。变态期间,3个群体幼虫的生长速度依次为PT>DJ>DL,分别为(2.54±0.39)、(2.37±0.52)、(2.05±0.45) μm/d,彼此间差异显著(P<0.05);变态率、变态时间、变态规格,PT群体与DL、DJ群体间差异显著(P<0.05)。室内培育阶段(20~40日龄),3个群体稚贝的生长速度依次为PT>DL>DJ,分别为(22.60±4.04)、(20.67±4.74)、(18.74±5.15) μm/d,PT、DL群体与DJ群体间差异显著(P<0.05);40日龄时,PT、DL、DJ群体稚贝的存活率分别为(87.07±4.29)%、(66.73±6.43)%、(35.75±4.84)%,彼此间差异显著(P<0.05)。室外养成阶段(80~160日龄),3个群体稚贝的生长速度依次为PT>DL>DJ,分别为(86.94±21.72)、(75.23±16.91)、(67.25±18.26) μm/d,彼此间差异显著(P<0.05);160日龄时,PT、DL、DJ群体幼贝的存活率分别为(90.21±4.68)%、(66.73±4.94)%、(56.98±6.58)%,彼此间差异显著(P<0.05)。

【英文摘要】Growth and development of Manila clam(Ruditapes philippinarum) were investigated in different geographical populations including Putai(PT),Dalian(DL) and Tokyo(DJ) on June 2007.The results showed that there were no significant differences in egg-diameter,and sizes in D larvae and single-siphon juveniles,but significant difference in sizes at settlement and metamorphosis and morphology of the broodstocks among different geographical populations.At the pelagic stage,shell length was smaller in DL population than that in PT and DJ populations.The daily growth and survival rates were found to be(9.37±0.44),(8.70±0.51),(9.28±0.59) μm and(95.08±1.87)%,(85.22±3.34)%,(75.32±3.49)% in the three populations larvae,respectively.During metamorphosis,there were significant differences in growth,metamorphosis rate,metamorphic time,and size at metamorphosis among the three populations.During the nursing stage indoor,the maximal shell length was observed in the PT population,followed by DJ population,and next to DL population.The daily growth and survival rates were(22.60±4.04),(20.67±4.74),(18.74±5.15) μm and(87.07±4.29)%,(66.73±6.43)%,(35.75±4.84)% in larvae of the three populations,respectively.During the rearing stage outdoor,the maximal shell length was found in the PT population,followed by DL population,and next to DJ population.The daily growth of(86.94±21.72),(75.23±16.91),and(67.25±18.26) μm and survival rates of(90.21±4.68)%,(66.73±4.94)%,and(56.98±6.58)% were observed in larvae of the three populations,respectively.

【题目】水稻籼粳交DH群体的构建及其基因型偏态分离分析

【中文关键词】水稻; DH群体; SSR标记; 纯合; 基因型; 偏态分离

【英文关键词】rice; DH population; SSR markers; homozygous; genotype; distorted segregation

【中文摘要】对籼(Oryza sativa L.ssp.indica)粳(O.sativa L.ssp.japonica)杂交组合中花11(粳)/中组14(籼)F1进行花药培养,共获得112个加倍单倍体(DH)再生植株。利用亲本间多态性SSR分子标记对该DH群体再生植株进行纯合性鉴定,并分析该群体的基因型偏离情况。选用22个多态性SSR标记分析的结果表明,所得再生植株都来自花粉母细胞的纯合植株,不存在来自体细胞的杂合株,确保了DH群体的准确性。带型分析结果显示,该群体未发生异常的基因型偏态分离。因此在组织培养体系中引进SSR标记,可以快速而准确地构建DH群体,基因型的偏态分离分析保证了群体的质量。

【英文摘要】F1 anther of Zhonghua 11/Zhongzu 14 (japonica/indica)combination was cultured and one hundred and twelve double haploid (DH) regenerant plants were obtained. All of the DH plants were analysed for their homozygosity using 22 polymorphic SSR markers between the two parents. Distorted segregation analysis in genotype for the population was carried out. Polymorphic SSR analysis suggested that the regenerant plants were all originated from microspore and no heterozygots from somatic cells. Band pattern analysis with polymorphic SSRs showed that there was no abnormal distribution in genotype for the population. The results indicated that the DH population consisted accurately of microspore-originated regenerants and quality of the population was guaranteed via distorted segregation analysis in genotype with SSR markers.

【题目】Histological and Ultrastructural Observation Reveals Significant Cellular Differences between Agrobacterium Transformed Embryogenic and Non-embryogenic Calli of Cotton
【中文关键词】无
【英文关键词】cell organization pattern;chloroplasts;embryogenic callus;Gossypium hirsutum;histological structure;transformation;ultrastructure.
【中文摘要】无
【英文摘要】Over the past few decades genetic engineering has been applied to improve cotton breeding. Agrobacterium medicated transformation is nowadays widely used as an efficient approach to introduce exogenous genes into cotton for genetically modified organisms.However,it still needs to be improved for better transformation efficiency and higher embryogenic callus induction ratios.To research further the difference of mechanisms for morphogenesis between embryogenic callus and non-embryogenic callus,we carried out a systematical study on the histological and cellular ultrastructure of Agrobacterium transformed calli.Results showed that the embryogenic callus developed nodule-like structures,which were formed by small, tightly packed,hemispherical cells.The surface of some embryogenic callus was covered with a fibrilar-like structure named extracellular matrix.The cells of embryogenic calli had similar morphological characteristics.Organelles of embryogenic callus cells were located near the nucleus,and chloroplasts degraded to proplastid-like structures with some starch grains.In contrast,the non-embryogenic calli were covered by oval or sphere cells or small clusters of cells. It was observed that cells had vacuolation of cytoplasm and plastids with a well organized endomembrane system.This study aims to understand the mechanisms of embryogenic callus morphogenesis and to improve the efficiency of cotton transformation in future.

【题目】微囊藻毒素(MC-RR)对白三叶种子萌发及幼苗生理生化特性影响
【中文关键词】藻毒素;白三叶;种子;抗氧化酶
【英文关键词】MC-RR; Trifolium repens; seed; antioxidant enzyme
【中文摘要】以白三叶种子和幼苗为材料,研究了不同浓度MC-RR对白三叶种子萌发、抗氧化酶活性变化以及MC-RR在白三叶体内积累规律。结果表明,发芽率和发芽势随着处理浓度的增加而降低,在高浓度处理下,与对照相比显著降低;株高随着MC-RR处理浓度增加而显著降低,根长和鲜重在低浓度处理下显著增加,在高浓度处理下显著降低;抗氧化酶活性的变化不尽相同,SOD活性随着处理浓度的增加与对照相比呈先增加后降低而后又增加的趋势,POD活性随着处理浓度的增加呈先增加后降低的趋势,CAT活性的变化趋势不同于SOD和POD;单位鲜重白三叶MC-RR含量随着处理浓度的增加与0.05mg/L处理下的MC-RR含量相比显著增加,而生物富集系数的变化趋势则与单位鲜重白三叶MC-RR含量相反,随着MC-RR处理浓度的增加而降低。说明随着MC-RR处理浓度的增加,白三叶受到的伤害增大。
【英文摘要】The seed and seedlings of Trifolium repens were treated with various concentration of MC-RR. The effects of MC-RR on the seed germination, the change of antioxidant enzymes and the regulation of MC-RR accumulation in T. repens were studied in this paper. The results showed that the germination percentage and the germinating viability decreased with the increase of MC-RR concentration. When at the higher concentration, the germination percentage and germinating viability significantly decreased compared with the control. Shoot height markedly inhibited with the rising of MC-RR concentration. Root length and fresh weight significantly increased under the lower concentration. Whereas they markedly reduced at the higher concentration. The changes of antioxidant enzymes were different each other. SOD activity indicated the trend of increase-decrease-increase compared with the control. POD activity illustrated that it increased firstly and the decreased. However, the trend of CAT activity was different from SOD and POD. The MC-RR content of T. repens increased with the treating concentration compared with the concentration of 0.05 mg/L,

whereas bioccocentration (BCF) decreased. All the results suggested that the seed and seedlings of T. repens would be damaged seriously with the increase of MC-RR concentration.

【题目】The identification and mapping of a tiller angle QTL on rice chromosome 9
【中文关键词】ORYZA-SATIVA L.; FRIZZY-PANICLE; SPREADING STUB; DWARF MUTANT; GENE; GROWTH; BIOSYNTHESIS; GRAVITROPISM; ARCHITECTURE; ELONGATION
【英文关键词】ORYZA-SATIVA L.; FRIZZY-PANICLE; SPREADING STUB; DWARF MUTANT; GENE; GROWTH; BIOSYNTHESIS; GRAVITROPISM; ARCHITECTURE; ELONGATION
【中文摘要】Tiller angle is an important component of plant architecture in rice even though little is known of its mode of inheritance. A quantitative trait loci (QTL) analysis based on a set of recombinant inbred lines extracted from an indica × japonica cross identified a major effect locus (designated qTA-9a) on chromosome 9, which was expressed in two independent environments. The qTA-9a allele derived from the indica parent IR24 increased tiller angle. This QTL was validated in a set of chromosome segment substitution lines involving the same two parental lines. A high resolution genetic map was constructed from a large secondary F2 population and anchored to the genomic sequence of rice. The QTL was narrowed to a 65-kb physical region, inclusive of eight putative genes. We have provided the basis for positional cloning of qTA-9a and have developed markers for a major tiller angle QTL.

【题目】Quantitative trait loci mapping and stability for low temperature germination ability of rice
【中文关键词】rice; low temperature germination ability; quantitative trait locus
【英文关键词】rice; low temperature germination ability; quantitative trait locus
【中文摘要】A high rate of germination at low temperatures is necessary for economic yields to be maintained. In this paper, the genetic control of low temperature germination ability (LTG) was assessed by the measurement of germination rate (GR), germination rate index (GI) and mean germination time (MGT), and genetically mapped using a set of recombinant inbred lines, derived from a cross between the japonica cultivar 'Asominori' and the indica cultivar 'IR24'. Putative quantitative trait loci (QTL) were validated by testing in two related sets of chromosome segment substitution lines (CSSL). In this genetic background, LTG is under the control of a number of QTL, each of relatively small effect, and is spread over six chromosomes. The most stable of these QTL was for GR, mapping to a segment of chromosome 11 which also carries a QTL for GI. On chromosome 2, qGR-2 not only controlled GR, but also was associated with GI and MGT. Significant differences in LTG were detected between 'Asominori' and some CSSL harbouring qGR-2 or

qGR-11.

【题目】QTL analysis of cold tolerance at seedling stage in rice (Oryza sativa L.). using recombination inbred lines
【中文关键词】rice; seedling cold tolerance; recombinant inbred lines (RILs); chromosome segment substitution lines (CSSL); quantitative trait loci (QTL) mapping
【英文关键词】rice; seedling cold tolerance; recombinant inbred lines (RILs); chromosome segment substitution lines (CSSL); quantitative trait loci (QTL) mapping
【中文摘要】Cold tolerance at seedling stage of rice (Oryza sativa L.) is a favorable trait for the stable establishment in temperate and high-elevation areas. In the present study, 71 recombinant inbred lines (RIL) derived from the cross of Asominori (Japonica) and IR24 (Indica) were used to identify quantitative trait loci (QTL) affecting cold tolerance at seedling stage. The putative QTL was further confirmed using some chromosome segment substitution lines (CSSLs), in which IR24 was used as the donor parent and Asominori as the recurrent parent. The average seedling mortality was used as cold tolerance after cold treatment with 6 degrees C for 7 days and recovery culture with 25 degrees C for 4 days at three-leaf seedling stage. Three QTL affecting cold tolerance at seedling stage were detected on chromosomes 1, 5 and 6 with LOD scores ranging from 2.2 to 4.1 using composite interval mapping (CIM). Among them, qSCT-1 located in the region of XNpb87-2-C955 on chromosome 1 was a major QTL which explained 24.51% of total phenotypic variance and favorable allele came from japonica parent, Asommori. In addition, IR24 alleles at the other two loci (qSCT-5 and qSCT-6) increased cold tolerance. And these three QTL were confirmed by four lines from the IR24 CSSLs. Transferring favorable allele from japonica variety to indica background or pyramiding different QTL identified from indica is an effective way to improve cold tolerance of rice. 【题目】Identification of quantitative trait loci associated with resistance to brown planthopper in the indica rice cultivar Col.5 Thailand
【中文关键词】NILAPARVATA-LUGENS STAL; ORYZA-SATIVA L.; GENE
【英文关键词】NILAPARVATA-LUGENS STAL; ORYZA-SATIVA L.; GENE
【中文摘要】The brown planthopper (BPH) is one of the most serious insect pests of rice throughout Asia. In this study, we constructed a linkage map to determine the locus for BPH resistance gene, using an F-2 population from a cross between a resistant indica cultivar, 'Col.5 Thailand', and a susceptible cultivar '02428'. Insect resistance was evaluated using 147 F-3 families and the genotype of each F-2 plant was inferred from the phenotype of corresponding F-3 families. Two QTLs was detected on chromosome 2 (explains 29.4% phenotypic variation) and 6 (46.2% variation explained) associated with resistance to BPH in the mapping population. Comparison of the chromosomal locations and reactions to BPH biotypes indicated that the gene on chromosome 6 is different from at least 18 of the 19 previously identified BPH resistance genes. These two genes have large effects on BPH resistance and may be a useful BPH resistance resource for rice breeding programs.

【题目】A novel lipoxygenase gene from developing rice seeds confers dual position specificity and responds to wounding and insect attack
【中文关键词】dual positional specificity; rice seeds; lipoxygenase; wounding and biotic stress
【英文关键词】dual positional specificity; rice seeds; lipoxygenase; wounding and biotic stress
【中文摘要】OsLOX1 is a novel full-length cDNA isolated from developing rice seeds. We have examined its biochemical properties and expression patterns. The protein has dual positional specificity, as it releases both C-9 and C-13 oxidized products in a 4:3 ratio. OsLOX1 transcripts were detected at low abundance in immature seeds and newly germinated seedlings, but accumulate rapidly and transiently in response to wounding or brown planthopper (BPH) attack, reaching a peak 3 h after wounding and 6 h after insect feeding. We produced transgenic rice lines carrying either sense or antisense constructs under the control of a cauliflower mosaic virus 35S promoter, and these rice lines showed altered OsLOX1 activity. In all of the antisense lines and more than half of the sense lines the expression levels of OsLOX1, the levels of enzyme activity, and the levels of the endogenous OsLOX1 products (jasmonic acid, (Z)-3-hexenal and colneleic acid) at 6, 48, and 48 h after BPH feeding respectively, were below the levels found in non-transgenic control plants; yet, the levels in the remaining sense transformants were enhanced relative to controls. Transformants with a lower level of OsLOX1 expression were less able to tolerate BPH attack, while those with enhanced OsLOX1 expression were more resistant. Our data

suggest that the OsLOX1 product is involved in tolerance of the rice plant to wounding and BPH attack.

【题目】Genetic analyses of heading date of Japonica rice cultivars from Northeast China
【中文关键词】genetic analyses; heading date; Japonica rice (Oryza sativa L.); Northeast China; photoperiod-sensitivity; temperature-sensitivity
【英文关键词】genetic analyses; heading date; Japonica rice (Oryza sativa L.); Northeast China; photoperiod-sensitivity; temperature-sensitivity
【中文摘要】Northeast regions of China (38-55 N latitude) play an important role in Japonica rice planting. Heading dates of 10 Japonica rice cultivars native to the Northeast of China were investigated and their sensitivities to photoperiod and temperature were analyzed. The results showed that these Japonica rice cultivars were insensitive to photoperiod but strongly sensitive to temperature, i.e. a high temperature can markedly shorten the heading date. Genetic analyses were conducted on these 10 cultivars using a set of heading date tester lines. All these Japonica cultivars carried a dominant early heading gene Ef-1, and most of these cultivars carried the photoperiod insensitivity allele et, and two types of alleles were presented at the Se-1 locus, including recessive photoperiod insensitivity gene Se-1 a and dominant strong photoperiod-sensitivity (PS) gene Se-1(n). The PS of these cultivars carrying El or Se-1(n) can be repressed or weakened by Ef-1 and the recessive allele hd2 they carried. These results provided a reasonable explanation to the adaptability of Japonica rice to the high latitude environment of the Northeast China, and could be useful for breeding new cultivars well adapted to the high latitude regions and expanding the rice cultivation range. (C) 2008 Elsevier B.V. All rights reserved.

【题目】水稻千粒重和垩白粒率的QTL及其互作分析
【中文关键词】水稻 千粒重 垩白粒率 QTL 上位性互作 QTLX环境互作效应
【英文关键词】Rice 1000-grain weight (TGW) Percentage of grains with chalkiness(PGWC) QTL epistatic interaction QTLXenvironment interaction(QE)
【中文摘要】产量因子千粒重和稻米品质指标垩白粒率密切相关。本研究以越光/Kasalath//越光BIL群体为材料,分析千粒重和垩白粒率的相关性、QTL、上位性互作及其环境的互作效应。相关分析表明,群体千粒重和垩白粒率在2005年和2006年均呈极显著正相关,相关系数分别为0.42和0.35 (P<0.001)。2年共检测到千粒重QTL 11个,其中5个在2年重复检测到,5个具有环境互作效应;千粒重上位性互作8对,7对与环境存在互作。垩白粒率QTL 6个,3个具有环境互作效应;上位性互作9对,其中4对具有上位性环境互作效应。比较分析发现3个主效QTL同时控制千粒重和垩白粒率的表现,千粒重和垩白粒率的增效等位基因来自同一亲本;1对上位性互作同时对千粒重和垩白粒率有相同的影响。一些与垩白粒率不相关的千粒重主效QTL,如qTGW-3c、qTGW-4a和qTGW-6b,可为育种所利用。对利用QTL定位结果进行千粒重和垩白粒率分子辅助选择育种进行了探讨。
【英文摘要】There is a close correlation between 1000-grian weight (TGW, an important yield factor) and percentage of grains with chalkiness (PGWC, an important rice quality index). In this study, a backcross inbred lines (BIL) population derived from a cross between Koshihikari (japonica) and Kasalath (indica) was used to detect correlations and among interactions QTL, epistatic and environment on TGW and PGWC. Correlation analysis showed that there was a significantly positive correlation between TGW and PGWC in the BIL population and the correlation coefficients were 0.42 and 0.35 (P<0.001) in 2005 and 2006, respectively. A total of eleven QTLs and eight epistatic interactions for TGW were detected in 2005 and 2006; of them, five QTLs were repeatedly detected in the two years, and five QTLs and seven epistatic interactions had significantly QE interaction. A total of six QTLs and nine epistatic interactions for PGWC were detected in 2005 and 2006; of them, three QTLs and four epistatic interactions had markedly QE interaction. Three main-effect QTLs simultaneously controlling TGW and PGWC were detected, and their alleles increasing TGW and PGWC were from the same parent; one epistatic interaction had similar effects on TGW and PGWC. Some main-effect QTLs, controlling TGW but not PGWC, such as qTGW-3c, qTGW-4a,and qTGW-6b, could be used for breeding. The strategy was discussed in using QTL mapping results for the marker-assisted selection breeding of TGW and PGWC.

【题目】杂草稻种子休眠数量性状位点的定位
【中文关键词】杂草稻 种子休眠 抽穗期 数量性状基因座(QTL)
【英文关键词】Weedy rice Seed dormancy Heading date Quantitative trait locus (QTL)
【中文摘要】利用杂草稻与粳稻品种衍生的分离群体对控制种子休眠性的遗传基础进行了研究。检测到4个控制种子休眠性的QTL, 分别位于第1、第2和第6(2个)染色体上, 贡献率分别为7.8%、7.1%、5.5%和4.5%, 其中第2染色体上的QTL可能是一个新的控制种子休眠性的位点, 多项方差分析表明这4个位点的作用具有累加效应。种子发芽率与开花时间存在显著的负相关关系, 检测到的唯一一个控制抽穗期的QTL与位于第6染色体上的一个控制种子休眠性的QTL连锁或具有多效性, 这可能是造成其显著相关的主要原因。
【英文摘要】The genetic basis of the seed dormancy of a weedy rice was dissected using a segregation population derived from a cross with a japonica cultivar. Two QTLs were located on chromosomes 1 and chromosomes 2, and two on chromosome 6. These QTLs explained 7.8%, 7.1%, 5.5%, and 4.5% of the overall phenotypic variance, respectively. The QTL on chromosome 2 appears to represent a novel source of genetic variation for seed dormancy. A multi-way analysis of variance indicated that the gene action of these

four QTLs was additive. A significant negative correlation was found between germination rate and flowering time. A single heading date QTL was identified, to be either pleiotropic on or linked to a seed dormancy QTL on chromosome 6, thereby accounting for the observed correlation between seed dormancy and flowering time.

【题目】水稻脂氧合酶-3基因启动子的特性分析
【中文关键词】脂氧合酶-3基因; 启动子; 水稻; 转基因植株; 逆境胁迫
【英文关键词】lipoxygenase-3 gene (Lox-3); promoter; rice; transgenic plants; adversity stress
【中文摘要】从栽培水稻品种越光中克隆了水稻脂氧合酶-3基因(Lox-3)的启动子,长度为1343bp,其序列与日本晴对应的序列完全相同。生物信息学分析表明,该启动子序列中包含受信号诱导的元件(G-box)、温度响应元件(CCGAAA)和水分胁迫响应元件(CACATG)等顺式作用元件;进一步构建了Lox-3基因启动子与gus和gfp基因的融合表达载体并获得转基因植株,发现报告基因在转基因植株的根、茎、叶、花药、种胚及种皮中均有表达,在萌发种子的胚和胚芽中也有表达,但在胚乳中不表达。此外,经ABA、NaCl及人工陈化处理后对报告基因的表达进行了定量分析,发现这些非生物胁迫可能通过诱导启动子顺式元件致使报告基因表达活性增强。
【英文摘要】In this study, the Lox-3 promoter was cloned from the rice cultivar Koshihikari and the length of the promoter is 1343 bp, which absolutely matches the corresponding sequence of Nipponbare genome. Bioinformatics analysis indicated the promoter sequence contained a common signa-l response cis-element (G-box), elements responsive to temperature (CCGAAA) and tomoisture stress (CACATG). Furthermore, transgenic plants driven by this promoter was obtained. Reporter gene expression was detected in roots, stems, leaves, anthers, seed capsules and embryos of transgenic plants, as well as in the embryos and the plumule rather than in endosperm, of germinating transgenic seeds. A quantitative analysis revealed that the reporter gene was induced by exogenous application with ABA, NaCl and artificial aging treatments, and these effects were supposed to be mediated by the cis-elements in the corresponding promoter.

【题目】水稻抗条纹叶枯病数量性状座位分析
【中文关键词】水稻 抗性 条纹叶枯病 数量性状座位 人工接种 田间自然接种
【英文关键词】rice resistance rice stripe quantitative trait locus artificial inoculation natural infection
【中文摘要】为探明水稻品种窄叶青8号抗条纹叶枯病的数量性状座位,构建了窄叶青8号/武育粳3号F2群体的分子图谱,采用人工接种和田间自然接种两种鉴定方法,以病情指数比率为表型值,对每个F2单株衍生的F2：3家系进行了抗条纹叶枯病鉴定。整个群体的病情指数比率均呈偏向于抗性亲本的连续性分布,表明条纹叶枯病抗性受数量性状基因的控制。进一步的QTL分析发现,两种鉴定方法所检测到的QTL完全不同,人工接种(强迫饲毒)方法仅检测到1个抗性基因位点qSTV7,其增强抗性的等位基因来源于窄叶青8号,而田间自然接种方法检测到2个抗性基因位点qSTV5和qSTV1,其增强抗性的等位基因分别来源于窄叶青8号和武育粳3号,暗示抗性亲本窄叶青8号可能携带耐病毒基因和抗灰飞虱基因,而感病亲本武育粳3号经遗传重组后,其抗性基因也得以表现。比较前人研究结果,发现检测到的QTL为新的抗条纹叶枯病基因位点,这些基因不同于抗条纹叶枯病主基因Stvb i,可为防止单一基因广泛使用造成的遗传脆弱性,提供新的抗性基因资源。

【英文摘要】In order to verify the quantitative trait loci for the resistance to rice stripe in rice variety Zhaiyeqing 8, a molecular linkage map was constructed based on the F2 population derived from the cross of Zhaiyeqing 8 and Wuyujing 3. Reactions of the two parents, F1 individuals and 129 F2：3 lines to the rice stripe were investigated by both artificial inoculation at laboratory and natural infection methods in the field attached the virus, and the ratio of disease rating index were scored. The ratios of disease rating index in Zhaiyeqing 8/Wuyujing 3 F2：3 population ranged from 0 to 134.08 and from 6.25 to 133.6 by artificial inoculation at laboratory and natural infection methods, respectively, with marked bias towards resistant parent, Zhaiyeqing 8. This indicates the resistance to the rice stripe was controlled by quantitative trait loci (QTL). Further QTL analysis showed that the QTLs detected by two inoculation methods were completely different. Only one QTL, qSTV7,was detected by artificial inoculation, at which the Zhaiyeqing 8 allele enhanced the resistance to rice stripe, while the other two QTLs, qSTV5 and qSTV11, were detected by natural infection, and the resistant alleles came from Zhaiyeqing 8 and Wuyujing 3, respectively. These results showed that the resistant parent Zhaiyeqing 8 carried the genes associated with the resistance to the rice stripe virus and small brown planthopper, the resistant gene in Wuyujing 3 was expressed after recombination between Wuyujing 3 and Zhaiyeqing 8. In comparison with the results previously reported, QTLs detected in the study were new resistant genes to rice stripe. This will provide a new resistant resource for avoiding genetic vulnerability for single resistant gene, Stvb-i.

【题目】水稻品种IR24抗条纹叶枯病相关QTL的检测
【中文关键词】水稻条纹叶枯病　灰飞虱　抗性　数量性状基因座
【英文关键词】Rice stripe　Laodelphax striatellus Fallen　Resistance　Quantitative trait locus (QTL)
【中文摘要】为探明籼稻品种IR24是否携有新的抗条纹叶枯病基因,利用衍生于Asominori/IR24的重组自交系(RIL)群体和以Asominori为遗传背景IR24插入片段的染色体片段置换系(CSSL)群体,进行抗条纹叶枯病相关QTL的检测。利用疫区田间自然条件鉴定的方法,在RIL群体中共检测到4个控制条纹叶枯病的QTL,分别位于第3、5、7、11染色体上(qSTV3、qSTV5、qSTV7、qSTV11),其中qSTV3、qSTV7和qSTV11增强抗性的等位基因来自抗性亲本IR24。采用图示基因型比较法,在CSSL群体中将4个抗条纹叶枯病相关基因位点分别定位在染色体片段置换系CSSL4、L17、L39、L61、L62的IR24插入片段上。对比分析RIL群体和CSSL群体的分子连锁图谱,发现qSTV3所在的标记区间与CSSL17的IR24片段相吻合,qSTV7所在的标记区间与CSSL4的杂合片段、CSSL39的IR24片段相吻合,qSTV11所在的标记区间与 CSSL61的IR24片段以及CSSL62的杂合片段相吻合,表明确实存在这3个位点。与前人的研究结果相比较,发现位于第3染色体上的qSTV3区域存在抗刺吸性害虫的基因簇,是一个表达稳定的抗灰飞虱基因座;位于第7染色体上的qSTV7不同于已报道的抗性基因座,表明IR24携有新的抗性基因,这些基因不同于主基因Stvb-i,为防止广泛使用单一基因而造成的遗传脆弱性提供了新的抗性基因源,并且为利用分子标记辅助选择,聚合不同抗性基因培育抗性稳定的条纹叶枯病抗性品种创造了条件。
【英文摘要】In order to verify the quantitative trait loci for rice stripe in rice cultivar IR24, QTL mapping of resistance to rice stripe was studied using both recombinant inbred lines (RIL) and a series of IR24 chromosome segment substitution lines (CSSLs) with Asominori genetic background. Four QTL were detected and located on chromosome 3, 5, 7,11, respectively, (qSTV3, qSTV5, qSTV7, qSTV11) using RIL population by natural condition test in the infected rice field. The positive resistance effects at qSTV3, qSTV7 and qSTV11 were from IR24. A graphical genotype analysis of the CSSL population indicated that the IR24-derived segments presented in five lines with QTL conferring rice stripe resistance. Comparing RIL with CSSL linkage maps, we found that the marker regions of qSTV3, qSTV7 and qSTV11 coincided with IR24 segment in CSSL17, heterozygous segment in CSSL4 and IR24 segment in CSSL39, and IR24 segment in CSSL61 and heterozygous segment in CSSL62, respectively. Additionally, qSTV3 was arranged on a gene cluster of chromosome 3 associated with sucking insect resistance, suggesting it be a new and stable expression locus, and qSTV7 be another new QTL detected in this research, after comparing with previous reports. These results indicated that IR24 carried several new resistance genes controlling rice stripe. This will provide a new resistance resource for avoiding genetic vulnerability from single resistance gene, Stvb-i, and provide a foundation for breeding rice varieties with stable resistance to rice stripe by diversifying rice stripe virus and small brown planthopper resistance genes in MAS.

【题目】水稻粒形相关性状及千粒重QTL的稳定性分析
【中文关键词】水稻; 粒形相关性状; 千粒重; QTL; 稳定性分析
【英文关键词】Oryza sativa L.; traits related to grain shape; 1000-gra in weight; QTL; stability analysis
【中文摘要】以Nipponbare(japonica)/Kasalath(indica)//Nipponbare BC1F10的98个家系为材料,在3种环境下对水稻粒形相关性状及千粒重进行数量性状基因位点(quantitative trait loci,QTL)的定位分析。利用QTL mapper 1.6软件在全基因组水平上检测了粒形相关性状及千粒重QTL。结果表明,在3种环境下共检测到4、1、4、5、5个QTL,分别控制粒长、粒厚、粒宽、粒形和千粒重。鉴定了以Nipponbare为背景、Kasalath为置换片段的染色体片段置换系群体在3种环境中的表型值,发现与背景亲本相比,置换片段包含qGL-6的株系NK28、包含qGL-12的株系NK32粒长均明显变长;置换片段包含qGW-1和qGW-7的株系NK9和NK32粒宽均明显变窄;置换片段包含qLWR-5的株系NK22和NK32、包含qLWR-12的株系NK32粒形明显变大;置换片段包含qTGW-1-1的株系NK9千粒重显著降低。上述结果表明,这些QTL是稳定表达的主效QTL。
【英文摘要】Ninety- eight backcross inbred lines derived from Nipponbare (japonica) /Kasalath (indica) //Nipponbare were used to map QTL for grain shape related traits and 1000-grain weight under the three environments. By QTL mapper 116 software, QTL controlling grain shapere lated traits and 1000-grain weight were detected on the whole genome. The number of QTL for grain length, grain thickness, grain width, the ratio of grain length to width, and 1000-grain weight were 4, 1, 4, 5 and 5, respectively. Further stability analysis was conducted using chromosome segment substitution lines (CSSL) with Nipponbare as the genetic background and Kasalath as the donorin three environments. The results showed that significant difference of phenotypic values existed between the recurrent parent, Nipponbare, and the NK28 harboring qGL-6, NK32 harboring qGL-12 alleles. Compared to Nipponbare, the seeds of NK28 and NK32 became longer. The two CSSL both harboring qGW-1 and qGW-7 allele, including NK9 and NK32, had markedly decreased in grain width across the three environments. The same case was for the two CSSL harboring qLWR-5 allele, namely NK22 and NK32, as well as the CSSL NK32 harboring qLWR-12 allele, and the CSSL NK9 harboring qTGW-1-1 allele. These effects of the alleles at above loci were significant and stable. The results provided the foundation for further map-based cloning and marker-assisted selection (MAS) breeding.

【题目】利用CSSL群体研究稻米加工品质相关QTL表达的稳定性
【中文关键词】水稻 加工品质 染色体片段置换系 QTL定位 稳定性分析
【英文关键词】Rice (oryza stativa L.) Milling quality Chromosome Segment Substitution Line (CSSL) QTL mapping expression stability
【中文摘要】【目的】研究稻米加工品质的分子遗传基础,为遗传改良和分子标记辅助选择提供有用信息。【方法】利用Asominori为遗传背景具有IR24染色体片段的置换系(CSSL)群体,在4个环境下对稻米糙米率、精米率和整精米率进行QTL定位和稳定性分析。【结果】结果共检测到30个QTL与稻米加工品质相关,其中qMR-6、qMR-8、qHR-3和qHR-6在4个环境中都能被重复检测到,影响精米率的qMR-6和qMR-8的平均贡献率分别为21.1%和22.2%;与整精米率相关的qHR-3和qHR-6,平均贡献率分别为34.6%和22.3%;且qMR-6、qMR-8、qHR-3和qHR-6对应的置换系与背景亲本Asominori在4个环境中相应性状的表现型之间都存在显著差异(P<0.05)。【结论】qMR-8、qBR-8b和qHR-8共定位在第8染色体R727-G1149区

间的QTL簇上,在笔者以前的研究中发现该QTL簇包含与稻米蒸煮食味、外观和营养品质等相关的多个主效QTL,这为剖析同一染色体区段内的1个或多个基因协同调控多个品质性状形成的复杂代谢网络提供信息。

【英文摘要】A chromosome segment substitution line (CSSL) population, derived from the cross of Asominori and IR24 with Asominori as the recurrent parent, was planted and phenotyped for brown rice rate (BR), milled rice rate (MR) and head rice rate (HR) in four sites. QTL for milling quality were characterized and expression stability of these QTL was further investigated by using target CSSLs harboring certain QTL. The phenotypic values of these three traits all showed continuous distributions and transgressive segregations in the CSSL population across the four environments.. Meanwhile, a total of 30 QTL were identified for the three quality traits, among which four QTL, qMR-6、qMR-8、qHR-3 and qHR-6, were all consistently detected in the four different environments. Moreover, phenotypic values were different significantly (P<0.05) between Asominori and the target CSSLs harboring any of the four QTL alleles, indicating expression stability of the four QTL was relatively higher. In addition, QTL qMR-8、qBR-8b and qHR-8 were co-located in the G1149-R727 interval on chromosome 8 carrying a QTL cluster. Interestingly, many major QTL affecting rice eating, cooking, appearance and nutrient quality was also mapped into the QTL cluster in our previous studies. These results thus obtained provide us a good chance to elucidate the complex mechanism that formation of many rice quality traits was simultaneously controlled by a gene or a gene cluster on chromosome 8.

【题目】与稻米高垩白率相关qPGWC-9生理功能分析

【中文关键词】垩白率;qPGWC-9;净光合速率;淀粉合成关键酶类

【英文关键词】percentage of grains with chalkiness (PGWC); qPGWC-9; net photosynthetic rate; key starch synthesis-associated enzyme

【中文摘要】利用携带qPGWC-9 目标区段而其他置换片段上不带有与垩白率相关QTL (quantitative trait locus)的高垩白染色体片段置换系(chromosomal segment substitution line, CSSL) AIS82,以其轮回亲本Asominori (低垩白)为对照,从源库关系角度探讨qPGWC-9 的生理功能。结果发现,籽粒灌浆期AIS82 与Asominori的剑叶净光合速率没有显著差异,说明光合作用强弱不是AIS82高垩白率产生的直接原因。灌浆前期AIS82的淀粉合成关键酶活性显著高于Asominori,但中后期AIS82 酶活下降快,整个灌浆期变化幅度相对较大,推测qPGWC-9主要影响了淀粉合成关键酶活性的动态变化,从而决定了高垩白表型。

【英文摘要】Percentage of grains with chalkiness (PGWC), one of the important traits assessing rice grain appearance quality, belonged to qualitative trait controlled by many genes. Our previous study identified a novel quantitative trait locus (QTL), namely qPGWC-9, related to high PGWC using chromosomal segment substitution line (CSSL) population. qPGWC-9 was shown to be expressed stably in eight environments. AIS82 which carried a IR24 chromosomal segment corresponding to qPGWC-9 in the Asominori genetic background was selected and analyzed to clarify the physiological function of qPGWC-9 from the relationship of source and sink of carbohydrates. It showed that AIS82 had higher PGWC than Asominori (control variety with low PGWC) (Table 1). The net photosynthetic rate of flag leaf of AIS82 showed no significant difference from that of Asominori (Figs.1,2), so photosynthetic ability in flag leaf was not directly related with high PGWC in AIS82. But, the changes in pattern of activity of the key enzymes associated with starch synthesis were different in these plants. Activities of some key enzymes in starch synthesis in AIS82 changed more radically than those in Asominori (Fig.3). These results suggest that qPGWC-9 might determine the activities of some enzymes associated with starch synthesis and therefore affect the degree of grain chalkiness.

【题目】多环境下稻米粒重的QTL定位
【中文关键词】精米粒重　稻谷粒重　数量性状基因座(QTL)　染色体片段置换系(CSSLs)
【英文关键词】Milled rice weight (MRW)　Paddy rice weight (PRW)　Quantitive trait loci (QTL)　Chromosome segment substitution lines (CSSLs)
【中文摘要】以粳稻Asominori为遗传背景的染色体片段置换系(CSSLs)群体为材料,利用基于性状-标记多元回归分析方法对稻谷粒重和精米粒重进行多环境的QTL定位。结果在5个环境共检测到6个粒重相关QTL,分布于第1、6、7和8染色体上,对表型变异的贡献率介于13%~35%;其中控制精米粒重的qMRW-1a和稻谷粒重的qPRW-1在不同环境中均能稳定表达,且均位于第1染色体RFLP标记XNpb113附近,该基因座还同时控制着粒宽。qMRW-1a和qPRW-1共同对应的置换系AIS8和AIS11与Asominori 的粒重差异在不同环境中均显著(P < 0.05),表明该QTL的等位基因在不同环境中效应显著。比较发现该QTL在不同遗传群体中均能被重复检测到,且与蔗糖磷酸合酶基因(SPS)位置一致,推测该QTL与淀粉合成代谢有关。qMRW-1a 和qPRW-1在不同环境条件和遗传背景中表达,因此可用于进一步的精细定位研究。
【英文摘要】Grain weight is one of the important traits in rice for it determines grain yield and affects appearance quality in some degree. Grain weight is controlled by quantitative trait loci (QTLs) and determined by grain width, length, thickness and plumpness. To date, many QTLs have been identified, however only two QTLs have been fine mapped. It is urgent for identifying more QTLs expressed in different environments and genetic backgrounds so that they could be used in further fine mapping and breeding applications. So a chromosome segment substitution line (CSSL) population consisting of 65 lines, derived from Asominori and IR24 cross with the genetic background of Asominori, were grown in different environments to detect grain-weight related QTLs based on the stepwise regression of the traits and markers. The phenotypic values for milled rice weight (MRW) and brown rice weight (BRW) showed a continuous distribution and some transgressive lines were also observed in the CSSLs population. A total of six QTLs for grain weight were detected in five environments, which located on the chromosomes 1, 6, 7, 8, and explained 13% – 35% of phenotypic variance. The qMRW-1a and qPRW-1 could express stably in all experiment environments, both being in the same chromosome location of nearest marker XNpb113 on chromosome 1. Thus the markers could be used for marker assisted selection (MAS) of rice grain weight. MRW and PRW differed significantly between the CSSLs harboring the QTL allele and Asominori. In comparision with previous studies, they were found to be expressed in various genetic populations, and also had the similar chromosomal location with the gene for sucrose phosphate synthase. Therefore we deduced the QTL was associated with rice starch metabolism. qMRW-1a and qPRW-1, which had highly stable expression characteristic, should be used for fine mapping to elucidate the genetic basis of the rice grain weight.

【题目】微囊藻毒素在鲋鱼体内生物富集及其体内的抗氧化反应
【中文关键词】微囊藻毒素;抗氧化反应;鲋鱼;生物富集
【英文关键词】microcystins;antioxidative response;Carassius auratus L;bioaccumulation
【中文摘要】为了解微囊藻毒素在鲋鱼Carassius auratus L. 体内生物富集作用,用 LC/MS监测不同时间的鲋鱼肝脏、肌肉,以及饲养用水中痕量的微囊藻毒素。结果显示,肌肉组织中MC-RR和MC-LR的含量在18 d 时达到峰值,分别为7.87 ng · g-1和2.18 ng · g-1;而肝脏组织中 MC-RR和MC-LR的含量在鲋鱼暴露9 天时达到最高值,分别为 25.30 ng · g-1和33.27 ng · g-1。研究结果支持肝脏组织是MCs 的主要靶向器官,并且表明肝脏组织对 MC-LR的富集量远大于MC-RR,而肌肉组织更易于积累MC-RR。文章还研究了鲋鱼体内的抗氧化酶(SOD、CAT 、GST 、GR酶)的活性变化,对MCs 介导的氧化胁迫进行了评估。通过分别测定暴露不同时间点(3 、9、18 d)肝脏和肌肉组织中的抗氧化酶的活性,发现它们的活性与组织中 MCs 的含量基本呈正相关,可能对 MCs 介导的氧化胁迫有缓解作用。以上表明,MCs 能在鱼体内积累,抗氧化系统虽可缓解,但不能完全降解。因此食用被MCs 污染的鱼类存在潜在的食品安全风险。

【英文摘要】In order to investigate the bioaccumulation of microcystins(MCs) in Carassius auratus L., the level of MCs in liver, muscle and water was monitored by LC/MS at different time after exposure. The results indicated that the level of MC-RR and MC-LR was the highest in muscle on the 18th day after exposure, with each amount of 7.87 ng/g and 2.18 ng/g, and reached the peak in liver on the 9th day with the amount of 25.30 ng/g and 33.27 ng/g respectively. The results showed that the bioaccumulation of MCs is prone to occur in liver than in muscle. The level of MC-LR was higher than MC-RR in liver, and the MC-RR was prone to accumulate in muscle. The oxidative stress of fish mediated by MCs was also evaluated by analyzing the activities of several antioxidases such as superoxide dismutase (SOD), catalase (CAT), Glutathione-S-transferase (GST) and glutathione reductase (GR). The activities of these antioxidases in liver and muscle were measured after exposing to MCs af ter 3, 9 and 18 days. It was demonstrated that the level of MCs was basically positive-correlated to the activity of antioxidase, which probably released the oxidative stress mediated by MCs. Overall, fish can accumulate microcystins and make response to the toxicity with antioxidative system, but cannot de-grade the MCs completely. So it should be noted that people with whose diets contain the fish exposed to MCs, would potentially suffer the health threaten.

【题目】Expression of Methyl Parathion Hydrolase in Pichia pastoris 12
【中文关键词】毕赤酵母表达系统,基因拷贝数,多拷贝载体
【英文关键词】Pichia pastoris expression system,the copy number of the expression cassette,integration vectors
【中文摘要】在毕赤酵母表达系统中,增加表达基因的拷贝数通常能提高重组蛋白的表达量,蛋白表达的优化往往涉及多拷贝表达株的筛选。为了提高甲基对硫磷水解酶MPH在毕赤酵母中的表达量,本文克隆了甲基对硫磷水解酶编码基因mpd并体外构建多拷贝载体,分两步将至少12拷贝的MPH-表达盒整合到了毕赤酵母的染色体上。拷贝数的增加显著的提高了重组蛋白的表达量,GS-12发酵液中积累的酶活是GS-1中的10倍,在摇瓶发酵条件下,共55 mg/L的重组MPH被分泌到胞外。
【英文摘要】In the Pichia pastoris expression system,increasing the copy number of the expression cassette often has the effect of increasing the amount of protein expressed. To improve the expression level of methyl parathion hydrolase (MPH), we constructed two integration vectorswith four and eight direct repeats of the expression cassette using an in vitro multimerization approach. After two successive integrations, at least 12 copies of the MPHexpression cassette were integrated into the P. pastoris chromosome. Under shake-flask conditions, over 55 mg active MPH/l was secreted into the medium by the multicopy clones. The extracellular enzyme activity was about 10-fold higher for the multicopy clones than for clones containing a single copy of the gene. Further investigations revealed that the multicopy MPH expression cassette could remain stably integrated and functional over five generations. Note that the expression vector pRF constructed in our study can be not only used to construct multiple copies of the expression cassette in vitro, but also integrated into the P. pastoris genome without introducing any antibiotic resistance gene, which is desirable for production of biotherapeutic proteins.

【题目】Temperature Difference Between the Air and Organs of Rice Plant and Its Relation to Spiklet Fertility

【中文关键词】水稻;气温;植株温度;穗肥
【英文关键词】rice air temperature temperature of organs spikelet fertlity
【中文摘要】气温与水稻植株温度的差异及其对穗肥的调节
【英文摘要】Based on the experiment of measuring panicles and leaves, air temperature, and humidity above the canopy of rice cultivars after heading in 2005 and 2006, we investigated the temperature difference (TD) between the air and organs of rice plant and its relationship with spikelet fertility. The results showed that TDs between the air and organs of rice varied with air temperature, air humidity, and plant type. For similar air humidity, TDs were lower at the air temperature of 28.5 ° C than at higher temperature of 35.5 ° C, whereas for the same air temperature, the TDs decreased as the air humidity increased. TDs were also affected by plant type of the cultivars. Erect panicle cultivars showed higher TDs than those with droopy panicles under similar climatic conditions, and cultivars with panicles abov e flag leaf (PAFL) had higher TDs than those with panicles below the flag leaf (PBFL). Cultivars grown in a location with lower air humidity and higher temperature, such as Taoyuan, China, had higher spikelet fertility than those in higher humidity under the similar air temperature during the grain filling stage. This is partially attributed to the larger TDs under the lower humidity. Rowspacing

【题目】水稻“精苗稳前、控蘖优中、大穗强后”超高产定量化栽培模式
【中文关键词】水稻;精苗稳前、控蘖优中、大穗强后;超高产;定量化栽培模式
【英文关键词】rice SOI super-high yielding model of quantitative cultivation
【中文摘要】【目的】寻求水稻稳定超高产的栽培模式。【方法】以早熟晚粳品种武粳15、常优1 号为供试材料,其它栽培措施统一在最佳技术指标前提下,就氮肥运筹与穗肥施用叶龄期,设置了稳前优中强后、平衡促进和促前控中3 种栽培模式,并以长江中下游地区单季稻大面积生产上的常规栽培模式为CK,对产量及其结构、群体生长发育动态以及根系活力等方面进行系统比较。同时,在江苏东海、兴化、高邮、常熟等地,以徐稻3 号、常优1号、陵香优18、武粳15 等品种为材料,进行(15—50)×667m2 连片的稳前优中强后超高产栽培综合试验与扩大到100×667m2 连片试验田上的生产性验证试验。【结果】2 品种稳前优中强后、平衡促进2 模式的实产均达到了超高产水平(≥750 kg/667m2)。与CK 相比,稳前优中强后、平衡促进2 模式每穗粒数多、群体颖花量大,单位面积穗数、结实率和千粒重则与之相当;2 模式的群体于有效分蘖临界叶龄期准时够苗,高峰苗出现在拔节期,且数量适中(适宜穗数的1.3—1.4 倍),此后群体平缓消减,至抽穗期基本稳定,最终成穗率显著高于CK;其群体LAI 动态与茎蘖动态趋势基本一致,最大LAI 均出现在孕穗期,为8.0—8.5,成熟期仍保持3.5—4.0;群

体光合势与干物质积累,2 模式在生育前期(移栽—拔节期)较CK 低,中期(拔节—抽穗期)与CK 相当,后期(抽穗—成熟期)显著高于CK;2 模式在拔节期的根系干重与CK 相当,抽穗期和成熟期则显著高于CK,而这3 个时期的根冠比均显著高于CK,其抽穗后(抽穗—腊熟期)的根系平均伤流量与颖花根流量均显著高于CK。同时,连续2 年多地的稳前优中强后超高产综合栽培试验以及后3 年扩大到100×667m2 连片试验田上的生产性验证试验,实产均达800 kg/667m2 左右。【结论】揭示了水稻超高产栽培的根本在于“强支撑、扩库容、促充实”;提出了水稻精苗稳前、控蘖优中、大穗强后的超高产定量化栽培模式。

【英文摘要】Thirty-one japonica cultivars with contrasting agronomic traits were used and 5 nitrogen (N) fertilizer treatments of level and timing were performed to determine the effects of N application on grain phytic acid and proteins including albumin, globulin, prolamin, and glutelin. Variance analysis showed a large effect of N and a smaller effect of cultivar on grain phytic acid and proteins. With increased N level, grain phytic acid concentrations progressively reduced whereas concentrations of the 4 proteins and ratios of glutelin to total protein increased, indicating that N level has a beneficial effect on rice nutritional quality. In addition, substantial genotypic differences in response of grain phytic acid and proteins to N treatments were detected. Some cultivars such as Xiushui09, Zhendao10, and Yanjing5 exhibited more stability of grain proteins under ontrasting N treatments, and the significance of this stability is discussed in regard to its use in rice quality improvement.

【题目】粳型超级稻产量构成因素协同规律及超高产特征的研究
【中文关键词】粳型超级稻;产量及其构成因素;超高产特征
【英文关键词】japonica super rice grain yield and its components character of super-high yielding
【中文摘要】【目的】水稻是中国重要的粮食作物,实现水稻的超高产生产对保证中国粮食安全有重要作用。本研究旨在探讨粳型超级稻产量构成因素协同演进规律及超高产特征。【方法】以具有代表性的4 个超级粳稻品种(武粳15、淮稻9 号、徐稻3 号和常优1 号)为材料,对高产(8 250—9 750 kg · hm-2)、更高产(9 750—11 250 kg · hm-2)和超高产(>11 250 kg · hm-2)3 个产量等级群体的产量及其结构、群体库容量和群体库容的充实进行了系统的比较研究。【结果】由高产到更高产再到超高产,4 个超级稻品种的群体颖花量不断提高(差异显著),而结实率、千粒重在3 个产量等级间略有增减(差异不显著)。在安全成熟的情况下,群体颖花量与产量呈极显著正相关;群体颖花量的提高在由高产提高到更高产的水平上,主要依靠单位面积穗数的增加,而由更高产提高到超高产水平,则主要依靠足穗基础上增加每穗粒数。在安全成熟条件下,群体库容充实度在3 个产量等级间因种略有增减,差异不显著,而群体库容实际充实量则随产量的增加而增加。【结论】以足量大穗构成群体安全大库容(安全成熟的群体高颖花量),通过保持正常的充实度(即保证常年的结实率与千粒重),从而提高群体库容总充实量,是粳型超级稻的超高产特征。

【英文摘要】【Objective】 A model of cultivation for stable yield of super-high-yielding rice was studied. 【Method】 Taking the early-maturing late-japonica varieties, Wujing 15 and Changyou 1, as materials, through the nitrogen fertilizer regimes under other cultivating conditions all being the optimal,three strategic management models of cultivation were examined, i.e. SOI (stabilizing, optimizing, intensifying during the early ,middle, late phase correspondingly to adopt the ratio of basal-tillering and panicle initiating fertilizer of 50:50 and nitrogen applying leaf age of remaining leaf primordium number of 4,3), BP (balance promoting during all phase to adopt the ratio of basal-tillering and panicle initiating fertilizer of 40:60 and nitrogen applying leaf age of remaining leaf primordium number of 5, 4, 3) and PC (promoting, controlling during the early, middle phase correspondingly to adopt the ratio of basal-tillering and panicle initiating fertilizer of 75:25 and nitrogen applying leaf age of remaining leaf primordium number of 5), in contrast to the CK (A model of conventional cultivation management) in field production of one-seasoned rice in the region of the middle and lower reaches of the Yangtze River. Their results were systematically compared in various aspects, such as yielding and its components, dynamics of population stems and tillers, leaf area index, photosynthetic potential, grain-leaf ratio, production of dry matter, root activity after heading, etc. In addition, confirmatory tests on the practicability of the super high yield cultivation of the SOI model on 6.7 hectares of contiguous fields, as well as comprehensive experiments in the scale of 1-3.3 hectares, were performed using other varieties, Xudao 3, Changyou 1, Lingxiangyou 18 and Wujing 15, in the areas of Donghai, Xinghua, Gaoyou and Changshu of Jiangsu. 【Result】 The yields of SOI and BP were ranking up to the level of super-high-yield(≥750 kg/667㎡)in two varieties. Compared with

CK, more spikelets per panicle and population spikelets were observed in the models of SOI and BP,with roughly the same level of panicles per unit area, filled-grain percentage, and 1000-grain-weight. In the models of SOI and BP in comparison with CK, the population of stems and tillers achieved the expected number punctually at the critical leaf-age for productive tillers, and reached the peak with an appropriate value (1.3-1.4 folds of expected panicle number), then decreased gently,ultimately arrived at a significantly higher rate of productive tillers to total tillers than CK. Plants in SOI and BP models developed approximately the same population LAI dynamics and dynamics of stems and tillers, their maximal LAI appeared at the booting stage (8.0-8.5) and remained a level of 3.5-4.0 at the maturity stage. As for the population photosynthesis potential and the dry matter accumulation, the models of SOI and BP showed lower values than CK during the early stages (from transplantation to jointing stage), during the middle stages (from jointing to heading) both two models were roughly the same with CK, showing no statistical significance, and for the later stages in growth and development (from heading to maturity), two models were at remarkably higher levels in these two parameters. The two models developed a nearly dry weight of roots as compared to CK at the stage of jointing, but they developed remarkably higher than CK at heading and maturity. A pattern of evidently higher values than CK in both SOI and BP was found in such parameters as the root-shoot ratio at the stages of jointing, heading and maturity, the average root exudates after heading (from heading to waxy stage), and the ratio of spikelets to root exudates. Besides, an average yield per 667m^2 was achieved, both in the comprehensive super-high-yield cultivation experiment of SOI in more than 2 consecutive years, and in the confirmatory tests for practicality in the contiguous fields of 6.7 hectares. 【Conclusion】 The results revealed that the pivotal principle for super-high-yield cultivation of rice lies in ‘ strengthening the supporting system, enlarging the sink capacity, and guaranteeing the grain-filling ’, and the super-high-yield cultivation mode was proposed, i.e. appropriate number of population stems and tillers with strong seedlings at early stage, high photosynthetic efficiency population structure with controlling ineffective tillers at middle stage, and enriched dry matter production with large panicles, strong stems, high efficiency leaves in proper population configuration at later stage.

【题目】水稻氮素和叶绿素SPAD 叶位分布特点及氮素诊断叶位选择
【中文关键词】氮素诊断;SPAD 值;叶位;氮含量
【英文关键词】Nitrogen diagnosis SPAD value Leaf position Nitrogen content
【中文摘要】【目的】研究分析水稻氮素和SPAD 值的叶位分布特点,并试图提出SPAD 计诊断氮素营养状况的最佳测定叶位。【方法】在95-38、武育粳3 号、镇稻5394、9915 等4 个粳型品种和1 个籼型品种R161-10 的盆播氮肥试验和宁粳2 号大田氮肥试验的基础上,研究水稻氮素和叶绿素含量(SPAD 值)随叶位的空间分布特征,并对不同叶位叶片的含氮率、叶绿素含量、SPAD 值之间及其与总叶片含氮率和植株含氮率之间的相关性进行分析,比较不同叶位叶片SPAD 测定值的变异系数。【结果】水稻不同叶位叶片含氮率、叶绿素含量、SPAD 值均存在差异,增加施氮量能提高叶片含氮率、叶绿素含量和SPAD 值,同时减少叶位间的差异;SPAD 值对氮素的敏感性顺序为顶4 叶、顶3 叶和顶2 叶,而顶1 叶的敏感性排序因品种不同而不同;穗分化期、齐穗期和成熟期均以顶3 叶与总叶片及植株含氮率相关系数最高;且适宜氮素水平下,穗分化期顶3 叶SPAD 值的变异系数最小。【结论】以某一特定叶片的SPAD 值或以叶色差的大小来诊断水稻氮素营养状况和推荐水稻穗肥施用时,顶3 叶是较为理想的指示叶或参照叶。

【英文摘要】【Objective】This study was conducted to summarize the general formula of panicle number per plant (ES) of rice and establish the function of theoretic number of tillers for effective tillering leaf position, and determine the tiller surviving rate of seedling (s), tiller emerging rate after transplanting (r), missing tiller number after transplanting (bn), and adjusting factor (a).【Method】Field experiments were performed in the special high-yield area at Taoyuan, Yongsheng County, Yunnan province, and tiller number and grain yield were determined. Five transplanting density treatments were conducted with an Indica hybrid rice variety, Eryou 107, in 2005; and six Indica hybrid rice varieties, Eryou 107, Eryou 318, Eryou 7954, Eryou 084, Eryouhang No. 1 and Xieyou 107, were used in high-yield field experiment in 2005 and 2006, respectively. 【Result】 All varieties followed the “ n-3 ” law of synchronously emerging of tiller with leaf. The theoretic number of tillers for effective tillering leaf position (A) was calculated and can be expressed as the function of the number of effective tillering leaf position (E). E was related with the total leaf number (N), leaf age at transplanting (SN), elongated node number (n), missing tiller number after transplanting (bn) and adjusting factor(a), E=(N-n-SN-bn-a). The

adjusting factor (a) for super high-yield rice should be taken as 1.5. For traditional wet-bed seedling,bn was 1.5, surviving rate of tillers with 2 leaves (s2) was 0.8, surviving rate of tillers with 1 leaf (s1) was 0.3; while for seedling tray,bn was 0.5, s2 was 1.0, s1was 0.5. From seedling recovering to stage of tiller equal panicle, r was 80% or so. 【Conclusion】 Fortraditional wet-bed seedling, E=(N-n-SN-3), ES=(1+t3+0.8t2)(1+0.8A)+0.3t1; for seedling tray, E=(N-n-SN-2), ES=(1+t3)(1+0.8A3)+t2(1+0.8A2)+0.5t1, where t1, t2, t3 represents the tillers with 1, 2 and 3 leaves, respectively, A2 and A3 represent the emerged tillernumber after transplanting for tillers with 2 and 3 leaves, respectively. The comparison of theoretical and actual tiller number showed that the formula well depicted the tiller emergence characteristics of super high-yield rice.

【中文关键词】支链淀粉;结构;糊化特征;米饭质地;水稻
【英文关键词】Amylopectin Structure Pasting properties Cooked-rice texture Rice
【中文摘要】【目的】探索稻米中支链淀粉理化特性及其与米粉的糊化特征的关系。【方法】以不同类型水稻代表性品种为材料,测定支链淀粉的蓝值和最大吸收波长,用Sephadex G75层析柱分析支链淀粉分枝链的链长分配,并分析其与稻米RVA谱和米饭质地间的关系。【结果】不同类型代表品种的支链淀粉的蓝值和最大吸收波长存在显著差异,籼型品种稻米支链淀粉的蓝值和最大吸收波长要高于粳型(巴西陆稻除外),非糯性品种支链淀粉的蓝值和最大吸收波长呈极显著的线性关系(r=0.995**)。经Sephadex G75分离的FrⅠ部分的链长的平均聚合度>100 glucose unite,FrⅡ部分的链长的平均聚合度为44~47 glucose unite,FrⅢ部分的链长的平均聚合度为10~17glucose unite。不同类型代表品种支链淀粉中长分枝链与短分枝链的比率存在明显的差异,在供试的糯性品种中,籼糯含长分枝链比粳糯多;非糯性品种中,籼稻比除粳型偏籼的巴西陆稻以外的粳稻含有更多的长分枝链。在同一类型品种中,供试的籼型杂交稻的支链淀粉中含有的长分枝链要比常规稻多,陆稻品种含的长的分枝链要高于水稻品种。支链淀粉的短链部分(FrⅢ)的比率与最高粘度和崩解值呈极显著的正相关关系(r=0.969**, r=0.949**),而长链部分(Fr(Ⅰ+Ⅱ))与最高粘度和崩解值呈极显著负相关关系(r=-0.969**, r=-0.949**)。【结论】水稻支链淀粉的分枝链长分配与稻米品质关系密切。在非糯性品种中,硬性和凝聚性大、松弛性和粘附性小的品种,米饭的口感表现硬,咀嚼有渣感,其Fr(Ⅰ+Ⅱ)比率大,即支链淀粉所含长分枝链比率高。
【英文摘要】second, while the first leaf varied within the varieties. The SPAD value of the third leaf from the top was most correlated with whole leaf and plant N concentration among the top four leaves through the panicle initiation stage, full-heading stage and mature stage.The CV of SPAD value of the third leaf from the top was smallest at fore-and-aft spike differentiation under optimal N level. 【Conclusion】 It was suggested that the third leaf from the top was the most ideal indicator when using SPAD value or leaf color difference to diagnose N status and make N fertilization recommendation at panicle initiation stage in rice.

【题目】超级稻群体籽粒库容特征的初步研究
【中文关键词】超级稻;颖花量;最大库容量;库容有效充实度;枝梗;单穗重
【英文关键词】Super rice Total amount of spikelets Peak sink Effective filling rate of sink Branch Weigh of seed per panicle
【中文摘要】【目的】探索超级稻群体库容形成及其构成特征。【方法】以具有代表性的5 个籼型超级稻为材料,用汕优63 为对照,比较研究超级稻群体籽粒库容构成及特征。【结果】(1)不同试点的超级稻品种均显著或极显著比对照增产,群体颖花量的增加是产量增加的直接原因。培育大穗是超级稻扩大库容量、增加颖花量的主要途径,而增穗并不能扩增群体总颖花量。(2)大穗是通过两种途径协调实现的:一是增加一次枝梗数及其上的平均着粒数,二是增加二次枝梗数但稳定二次枝梗上的平均着粒数; 其中增加二次枝梗数及其总粒数是主要的; 超级稻在一、二次枝梗数增加的同时,通过稳定二次枝

梗上的平均着粒数而增加一次枝梗上的平均着粒数,优化颖花分布,提高全穗结实率而增加单穗籽粒重; 超级稻单穗重达4.0 g 以上, 平均比对照增重10.9% 。(3)超级稻产量潜力高,最大库容达870 kg/667m2,显著高于对照,平均增幅近10%;但最高库容有效充实度在品种间、试点间变化较大,并无稳定优势,平均为80.3%,略低于对照,故因种因地栽培是实现超级稻稳定超高产的关键。【结论】超级稻在稳定适宜穗数的基础上通过协调增加一次枝梗数和二次枝梗数及其平均着粒数来增大穗型,通过优化一、二次枝梗上颖花分布来提高结实率从而增加单穗重。

【英文摘要】【Objective】 This study was conducted to investigate the relationship between leaf position on the stem of rice cultivar and effective accumulated temperature and to describe the progress of leaf appearance on main stem of rice. 【Method】 Sixteen rice cultivars were used in this experiment. They were planted with different sowing dates in Nanjing, Jiangsu and Lijiang, Yunnan. The relationship between leaf position on the stem of cultivar and effective accumulated temperature was observed.【Result】 The results indicated that the leaf within one stem appeared more later it would need more effective accumulated temperature. Moreover, there were two turning points during rice growth period. One appeared when leaf number was 3 and the other one emerged while leaf number equaled N-n-2. Therefore, the piecewise function was used to describe the progress of leaf appearance on main stem of rice. Data collected from two regions were used to validate the model. The RMSE between simulated values and measured values were less than 0.1. 【Conclusion】 This study suggested that the model had good forecast ability and practicability for leaf appearance.

【题目】粳稻小粒穗的症状及其籽粒性状的变化特征
【中文关键词】水稻;粳稻;小粒穗;症状;粒重;分布
【英文关键词】Rice Japonica Shrunk-grain Panicle Symptom Grain weight Distribution

【中文摘要】【目的】系统介绍江苏省近两年来大面积发生的小粒穗异常生长现象,从稻穗、籽粒、糙米等方面对发生症状给出详细的图文说明。【方法】以武育粳3 号为分析对象,对几个代表性地区的小粒穗进行取样,分析了正常籽粒和小粒穗籽粒的形态分布和粒重分布特征。【结果与结论】在正常籽粒中,籽粒的长、宽和粒重均呈较为规律的单峰连续分布,且分布呈一定程度的右偏趋势;小粒穗籽粒的形态分布和粒重分布则较不规则,总体上均呈双峰分布态势。两个峰累计分布的比例与小粒穗发生的严重程度有密切关系。在分析发生症状的基础上,对小粒穗现象的名称、症状以及诊断的指标等一系列问题进行了讨论。

【英文摘要】【Objective】Over the past two years, an abnormal growth phenomenon called shrunk-grain panicle has occurred in a large area in Jiangsu Province. The phenomenon was described in detail by figures and characters in this paper. 【Method】With Japonica rice Wuyujing 3 as the experimental material, characteristics of grain morphology distribution and grain weight were studied. Normal grains and Shrunk-grain Panicle were sampled from several representative areas. 【Result and Conclusion】The length, width, and weight of the normal grains were distributed as regular, continuous and single peaked. Plant growth typically had a right-leaning tendency. On the contrary, the distribution of the grain morphology and weight were irregular and nearly doubled that of the Shrunk-grain Panicle. The proportion of the cumulative distribution in the two kinds of peaks was closely related with the degree of Shrunk-grain Panicle. The paper discusses analysis of the phenomenon's symptoms, problems, and diagnosis.

【题目】起身肥改善水稻根际土壤氮素分布与利用的研究
【中文关键词】水稻;塑盘穴播;起身肥;氮肥利用率;产量
【英文关键词】Rice Plastic-plate dotsow Nitrogen fertilizer before transplanting Nitrogen utilization efficiency Yield
【中文摘要】【目的】探讨起身肥对移栽后水稻根际土壤氮素分布与利用的改善作用,为氮肥的精确合理施用奠定基础。【方法】以宁粳2 号为材料,通过塑盘穴播育秧带土、带肥移栽,研究不同起身肥水平下植株周围土壤矿质态氮浓度的时空变化及起身肥对水稻氮肥利用率和产量的影响。【结果】施起身肥后均能显著提高移栽后水稻根际土壤氮素浓度。随移栽后时间推移,距植株1 cm 处土壤氮素浓度呈下降趋势,而距植株4 和7 cm 处土壤氮素浓度呈先升后降态势。与非起身肥处理相比,起身肥能够极显著地促进水稻对氮肥的吸收和利用。水稻吸氮量、基蘖氮肥利用率和水稻产量以施适量起身肥处理最高。其基蘖氮肥利用率高达27.17%,比非起身肥处理高15%,差异极显著。产量为8 814.0 kg · ha-1,比非起身肥处理高529.5 kg · ha-1。【结论】秧田施起身肥310.5 kgN · ha-1,可以提高水稻生育前期根际土壤矿质态氮浓度,促进分蘖的早生发快,增加分蘖成穗率,显著提高氮肥利用率和水稻产量。
【英文摘要】【Objective】The study was conducted to investigate the improvement of the application of nitrogen fertilizer before transplantation on nitrogen distribution and utilization efficiency around the soil of rice and to give guidance for nitrogen fertilizer application. 【Method】The Japonica variety of Ningjing-2 was conducted in this study, and effects of nitrogen before transplanting on spatio-temporal distributing of mineral nitrogen, nitrogen fertilizer utilization efficiency and grain yield were studied with raising seedling by means of plastic-plate and transplanting with soil. 【Result】The results indicated that nitrogen fertilizer before transplantation could improve nitrogen content in the rhizosphere soil of rice. Along with the process days after transplantation, nitrogen content in soil 1 cm apart from the plant declined, while 4, 7 cm apart from plant it increased first and then declined. The study also demonstrated that the application of nitrogen fertilizer before transplantation could promote the nitrogen assimilation and utilization. Scientists compared it with rice and without it. Tests showed itcould achieve the highest nitrogen assimilation, basal-tillering nitrogen fertilizer utilization efficiency and grain yield with proper nitrogen fertilizer before transplantation. With this, there was 27.17% of basal-tillering nitrogen fertilizer utilization efficiency and 8814.0 kg · ha-1 of grain yield. Yield increased 15% and 529.5 kg · ha-1 respectively compared with that of without nitrogen fertilizer before transplantation.【Conclusion】This study suggested that it could increase mineral nitrogen content in the rhizosphere soil of rice, accelerate tiller ’ s development, and enhance the rate of effective tillers with 310.5 kgN · ha-1 in seedling field. It can improve nitrogen utilization efficiency and grain yield distinctly.

【题目】水培条件下硫素营养对粳稻米质的影响
【中文关键词】硫素;粳稻;米质;蛋白质
【英文关键词】sulfur japonica rice rice quality protein
【中文摘要】【目的】探讨水培条件下,硫素营养对粳稻稻米品质的改善作用,明确其品质指标随硫素浓度改变而变化的规律,以期提高人们对硫肥的重视,为硫肥的精确合理施用奠定理论基础。【方法】以粳稻武粳15 和武育粳3 号为材料,采用水培法,研究硫素营养对粳稻稻米品质指标的影响。【结果】在适宜营养液硫浓度下,武粳15 和武育粳3 号的稻米品质得到显著改善。武粳15 和武育粳3 号分别在200 μmol · L-1和260 μmol · L-1硫浓度处理下,加工品质、外观品质指标得到显著改善,与对照相比,胶稠度分别增加了12.1 mm 和8.4 mm。在米粉糊化特性上,武粳15 在200 μmol · L-1硫处理的米粉峰值粘度较对照增加143 cP,消减值降低290 cP。武育粳3 号在260 μmol · L-1 硫浓度处理下,米粉的峰值粘度较对照增长158 cP,消减值降低34 cP。两个品种籽粒蛋白质含量及总游离氨基酸含量随硫浓度的升高呈增加的趋势,4 种蛋白组分含量与硫浓度总体上呈正相关关系。【结论】200 μmol · L-1硫处理的武粳15 和260 μmol · L-1 硫浓度处理的武育粳3 号,其品质相关理化指标得到较好的改善。
【英文摘要】【Objective】 The study was conducted to investigate the improvement of sulfur nutrition on rice quality of japonica rice cultivar and find out the change tendency of japonica rice cultivar's quality with sulfur concentration increasing in solution culture. And it was also hoped it could make people give enough attention to sulfur fertilizer and give guidance for sulfur fertilizer' accurate and rational application. 【Method】 Solution culture method was used to study the effect of sulfur on physiochemical properties of rice grain of two japonica rice cultivars, Wujing15 and Wuyujing3. 【Result】 The results showed that Wujing15 and Wuyujing3 rice

quality were improved significantly under rational sulfur concentration. Milling quality and appearance quality were improved remarkably, under 200 μmol S · L-1 treatment for Wujing15 and 260 μmol S · L-1 for Wuyujing3, in comparison with 80 μmol S · L-1 treatment. In comparison with 80 μmol S · L-1 treatment, the gel consistency increased by 12.1mm and 8.4mm for Wujing15 and Wuyujing3, respectively. For Wujing15, the peak viscosity increased by 143 cP, setback decreased by 290 cP. For Wuyujing3, the peak viscosity increased by 158 cP, setback value reduced by 34 cP, in comparison with 80 μmol S · L-1 treatment. Additionally, the protein contents and total amino acid contents increased with S concentration increasing for both cultivars, in comparison with 80 μmol S · L-1 treatment. The two rice cultivars' four protein fractions content of the two rice cultivars had positive relationship with sulfur concentrations on the whole. 【Conclusion】 Under 200 μmol S · L-1 treatment for Wujing15 and 260 μmol S · L-1 for Wuyujing3,the physiochemical properties of grain of the two cultivars had substantial improvement.

【题目】杂交粳稻13.5thm－2超高产群体动态特征及形成机制的探讨
【中文关键词】杂交粳稻;超高产;群体特征;形成机制
【英文关键词】Hybrid japonica rice Super-high yielding Characteristics of population Formation mechanism
【中文摘要】选用杂交粳稻甬优8号,以国家粮食丰产工程兴化、姜堰实施基地1.0 hm2连片与6.67 hm2连片超高产攻关方为依托,研究了13.5 t hm－2超高产群体特征,并探讨了群体形成机制。结果表明,较之12.0 t hm－2左右群体,13.5 thm－2群体的穗型大,群体颖花量多(60 000×104 hm－2以上),有效穗数、结实率和千粒重与之相当;群体茎蘖于生育前期稳步增长,至有效分蘖临界叶龄期达适宜穗数,高峰苗出现在拔节期,数量少,为预期穗数的1.3倍左右,此后群体平缓下降,至抽穗期达适宜穗数,成穗率高(>75%);群体叶面积指数前期增长相对较缓慢,最大值出现在孕穗期,为8.5左右,此后下降缓慢,成熟期仍保持在4.0以上;群体光合势生育前期较小,中、后期较大,总光合势为675×104m2 d hm－2以上,抽穗至成熟期的光合势占总光合势的45.0%以上;群体拔节前干物质积累速度相对较缓、积累量略低,拔节后积累速度较快,至抽穗期群体生物量为13.5 t hm－2以上,抽穗后积累量亦高,一般为9.75 t hm－2以上,总干物重高达23.25 t hm－2以上。13.5 t hm－2超高产群体形成机制为,依靠精苗,发大蘖,及时够苗,提高够苗期群体质量(有效分蘖临界叶龄期),为中期高质量群体结构的培育奠定生物学基础;依靠合理的群体动态及其规模,培育适宜数量的壮秆大穗,于抽穗期形成具有强抗倒力和巨量安全库容的高光效群体;依靠平稳消退的光合系统,提高抽穗后群体光合物质生产力,增大群体库容的总充实量,并维持较大的茎鞘强度,增强群体的安全抗倒力。

【英文摘要】Population characteristics of super-high-yielding hybrid japonica rice (13.5 t ha－1) were studied and its formation mechanism was explored using Yongyou 8 as material in Xinghua and Jiangyan. Results showed that population of 13.5 t ha－1 had more spikelets per panicle and total spikelets than population of 12.0 t ha－1. There was no significant difference in panicles, filled-grain percentage and 1000-grain weight between populations of 13.5 t ha－1 and 12.0 t ha－1. Population of 13.5 t ha－1 exhibited fewer tillers at the early growth stage and achieved excepted number of stems and tillers at critical leaf-age for productive tillers, whose max number of stems and tillers was at jointing stage and was about 1.3 times of excepted number. Then, the number of population stems and tillers began to decrease stably, which achieved expected number again. At last, ratio of productive tillers to total tillers of 13.5 t ha－1 population was more than 75%, which was higher than that of population of 12.0 t ha－1.The leaf area index of 13.5 t ha－1 population was lower than that of 12.0 t ha－1 population at the early growth stage, and the max leaf area index was about 8.5 at booting, which decreased stably and was above 4.0 at maturity. The photosynthetic potential of population with 13.5 t ha－1 was small at early stage and larger at middle and late stages, as compared with population with 12.0 t ha－1. The total photosynthetic potential was above 675×104 m2 d ha－1, of which most than 45.0% was from heading to maturity. The dry matter accumulation was smaller compared with population with 12.0 t ha－1 before jointing, and the weight of it was above 60 kg ha－1 at heading, which was significantly higher than that of population with 12.0 t ha－1. The total weight of dry matter was above 23.25 t ha－1, of which above 9.75 t ha－1 was accumulated from heading to maturity. Formation mechanism of super-high yielding population (13.5 t ha－1) was that: population quality was enhanced at critical leaf-age for productive tillers through cultivating strong seedlings, germinating low positiontillers and achieved expected number of stems and tillers in time, which formed the biological foundation for high quality population at middle stage; in order to form high photosynthetic efficiency of population structure with strong lodging-resistance and

large population spikeletes at heading, suitable number of strong stems and large panicles was cultivated through establishing suitable dynamic and size of population; in order to enlarge sink-filling and keep strength of stems and sheaths, dry matter accumulation was enriched after heading through photosynthetic system smooth and steady fade away.

【题目】水稻不同生育期类型品种精确定量施氮参数的初步研究
【中文关键词】水稻;不同生育期类型;施氮量;精确定量施氮;100 kg 籽粒吸氮量
【英文关键词】Rice Different growth type N application rate Precise and quantitative N application N requirement for 100 kg grains
【中文摘要】以长江中下游地区早熟中粳、中熟中粳、迟熟中粳、早熟晚粳和中熟晚粳5 种类型品种为材料, 设置3 种施氮水平(0、225 和300 kg hm − 2 纯氮), 研究精确定量施氮3 个参数的变化规律。结果表明: (1)不施氮条件下的土壤基础供氮量即基础产量吸氮量, 随水稻品种生育期的延长而增加, 计算基础产量吸氮量的参数即100 kg 稻谷吸氮量,在中熟中粳、迟熟中粳和早熟晚粳3 种类型间差异较小, 产量为6 t hm − 2 (4.87~6.58)时为1.58 kg (1.50~1.63)。(2)施氮条件下, 100 kg 籽粒吸氮量在中熟中粳、迟熟中粳和早熟晚粳间的变化较稳定, 平均为7.5 t hm − 2 产量时, 225 kghm − 2 氮素水平为1.86 kg (1.85~1.87), 300 kg hm − 2 氮素水平为2.01 kg (1.98~2.05); 9 t hm − 2 的产量时, 225 kg hm − 2 氮素水平为1.94 kg (1.91~2.04), 300 kg hm − 2 氮素水平为2.08 kg (2.01~2.19); 10.5 t hm − 2 的产量时, 225 kg hm − 2 氮素水平为1.95 kg (1.93~2.01), 300 kg hm − 2 氮素水平为2.09 kg (2.08~2.10)。说明随着施氮量的增加100 kg 籽粒吸氮量呈增加趋势。相关分析表明, 100 kg 籽粒吸氮量与产量呈极显著的二次曲线关系, 其中早熟中粳和中熟晚粳的相关系数小于其他3 种类型。(3)氮肥利用率随施氮量的增加基本呈下降趋势, 除中熟晚粳外表现为随生育期的延长而增加, 即在225kg hm − 2 氮素水平下分别为31.32%、37.64%、38.5%、41.08%和38.11%, 300 kg hm − 2 氮素水平下分别为28.74%、36.13%、37.16%、40.15%和39.42%。(4)欠适宜种植的早熟中粳和中熟晚粳的施氮参数相对于其他类型变异较大; 相对于非主推品种, 主推品种(当家品种)的施氮参数值较高且更趋稳定。说明在合理的品种选择和布局条件下, 施氮参数变化规律较强, 生产上利用斯坦福方程精确计算水稻目标产量施氮量是可行的。
【英文摘要】The objective of this study was to expose the change law of the three parameters of the precise and quantitative N application based on the Stanford equation in different growth types of rice. Three levels of N fertilizer application rates of 0, 225, and 300 kg ha-1 N were designed in a field experiment with early (125 – 135 d), medium (136 – 145 d), late-maturing (146 – 155 d) medium japonica and early (156 – 165 d), medium-maturing (166 – 175 d) late japonica rice in 2007 and 2008 on the farm of Yangzhou university, Jiangsu province, China. The results were as follows: (1) Under zero N application, soil basal N application (N accumulation for basal yield) increased with the extension of the rice growth duration, in which the parameter of calculating N accumulation for basal yield was the N requirement for 100 kg grains. There were only small differences in N requirement for 100 kg grains between medium, late-maturing medium japonica and early-maturing late japonica rice. For an average yield of 6 t ha − 1 (4.87 – 6.58), the N requirement for 100 kg basal yield was 1.58 kg (1.50 – 1.63). (2) Under N application, the N requirements for 100 kg grains were rather stable in medium, late-maturing medium Japonica and early-maturing late Japonica rice. With the average yield of 7.5t ha − 1, N requirement for 100 kg grains was 1.86 kg (1.85 – 1.87) under 225 kg ha-1 N level and 2.01 kg(1.98 – 2.05) under 300 kg ha − 1 N level, respectively. With the average yield of 9 t ha − 1, N requirement for 100 kg grains was 1.94 kg (1.91 – 2.04) under 225 kg ha − 1 N level and 2.08 kg (2.01 – 2.19) under 300 kg ha − 11 N level, respectively. With the average yield of 10.5 t ha − 1, N requirement for 100 kg grains was 1.95 kg (1.93 – 2.01) under 225 kg ha − 1 N level and 2.09 kg (2.08 – 2.10) under 300 kg ha − 1 N level, respectively. These results suggested that N requirement for 100 kg grains increased with the rising of N application rates. Correlation analysis showed that there existed highly significantly positive conic correlation between yield and N requirement for 100 kg grains, and the correlation coefficients for early-maturing medium japonica and medium-maturing late Japonica were less than those for the other three types. (3) The N use efficiency decreased with the increase of N application rate,and increased with the extension of the growth duration except in the medium-maturing late japonica. N use efficiency was 31.32%, 37.64%, 38.5%, 41.08%, and 38.11% under 225 kg ha − 1 N level , and 28.74%, 36.13%, 37.16%, 40.15%, and 39.42% under 300 kg ha − 1 N level, for the five types of rice with extended growth duration respectively. (4) The parameters of N application displayed larger differences in early-maturing medium

japonica and medium-maturing late japonica rice which were less suitable for local cultivation, compared with the other three types, while these parameters values of the prevailing varieties (headed varieties) were higher and more stable than those of common varieties. These results demonstrated that the changes of the parameters of N application were much larger, it is feasible for the N quantity required for target yield to be calculated accurately by using Stanford equation under the condition of reasonable variety selection and planting location.

【题目】不同氮肥吸收利用效率水稻基因型叶片衰老特性

【中文关键词】水稻;氮肥利用效率;衰老特性;相关性
【英文关键词】Rice N use efficiency Characteristics of senescence Correlation

【中文摘要】选用氮肥利用高效型和低效型具有代表性的12 个粳稻品种, 研究225 kg hm − 2 施氮条件下其氮素吸收积累特性。与氮低效基因型相比, 氮高效基因型水稻在拔节至抽穗、抽穗至成熟阶段的氮素吸收速率、氮素积累量和积累比例均具有明显优势, 其中以抽穗至成熟阶段的优势尤为显著。该阶段水稻各器官逐渐衰老, 植株各项生理功能逐渐衰退, 为明了水稻衰老与植株中后期氮素吸收与积累、氮肥吸收利用效率的相互关系, 相继研究了花后各基因型水稻的衰老特性。结果表明, 齐穗后的不同时期, 氮高效基因型水稻的超氧化物歧化酶(SOD)、过氧化物酶(POD)和过氧化氢酶(CAT)活性均显著高于氮低效基因型, 而膜脂过氧化产物丙二醛(MDA)的含量却要显著低于氮低效基因型水稻。相关性分析表明, 水稻的氮肥利用效率与齐穗后剑叶中的SOD、POD 和CAT 活性呈极显著正相关, 而与其剑叶中的MDA 含量呈极显著负相关。由此说明, 与氮低效基因型相比, 氮高效基因型水稻生育后期剑叶中用于清除活性氧自由基的SOD、POD、CAT 活性较高, 能有效阻止高浓度氧的积累和膜脂过氧化作用, 降低MDA 的含量, 因而降低叶片的衰老进程, 在维持较长光合功能期的同时能增强物质积累, 促进植株对氮肥的吸收和利用。

【英文摘要】Although excessive use of N fertilizer can result in the rapid decrease of N use efficiency and other serious environment problems, N fertilizer is yet the most important and largest input in modern rice production. Previous researches have been demonstrated that variation in N use efficiency existed among rice genotypes. Therefore, it is of urgent importance to elucidate the physiological mechanism of rice N absorption and utilization for increasing N use efficiency. In this research, field experiment with 225 kg ha − 1 N fertilizer application was carried out in 2006 on the farm of Yangzhou University, Jiangsu province, China. Twelve rice genotypes (six N efficient and six N inefficient) selected from one hundred and twenty rice cultivars grown in Yangzhou during 2004 and 2005 were adopted to investigate the characteristics of N absorption and accumulation. Compared with N inefficient genotypes, N efficient genotypes had more obvious advantages in N absorption rate, the amount and the percentage of N accumulation during the growth phases from elongating to heading and from heading to maturing. And of which the advantage during the growth phase from heading to maturing was particularly significant. Since rice organs aged and the plant physiological functions declined gradually from heading to maturing, the characteristics of rice senescence was then studied to understand the relationships between rice senescence and the N absorption and accumulation, and the N use efficiency. Results showed that, during the period of grain filling, the activities of superoxide dismutase (SOD), peroxidase (POD), and catalase (CAT) in flag leaf of N efficient genotypes were obviously higher than those of N inefficient genotypes. Contrarily, content of malondialdehyde (MDA), which is the product of membrane lipid peroxidation, was lower in N efficient genotypes than in N inefficient genotypes signifi cantly. After the stage of full heading, N use efficiency was positively correlated to the activities of SOD, POD, and CAT in flag leaf of rice and negatively correlated to the content of MDA. So it reveals that, at late growth stages of rice, the activities of SOD, POD, and CAT of N efficient genotypes were higher than those of N inefficient genotypes in flag leaves, which could eliminate reactive oxygen species, inhibit the membrane lipid peroxidation and decrease the content of MDA more efficiently in N efficient rice genotypes. Therefore, compared with the N inefficient genotypes, the leaf senescence of N efficient genotypes was relatively slower, which could prolong the functional period of leaves, enhance the organic matter accumulation and improve the efficiency of N absorption and utilization.

【题目】不同基因型水稻苗期对1,2,4-三氯苯胁迫的生理响应
【中文关键词】1,2,4-三氯苯;水稻;耐性基因型;敏感基因型;毒性;抗氧化酶
【英文关键词】1,2,4-trichlorobenzene Rice Tolerant genotype Sensitive genotype Toxicity Antioxidant enzymes
【中文摘要】利用沙培试验, 研究了6 种浓度(0、0.1、0.2、0.4、0.6、0.8 mmol kg－1 沙)的1,2,4-三氯苯(TCB)对两水稻品种香粳20-18(耐性基因型)和泗阳1382(敏感基因型)种子发芽率、发芽指数、幼苗生物量以及叶片和根系的蛋白质含量、丙二醛含量(MDA)、超氧化物歧化酶(SOD)活性、过氧化物酶(POD)活性、过氧化氢酶(CAT)活性等生理指标的影响。结果表明, TCB 胁迫下, 水稻种子发芽率和发芽指数变化不明显, 幼苗的生物量显著下降, 香粳20-18 下降幅度比泗阳1382 小; 随TCB 胁迫程度的增强, 香粳20-18 叶片和根系可溶性蛋白质含量呈增加的趋势, 泗阳1382 叶片蛋白质含量显著下降, 高浓度TCB 胁迫下其根系蛋白质含量显著下降; 两个基因型叶片的.O2- 产生速率先降后升,香粳20-18 根系的.O2- 产生速率先降后升, 高浓度TCB 胁迫下显著高于对照, 而泗阳1382 与对照差异不显著; 香粳20-18 叶片SOD 活性随TCB 胁迫程度的增强呈上升趋势, 低浓度TCB 胁迫下就开始显著高于对照, 根系SOD 活性显著增强, 而泗阳1382 叶片和根系SOD 活性与对照差异不显著; 香粳20-18 叶片POD 活性先升后降, 根系POD 活性显著高于对照, 而泗阳1382 叶片和根系POD 活性均显著下降; 香粳20-18 叶片CAT 活性高于或显著高于对照, 泗阳1382 低于或显著低于对照; 两个基因型叶片的MDA 含量先降后升, 高浓度TCB 胁迫下MDA 含量显著高于对照,根系MDA 含量均随TCB 胁迫程度的增强而显著增加。总之, 生物量降低幅度小、叶片和根系的蛋白质含量高、抗氧化酶系统清除活性氧的能力强、MDA 含量低是耐性基因型的主要生理特征。
【英文摘要】1,2,4-Trichlorobenzene (TCB) has pervaded in industrial and agricultural production. Because of a series of problem scaused by its stableness and fatalness, TCB has been added into the environmental pollutant list. In order to know how TCB affects the rice seed germination, seedling growth and its physiological characteristics, the seed germination, seedling biomass,soluble protein, and malnodialdehyde (MDA) contents, as well as activities of superoxide dismutase (SOD), peroxidase (POD), and catalase (CAT) in leaves and roots of seedlings treated with TCB were investigated in a sand culture experiment using rice cultivars, Xiangjing 20-18 (TCB tolerant genotype)and Siyang 1382 (TCB sensitive genotype). The results indicated that TCB had little effect on the seed germination rate and index, however caused the significant reduction of seedling biomass, with Xiangjing 20-18 being more affected than Siyang 1382. With TCB stress degree strengthening, soluble protein content of Xiangjing 20-18 leaves and roots presented an increasing tendency, while that of Siyang 1382 leaves decreased significantly, and that of its roots decreased too under treatment of high TCB concentration.O2- producing velocity of leaves in two genotypes decreased firstly, then increased with increasing TCB concentration. That of Xiangjing 20-18 roots presented the same tendency, and significantly higher than the control at TCB≥0.6 mmol kg－1, while that of Siyang 1382 roots had no significant difference with that of the control. SOD activity of Xiangjing 20-18 leaves increased, and that of roots increased significantly. After TCB≥0.2 mmol kg－1,SOD activity of Xiangjing 20-18 leaves was significantly higher than that of the control, that of Siyang 1382 leaves and roots was not significantly different with that of the control. POD activity of Xiangjing 20-18 leaves increased firstly, then decreased, and that of roots was significantly higher than the control, while that of Siyang 1382 leaves and roots decreased significantly. CAT activity of Xiangjing 20-18 leaves was higher or significantly higher than that of the control, and that of Siyang 1382 was contrary to the result of Xiangjing 20-18. MDA content of leaves decreased firstly, then increased, being significantly higher than that of the control at high TCB concentration, and that of roots increased significantly in two genotype. In conclusion, lower reduction of seedling biomass, high protein content of leaves and roots, the better active oxygen ’s elimination ability and lower MDA content in plants would be considered as the physiological traits in TCB-tolerant genotypes of rice.

【题目】超高产常规粳稻宁粳1 号和宁粳3 号群体特征及对氮的响应
【中文关键词】常规粳稻;超级稻;超高产;群体;氮
【英文关键词】Japonica Super rice Super-high yield Population Nitrogen
【中文摘要】2007—2008 年对宁粳1 号和宁粳3 号的丰产示范方进行调查, 2008 年以宁粳3 号为材料进行氮肥用量和前后比例试验, 研究常规粳型超级稻超高产群体特征及对氮的响应。结果表明, 常规粳型超级稻宁粳1 号和宁粳3 号抽穗后干物质积累占籽粒产量的70%~80%, 茎叶等营养器官的表观转运率少, 易高产稳产。足够的颖花量是高产稳产的保证, 要达到11.0 t hm − 2 以上的产量, 颖花数要 ≥ 42 000 m − 2; 要达到11.7 t hm − 2 以上的产量, 颖花数要 ≥ 45 000 m − 2,同时结实率 ≥ 90%, 粒重 ≥ 26 mg。超高产群体抽穗期适宜叶面积指数(LAI)为7.0~7.5, 叶色呈“ 黑黄 ”节奏变化,后期生长速率(CGR)高, 收获指数(HI)≥ 0.5。氮肥的适量施用和适当后移, 不仅可以保证宁粳1 号和宁粳3 号生育期“ 黑黄 ”节奏变化, 建立抽穗期适宜LAI 的群体, 还可以保持超高产株型特征, 提高抽穗后LAI、叶面积维持期、CGR和HI, 最终实现超高产量。
【英文摘要】In order to study the super high-yielding population characteristics of super japonica rice and its responses to nitrogen,two field experiments with five N rate treatments and four N application ratio treatments of Ningjing 3 were carried out in 2008,the 6.7 ha demonstration fields of Ningjing 1 and Ningjing 3 in 2007 and 2008 were also investigated. Results showed that the dry matter accumulation of Ningjing 1 and Ningjing 3 after heading was 70 – 80% of the grain yield, and the apparent translocation ratio of dry matter from stem and leaves to grain was small, which resulted in the high and stable grain yield. Ample spikelets per square meter were the guarantee of super and stable high yield. To achieve the target yield of 11.0 t ha − 1, the spikelets per square meter must be above 42 000 m − 2; to achieve the target yield of 11.7 t ha − 1, the spikelets per square meter must be above 45 000 m − 2, as well as grain filling rate and grain weight must be above 90% and 26 mg. For super high-yielding rice population, the optimal LAI at heading should be 7.0 – 7.5, crop growth rate (CGR) from heading to maturity should be higher and the harvest index (HI) should be above 0.5. The appropriate N rate and relative more N topdressed at panicle initiation stage could not only ensure the optimal LAI at heading, but also maintain the plant type characteristics of super high-yielding rice, improve the LAI after heading, leaf area duration, CGR and HI, therefore achieve the super high grain yield.

【题目】超级中籼杂交水稻氮素积累利用特性与物质生产
【中文关键词】超级中籼杂交水稻;氮素;吸收/运转;物质生产
【英文关键词】Middle-season indica super hybrid rice Nitrogen Absorption/translocation Dry matter production
【中文摘要】在大田条件下比较了5个超级稻品种和对照汕优63的物质生产及氮素吸收利用特性。结果表明,超级稻物质生产与积累优势始于拔节期,并随着生育进程而扩大,抽穗以后的干物质量积累优势明显。超级稻对氮素的吸收积累总量达196.5(184.3~200.8)kg hm-2,较对照的176.5kg hm-2增加20.0kg hm-2,其中拔节前与对照相当,拔节至抽穗期增加9.2kg hm-2,抽穗至抽穗后25d增加4.9kg hm-2,抽穗后25d至成熟期增加4.3kg hm-2。氮素吸收速率拔节至孕穗阶段达最高峰,超级稻为3.68(3.44~3.96)kg N hm-2d-1,对照为3.55kg N hm-2d-1;孕穗期以后吸氮速率随着生育进程而逐渐下降,抽穗25d以后,对照基本不具再吸收能力,而超级稻仍具一定吸收能力(0.36kg N hm-2d-1)。超级稻生育中、后期氮素吸收利用能力的提高促进了抽穗和灌浆结实期植株特别是叶片含氮率的提高,孕穗期、抽穗期、抽穗后25d、成熟期叶片含氮率均与相应生育阶段的干物质积累量显著相关,与最终总生物量极显著相关。超级稻在10.5t hm-2产量水平下的百千克籽粒吸氮量在1.83kg左右。
【英文摘要】【Abstract】 The field experiment was conducted in 2006 to research the difference of characteristics of dry matter accumulation and nitrogen uptake and utilization between five super rice cultivars and the control—Shanyou 63. The dry matter production of middle-season indica super hybrid rice was started from the beginning of elongation stage, and with the rice growing, the com- parative advantage of dry matter accumulation was gradually speeded up. The middle-season indica super hybrid rice had apparent advantage in biomass accumulation after heading. Total amount of nitrogen absorption was 196.5 (184.3 – 200.8) kg ha-1 in super rice cultivar, which was 20.0 kg ha-1 higher than that of control. The amount of nitrogen absorption of middle-season indica super hybrid rice cultivar corresponded to that of control before jointing stage, however, increased 9.2 kg ha-1 more than that of CK from

jointing stage to heading stage, 4.9 kg ha-1 more than that of CK at 25 days after heading stage, and 4.3 kg ha-1 more than that of CK from 25 days after heading stage to maturity. The Nitrogen uptake rate reached its peak at booting stage, and the middle-season indica super hybrid rice was 3.68 (3.44 – 3.96) kg N ha-1 d-1 while the control was 3.55 kg N ha-1 d-1. And then, the nitrogen uptake was slower and slower after booting stage, and at 25 days after heading and at maturing stage, the N-uptake rate was 0.36 kg N ha-1 d-1 in super rice, whereas it was almost zero in the control. It can be seen that middle-season indica super hy- brid rice held high N rate in the leaf blade after heading stage, which was beneficial to chlorophyll contents stability and photo- synthate accumulation so that the super high yield of the rice could become true. The result also showed that the super hybrid rice should absorb about 1.83 kg N per hundred kilogram grain when its yielding level was 10.5 t ha-1.

【题目】氮肥运筹对超级杂交粳稻产量、品质及氮素利用率的影响
【中文关键词】超级杂交粳稻;氮肥运筹;产量;氮素利用率;品质
【英文关键词】Super japonica hybrid rice Nitrogen application Yield Quality Nitrogen use efficiency
【中文摘要】在高产施氮量条件下(225kghm^-2),按基蘖肥、穗肥不同施氮比例且穗肥依不同叶龄期追氮共设计了20种施氮模式,研究了其对超级杂交粳稻常优1号产量、氮素利用率及主要米质性状的影响。结果表明:氮肥运筹对常优1号产量影响极大,基蘖肥与穗肥施氮比例为58.34:41.66,穗肥以叶龄余数4、2叶等量施氮时,产量最高;产量与总吸氮量、氮肥农学利用率、氮肥表观利用率、生理利用率呈极显著正相关关系,氮收获指数和百千克籽粒需氮量与产量呈二次曲线关系;随着穗肥施氮比例的下降,稻米整精米率、蛋白质含量、垩白率、垩白度逐渐下降;胶稠度、直链淀粉含量呈直线上升趋势;穗肥随追肥叶龄期推迟,整精米率、蛋白质含量提高,而直链淀粉含量下降。胶稠度、外观品质因基蘖肥施氮比例的不同而异。综合来看,基蘖肥、穗肥施氮比例为6:4,穗肥以倒4、2叶期追肥可使该品种超高产、优质、高效得到较好的协调统一。
【英文摘要】Effects of nitrogen application regimes, based on the proportion of base-tillering fertilizer to panicle fertilizer and leaf age of panicle fertilizer supply, were studied on yield, nitrogen use efficiency and quality in supper japonica hybrid rice, cv. Changyou 1, under the high grain yield at 225 kg ha^- 1 of N condition during a whole growth stage. The result indicated that the yield was influenced significantly by nitrogen application regimes. The regime for highest yield was that the ratio of base-tillering fertilizer to panicle fertilizer was 58.34:41.66, and the split panicle fertilizers were equally applicated at fourth and second leaf age from top. There were highly significantly positive correlations between yield and total N uptake, agronomic N use efficiency, apparent N recovery efficiency, physiological N use efficiency, and significantly quadratic relationships between yield and kg N 100 kg^-1 grain yield, N harvest index. With the decreasing of N rate of panicle fertilizer, head milled rice, protein content, chalky ratio and chalkiness were decreased; gel consistency and amylose content increased gradually. With postponing the time of N-applying leaf age, head milled rice and protein content were raised,and amylose content dropped. The gel consistency and apparent features were varied by different application proportions. On the whole, the proportion of N-application at 6:4 and the top dressing of panicle N-fertilizers with equal amount at fourth and second leaf age from top might realize the coordination of supper high-yield, good quality, and high N use efficiency.

【题目】氮肥运筹对杂交稻主要品质性状及淀粉RVA谱特征的影响
【中文关键词】杂交稻;氮肥;品质;RVA
【英文关键词】Hybrid rice Nitrogen application Quality RVA
【中文摘要】以杂籼K 优818 和杂粳常优1 号为材料, 研究了在高产施氮量条件下(225 kgPhm2) , 前、中期不同施氮比例及中期依不同叶龄期追氮对主要米质性状及淀粉RVA 谱特征的影响。结果表明, 随着施氮比例的前增中减, 两品种稻米整精米率、蛋白质含量、消减值、垩白率、垩白度、糊化温度逐渐下降; 胶稠度、淀粉峰值黏度、崩解值呈直线上升趋势; 而热浆黏度、最终黏度对氮肥运筹的反应因品种而异。说明适当减少中期施氮比例可改善稻米外观、蒸煮品质并提高淀粉黏性, 但同时也对稻米加工、营养品质带来不利的影响; 中期不同叶龄期追氮因前期施氮比例的差异和品种的不同, 效应也不尽一致, 总体而言, 随中期施氮比例的减少, 相应推迟追肥叶龄期可以获得较好的稻米外观品质、蒸煮品质和淀粉黏性。对于胶稠度、淀粉峰值黏度、热浆黏度、最终黏度、崩解值、垩白率、垩白度、消减值等品质指标, 常优1 号较K 优818推迟一个叶龄期施肥最佳。
【英文摘要】Rice quality can be improved through nitrogen fertilizer strategy, such as the rate and the timing of application.The establishment of "the leaf agemodel of development process of rice" makes rice cultivation move accurate in growth and development process modeling, cultivation diagnosis standardization and regularization of technical measures.The objective of this study was to find the suitable way of nitrogen application for improving the rice quality under the condition of the high yield.Using hybrids K-you 818 and Changyou 1 planted with a total applied nitrogen amount of 225 kg/ha in the all growth stage.The different proportion of N-fertilizer at early and middle stages (the ratio of basic- tilling and stem- panicle fertilizer was 3: 7, 5: 5 and 7: 3, respectively) and N-applying leaf age of stem- panicle N- fertilizers (Stage of remaining leaf primordium number 5, 3; 5, 4, 3, 2, 1; 4, 2; 3, 1, respectively) were imposed on the experiment.The results showed that with the increasing of N- application rate at early stages, head milled rice, protein content, setback, chalkiness and pasting temperature were decreased; gel consistency, peak viscosity and breakdown increased gradually; effect of N fertilizer on trough viscosity and final viscosity varied with different cultivars.It suggested that the decrease of the nitrogen application proportion at middle stage improved facial features, cooking quality and viscosity of amylum, but adverse effect on milling quality and nutrient quality were found.Effect of N-applying leaf age on quality varied in different application proportions and cultivars.With the decreasing proportion of N-application at middle stages, good facial features, cooking quality and viscosity of amylum were obtained by postponing the time of N- applying leaf age.Some quality indexes of Changyou 1 reached maximum (such as gel consistency, peak viscosity, trough viscosity, final viscosity and breakdown etc.) or minimum (such as chalkiness percentage, chalkiness degree and setback etc.) when the time of panicle fertilizer application was at a leafage later than that of K-you 818. This may be attributes to Changyou 1 with long days-to-maturity. As a whole, the N-application proportion of 7: 3 at early and middle stages could result in a good performance for quality of the two cultivars, while under this proportion, a much more good performance for quality of K-you 818 and Changyou 1 could be observed when applied stem- panicle N- fertilizers with equal amount in 4 th and 2 nd, 3 rd and 1 st leaf age from top, respectively.

【题目】氮素穗肥对水稻幼穗细胞分裂素和生长素浓度的影响及其与颖花发育的关系
【中文关键词】水稻;氮素穗肥;激素;每穗颖花数
【英文关键词】Rice Panicle nitrogen fertilizer Hormone Spikelets per panicle
【中文摘要】以粳稻品种武育粳3 号和2401 为研究材料, 在盆栽条件下, 设高(HN)、低(LN)两个穗肥施氮水平, 对幼穗发育过程中(颖花分化至抽穗后7 d)细胞分裂素(ZRs、iPAs)和生长素(IAA)含量及其动态分别进行测定和比较分析。结果表明, 幼穗发育过程中穗中细胞分裂素和生长素含量均表现先降后升的趋势, 穗肥的施用(HN 处理)提高了各个时期细胞分裂素的含量, 尤其是颖花分化期效果最为明显。而生长素的变化情况较为复杂, 从颖花分化期到花粉母细胞减数分裂期前LN 处理稍高于HN 处理, 之后HN 处理又逐渐超过LN 处理。穗发育期间HN 处理的ZRs/IAA 和iPAs/IAA 均高于LN 处理, 颖花分化期差距最大, 随后逐渐减小, 到花粉母细胞减数分裂期差异最小, 抽穗时比值差距又再次扩大, 两个品种表现相似

。水稻氮素穗肥的施用具有延长颖花分化时间、增加每穗颖花数的作用,这可能与其提高幼穗分化期尤其是颖花分化期的细胞分裂素含量及其与生长素的比值有关。

【英文摘要】Panicle N fertilizer, which is nitrogen fertilizer applied at panicle development stage, has great influence on the development of rice panicle. Studies have revealed that the beneficial response of nitrogen fertilizer on spikelet development is associated with the increase of spikelets number per panicle. However, little is known concerning the effect of panicle N fertilizer on endogenous hormones in rice young panicle. In the present study, two japonica rice cultivars (Wuyujing 3 and 2401) were used,and two panicle N fertilizer treatments, 120 kg N ha − 1 as high nitrogen (HN) and 0 kg N ha − 1 as low nitrogen (LN), were conducted to investigate the relationship between spikelets number and hormonal changes during rice panicle differentiation. The results showed that zeatin + zeatin riboside (ZRs), isopen-tenyl adenine (iPAs), and indole-3-acetic acid (IAA) concentrations were the highest at spikelet differentiation stage, sharply declined and remained almost static till heading, and recovered slightly after heading. Panicle N fertilizer treatment resulted in higher concentrations of ZRs and iPAs, especially at the spikelet differentiation stage. Whereas, IAA displayed lower concentration in HN as compared to LN. Moreover, there were higher ratios of ZRs/IAA and iPAs/IAA for HN as compared to LN during the panicle differentiation stage. The difference between them was the maximum at the spikelet differentiation stage and then declined to the minimum before heading, while there was no significant difference between two cultivars. The results suggested that the effect of panicle N fertilizer on spikelet differentiation and numbers per panicle could be associated with the changes of endogenous hormones such as ZRs, iPAs, and IAA, either in their concentrations or in their ratios.

【题目】机插稻育秧床土的培肥效应研究

【中文关键词】机插水稻;育秧;床土;肥力;秧苗质量
【英文关键词】Mechanical transplanting rice Seedling-raising Seedbed soil Soil fertility Seedling quality

【中文摘要】床土培肥是培育水稻机插秧苗的首要措施。在不同类型床土条件下对培肥水平与床土速效氮磷钾增加的关系及育秧过程中的肥力消耗进行了分析。结果表明,通过添加速效肥料进行床土培肥,随培肥量增加床土速效氮磷钾含量迅速增加,速效氮的增加呈指数关系,高培肥处理的增幅大于低培肥处理,丘陵土的增加快于冲积土;速效磷含量随培肥水平的提高直线上升,床土类型间有显著差异,丘陵土快于冲积土;速效钾的增加趋势与速效磷相似,但增速在不同床土间几近相同。育秧过程中速效养分的消耗也各具特点,总的趋势是高培肥水平下高消耗,速效氮消耗快于速效磷和速效钾。一定肥力范围内,秧苗株高和地上部干物质随床土培肥水平的升高而增加,通过床土培肥措施可以有效地调控秧苗株高。但根P冠比随培肥水平增加而下降。只有在合适的肥力指标范围内,才能育成适宜形态和地上、地下部生长均衡的健壮机插秧苗。

【英文摘要】Seedbed soil fertilizing is one of the key measures for raising mechanical transplanting rice seedling. The relationship of fertilizing levels to the increase of available N, P, K in seedbed soil and their uptake during seedling growth were analyzed, using alluvial soil and hill- paddy field soil as seedbed soil, fertilizing the seedbed soil with 10-10-5 compound fertilizer, with Wuyujing 3 as material. The results showed that contents of available N, P, K were increased quickly by application of inorganic fertilizer. The increase of available N exhibited an exponent curve, and was higher under high level of fert ilization than under low level, and was faster in hill soil thao in alluvial soil1 Available P content was increased linearly with the increase of fert ilizing level, there was significant difference between soil types, and the increased velocity in hill soil was more quickly than that in alluvial soil1 The trend of increase in available K content was similar to that in P, but the difference of increased velocity between different types of soilwas not significant1 After the seedlings grew and consumed, the uptake of nutrients in seedlings was high under a higher fertilizing level of available N, P, K during raising. The available N in seedbed in all treatments was highly correlated with fertility level before fertilizing, indicating that the use of available N by seedling was affected by the fertility level of seedbed soil. The consumption of available P was increased linearly with the increase of the fertilizing levels, and significant difference was found among seedbed soil types. The consumption of available K was similar to that of available P, but it was consistent among different soil types. The seedling growth on various fertilizing levels was observed. The data showed that seedling height was increased while root/shoot ratio was reduced with the increase of the fertilizing level within a suitable range1 From the above results, we can conclude that fertilizing the seedbed can increase available N, P, K contents

rapidly, but the characteristics are different and closely related to the soil types. Only within the range of suitable fertilizing level, the strong seedlings with the suitable shape and root/shoot ratio for mechanical transplanting can be raised.

【题目】结实期不同时段高温对稻米品质的影响
【中文关键词】水稻;稻米品质;高温;淀粉黏滞性谱
【英文关键词】Rice(Oryza sativa)　Rice quality　Higher temperature　Rapidvisco- analyzer
【中文摘要】选用扬稻6 号(籼稻) 和武育粳3 号(粳稻) 2 个品种, 利用人工气候室进行灌浆结实期阶段控温试验, 探讨结实期高温对稻米品质指标和淀粉RVA 的影响, 以及温度影响的时段效应。结果表明, 结实期温度对稻米品质影响明显, 且不同品种、不同品质指标对温度的反应存在差异。结实期高温, 使2 品种长宽比变小, 垩白粒率、垩白度变大, 糙米率、精米率和整精米率显著降低, 蛋白质含量升高, 淀粉RVA 谱特征值糊化开始温度、冷胶黏度、回复值和消减值升高, 最高黏度、热浆黏度和崩解值下降; 结实期温度对AC 的影响因品种而异, 高温使扬稻6 号AC 升高, 武育粳3 号AC 降低。全结实期高温对稻米品质的影响最大, 结实前期高温次之, 结实后期高温的影响较小。从抽穗到开花后20 d 是温度影响稻米品质的关键时期, 对稻米品质的形成具有决定性作用, 而结实后期(开花20 d 后) 环境温度对稻米品质的影响较弱。
【英文摘要】The temperature of rice grain-filling stage is the primary ecologic factor for rice qualities.Yangdao6(indica rice) and Wuyujing3(japonica rice) were used to study the effects of higher temperatures in different filling stage on rice qualities and characteristic values of Rapidvisco- analyzer with climatic cabinets.The temperature treatments were as follows: higher temperature(30 °C) in whole grain-filling stage(A) ; higher temperature in early grain- filling stage(GFS) and optimum temperature(23°C) in later GFS stage(B) ; optimum temperature in early GFS and higher temperature in later GFS(C) ; optimum temperature in whole GFS(D,CK) (Table 1). The results showed that, different cultivars had different responses to various temperature treatments, and so did the various indexes of rice qualities.With high temperature in GFS, rice grain chalkness rate and grain chalkness was increased, while the brow rice rate, the milled rice rate and the head rice rate decreased significantly(Table 2) ; the effects of GFS temperature on rice AC value were various with cultivars, under high temperature treatments,Yangdao 6's AC value were increased,while Wuyujing3's AC value decreased(Fig11). Under high temperature treatments, both cultivars performed higher protein content (Fig12) , higher Gelatinization temperature, Final viscosity, Consistency and Setback, lower Peak viscosity, Hot viscosity, and Breakdown (Table 3) .Compared with D treatment , the rice qualitieswere affected by A treatment mostly, moderately by B treatment, while least by C treatment. The rice quality indexes under A and B treatments were various greatly with those under C and D treatment;while those under A treatment were various slightly with those under B treatment, and so did those under C treatment with D treatment. It can be concluded that: the period from heading to the 20 days later is the vital stage for whole rice quality in response to higher temperature, which affects rice qualities decisively, while the effect of the temperature in the later stage(beyond 20 days from heading) is slight. And the effect of higher temperature on some parameters of quality differs with cultivar, even though higher temperature degrades whole rice quality in general.

【题目】结实期水分亏缺对反义Wx基因转化系水稻籽粒淀粉合成关键酶活性及淀粉累积的影响
【中文关键词】水稻;水分亏缺;Q 酶;去分支酶(DBE) ; 直链淀粉含量;结实期

【英文关键词】Rice Water deficiency Q enzyme Debranching enzyme Amylose content Grain- filling period
【中文摘要】以反义Wx 基因转化系水稻及其受体亲本武运粳7 号(9522) 为材料, 研究了结实期水层灌溉和水分亏缺条件下籽粒淀粉合成关键酶活性、淀粉及直支链淀粉含量的变化。结果表明, 以水层灌溉为对照, 结实初期(花后5~ 10 d) 的水分亏缺利于籽粒中腺苷二磷酸葡萄糖焦磷酸化酶(ADPGPase) 和颗粒淀粉合成酶(GBSS) 活性的提高, 但随着水分亏缺时间的延长, 到灌浆后期2 种酶活性降低的速度快于对照。水分亏缺显著降低了可溶性淀粉合成酶(SSS) 的峰值。Q 酶活性于水分胁迫下显著受到抑制, 花后20 d 到成熟期酶活性降低的幅度较大。而2 类去分支酶(异淀粉酶和普鲁兰酶) 于水分亏缺下活性显著升高, 在灌浆后期花后25~ 30 d 普鲁兰酶仍保持着较高的活性。与水层灌溉相比, 水分亏缺下籽粒中总淀粉的积累和支链淀粉含量明显降低。GBSS 最大活性与直链淀粉含量关系最为密切, 呈极显著正相关(r =01981* *) , SSS、Q 酶和DBE 最大酶活性分别与淀粉和支链淀粉含量不显著相关性。由此推测土壤水分对支链淀粉合成和积累的影响并不是由某一种酶调节的, 而是由SSS、Q 酶和DBE 以及其他一些酶共同催化完成的。
【英文摘要】Soil drought is one of the most important factors limiting rice production in China1 Recently, more attention for the inferior quality of rice caused by water stress has been paid in agricultural production1 The previous study showed that the indices of quality, such as chalkiness, gel consistency and RVA profile were changed by soil drought.It is considered that rice quality is related to the process of starch accumulation. Therefore, all changes of rice quality under water deficit conditions are responsible for physiological metabolism of starch accumulation during grain filling1 In present study, the pot experiments were conducted at Yangzhou University.Three transgenic rice plants CA1, CA2 and CA3 carrying antisense Wx gene and a wild type (cv. Wuyunjing 7) were grown under water deficiency at flowering stage. In order to assess the implication of physiological metabolism of starch accumulation to water deficiency, as the indictors of rice quality, the contents of soluble sugar, starch, amylose and amylopect in were measured1 The starch accumulat ion capacity was determined by measuring adenosine diphosphoglucose pyrophosphorylase(ADPGPase) , soluble starch synthase(SSS) , granule-bounding starch synthase(GBSS) , starch branching enzyme(Q-enzyme) and two debranching enzymes(Isoamylase and Pullulanase) in rice grain during filling period.The results showed that the activities of ADPGPase and GBSS were significantly enhanced at initial filling stage(5-10 d) , and then declined rapidly from 20 days after anthesis(DAA) to ripening (Fig11) by drought stress. The maximum activity of SSS significantly decreased, but less affected by water deficiency at the later stage of starch accumulation.Q enzyme catalyzed the formation of a- 1, 6 indican bond involved in the synthesis of amylopectin was most sensitive to water in that it responded earlier, and to a greater extent, than the other enzymes. The significant decrease in activity of Q enzyme was observed under water-deficit conditions, especially in later grain- filling stage(Fig12) . However, under such drought conditions, leading to decrease of starch accumulation, the decline in Q enzyme activity was more than that in ADPGPase and SSS. The activities of two debranching enzymes(DBE, Isoamylase and Pullulanase) were elevated significantly, and the high activity of Pullulanase was substantially observed at 20-30 DAA under water deficiency(Fig13). The total accumulation of starch and the content of amylopectin were reduced under water deficiency compared to well-watered treatments(Fig14, Fig15). A positive correlation between the maximal activity of GBSS and the content of amylosewas observed(r = 01981* *) . However, there were no clear correlations between themaximal activities of SSS,Q enzyme,DBE and starch content or amylopectin content. The results suggested that the influences of soil water potential on starch accumulation and the synthesis of the amylopectin were attributed to changes of activities in SSS,Q-enzyme, DBE and other enzymes, and not regulated by only one of them.

【题目】结实期水分胁迫对水稻反义WX基因转化系主要米质性状及米饭质地的影响
【中文关键词】水分胁迫;稻米品质;米饭质地;反义Wx 基因
【英文关键词】Water stress Rice quality The textural of cooked rice Antisense Wx gene
【中文摘要】以反义Wx 基因的转化系及其受体亲本武运粳7 号(9522) 为材料, 研究了结实期水分胁迫对主要品质性状及米饭质地的影响。结果表明, 与水层灌溉处理相比, 结实期水分胁迫使整精米率和垩白粒率提高; 崩解值明显降低, 而最终黏度和消减值却明显提高; 米饭的硬性增加, 黏附性减小, 稻米的蒸煮食味品质有着变劣的趋势。
【英文摘要】It is well known that environments have significant effects on the yield and rice quality. In previous study, the indices of quality, such as chalkiness, gel consistency and RVA profile were altered by soil water moisture. Amylose content is always used to

evaluate the rice eating and cooking quality. And now the characteristics of RVA profile are preferred for the prediction of the texture of cooked rice. Our earlier work showed that RVA profile of rice flour was affected by water stress, but there was no obvious difference in amylose content between well water and water stress. The objective of the study was to research the effects of water stress on the texture of cooked rice and grain quality for rice with the same genetic background. Three transgenic rice lines CA1, CA2, CA3 carrying antisense Wx gene and wild type (cultivar Wuyunjing 7) were grown in pots and were subjected to water stress from flowering stage to filling stage. The results showed that the grain qualities of transgenic rice plants and Wuyunjing 7 were affected by water stress at the grain-filling stage, head milled rice and the percentage of chalky grains increased obviously (Table 3). Changes of RVA profile of rice flour were noticed, breakdown was lower under water stress than under well water, and final viscosity and setback under water stress were higher than those under well water (Table 4). Effect of water stress on the texture of cooked rice presented on the hardness and adhesiveness, the former was increased and the latter was reduced (Table 5) , and there was a tendency of low eating and cooking quality.

【题目】苗床落谷密度、施肥量和秧龄对机插稻苗质及大田产量影响
【中文关键词】机插水稻育秧;落谷密度;苗床施肥量;秧龄; 秧苗质量;产量
【英文关键词】Mechanical transplanting rice Sowing density Fertilizer amount Seedling age Seedling quality Grain yield
【中文摘要】以迟熟中粳武育粳3 号为材料, 塑料软盘育秧, 进行落谷密度和施肥量二因素试验, 并将各处理秧苗分3 期插入大田, 实收产量, 测定其构成。主要结果如下: (1) 3 试验因素对苗质和产量的影响为秧龄> 施肥量> 落谷密度。(2) 秧龄由16 d 延至21 d, 即使较密的落谷密度、少量施肥(处理编码M1、M2) 或较稀的落谷密度、多量施肥(编码X3) , 均表现减产趋势, 故适龄早栽至关重要。(3) 秧龄21 d 秧苗的发根力和茎鞘淀粉含量等指标均优于秧龄16 d 的(差异显著) , 但因大田苗数和穗数减少, 稻谷产量显著下降。可见机插秧的壮苗指标因秧龄而异。(4) 各产量构成因素对产量效应的通径分析表明, 在本试验条件下, 穗数对产量的影响最大(通径系数为1.1112) , 每穗粒数次之(通径系数为0.6517) 。说明机插稻以争穗数为第一要务。
【英文摘要】An experiment of two factors(sowing density and fertilizer amount in seedbed) was conducted in plastic film seedling nursery using a latematurity japonica cultivar Wuyunjing 3. The seedlings of three different ages were transplanted into paddy field, and yield and yield components were tested. The main results were as follows: (1) The effect of seedling age on seedling quality and yield was predominant, and followed by fertilizer amount and sowing density. (2) The trend of grain yield reduction was obvious when seedling age was extended from 16 d to 21 d after sowing, although under dense sowing with less fertilizer application (treatments code M1 and M2) , or thin sowing with more fertilizing (code X3) . Therefore, transplanting at optimum seedling age is very important for mechanical transplanting. (3) The seedling quality indices, such as root developing ability and sugar content in stem and sheath at seedling age of 21 d were superior to that at seedling age of 16 d (significantly different) , but the grain yield in paddy field of 21 d seedling age was decreased because of plant and panicle number reduction. So the indices of vigorous seedling would be varied with seedling age. (4) Path analysis of yield components on yield showed that panicle number was the most effective (path coefficient 1.1112) followed by grains per panicle (path coefficient 0.6517) for mechanical transplanting rice.

【题目】起身肥对水稻分蘖和氮素吸收利用的影响
【中文关键词】水稻;塑盘穴播;起身肥;氮肥利用率;产量
【英文关键词】Rice Plastic-plate dotsow Nitrogen fertilizer applied before transplanting Nitrogen utilization efficiency Yield
【中文摘要】以宁粳2 号为材料, 通过塑盘穴播育秧, 带土、带肥移栽, 研究了起身肥对水稻分蘖的发生、氮素积累量、氮肥利用率和产量的影响。结果表明, 移栽后17 d, 基蘖肥水平相同条件下, 起身肥处理 (N-100%) 群体茎蘖数比非起身肥处理 (CK) 高3×105 hm-2。有效分蘖临界叶龄期N-100%处理中, >3 叶龄分蘖比率显著高于CK。与CK 相比,N-100%处理多施5.55 kg N hm－2, 而分蘖成穗率、有效穗数、氮素积累量、氮肥利用率和产量均显著提高。N-75%处理 (施起身肥, 基蘖肥施量为常规的75%) 中, 总施肥量比CK 低32.4 kg N hm－2, 而氮素积累量和氮肥利用率均高于CK。N-50%处理 (施起身肥, 基蘖肥施量为常规的50%) 基蘖肥水平过低, 影响分蘖的发生与生长, 与CK 相比, 氮肥利用率和产量都显著降低。因此, 适量的起身肥可以促进分蘖的早生快发, 提高水稻的分蘖成穗率, 减少基蘖氮肥的施用量, 促进水稻对氮肥的吸收和利用, 提高氮素积累量和氮肥利用率。
【英文摘要】Nitrogen (N) before transplanting, applied in seedling-bed and carried to the paddy field with seedlings is proposed in this paper. The effect of this method on tillering, N accumulation, N fertilizer utilization efficiency (NUE), and grain yield were investigated in a field experiment with a japonica cultivar Ningjing 2. The results indicated that, on the condition of equal basic and tillering N fertilizer, the tillers number in the treatment of nitrogen fertilizer applied before transplanting (N-100%) was 300 thousand ha-1 higher than that in treatment of no N fertilizer applied before transplanting (CK). At the critical stage of productive tiller, the tillers rate with leaf age >3 in N-100% treatment was remarkably higher than that in CK. Compared with CK, the rate of effective tillers, number of effective panicles, N accumulation, NUE, and grain yield of N-100% treatment were markedly increased. But the application of N was only 5.55 kg ha－1 more than that of CK. In N-75% treatment the application of N was 32.4 kg ha－1 lower than that in CK, while N accumulation and NUE were higher than those in CK. Compared with CK, N application of N-50% treatment was too lower, therefore it had negative effect on accelerating tiller’s development. As a result NUE and grain yield of N-50% treatment were observably lower than that of CK. The results suggested that proper N fertilizer applied before transplanting had positive effect on accelerating tiller’s development, and enhancing rate of effective tillers. Moreover, application of N fertilizer before transplanting could reduce the quantity of basic and tillering N fertilizer, speed absorption and utilization of N fertilizer, and increase N accumulation and NUE in rice.

【题目】生育类型与施氮水平对粳稻加工品质的影响
【中文关键词】水稻; 生育类型; 氮肥水平; 加工品质; 分类
【英文关键词】Rice Growth-development type Nitrogen Milling quality Classify
【中文摘要】以长江中下游地区5 种生育类型中有代表性的57 个粳稻品种为试材, 研究了空白, 低(150 kg hm-2)、中(225kg hm-2)、高(300 kg hm-2) 4 种氮素水平下粳稻加工品质的变化规律, 探讨了粳稻加工品质各项指标在不同氮肥水平和生育类型下的差异以及整精米率对氮素响应的品种差异及其分类。结果表明: (1)所有类型品种, 糙米率、精米率和整精米率均随氮肥水平的增加而增加, 但增加幅度逐渐减小, 其中整精米率在高肥与中肥水平下的差异不显著。(2)总体上各类型品种间生育期越长, 加工品质越好: 晚粳类型的糙米率、精米率和整精米率高于中粳类型, 各类型内迟熟品种高于早熟品种, 其中晚粳品种的平均整精米率比中粳品种高出19.07%。(3)根据水稻整精米率对氮肥响应的敏感程度, 把所有品种分为迟钝型、中间型和敏感型3 种。并据此推荐了利于生产实践中提高加工品质的两类品种, 一类是整精米率较高且在各氮肥水平下均表现比较稳定, 另一类在低氮肥水平下整精米率较低, 但通过增施氮肥, 可把整精米率提高到较高水平。
【英文摘要】Nitrogen is the most important and largest input required in rice production although over use of N causes so many environment problems. The milling quality is one of the important aspects of rice quality. The effect of nitrogen application rate on milling quality is varied in different rice varieties, especially in different types. In this research, the field experiment for milling quality was carried out with 57 japonica rice varieties including five growth-development types, planting in the region of Yangtze River, under four

nitrogen levels (zero, low, medium, and high) to investigate the difference of rice types under four nitrogen levels. Genotypic difference of head rice rate in response to nitrogen levels was discussed and their types were also classified. The main results were as follows: (1) As the increase of nitrogen application, the brown rice rate, milled rice rate and head rice rate of all the rice varieties were improved although the range of improvement decreased gradually. And there was no significant difference in head rice rate between medium and high nitrogen level. (2) In general, the longer of rice growth duration, the better of rice milling quality. According to this research, the milling quality of late japonica rice was better than that of medium japonica rice and the milling quality of late mature rice variety was superior to that of early mature rice varieties. The head rice rate of late japonica rice was higher than that of medium japonica rice by 19.07% on an average. (3) The response of head rice rate to nitrogen varied significantly. According to the variation coefficient of head rice rate under different nitrogen levels, rice varieties could be classified into three types including insensitive type, intermediate type and sensitive type. The varieties with high and stable head rice rate under all nitrogen levels and with high head rice rate at only high nitrogen application rate were recommended to be used in production.

【题目】水稻氮高产高效与低产低效两类品种株型特征的研究
【中文关键词】水稻;株型特征;氮效率;产量
【英文关键词】Rice Plant-type characteristics N use efficiency Yield
【中文摘要】以氮利用高产高效型和低产低效型的 12 个粳稻品种的大田试验研究了 225 kg hm－2纯氮水平下株型特征的类型间差异, 以及株型特征、倒伏性状、产量和氮肥利用率的相互关系。结果表明, 水稻上三叶的叶长、叶披垂度, 氮高产高效型品种显著低于氮低产低效型, 平均分别低 9.29%、65.3%; 上三叶的叶宽、群体 LAI、有效 LAI、高效 LAI和比叶重, 氮高产高效型平均分别比氮低产低效型高 29.25%、8.27%、13.32%、6.66%和 5.82%。相对于氮低产低效型品种, 氮高产高效型品种植株茎秆节间配置合理, 抗倒能力增强。水稻的产量、氮肥利用效率与植株上三叶的叶长、叶披垂度均呈显著或极显著负相关, 与上三叶的叶宽、群体 LAI、有效 LAI、高效 LAI 和比叶重呈显著或极显著正相关, 与抗折力、弯曲力矩和秆型指数呈显著或极显著正相关。尤其是剑叶、倒三叶的叶长和叶宽对氮素利用效率的作用较大。说明良好的株型结构是氮肥利用效率提高的前提.
【英文摘要】A field experiment with 225 kg ha－1N fertilizer application was carried out in 2006 and 2007 on the farm of Yangzhou university, Jiangsu province, China. Using 12 rice genotypes (six N-efficient and six N-inefficient) selected from 120 rice cultivars grown in Yangzhou during 2004 and 2005 to investigate the relationship among the plant-type characteristics, N use efficiency and yield performance. The results showed that the top three leaves length and drop-angle of high yield and N-efficient rice geno-types were 9.29%, 65.30% lower than those of the low yield and N-inefficient ones, and the width of the top three leaves, population LAI, valid LAI, high valid LAI, and LW/LA (leaves weight/leaves area) of the former of were 29.25%, 8.27%, 13.32%,6.66%, and 5.82% higher than those of the latter on average respectively. The high yield and N-efficient genotypes had higher lodging resistance capability and more reasonable distribution for the length of internodes on stem than the low yield and N-inefficient ones. Yield and N use efficiency negatively correlated (significantly at $P<0.05$ or $P<0.01$) with the length and drop-angle of the top three leaves, while positively correlated (significantly at $P<0.05$ or $P<0.01$) with the width of the top three leaves, population LAI, valid LAI, high valid LAI, SLW, anti-broken strength, bender moment, and lodge index. Especially, the length and width of the flag and top 3rd leaves played an important role in the N use efficiency. It was indicated that good plant-type structure is a prerequisite for N use efficiency.

【题目】直链淀粉含量不同的稻米淀粉结构、糊化特性研究
【中文关键词】水稻;直链淀粉含量;糊化特性;相对结晶度
【英文关键词】Rice Amylose content (AC) Paste property Relative crystallinity
【中文摘要】选用直链淀粉含量不同的4个水稻品种,研究其淀粉结构和糊化特性。发现不同品种的淀粉体结构、糊化特性随直链淀粉含量的不同呈现一定的变化规律。直链淀粉含量从3143%至21165%,其晶体类型为A型,相对结晶度呈下降趋势,消减值表现为升高趋势,相对结晶度和消减值与直链淀粉含量分别呈显著负相关和极显著正相关(r=-01964*,r=01997**),消减值与结晶度呈显著负相关(r=-01960*)。米粒的背部和腹部间淀粉体大小和排列有所不同,糯性或低直链淀粉含量与相对非糯性或高直链淀粉稻米的胚乳结构存在差异,淀粉体排列以糯稻较紧,粳稻次之,籼稻最松。淀粉的相对结晶度可能与胚乳中淀粉体的形状和紧密程度有关。
【英文摘要】fertilizer, basic nitrogen recovery efficiency before elongation stage, nitrogen recovery efficiency during the whole growing stage,and nitrogen harvest index were raised significantly, but plant nitrogen productivity was opposite. Grain yield, nitrogen accumulation, nitrogen translocation amount and percentage after anthesis, and nitrogen distribution in different rice organs amounted to the maximum at K2O application rate of 180 kg ha − 1, as well as nitrogen absorption from fertilizer, basic nitrogen recovery efficiency before elongation stage, nitrogen recovery efficiency during the whole growing stage. However, nitrogen absorption percentage from elongation stage to heading stage, nitrogen distribution percentage in culm and sheath, plant nitrogen productivity decreased to the minimum. The yield and nitrogen recovery efficiency of conventional japonica cultivars were higher than those of hybrid japonica cultivars.

【中文关键词】外源硅;纹枯病菌(Rhizoctonia solani) ;水稻;光合作用;荧光参数;MDA含量
【英文关键词】silicon Rhizoctonia solani rice photosynthesis fluorescence parameters MDA content
【中文摘要】为了进一步探讨外源加硅增强水稻对纹枯病的抗性作用,以抗病品种91SP和感病品种Lemont为材料,研究了人工接种纹枯病菌条件下外源硅对水稻叶片叶绿素含量、光合作用、叶绿素荧光特性和MDA含量的影响。结果表明: (1)外源加硅能降低抗病品种91SP的纹枯病病级和病情指数,显著降低感病品种Lemont的病级和病情指数; (2)接种纹枯病菌后,水稻叶片叶绿素含量、净光合速率(Pn) 、气孔导度(Gs)均明显降低,胞间CO2浓度(Ci)增大,而加硅处理的水稻叶片叶绿素含量、Pn、Gs不同程度增加, Ci有所降低; (3)接种纹枯病菌后,两个品种PSⅡ最大光化学效率(Fv /Fm) 、PSⅡ有效光化学效率(Fv′/Fm ′) 、PSⅡ实际光化学效率(ΦPSⅡ) 、光化学猝灭系数(qP)和表观光合电子传递速率(ETR)均降低,非光化学猝灭系数(qN P)增大,而对于加硅处理的水稻叶片,上述荧光参数在纹枯病菌侵染条件下的变化均受到不同程度的抑制。(4)外源硅可不同程度地减缓纹枯病菌侵染引起的丙二醛(MDA)含量的增加,对感病品种Lemont的缓解作用要大于抗病品种91SP。可见,外源硅处理可以不同程度地缓解纹枯病菌侵染条件下非气孔因素引起的水稻叶片光合速率的下降以及对光合机构的破坏作用,提高光化学效率,改善叶片的光合功能,减轻叶片膜脂过氧化程度,增强水稻对纹枯病的抗性。
【英文摘要】Sheath blight caused by Rhizoctonia solani infection is one of the three major pathogen2caused diseases in rice.Sodium silicate has been reported to imp rove the resistance of rice to sheath bright. In this study, we invested the impacts of sodium silicate on rice photosynthesis under Rhizoctonia solani (R. solani) infection. We hydroponically cultured two rice cultivars with different resistances to R. solani infection (resistant cultivar 91SP, suscep tible cultivar Lemont) and characterized different photosynthetic physiological parameters.Our experiments showed that: (1) After being inoculated with R. solani, the rice with sodium silicate app lication (the Si + rice) had lower (but not statistically significant) disease rating and disease index compared to the Si2 rice p lants in resistant cultivar 91SP, but the Si + rice p lants of suscep tible cultivar Lemont had significantly lower rating and disease index with relative control effect of 27. 42% compared to the Si2 rice p lants. (2) After being inoculated with R. solani,chlorophyll content, net photosynthetic rate (Pn) and stomatal conductance (Gs) of rice leaves were decreased significantly, while intercellular CO2 concentration (Ci) was increased. After treated with exogenous sodium silicate,chlorophyll content, Pn and Gs were increased, while Ci was decreased. (3) After being inoculated with R. solani, PSⅡ maximal quantum efficiency (Fv /Fm) , PSⅡ effective quantum efficiency (Fv′/Fm ′) , PSⅡ actual photochemical efficiency (ΦPSⅡ) , photochemical quenching (qP) and acyclic electron transfer late (ETR) were all decreased, but non2 photochemical quenching (qN P) was increased. The Si + rice p lants showed less changes in these fluorescence parameters. (4) Si + rice p lants showed less boost in MDA contents upon R. solani inoculation in both cultivars. The results suggested that, exogenous sodium silicate app lication can alleviate the decreases of photosynthetic rate induced bynon2stomata factors and the damage of photosynthesis system, increase photochemical efficiency, imp rove the foliarphotosynthetic ability, reduce the degree of leaf lip id peroxidation, and enhance the rice p lants resistance to sheath blight.

【题目】施硅增强水稻对纹枯病的抗性
【中文关键词】硅;纹枯病菌;水稻;硅化细胞;抗病相关酶
【英文关键词】silicon Rhizoctonia solani rice siliceous cell defence enzyme

【中文摘要】采用水培的方法,从细胞学和生理生化方面研究了硅增强水稻对纹枯病的抗性作用。结果表明:加硅处理的水稻叶片硅化细胞和叶片表面的硅元素含量均显著高于缺硅处理(对照);接种纹枯病菌后,加硅处理的MDA含量总体上低于缺硅处理,峰值尤为显著;加硅处理的SOD活性始终高于缺硅处理,接种后第 4 天加硅处理 SOD 活性较低时,其 POD 活性较高,而缺硅处理的 POD 活性较低,表明硅增强了 SOD 和 POD 之间的协调性;接种后硅对 CAT 和 PAL 活性没有产生明显影响,但降低了 PPO 活性;加硅能显著降低水稻植株的纹枯病病情指数。

【英文摘要】The enhancing resistance and decreasing incidence to sheath blight (Rhizoctonia solani)by silicon were studied from cytological and physiological aspects by using rice plants solution-cultured with si1icon supplementation or with si1icon-deficience. By an environmental scanning electron coupled with X-ray microanalysis, as well as gravimetric quantification, the number of siliceous cell and Si content of the Si+rice leaf were much more than those of Si-rice leaf (Figs.1,2; Table 1). After being inoculated with R. solani MDA content in Si+rice plants was almost higher than that in Si-rice plants, SOD activity in Si+rice plants was always higher than that in Si-rice plants, SOD activity in Si+rice plants reached a minimum on 4 d,and POD activity was at the maximum, but POD activity in Si-rice plants was lower. These results suggested that silicon could enhance the harmony of SOD and POD. And silicon had no effect on CAT and PAL activity, but weaken PPO activity(Fig.3). After being inoculated with R. solani, the Si+rice plants had significantly lower disease index with relative control effect of 1/4 compared to the Si-rice plants (Table 2).

【题目】机插稻鸭共作系统氮素基蘖肥用量对水稻群体质量与氮素利用的影响

【中文关键词】机插水稻;稻鸭共作;氮素用量;群体质量;氮素利用

【英文关键词】machine-transplanted rice　rice-duck farming system　amount of nitrogen rice population quality　nitrogen utilization

【中文摘要】以武粳巧为试材,研究了氮素基粟肥用量对机插稻鸭共作水稻群体特征和氮素吸收利用的影响。结果表明在稻鸭共作系统中,随氮素基孽肥用量的减少,机插水稻群体最高分孽数减少,最高分孽数前后的分孽发生和消亡速率降低,粒叶比、有效叶面积率、高效叶面积率提高,齐穗期和成熟期干物质积累量降低,各阶段尤其是拔节至齐穗期的吸氮量降低。当氮素基孽肥用量适宜,基、穗肥比4.5:5.5时,机插水稻群体的分孽成穗率较高,叶面积指数适宜,齐穗期至成熟期的干物质积累量最大,拔节前氮素基集肥利用率、氮肥当季利用率、氮素农学利用率、氮素收获指数和氮肥偏因素生产力协同提高,群体穗数合理,产量最高。稻鸭共作不仅提高拔节前氮素基桑肥利用率和氮肥当季利用率,而且改善机插水稻的群体质量,提高抽穗后群体的生产能力和水稻产量。关键词机插水稻稻鸭共作氮素用量群体质量氮素利用。

【英文摘要】Wujing15(japonica rice cultivar)was used, and four different amount of basal and tillering nitrogen fertilizer(BN)were conducted to investigate the effects of nitrogen fertilizer on the population quality and nitrogen utilization of machine-transplanted rice in rice-duck farming system. The results showed as followed:1) In rice-duck farming system, along with the reduction of the amount of BN, the maximum number of tillers and the speed of tiller appearance and dying decreased; the proportion of effective leaf area, high effective leaf area and the ratio of spikelets number to leaf area increased; dry matter and nitrogen accumulated from heading to maturity decreased; nitrogen uptake decreased at each stage especially from jointing to heading. 2)When the amount of BN at a suitable level, and the ratio of BN to topdressing nitrogen was 4.5:5.5, the ratio of effective tiller was higher under the machine-transplanted rice-duck fanning system which at the same time contained a suitable LAI and reached the highest amount of day matter accumulated from heading to maturity. Moreover, higher BN utilization efficiency before jointing stage, nitrogen utilization efficiency, nitrogen harvest index, nitrogen agricultural efficiency and nitrogen partial factor productivity were achieved at that point also. 3)Machine-transplanted rice-duck farming system not only enhanced the nitrogen fertilizer use efficiency before jointing and of the whole planting season, but also improved the population quality and thus strengthen the ability of day matter producing and eventually rice yield.

【题目】粳稻硅素积累与分配对氮素的反应及其基因型差异
【中文关键词】水稻;硅素;积累和分配;氮素;基因型差异
【英文关键词】rice silicon accumulation and distribution nitrogen genotype variation
【中文摘要】以15个常规粳稻品种为材料,设置0、150、225、300 kg/hm2四种氮素水平,研究水稻硅素积累与分配对氮素的反应及其基因型差异。结果表明,不同生育时期,硅在水稻各器官、全株中的积累量均随氮素水平的提高而增加。随氮素水平的提高,水稻在移栽)拔节和抽穗)成熟阶段的积累比例增加,而拔节)抽穗阶段的积累比例减少,在茎鞘中的分配比例减少而叶片和穗中的分配比例增加。不同生育时期,硅在茎鞘、叶片和全株中的含量均随氮素水平的提高而下降,抽穗和成熟期,穗中的硅素含量随氮素水平的提高而下降,至中肥最低,高肥条件下略有回升。不同氮素条件下,水稻硅素的积累与分配特性存在显著的基因型差异,同时各基因型硅素积累与分配对氮素的反应也存在差异。其中,武育粳7号、华粳3号、武香粳9号、香粳20-18、武育粳3号、晚粳4003、早丰9号、华粳2号的硅素积累效率具有随氮素水平的提高保持稳定或相对提高的特性,对于氮肥用量不断增加条件下水稻植株的抗逆性改良具有较好的遗传潜力。
【英文摘要】Field experimentwas conducted in order to investigate the response of silicon accumulation and distribution of 15 rice cultivars (conventionalJaponica) to different N levels (0 kg/ha, 150 kg/ha, 225 kg/ha, 300 kg/ha as urea) and genotype variations. Results indicated that the content of silicon in rice organs and plant increased with N rate at three growth stages including elongation, heading and maturity. The percentage of silicon accumulation increased during the periods from transplanting to elongation and fromheading to maturity, but decreased from elongation to heading. The proportion of silicon distributed in culm and sheath decreased with N rate, while the proportion in leaf and panicle increased with N rate. The concentration of silicon in rice organs and plant all declined continuously with N rate, except that silicon concentration in panicle increased appreciably attheNlevel of 300 kg/ha. At each level ofN, the characteristics of silicon accumulation and distribution differed significantlywith rice genotypes. At the same time, the responses of silicon accumulation and distribution of rice genotypes toN also varied significantly. Among 15 rice cultivars, the silicon accumulation efficiency of Wuyujing 7, Huajing 3,Wuxiangjing 9,Xiangjing 20-18,Wuyujing 3,Wangjing 4003,Zaofeng 9 and Huajing 2 increased with or not significantly affected by N levels, having better genetic potential to en-hance the resistance to multiple stresses with the increasing application of N in rice production.

【题目】施氮量对机插杂交粳稻徐优403产量和品质的影响
【中文关键词】机插杂交粳稻;施氮量;产量;品质;RVA谱
【英文关键词】mechanical-transplanted hybrid rice nitrogen application rate yield; quality RVA profile
【中文摘要】软盘旱育机插条件下,以杂交中粳徐优403为材料,研究了里下河地区稻麦两熟制同施氮量对机插杂交稻徐优403产量和品质的影响。结果表明,随施氮量的增加,机插杂交稻徐优403的穗数和每穗颖花数和产量呈先增后减趋势,以N225kg/hm²甘处理最高;结实率和千粒贡表现为随施氮量增加而减小。施氮量主要影响稻米品质中的坐白度和坐白率,其次为消减值,而对其它品质指标影响较小。品质性状中的加工碾磨品质、稻米的表面积、横面积可与产量在一定程度土实现高产优质统一;而其它品质指标则表现为对施氮存在负响应。综合来看,机插杂交稻徐优403适宜施氮量以施N225kg/hm²澎为宜。
【英文摘要】Effects of the different nitrogen rates on yield and quality of mechanical-transplanted hybrid rice were studied under the yearly rice-wheat crop system in the Lixia River area .The cultivar is xuyou403, a mid-season hybrid japonica rice cultivar. With the increase of nitrogen application rate , the harvested panicles per plant , number of grains per panicles, and the grain yield are increased first and then decreased; the 225kg/ha nitrogen application rate is rate for the highest production . The grain filling rate and 1000-grain

weight appear to be decreased along with increase of nitrogen application rate . The nitrogen application rate mainly affected the chalkiness degree and the chalkiness rate , then setback , the other rice qualities were less effected .The milled rice qualities , the surface area , and section area are at their best values at 225kg/ha nitrogen application rate , the same as the grain yield ,while the other grain qualities trended to be bad with the increase of nitrogen application . Considering the grain yield and qualities together , the 225kg/ha of nitrogen fertilizer rate is suitable for rice production.

【题目】氮素穗肥对不同品种稻米品质性状的影响
【中文关键词】水稻;氮素穗肥;黏滞谱;相对结晶度
【英文关键词】rice panicle nitrogen fertilizer RVA profile relative crystallity
【中文摘要】以4种不同类型的稻米为材料,采用4个不同的氮素穗肥处理,利用黏度分析仪和XRD技术测定其淀粉特性,探索氮素穗肥对稻米品质及淀粉特性的影响。试验结果表明,氮素穗肥对稻米蛋白质、直链淀粉含量、支/直比和胶稠度的影响,品种间存在差异。各品种稻米的黏滞谱曲线随着氮肥的增加均呈整体下降趋势;相对粳稻而言,杂交籼稻和糯稻黏滞谱曲线在不同的氮肥处理下降幅度较小。各品种稻米淀粉的相对结晶度均表现为随氮肥施用量的增加而减小,17b和18b的两个衍射峰的分离状态逐渐减小。氮素穗肥施用量与稻米品质和淀粉特性关系密切,可通过调控氮素穗肥水平来改善稻米品质。
【英文摘要】The aim of this studywas to determine the effect of panicle nitrogen fertilizer on starch characters and quality properties of rice. Four different panicle fertilizer levels were set up, Rapid Visco Analyzer and XRDwere used to analyze starch properties of four different rice varieties. The results demonstrated that the effects of panicle nitrogen fertilizer on protein content, amylose content, rate of amylopectin to amylose content and Ge-l consistency differed with rice varieties. Rice RVAprofiles (PKV, HPV and CPV) decreasedwith panicle nitrogen fertilizer rates. However, RVAprofiles of hybrid indica and glutinous rice decreased less than japica. The results also showed that relative crystal rate fell with increasing N rates, withtwo separate peaks at17b and 18b graduallybeingtranslated intoone peak and the heightof peak at 18b being increased. The results implied that starch properties and rice qualitieswere closely related, and proper rate of panicle N-fertilizer could improve rice qualities.

【题目】花后水稻穗部夜间远红外增温处理对稻米品质的影响
【中文关键词】夜间增温;日间增温;稻米品质;淀粉结构
【英文关键词】elevated night temperature elevated daytime temperature rice grain quality starch structure
【中文摘要】以武育粳3号为材料,在开放环境下使用远红外加热器对水稻穗部进行增温处理,研究了灌浆结实期穗部日间或夜间增温对稻米品质的影响。结果表明,夜间增温降低了糙米率、精米率和整精米率,增加了垩白发生,降低了稻米的加工品质和外观品质,与日间增温影响一致。夜间增温提高了稻米蛋白质含量,与日间增温相似,但夜间增温有降低稻米直链淀粉含量的趋势,与日间增温相反。夜间增温处理淀粉结构与日间增温差异较分明,尤其是胚乳腹部,夜间增温胚乳腹部的淀粉粒个体较大,棱角分明,排列紧密;而日间增温淀粉体较小,呈圆形和椭圆形,但数量较多。夜间增温对淀粉相对结晶度的影响与日间增温相似,但夜间增温增幅较小。总体来说,灌浆结实期夜间增温对稻米的加工品质、外观品质、营养品质影响与日间增温一致,对蒸煮食味品质和淀粉结构的影响与日间增温存在很大的差异,且夜间增温对稻米品质的影响程度整

体上小于日间增温。
【英文摘要】To determine the effects of elevated temperature during grain filling on grain quality of rice, Wuyujing 3 (japonica rice) was planted in pots under elevated night temperature(ENT) and elevated daytime temperature (EDT) at the grain filling stage by using far-infrared heaters. The two treatments both decreased brown rice rate, milled rice rate and head rice rate, while increased chalky rice rate and chalkiness. The effect of EDT was more significant. ENT decreased amylose content, whereas EDT increased it. Under ENT, starch granules were compact in arrangement with larger granule and clearer edge, by contrast, under EDT the starch granules were smaller and spheric-shaped with few gaps. X-ray diffraction patterns revealed larger relative crystallinity under both temperature treatments as compared to control with a less increase under ENT. The results show that compared with EDT, ENT exerted similar but less effects on milling quality, appearance quality and nutritional quality. However, effects of both treatments on starch structure, eating and cooking quality were different.

【题目】江淮流域杂草稻叶绿体DNA的籼粳分化.
【中文关键词】杂草稻;栽培稻;叶绿体DNA;籼粳分化;细胞质来源;分子标记
【英文关键词】weedy rice cultivated rice chloroplast DNA indica-japonica differentiation cytoplasmic origin molecular marker
【中文摘要】为了探明江淮流域杂草稻的细胞质来源,根据水稻叶绿体DNA ORF100(Open Reading Frame 100)序列在籼粳间存在69 bp差异的特征,设计了InDel标记cpDNA69。利用该标记对2个分别以籼稻和粳稻为母本的F2群体、22份栽培稻(Oryza sativaL.)、3份普通野生稻(O. rufipogonGriff.)进行了分析验证。PCR结果可以获得缺失和非缺失两种带型,缺失带型与以籼稻为母本的F2群体、10份籼稻材料完全对应;非缺失带型与以粳稻为母本的F2群体、11份粳稻材料完全对应,3份广西普通野生稻为非缺失带型,属粳型,1份以粳稻为母本的籼粳杂交材料为粳型。因此,cpDNA69可以用作叶绿体籼粳鉴定标记。利用该标记对22份杂草稻的叶绿体DNA鉴定的结果表明,7份早年发现的杂草稻,即江苏省连云港稆稻和安徽省怀远、来安、全椒、肥东的塘稻的叶绿体DNA为非缺失带型,属粳型,而近年来在江苏省扬中、高邮、灌云、洪泽、盐都、兴化、如皋等地直播稻田发现的15份红米杂草稻的叶绿体DNA为缺失带型,属籼型。这为进一步研究江淮流域杂草稻的来源提供了依据。
【英文摘要】To detect the cytoplasmic origin of weedy rice in the Changjiang-Huaihe River Valley of China, an InDel marker cpDNA69 was developed based on the 69 bp deletion in indica chloroplast DNA ORF100(cpDNA Open Reading Frame 100).Three accessions of common wild rice (OryzarufipogonGriff.) from Guangxi, China and 22 cultivars (O. sativaL.) and two F2populations with indica and japonica rice as maternal parent respectively were investigated by the length polymorphism for ORF100 region. The non-deletion cpDNA ORF100 was found in japonica cultivars and the F2plants with japonica rice as maternal parent, and the deletion cpDNA ORF100 was found in the indica cultivars and the F2plants with indica rice as maternal parent. The three accessions of common wild rice carried the non-deletion cpDNA type and one indica-like cultivar developed from the hybrid of japonica and indica carried the same non-deletion cpDNA type. These results confirm that cpDNA69 was a perfect marker to distinguish the indica/japonica cpDNA ORF100. Then the indica-japonica differentiation of chloroplast DNA in 22 accessions of weedy rice from the Changjiang and Huaihe River Valley were investigated with cpDNA69. The cpDNA of Ludao from Lianyungang, Jiangsu Province, and Tangdao from Huaiyuan, Laian, Quanjiao, Feidong, Anhui Province carried nondeletion type ORF100. However the cpDNA of red weedy rice discovered in recent years in Jiangsu Province carried the 69 bp deletion type ORF100. It is suggested that the indica-japonica differentiation of cpDNA has occured in weedy rice in the Changjiang and Huaihe River Valley.

【题目】两个杂交粳稻组合超高产生长特性的研究
【中文关键词】杂交粳稻;超高产栽培;生长特性;干物质生产
【英文关键词】japonica hybrid rice super-high-yielding cultivation growth characteristics dry matter production
【中文摘要】将两个杂交粳稻组合(陵香优18和常优1号)于大田条件下种植,对超高产(产量>12.0 t/hm2)田块的水稻物质生产和产量形成生长特性进行了分析。结果表明,与高产栽培(CK, 10.5~11.0 t/hm2)水稻相比,超高产栽培水稻穗数、每穗粒数显著高于CK,结实率和千粒重略高于CK,但差异不显著;超高产栽培水稻二次枝梗数、二次枝梗总粒数显著高于CK;有效分蘖临界叶龄期之前,超高产栽培条件下水稻生长比CK快,在有效分蘖临界叶龄期茎蘖数达到预期的穗数,叶面积指数、光合势、干物质积累和群体生长率较CK大;有效分蘖临界叶龄期至拔节期,超高产栽培条件下水稻生长平稳,无效分蘖发生少,高峰苗低,叶面积指数、光合势、干物质积累和群体生长率较CK小;拔节以后,超高产栽培条件下水稻茎蘖数下降平缓,成穗率高,叶面积指数、光合势、干物质积累和群体生长率较CK高,尤其是抽穗以后,超高产栽培条件下水稻具有明显的生长优势,叶面积指数、光合势、干物质积累和群体生长率均极显著高于CK。
【英文摘要】Growth and dry matter production characteristics, yield formation and yield components of rice under super-high-yielding (>12.0 t /hm2) cultivation were analyzed using two japonica hybrid rice combinations (Lingxiangyou 18 and Changyou 1) in paddy field. The results showed that the number of panicles, the number of grains per panicle, the number of secondary branches per panicle and the number of spikelets on secondary branches under super-high-yielding cultivation (SHYC) were significantly higher than those under traditional high yielding (10.5 t/hm2to 11.0 t/hm2) cultivation(CK).The seed-setting rate and 1000-grain weight under SHYC were a little higher than those under CK, but without significant difference. Before the critical lea-f age for productive tillering, rice under SHYC grew faster and at the critical lea-f age for productive tillering the number of stems and tillers was up to the expected value, and leaf area index, photosynthetic potential, dry matter accumulation and crop growth rate were larger than those under CK. From the critical lea-f age for productive tillering to elongation, rice under SHYC had a steady growth with less ineffective tillers and lower peak number of seedlings,and its leaf area index, photosynthetic potential, dry matter accumulation and population growth rate were lower than those under CK. After elongation, with a steady decline in growth and a high productive tiller rate, rice under SHYC had higherleaf area index, photosynthetic potential, dry matter accumulation and population growth rate than under CK. Super-high-yielding rice had an obvious growth superiority. Especially after heading, leaf area index, photosynthetic potential, dry matter accumulation and population growth rate were significantly higher under SHYC than under CK.

【题目】三唑磷对稻纵卷叶螟诱导的水稻植株挥发物释放的影响
【中文关键词】水稻;挥发物;三唑磷;稻纵卷叶螟
【英文关键词】rice volatile triazophos Cnaphalocrocis medinalis
【中文摘要】研究了施用三唑磷对稻纵卷叶螟诱导的水稻挥发物的影响。利用固相微萃取法收集水稻挥发物,并通过气相色谱-质谱联用仪对挥发物进行分离和鉴定,共收集到36个水稻挥发物组分,其中已定性的14个,以萜类及其氧化物(11个)为主。在已定性的组分中,异喇叭烯、(-)-α-雪松烯、(+)-β-雪松烯、雪松醇等4个组分在水稻上尚未见报道。不同处理间水稻挥发物种类相同,但挥发物组分相对含量存在差异。三唑磷浓度不同导致5种挥发物组分(占总种类数的13.9%)相对含量的变化;而27种组分(占总种类数的75.0%)相对含量因施药天数不同而存在显著差异;农药与水稻品种、害虫密度等生物因子间的互作使32种水稻挥发物组分(占总种类数的88.9%)相对含量显著改变。
【英文摘要】The volatiles from rice plants infested byCnaphalocrocis medinaliswere studied under triazophos application.Thirty-six components were collected from headspace of rice plants by solid phase microextraction, 14 of which were identified by gas chromatography coupled with mass spectrometry, and the major components are terpenes and their oxides (11 kinds).Four of the identified components including isoledene, (-)-α-cedrene, (+)-β-cedrene and cedrol have not been reported in rice plants. Different

triazophos treatments did not result in the emission of new compounds, but the relative proportions (percent of total peak area) among the compounds in the blend were altered. The proportions of 5 components (13.9%) had significant differences under triazophos treatment at three levels. The proportions of 27 components (75.0%) changed at different days after triazophos treatment. Furthermore, the proportions of 32 components (88.9%) were significantly changed due to the interactions between triazophos and rice varieties, densities ofC. medinalis.

【题目】施硅量对粳稻品种武育粳3号产量和品质的影响
【中文关键词】硅;粳稻;稻谷产量;品质性状;淀粉黏滞性(RVA 谱)
【英文关键词】silicon japonica rice grain yield quality traits starch viscosity(RVA profile)
【中文摘要】以迟熟中粳稻武育粳3号为材料,研究了不同硅肥水平对粳稻产量和稻米品质的影响。结果表明,大田基施硅肥0~450kg/hm2 范围内,随着施硅量的增加,穗数、每穗粒数、千粒重、产量先增后降,精米率、回复值有增加的趋势,整精米率显著增加,RVA 谱曲线降低,直链淀粉含量、峰值黏度、热浆黏度、冷胶黏度、到达峰值黏度时间呈下降的趋势,消减值则先下降然后上升。施硅对出糙率、透明度无明显影响。适量施硅可以降低垩白米率、垩白大小和垩白度,改善稻米的外观品质。施硅能提高稻米胶稠度、崩解值,有提高稻米蛋白质含量的趋势。综合产量和品质性状,以施硅肥225kg/hm2 的处理较好。
【英文摘要】The effects of silicon fertilizer rates on yield and quality of rice grain were studied with a mid-season japonica rice cultivar Wuyujing 3. With the increase of Si application rate, number of panicles per plant, number of grains per panicle, 1000-grain weight and grain yield increased firstly and then decreased within the range of Si application rate of 0-450 kg/hm2, while milled rice rate and consistence showed a tendency to increase, and head rice rate increased significantly. The curves of RVA profile decreased, and amylose content, peak viscosity, hot viscosity, cool viscosity, peak time had the trend of descent, while setback decreased firstly and then increased. Meanwhile, brown rice rate and transparency had no obvious difference in the treatments. but proper Si rates decreased the chalky grain rate, chalkiness area and chalkiness, and increased protein content,gel consistency and breakdown. Considering the grain yield and quality together, 225 kg/hm2 of Si fertilizer rate was suitable.

【题目】水稻超高产栽培模式及系统理论的研究进展
【中文关键词】水稻;超高产栽培;模式;系统理论
【英文关键词】rice supper high yielding cultivation pattern systematic theory
【中文摘要】围绕着超高产, 回顾了水稻超高产栽培模式的发展, 并重点介绍了其中几种水稻超高产栽培模式, 进而分析了水稻超高产形成的系统理论和途径, 探讨了水稻超高产栽培在大面积推广和生产中存在的问题并提出了解决途径, 最后展望了水稻超高产栽培模式的未来发展。
【英文摘要】The development of the patterns of super high yielding cultivation in rice was reviewed. Several new patterns of super high yielding cultivation in rice were highlighted and the systematic theories and approaches of the formation of super high yielding were analyzed. Moreover, the problems existed in the course of large scale extension and production of super high yielding were discussed and the solutions were then put forward. Finally, the development of super high yielding cultivation pattern in the future was

forecasted.

【题目】行株距配置对水稻茎秆形态生理与群体生态的影响
【中文关键词】水稻;行株距配置;形态特性;生理特性;小气候
【英文关键词】rice row-spacing morphological characteristics physiological characteristics microclimate
【中文摘要】以籼稻品种丰优香占和粳稻品种武运粳7 号为材料,研究了不同行株距配置对茎秆形态生理与群体生态的影响。结果表明,中等行距(30. 0 cm ×13. 3 cm) 处理的产量最高,窄行距产量最低,差异显著(P < 0. 05) 。中等行距配置较宽窄行距处理显著减少了节间长度,增加了节间粗度、茎壁厚度及维管束数目,植株抗折力得到明显的提高,差异达显著水平(P < 0. 05) ;中等行距处理下水稻茎秆在齐穗期和灌浆后期单位长度节间干物质含量及灌浆期干物质转运量最大。此外,中等行距配置群体具有适宜的叶面积指数和较高的剑叶光合速率;不同行距配置群体内部CO2 浓度、光照强度、温度和湿度等微气象因子具有一定差异,中等行距配置具有良好的群体微气象环境。阐述了适当扩大行距是水稻高产的必备条件。
【英文摘要】With japonica rice Wuyunjing 7 and indica rice Fengyouxiangzhan as test materials , effects of row-spacing on morphological and eco-physiological characteristics of rice were studied. The yield of medium row-spacing treatment (30 cm×13. 3 cm) was the highest , while that of narrow row-spacing (20 cm ×20 cm) was the lowest , with a significant difference at 0. 05 level . Medium row-spacing treatment significantly diminished internode length and enhanced internode thickness , wall thickness , the number of vascular bundles of internode , and the lodging resistance compared to wide row-spacing (40 cm ×10cm) and narrow row-spacing treatment s. The content of dry matter in basal internode at the heading stage and the 20th day after heading , and the amount of dry matter transferred to grain at the filling stage were the highest at the medium row-spacing treatment . Moreover , there were appropriate leaf area index and higher photosynthetic rate of flag leaf at medium row-spacing treatment . Furthermore , the distinctive differences were found in the content of CO2 , light intensity , air temperature and humidity in the population among different row-spacing treatments , and medium row-spacing treatment showed ideal microclimate within the population of rice. It clearly suggested that medium row-spacing treatment is necessary for high-yielding cultivation of rice.

【题目】增加土壤温度对高海拔生态区水稻分蘖成穗及产量形成的影响
【中文关键词】水稻;成穗率;高海拔;土壤温度;产量
【英文关键词】rice productive till percentage high altitude soil temperature yield
【中文摘要】在高海拔寒冷稻作区,通过晒水池增温进行温水灌溉和垄作栽培提高土壤温度。垄作栽培、温水灌溉在移栽后到有效分蘖临界叶龄期的土壤日平均温差分别比常规栽培(对照) 高2. 94 ℃和0. 57 ℃。通过调查有效分蘖临界叶龄期水稻的分蘖发生数量和质量,探讨增加土壤温度对水稻分蘖发生和产量及其构成因素的影响。结果表明,丽粳10 号垄作栽培、温水灌溉成穗率比对照分别高14. 59 和0. 14 个百分点,大白谷分别高12. 08 和2. 09 个百分点。丽粳10 号垄作栽培、温水灌溉的产量分别比对照高13. 79%和10. 82% ,大白谷分别高13. 35%和11. 54%。土壤增温可促进高寒生态区水稻早发和干物质积累,增加有效分蘖,优化群体质量,提高成穗率和产量。
【英文摘要】To study the effect of increased soil temperature on rice production , three treatment s (ridge cultivation , warm-water irrigation by sunning water pool and conventional cultivation) were arranged in a field experiment . The soil daily average temperature

difference under ridge cultivation and warm-water irrigation by sunning water pool was 2. 94 °C and 0. 57 °Chigher than that under conventional cultivation in the period f rom rice transplanting to critical stage for productive tiller in high-altitude and cold area. The quantity and quality of rice tiller before critical stage for productive tiller as well as the influence of soil warming measures to rice tillering and yield components were studied in high altitude area. The results showed that compared to the conventional cultivation , the productive tiller percentage increased by 14. 59 and 0. 14 percent points under the ridge cultivation and warm-water irrigation , respectively for Lijing 10 , and by 12. 08 and 2. 09 percent points for Dabaigu , respectively . The yield increased by 13. 79 % and 10. 82 % under the ridge cultivation and warm-water irrigation , respectively for Lijing 10 , and by 13.35 % and 11. 54 %for Dabaigu , respectively . The soil warming measures was helpful in promoting rice growth , accelerating tillering , increasing the accumulation of dry matter , optimizing the population quality and increasing productive tiller percentage and yield.

【题目】不同耕作方式与秸杆还田周年生产力的综合评价

【中文关键词】作物;耕作;秸秆;生产力

【英文关键词】crops cultivation straw productivity

【中文摘要】该文通过3年定位试验,比较研究了稻麦两熟条件下免耕套种秸秆覆盖、免耕套种高茬、翻耕秸秆还田、翻耕秸秆不还田(对照,CK)4 个处理对周年生产力的影响。结果表明:免耕套种的小麦产量降低,水稻产量增加,年产量略降,翻耕秸秆还田具较高产量生产力。如考虑节省的秧田种植小麦,则免耕套种的稻麦年产量可与翻耕秸秆还田持平。经技术经济分析,采用稻麦免耕套种秸秆还田,具有明显的节本增收、提高活劳动净产率的效果,在稻麦周年产量不减的同时,比翻耕秸秆不还田处理增收1874.8 元/hm2,增加18.0%,经济生产力最高。翻耕秸秆还田比不还田有一定的增产增收效果,如果考虑到耕地持续生产力,秸秆还田后所带来的土壤肥力效应和减少肥料用量,其增产增收效果更为明显。从高产、高效、可持续发展等方面,运用综合评分法对稻麦两熟制不同耕作栽培方式周年生产力综合评价,免耕套种秸秆还田得分最高,周年生产力最好,免耕套种高茬和翻耕秸秆还田居中,翻耕秸秆不还田得分最低,周年生产力最差。

【英文摘要】An experiment of four treatments (no-tillage + straw mulching, NTS; no-tillage + high stubble remaining, NTH; conventional tillage + straw incorporation, CTS and conventional tillage + no straw returning, CT) was designed to investigate the effects of tillage and straw returning on yearly productivity in a wheat-rice double cropping system for three consecutive years. Results show that wheat yields under NTS and NTH were low, but rice yield increased to some extent, the total yield of rice and wheat was relatively low. Providing additional wheat yield in rice seedling field needed by the latter two treatments, the total yields of rice and wheat under NTS and NTH were higher than those of CTS and CT. Technically and economically, NTS could reduce the cost, increase the total income by about RMB 1874.8 per hm2, about 18% raising rate, so increase the yearly economic productivity. Compared with CT, CTS achieved a higher yield and productivity. Viewing the effects of CTS on soil fertility and the decreased fertilizer usage, the efficiency was very obvious. Considering yield, quality and sustainable development, a comprehensive appraisal system was proposed to give a fair evaluation of yearly productivity of rice and wheat under different cropping systems. Four tillage and cultivation methods were evaluated according to this evaluation system. The appraisal results show that NTS won the highest score due to its highest yearly productivity. NTH, CTS took the 2nd and 3rd places. CT was the last.

【题目】稻鸭共作系统的稻田氮素渗漏和径流特征
【中文关键词】稻鸭共作系统;氮素渗漏;氮素径流
【英文关键词】rice-duck farming system N leakage N runoff
【中文摘要】通过田间试验,分析了稻鸭共作(MRD)、常规栽培(MR)和淹灌单作(CK)3种稻作方式的稻田氮素渗漏和径流特征. 结果表明:与MR处理相比,稻鸭共作系统稻田渗漏液氮素浓度尤其是NO3- 2N浓度显著减少,与CK处理相比,稻鸭共作稻田渗漏液氮素浓度有增加趋势;MRD处理在施肥7 ~9 d后,田面水中的NH4+ 2N 和NO3- 2N 浓度高于MR 处理,由于MRD处理不用搁田且田埂较高,田间排水量显著减少,氮素径流损失反而显著少于MR处理;与MR处理相比,MRD处理增加了鸭粪的氮素投入,减少了氮素渗漏和径流损失,减少了化学氮肥用量,增加了水稻地上部吸氮量;MRD系统的氮素输入总量和氮素输出总量均减少,且减少量基本相等.
【英文摘要】A field experimentwas conducted to study the characteristics of paddy field nitrogen (N)leakage and runoff under rice2duck farming (MRD) , conventional farming (MR) , and conventional farming with flooding (CK). Comparing with that under MR, the paddy field under MRD had anotable decrease of N (especially NO3- 2N) concentration in its leaked liquid; but this concentration was tended to be increased, compared with that under CK. After 7- 9 days of fertilization, the NH4+ 2N and NO3- 2N concentrations in paddy field surface water were higher under MRD than under MR. However, owing to the no draining and the higher band, the paddy field under MRD had a notable reduction of drainage, resulting in a marked decrease of N runoff than that under MR.Comparing with MR, the paddy field under MRD had an addition of nitrogen supply from duck dung, a reduction of N leakage and runoff, a lesser application of chemical nitrogen fertilizer, and more nitrogen up take by rice plant. Both the reduction of N input and that of N output in rice-duck farming system were nearly equal in quantity.

【题目】稻鸭共作下水稻植株的壮秆效应及生理特性
【中文关键词】稻鸭共作;碳氮代谢;茎秆特性;根系活力
【英文关键词】rice-duck farming carbon and nitrogen metabolism stem characters root vitality
【中文摘要】通过田间小区对比试验,分析了稻鸭共作下水稻植株的壮秆效应及其相关生理特性. 结果表明:由于鸭子在稻田的活动使水稻植株形态发生了明显变化,植株碳水化合物含量、植株碳氮比、茎秆干物质输出率都明显增加,茎秆基部节间长度比对照缩短2.88% ,茎粗增加64.90% ,茎秆强度和抗倒伏指数也分别提高了11.78%和10.95%;稻鸭共作提高了水稻深层根系比例和根系活力,黑根比例降低了16.63%. 因此,稻鸭共作对水稻植株有壮秆效应,提高了植株的抗逆性,有利于水稻稳产高产.
【英文摘要】A field plot comparison experiment was conducted to study the strong stem effect and physiological characteristics of rice plant under rice-duck farming. The results showed that under rice-duck farming, themorphology of rice plant changed obviously, and the carbohydrate content and C/N ratio of the plant as well as the drymatter output from rice stem increased significantly, due to the activities of duck in paddy field. In the meantime, the length of basal internodes decreased by 2.88%, while the stem diameter, stem mechanical strength, and stem lodging resistant index increased by 64.90%, 11.78%, and 10.95%, respectively. Rice-duck farming increased the root mass and root vitality in deeper soil layers, and decreased the proportion of black roots by 16.63%. It was indicated that rice-duck farming benefited the formation of strong rice stem and increased the stress resistance of rice plant, which would be favorable to the stable and high-yielding of rice.

【题目】结实期水分胁迫对不同氮肥水平下水稻产量及品质的影响
【中文关键词】水稻;水分胁迫;品质;产量
【英文关键词】Rice W ater stress Grain quality Yield
【中文摘要】以生产上广泛使用的3个水稻品种为材料, 研究了结实期适度水分胁迫对不同氮肥水平下稻米产量及其品质的影响. 结果表明, 正常施氮水平下, 水分胁迫使3个品种籽粒产量降低11.6% ~ 14. 7%, 虽整精米率有所提高, 但垩白度却显著增加(18. 7% ~ 33.1%), 外观品质变劣; 而高氮水平下, 水分胁迫处理的产量增加18. 8% ~ 22.2%, 垩白粒率和垩白度分别降低15.3% ~ 37.2%和13. 7% ~ 29.9%, 外观品质变优. 稻米RVA谱特征值和米饭质地也明显受到结实期土壤水分和施氮水平的影响. 正常施氮水平下, 水分胁迫处理的最高粘度和崩解值(扬稻6号除外)要低于水层灌溉处理, 而其消减值却明显高于水层灌溉处理, 水分胁迫使得正常施氮处理的米饭口感较硬, 弹性较差, 粘性降低, 且咀嚼有渣感. 而高氮水平下, 水分胁迫利于米粉糊化过程中早期粘度的上升, 最高粘度增加, 崩解值也明显高于水层灌溉, 消减值却明显减小, 米饭的硬性和凝聚性减小, 松弛性和粘附性增大, 米饭质地有变优的趋势.
【英文摘要】To examine the effects of nitrogen (N) supply and water stress on rice grain yield and its quality, a pot experiment was conducted at Yangzhou University. Three rice cultivarsw ere grown under two N levels (high N and normal N) from initial head ing, and two water conditions (wellw ate ring and water stress) were installed for each of the two N levels from flow ering tom aturity. The results showed that when the plants o f test cultivars were grown under normal N level ,water stress markedly reduced the grain-filling percentage and grain weight, resulting in a significant decrease o f grain yield by 11.6% ~ 14.7%. Though the head milled rice had a slight increase, the percentage of chalk iness was significantly increased by 18. 7% ~ 33.1%, w hich resulted in an in ferior performance in grain apparent quality. In contrast, when the plants were grown under high N level,water stress increased the grain yield by 18.8% ~ 22.2% because o f the increase of grain-filling percentage and grain weight. As compared with well watering, water stress decreased the percen tages of chalky grain and chalkiness by 15.3% ~37. 2% and 13.7% ~ 29.9%, respectively, which improved the performance of grain apparent quality. The pronounced effects of N application and water treatment were observed on the RVA profile and cooked quality. Under both two N levels, water stress decreased the peak viscosity and break down (except for Yangdao 6) while in creased the setback. Accord ing to the performance in the indices of cooked quality, the palatability became poor when subjected to water stress under normal N level , as the result of the increase of hardness and cohesiveness.In contrast, under high N level, water stress availed the ascending o f viscosity at the early stage when rice flours were pasting, peak viscosity and break down were increased, and set back was decreased, suggesting that the pal-pability got well .It was concluded that mild water stress during grain filling period was benefit for the development of high quality grain when rice plants were grown under high N level.

【题目】结实期相对高温对稻米淀粉粘滞性谱及镁钾含量的影响
【中文关键词】水稻;结实期;相对高温;Mg /K;淀粉粘滞性谱
【英文关键词】rice grain-filling stage relatively h igh temperature Mg /K starch v iscosity profile.
【中文摘要】选用武育粳3号(粳稻)和扬稻6号(籼稻)两个水稻品种, 利用人工气候室在水稻灌浆结实期进行控温试验, 设置全结实期相对高温、结实前期相对高温、结实后期相对高温、全结实期适温(对照, 日均温23℃)对照4 个处理, 探讨结实期不同时段相对高温(日均温度30℃)对稻米淀粉粘滞性谱和Mg、K 等元素含量的影响. 结果表明: 结实期相对高温使武育粳3号和扬稻6号淀粉粘滞性谱特征值发生改变, 其中糊化开始温度、冷胶粘度、回复值和消减值升高, 最高粘度、热浆粘度和崩解值下降; 结实期相对高温促进了米粉中Mg、K、N 含量的提高, 特别是K含量的大幅提高, 使稻米中Mg/K和Mg/(N · AC · K)明显降低; 而2个水稻品种的直链淀粉含量(AC)对相对高温的反应截然相反, 武育粳3号的AC 降低、扬稻6号的AC升高. 全结实期相对高温对稻米淀粉粘滞性谱和Mg、K 等元素含量的影响最大, 结实前期其次, 结实后期的影响较小,

开花后20 d内是稻米淀粉粘滞性谱和Mg、K等元素含量受温度影响的关键时期. Mg/K和Mg/(N·AC·K)与淀粉粘滞性谱特征值显著相关, 可以作为稻米食味品质评价的参考指标.

【英文摘要】With rice cultivars Yangdao 6 (Indica) and Wuyu jing 3 (Japonica) as test materials, the effects of relatively high temperature (RHT, mean temperature 30 °C) at grain-filling stage (GFS) on the starch viscosity profile and magnesium (Mg) and potassium (K) contents of rice grain were studied in a phytotron. Four temperature treatmentsw ere installed, i.e., RHT at whole GFS, RHT at early GFS and optimum temperature at later GFS, optimum temperature at early GFS and RHT at later GFS, and optimum temperature (CK, mean temperature 23 °C) at whole GFS. The results showed that RHT at GFS significantly influenced the characteristic values of rice grain's starch viscosity profile, e.g., the values of gelatinization temperature, final viscosity, consistency, and setback increased, while those of peak viscosity, hot viscosity, and breakdown decreased, with Yangdao 6 and Wuyujing 3 followed the similar pattern. The RHT increased the contents of Mg, K, and N, especially of K, resulting in a marked decrease of Mg/K and Mg/(N · AC · K) in the grain. The grain's amylase content (AC) of the two cultivars showed contrasting in response to temperature treatments. Wuyujing 3 performed decrease, while Yangdao 6 exhibited increase in AC values. The RHT at whole GFS affected the starch viscosity profile and the Mg and K contents most greatly, followed by the RHT at early GFS, and the RHT at later GFS. The period with in 20 days after flowering was the key period during which temperature affected the grain's starch viscosity profile and Mg and K contents. The Mg/K and Mg/(N · AC · K) in rice grain significant corre lated with the characteristic values of starch viscosity profile, which could be used as the reference indices of rice eating quality.

【题目】水稻耐1,2,4-三氯苯胁迫基因型的苗期筛选

【中文关键词】水稻;基因型;TCB 胁迫;耐性评定

【英文关键词】rice genotypes TCB stress tolerance evaluation

【中文摘要】为了评定不同水稻基因型对1,2,4- 三氯苯(TCB) 的耐性强弱, 确定合适的筛选指标和筛选浓度, 在人工气候箱条件下, 采用发芽试验和砂培水稻幼苗的方法, 对幼苗期水稻基因型耐TCB 胁迫的差异性进行了鉴定, 并确定了水稻基因型耐TGB 胁迫合适的筛选指标和筛选环境。结果表明, 以0.35 mmol · kg- 1 沙浓度TCB 更适合用于水稻基因型的耐性鉴定。以发芽势、发芽率、最长根长、根数、株高、地上部干重、根干重和总干重的性状相对值(处理测定值/对照测定值×100%) 作为幼苗耐性指数(tolerance index, TI),其中相对最长根长、相对株高、相对地上部分干重、相对根干重和总干重是评价水稻对TCB 胁迫耐性强弱的较好指标。基于耐性指数对各基因型进行聚类分析, 将50 个水稻基因型聚为耐性、较耐、较敏感和敏感4 类。

【英文摘要】1,2,4-Trichlorobenzene (TCB) has pervaded in industrial and agricultural production. Because of a series of problems caused by its stableness and fatalness, TCB has been added into the environmental pollutant list. In order to know how TCB affects the rice seed germination, seedling growth and its physiological characteristics, the seed germination, seedling biomass,soluble protein, and malnodialdehyde (MDA) contents, as well as activities of superoxide dismutase (SOD), peroxidase (POD), and catalase (CAT) in leaves and roots of seedlings treated with TCB were investigated in a sand culture experiment using rice cultivars, Xiangjing 20-18 (TCB tolerant genotype)and Siyang 1382 (TCB sensitive genotype). The results indicated that TCB had little effect on the seed germination rate and index, however caused the significant reduction of seedling biomass, with Xiangjing 20-18 being more affected than Siyang 1382. With TCB stress degree strengthening, soluble protein content of Xiangjing 20-18 leaves and roots presented an increasing tendency, while that of Siyang 1382 leaves decreased significantly, and that of its roots decreased too under treatment of high TCB concentration. .2O producing velocity of leaves in two genotypes decreased firstly, then increased with increasing TCB concentration. That of Xiangjing 20-18 roots presented the same tendency, and significantly higher than the control at TCB≥0.6 mmol kg − 1, while that of Siyang 1382 roots had no significant difference with that of the control. SOD activity of Xiangjing 20-18 leaves increased, and that of roots increased significantly. After TCB≥0.2 mmol kg − 1, SOD activity of Xiangjing 20-18 leaves was significantly higher than that of the control, that of Siyang 1382 leaves and roots was not significantly different with that of the control. POD activity of Xiangjing 20-18 leaves increased firstly, then decreased, and that of roots was significantly higher than the control, while that of Siyang 1382 leaves and roots decreased significantly. CAT activity of Xiangjing 20-18 leaves was higher or significantly higher than that of the control, and

that of Siyang 1382 was contrary to the result of Xiangjing 20-18. MDA content of leaves decreased firstly, then increased, being significantly higher than that of the control at high TCB concentration, and that of roots increased significantly in two genotype. In conclusion, lower reduction of seedling biomass, high protein content of leaves and roots, the better active oxygen ’s elimination ability and lower MDA content in plants would be considered as the physiological traits in TCB-tolerant genotypes of rice.

【中文关键词】水稻;铅胁迫;铅积累
【英文关键词】rice(Oryza sativa L.) Pb stress Pb accumulation
【中文摘要】为选育籽粒中对Pb 低积累或低吸收水稻品种提供依据,本研究采用盆栽试验方法,比较了不同类型水稻品种及植株不同部位在胁迫和对照条件下对Pb 的吸收积累特性。结果表明,供试品种不同部位中Pb 含量的变异系数较高,变幅在18.34%~35.57%。不同部位中Pb 的含量差异明显,根系对Pb 具有较强的积累能力。胁迫条件下,根系中Pb 的平均含量为287.616 mg · kg-1,约是茎叶和糙米含量的58 倍和1 267 倍;对照条件下,根系中Pb 的平均含量为9.078 mg · kg-1,约是茎叶和糙米含量的3 倍和50倍;胁迫条件下根系中Pb 的含量是对照的36.34 倍,而茎叶和糙米分别是对照的1.65 倍和1.36 倍。不同品种对Pb 的积累能力存在显著差异,同一品种在胁迫与对照条件下对Pb 的含量也存在明显差异,其中,宁54146 对Pb 胁迫较敏感。相关分析表明,对照和胁迫条件下,植株不同部位中Pb 的含量均不存在相关性。
【英文摘要】To evaluate rice genotypes with low Pb uptaking and low Pb accumulation in grains, for breeding programme, Pb accumulation in different plant parts was tested in a pot experiment by using various types of rice cultivars under Pb stress and the control conditions. The results showed that Pb accumulation differed significantly in various plant parts, varied from 18.34% to 35.57%. The average accumulation of Pb in the roots was 287.616 mg · kg-1 under Pb stress, which was approximately 58 times and 1 267 times higher than that in the shoots and in the brown rice, respectively. Meanwhile, under the control conditions, the average Pb content in the roots was 9.078 mg · kg-1, 3 times and 50 times higher than that in the shoots and in the brown rice. It indicated that roots had good capacity of uptaking Pb under both Pb stress and the control. Under stress, on average, Pb amount in the roots, in the shoots and in the brown rice were 36.34 times, 1.65 times and 1.36 times higher than that in respective plant parts under the control. There was a significant difference in Pb accumulation among rice cultivars . Ning 54146 was sensitive to Pb stress. Pb accumulation in the roots, shoots and the brown rice was not significant correlated in both Pb stress and control conditions.

【题目】降解菌S113对甲磺隆污染土壤生物修复作用的研究
【中文关键词】S113; 甲磺隆; 生物修复
【英文关键词】S113; Metsulfuron-methyl; Bioremediation
【中文摘要】在室内条件下, 研究了降解菌S113(Methylop ila sp1) 对甲磺隆污染土壤的修复作用。S113 能够以甲磺隆为唯一碳源生长, 72 h 对50 mg L- 1甲磺隆的降解率达98138%。投加降解菌S113 可显著提高土壤中甲磺隆的降解速率。当甲磺隆浓度为10 mg kg- 1干土, S113 接种量为108个g- 1土时, 第30 天土壤中甲磺隆降解率为7619%, 对照土壤中甲磺隆降解率仅为1119%。S113 降解甲磺隆的速率和接种量呈正相关, 当接种量减少为105 个g- 1干土时, 降解菌对甲磺隆的降解作用微弱。在土壤中甲磺隆浓度较低的条件下, S113 的降解效果显著, 而当土壤中甲磺隆浓度达到50 mg kg- 1时, 甲磺隆降解率仅为

3916%。S113 降解土壤中甲磺隆的最适温度为30e , 第30 天的降解率可达7519%。当温度为25 e 、20e 时, 第30 天甲磺隆降解率仅为531 5%和2319%。S113 菌剂灌根, 能不同程度地缓解土壤中浓度为40、80 Lg kg- 1的甲磺隆对玉米生长的抑制作用, 但当甲磺隆浓度增加到120 Lg kg- 1时, 接种S113 对药害解除作用不显著。结果表明, 人工接种降解菌S113, 能有效去除土壤中甲磺隆残留。

【英文摘要】Bioremediation of metsulfuron-methyl contamined soil with S113 (Methylopila sp1) was studied under laboratory conditions1 S113 was capable of utilizingmetsulfuron-methyl as its sole carbon source for growth and degrading 98138% of the 50 mg L- 1metsulfuron-methyl within 72 h1 Addit ion of S113 could prominently accelerate degrading of metsulfuron-methyl1 When S113 was inoculated into the soil at a rate of 108 cells g- 1 dry soil, 7619% of the metsulfuron-methyl (10 mg kg- 1dry soil) in the soil was degraded after 30 days, whereas only 1119% was degraded in CK. When inoculation rate decreased to 105 g- 1 dry soil, the action of S113 degrading metsulfuron-methyl in soil was not distinct, showing that degradation rate was related positively to the amount of inoculation, When metsulfuron-methyl was low in concentration, S113 was effective1 When the concentrat ion ofmetsulfuron-methyl was increased to 50 mg kg- 1, metsulfuron-methyl degradation rate was only 3916%1 Soil temperature also affected metsulfuron-methyl degradation rate1 When it was 30e , the rate reached 7519% in 30 days, whereas when it was 25e and 20e , the rate was lower to 5315% and 2319%, respectively1 Pouring S113 solution around the roots with S113 solution could mitigate the inhibitive effect of metsulfuron-methyl at 40 or 80 Lg kg- 1 on maize growth to a varying degree1 When the concentration of metsulfuron-methyl increased to 120 Lg kg- 1, the mitigating effectswere not distinct1 The findings suggest that art-ificial inoculation of S113 could effectively degrade metsulfuron-methyl in soil

【题目】微生物菌群JSM004对微囊藻毒素的生物降解

【中文关键词】生物降解;微囊藻毒素;菌群;蓝藻

【英文关键词】biodegradation; mcirocystin; bacterial population; cyanobacteria

【中文摘要】以太湖水华蓝藻中提取纯化的微囊藻毒素(microcystins,MCs)作为微生物生长的碳源和氮源,从富营养化的太湖水体中分离筛选到MCs高效降解菌群JSM004,24h内可以将初始浓度分别为3.64和2.62mg · L^-1的MC—RR和MC—LR完全降解。在研究关于环境因子对JSM004降解效率的影响中,发现菌群JSM004的生长受温度和pH值影响较大,而且其对MCs的降解效率也随之变化。结果表明,在接近实际水体的中性和弱碱性环境中,JSM004对MCs的降解活性最强,加入不同含碳和含氮化合物能够促进混合微生物菌群的生长,但是对MCs的降解却有明显的延滞作用。与对照组相比,MCs被完全降解的时间至少推迟24h。在实验室条件下,JSM004可在72h内完全降解太湖水中高浓度的MCs。研究结果表明微囊藻毒素降解菌群JSM004具有良好的MCs降解效果,有实际应用前景。

【英文摘要】The indigenous mixed bacterial populations JSM004 were isolated from eutrophic waters of Lake Taihu by using the MCs extract from cyanobacteria of blooms as the sole carbon and nitrogen source. This isolate showed high MCs-degrading activity, which could completely degrade 3.64 mg/L of MC-RR and 2.62 mg/L of MC-LR within 24h. Subsequently, the effects of environmental factors on the MCs-degradation by JSM004 were investigated, and the results showed that both temperature and pH value could affect the growth of JSM004 as well as its MCs-degrading rate. It was demonstrated that JSM004 showed highest MCs-degrading activity in natural or slight alkali culture fluids. The addition of other carbon or nitrogen compounds could promote the growth of JSM004, but cause a prolonged lag phase more than 24h to completely degrade MCs as compared to the control group. Under the laboratory conditions, JSM004 could completely degrade high levels of MCs of lake water in 72h. In conclusion, JSM004 could be considered as one of the prospective candidates in the application of MCs removal because of its high efficiency of MCs-degradation.

【题目】藻毒素对青菜生长的影响及其在幼苗体内的积累
【中文关键词】藻毒素;青菜;积累;抗氧化酶
【英文关键词】mcrocystins;Brassica chinensis L.;accumulation;antioxidant enzyme
【中文摘要】以青菜为材料,研究不同浓度藻毒素(MC)对其发芽、生长和抗氧化酶活性的影响,以及MC—LR和MC—RR在幼苗体内的积累。结果表明:随着MC浓度的升高,种子发芽率没有显著差异,但发芽势受到明显抑制。 与对照相比青菜幼苗的株高、根长、鲜重和干重均显著降低。MC对青菜幼苗体内抗氧化酶SOD、POD、CAT活性具有不同影响,高浓度MC对酶活性具有一定抑制作用。幼苗体内MC—LR和MC—RR积累含量随着MC处理浓度的升高而增加;但MC—LR和MC—RR的生物富集系数(BCF)随着MC浓度的增加而减小。结果显示MC可在青菜幼 苗体内积累,这可能产生潜在食品安全风险。
【英文摘要】Effects of different concentrations of microcystins(MC)on the growth and the activities of antioxidant enzymes in Chinese cabbage(Brassica.chinens L.)and the accumulation of MC—LR and MC-RR in seedlings were studied.The results showed that seedling height,root length,fresh weight and dry weight all significantly reduced,compared to contro1.The activities of antioxidant enzymes as SOD,POD and CAT were inhibited by higher concentrations of MC.With the concentration of microcystins increased,the contents of MC—LR and MC—RR accumulated in seedlings were increased,while the bioconcentration factor(BCF)were reduced.The results suggested that MC can be accumulated in Chinese cabbage seedlings,which had potential food safety risk.

【题目】不同地力水平下施氮量对水稻淀粉RVA谱特征的影响
【中文关键词】水稻;施氮量;地力水平;淀粉黏滞性谱
【英文关键词】rice nitrogen rate soil fertility level starch viscosity profile
【中文摘要】以武香粳14和武粳15为材料,研究了不同地力水平下施氮量对稻米淀粉RVA谱特性的影响。结果表明: 1)两供试品种在高、中、低3种地力水平下,RVA谱曲线随施氮量的增加而降低。2)除个别指标外,地力水平、施氮量对RVA谱特征值的影响,均达到显著或极显著的差异。3)在RVA特征值中,热浆黏度、崩解值、最终黏度和回复值存在显著的地力与施氮量互作效应。4)峰值黏度、热浆黏度、崩解值、最终黏度、回复值、峰值黏度时间随施氮量的增加呈显著或极显著下降,每1 hm2追施氮量225 kg是稻米蒸煮食味品质变劣的临界施氮量。
【英文摘要】By using rice varieties Wuxiangjing 14 and Wujing 15 as materials, the effects of nitrogen application on RVA profile characters under different soil fertility levels were studied. The curves of RVA profile decreased with the increased nitrogen rate. Soil fertility level and nitrogen rate had remarkable effects on the RVA profile characteristic value except one or two characteristic values. The interactive effect of soil fertility level and nitrogen was remarkable on hot viscosity, break-down, cool viscosity, and consistence. With the increase of nitrogen rate, peak viscosity, hot viscosity, breakdown, cool viscosity, consistence and peak time decreased remarkably.The nitrogen rate of 225 kg/hm2was the critical on the cooking and eating quality of rice.

【题目】Genome-wide genetic dissection of germplasm resources and implications for breeding by design in soybean
【中文关键词】无
【英文关键词】soybean, Breeding by Design, germplasm resources, QTL mapping, type of QTL constitution, association mapping, germplasm genomics.
【中文摘要】无
【英文摘要】“ Breeding by Design ” as a concept described by Peleman and van der Voort aims to bring together superior alleles for all genes of agronomic importance from potential genetic resources. This might be achievable through high-resolution allele detection based on precise QTL (quantitative trait locus/loci) mapping of potential parental resources. The present paper reviews the works at the Chinese National Center for Soybean Improvement (NCSI) on exploration of QTL and their superior alleles of agronomic traits for genetic dissection of germplasm resources in soybeans towards practicing “ Breeding by Design ”. Among the major germplasm resources, i.e. released commercial cultivar (RC), farmers ’ landrace (LR) and annual wild soybean accession (WS), the RC was recognized as the primary potential adapted parental sources, with a great number of new alleles (45.9%) having emerged and accumulated during the 90 years ’ scientific breeding processes. A mapping strategy, i.e. a full model procedure (including additive (A), epistasis (AA), A × environment (E) and AA × E effects), scanning with QTLNetwork2.0 and followed by verification with other procedures, was suggested and used for the experimental data when the underlying genetic model was usually unknown. In total, 110 data sets of 81 agronomically important traits were analyzed for their QTL, with 14.5% of the data sets showing major QTL (contribution rate more than 10.0% for each QTL), 55.5% showing a few major QTL but more small QTL, and 30.0% having only small QTL. In addition to the detected QTL, the collective unmapped minor QTL sometimes accounted for more than 50% of the genetic variation in a number of traits. Integrated with linkage mapping, association mappings were conducted on germplasm populations and validated to be able to provide complete information on multiple QTL and their multiple alleles. Accordingly, the QTL and their alleles of agronomic traits for large samples of RC, LR and WS were identified and thenthe QTL-allele matrices were established. Based on which the parental materials can be chosen for complementary recombination among loci and alleles to make the crossing plans genetically optimized. This approach has provided a way towards breeding by design, but the accuracy will depend on the precision of the loci and allele matrices.

【题目】不同施氮水平下稻米品质对日间增温响应的差异
【中文关键词】稻米品质;穗肥;日间增温
【英文关键词】rice quality panicle nitrogen fertilizer high day-time temperature
【中文摘要】以武育粳3号为材料,设置低、中、高3个氮素穗肥处理,开放环境下使用加热器进行日间增温处理,研究灌浆结实期不同施氮水平下稻米品质对日间增温响应的差异。结果表明: 1)灌浆结实期日间增温使各氮肥处理精米率和整精米率下降,垩白粒率和垩白度增加,糙米率和子粒长宽比各氮肥处理变化不一,低氮和中氮处理糙米率和子粒长宽比减小,高氮处理则变大;加工品质和外观品质各指标变化幅度均以中氮处理最大,减少或增加氮肥施用量均可以有效地缓解高温对稻米加工品质和外观品质的负面效应,尤以增施氮肥效果较佳。2)增温条件下,减少和增加氮肥施用量均能降低稻米直链淀粉含量,其中增施氮肥降低幅度较大;增温后各氮肥处理蛋白含量均增加,增加幅度与施氮量呈负相关关系,高温高氮处理直链淀粉含量最低,蛋白含量最高。3)增温后各穗肥处理结实率和千粒重均下降,以中氮处理下降最显著;减少和增加穗氮施用量均能有效地缓解高温对水稻产量的影响,其中也以增施氮肥相对较好。综上所述,适当地增加氮肥施用量能较有效地缓解高温对稻米品质和产量的负面影响。
【英文摘要】Effect of high day-time temperature (HDT) on rice quality under different panicle nitrogen levelswas investigated using japonica rice(Oryza sativacv. Wuyujing 3). There was significant difference in the effect of HDT among different nitrogen levels.

HDTresulted in decreasedmilling quality, milled rice rate and head rice rate. Amongthe nitrogen treatments, effect of medium nitrogen treatment was largest, followed by lowand high nitrogen treatment. For appearance quality, medium nitrogen treatment also exhibited the largest effect, while low nitrogen treatment showed the least. Grain chalkiness rate and grain chalkiness increased in all nitrogen treatments. Low and medium nitrogen treatments had lower brown rice rate and grain length towidth ratio, but high nitrogen treatment had higher ones. Grain protein content increased with HDT regardless of nitrogen treatment. By contrast, the influence of HDT on amylose content varied with nitrogen treatments. Medium nitrogen treatment had higher amylose contentwhereas low and high nitrogen treatments had lower one. In addition, filled grain rate and grain weight was declined in all nitrogen treatments under HDT, with medium treatment having the lowest values. We concluded that suitable N application could effectively alleviate the negative impact of high temperature on the rice quality and yield.

【题目】水稻休眠分蘖芽萌发过程中内源激素水平的变化
【中文关键词】水稻;分蘖芽;萌发;休眠;内源激素
【英文关键词】Rice Tillering bud Sprout Dormancy Phytohormone
【中文摘要】以 2 个籼稻品种 II 优航 1 号、扬稻 6 号为材料, 研究了齐穗后去除顶穗和保留顶穗对倒 2 节间叶腋内休眠分蘖芽(倒 2 芽)的生长动态及倒 2 芽、倒 2 芽着生节(倒 2 节)中内源激素(IAA、Z+ZR、ABA)含量的影响。结果表明, 去除顶穗后, 倒 2 芽休眠解除, 开始萌发生长。在去除顶穗后 1 d 内, 倒 2 节中吲哚-3-乙酸(IAA)水平、倒 2 芽中脱落酸(ABA)水平迅速下降, 其后 2 种激素含量基本保持稳定, 而留穗处理这 2 种激素含量变化不大。去除顶穗后, 倒 2 节和倒 2 芽中玉米素+玉米素核苷(Z+ZR)含量均持续升高, 与留穗处理间的差异不断扩大, 其变化动态与倒 2 芽生长动态相一致。而 2 个处理间倒 2 节中 ABA 水平、倒 2 芽中 IAA 水平相差不大。分蘖芽的萌发生长是多种激素共同作用的结果, 芽中较低的 ABA/(Z+ZR)值、节中较低的 IAA/(Z+ZR)值有利于分蘖芽的生长, 其值较高抑制分蘖芽生长。
【英文摘要】Tiller number is a major factor affecting rice grain yield. The endogenous hormone has substantial regulative effect on tillering of rice. However, little is known on the hormonal changes in releasing tillering bud. In this study, two indica rice cultivars were used with two treatments, removing panicle and retaining panicle, to investigate the pattern of hormonal changes during the period of dormant tillering bud sprouting. The result showed that the dormant tillering bud released and grew quickly after panicle removing. One day after removing panicle, the level of IAA in node and level of ABA in tillering bud decreased significantly, then the contents of these two hormones maintained at a constant level. The contents of Z+ZR in both node and bud increased significantly in panicle removing treatment. However, the content of IAA in the bud and the content of ABA in the node showed no significant difference between the two treatments. Further, the results showed that the ratio of hormones rather than a single hormone has the larger impact on tillering bud growth, with lower values of ABA/(Z+ZR) in bud and IAA/(Z+ZR) ratio in node showing beneficial effect whereas higher values of the two ratios demonstrating deleterious effect on tillering bud growth.

【题目】外源一氧化氮缓解微囊藻毒素对青菜幼苗的毒害效应
【中文关键词】一氧化氮;微囊藻毒素;MCs;青菜幼苗;氧化胁迫

【英文关键词】Nitric oxide; Microcystins; MCs; Chinese cabbage seedling; Oxidative stress
【中文摘要】微囊藻毒素(MCs)能够诱导青菜幼苗产生氧化损伤,并进一步抑制青菜幼苗的生长。相比较于单独MCs处理,外源一氧化氮(供体为SNP)预处理能够显著降低青菜幼苗体内活性氧(ROS)水平、减缓脂质过氧化反应,从而在一定程度上缓解了MCs胁迫对青菜幼苗生长的抑制效应。这说明一氧化氮可能作为信号参与了青菜幼苗对MCs的解毒反应。
【英文摘要】Microcystins (MCs) caused severe oxidative damage and growth inhibition of Chinese cabbage seedling. As compared to MCs treatment, exogenous nitic oxide donor SNP alleviated the growth inhibition of Chinese cabbage seedling caused by MCs stress by significantly decreasing the level of reactive oxygen (ROS) as well as the concentration of TBARS that was considered to be an indicator of lipid peroxidation of plasma membrane. These results suggested that nitric oxide might be involved in the antioxidative stress in Chinese cabbage seedling under MCs exposure.

【题目】穗肥施量对水稻植株形态、群体生态及穗叶温度的影响
【中文关键词】水稻;穗肥;形态;群体生态;穗叶温度
【英文关键词】Rice Panicle fertilizer Morphological Microclimate Temperature of panicle and leaf
【中文摘要】以 2 个籼、粳稻品种为材料, 设置高、中、低 3 个穗肥处理, 以空白为对照, 构建不同的群体结构, 研究穗肥施量对植株形态和群体生态及穗叶温度的影响。结果表明, 穗肥施量对穗长、穗弯曲度、叶长和叶角有明显影响; 不同穗肥处理群体内部温度、湿度、光照强度和 CO2浓度等微气象因子具有一定差异, 中肥处理具有良好的群体微气象环境; 此外, 中肥处理群体具有适宜的 LAI、净光合速率和蒸腾速率, 冠层温度较低; 施肥水平显著影响植株器官的温度, 穗叶的温度随穗肥施量的增加而降低, 中肥与高肥处理植株穗叶的温度差异不显著, 但与低肥和空白处理差异显著。研究结果说明通过优化田间管理如合理的施肥来构建良好的群体, 对降低植株穗叶和冠层温度以提高水稻抗热害能力效果显著。
【英文摘要】Using two japonica and indica rice cultivars with three panicle fertilizer application rate treatments and a control, different populations of rice were constructed, and the effect of panicle fertilizer application rate (PFAR) on morphological, ecological characteristics and organ temperature of rice were studied. The results showed that PFAR had a significant effect on length of panicle, panicle camber, length of leaf and leaf angle. It was also observed that air temperature, humidity, light intensity and content of CO2were also affected by different PFAR treatments, medium PFAR was proved to be best for microclimate within rice population. Besides, there were felicitous leaf area index, length of second leaf, photosynthetic rate, transpiration and lower canopy temperature at medium PFAR. The temperature of plant organs was significantly affected by PFAR, the more the PFAR, the lower the temperature of panicle and leaf. The organ temperature was significantly different at the 0.05 level between medium PFAR and lower PFAR, control treatments, while not significantly between medium PFAR and higher PFAR. This study clearly showed that appropriate agronomic practices, such as PFAR, have a significant effect on the temperature of plant organs and canopy, and also enhance the resistance to heat stress.

【题目】氮素和6-BA对水稻分蘖芽发育的影响及其生理机制
【中文关键词】水稻;分蘖芽;发育;氮素;6-BA
【英文关键词】Rice Tillering bud Development Nitrogen 6-BA

【中文摘要】以扬稻 6 号、南粳 44 为材料, 研究了氮素和 6-BA 对水稻分蘖芽萌发的影响及分蘖芽萌发过程中碳氮代谢和细胞分裂素含量的变化。结果表明, 氮素和 6-BA 都能促进分蘖芽的萌发, 但二者维持分蘖芽进一步生长的能力存在明显差异, 氮素能够促进分蘖芽持续生长, 而 6-BA 是无法维持分蘖芽的持续生长。氮素和 6-BA 均提高了分蘖节中细胞分裂素(Z+ZR 和 iP+iPR)含量及叶、根中硝酸还原酶(NR)活性, 但 6-BA 处理无法提高水稻植株体内可溶性蛋白含量及氮素和非结构性碳水化合物的积累, 使水稻植株体内营养物质积累不足。这说明, 氮素和细胞分裂素通过内源激素平衡和碳氮代谢两条生理途径调控分蘖发生。

【英文摘要】Tiller number is a major factor affecting rice yield, nitrogen and cytokinin have substantial regulative effect on tillering of rice. However, little is known on the mechanism of nitrogen and cytokinin regulating tillering bud growth and on the relationship of them during this process. In this study, two rice cultivars (Yangdao 6 and Nanjing 44) were used to investigate the effect of nitrogen and cytokinin on the regulation in tillering bud growth and the changes of nitrogen, carbon and cytokinins in plant during this process. The results showed that both nitrogen and cytokinin promoted the germination of tillering bud, but there was a significant difference in the effect of them on the subsequent outgrowth, nitrogen promoted both germination and outgrowth of tillering bud, however, cytokinin only promoted tillering bud ’s germination. Both nitrogen and 6-BA significantly increased cytokinin (Z+ZR and iP+iPR) content in tillering node and promoted activity of nitrate reductase (NRA) in leaf and root, but 6-BA couldn ’t significantly increase the content of soluble protein, nitrogen and non structural carbohydrate (NSC) in plant. In conclusion, nitrogen and 6-BA may regulate tiller production by two approaches, one is the promotion of endogenous hormones balance and the other is the controlling of carbon and nitrogen metabolism.

【题目】钾对不同类型水稻氮素吸收利用的影响

【中文关键词】水稻;施钾量;氮素吸收;氮素利用率

【英文关键词】Rice Potassium application rates Nitrogen absorption Nitrogen use efficiency

【中文摘要】以常规粳稻武运粳 7 号、武香粳 14 和杂交粳稻 86 优 8 号、泗优 422 为材料, 研究了钾对水稻氮素吸收、分配和利用的影响。结果表明, 钾对水稻有明显增产效应, 增产率 4.56%~14.77%; 钾提高了水稻不同生育阶段植株吸氮量, 以拔节期到抽穗期氮素积累增量最大, 但吸氮比例下降; 钾促进了抽穗后氮素转运量和转运率, 提高了氮素在不同器官分配量及叶片、穗分配比例, 但降低了茎鞘分配比例; 钾增强了植株对肥料氮吸收, 基肥氮素利用率、全生育期氮素利用率和氮素收获指数显著增长, 但降低了植株氮生产效率; 以 180 kg hm − 2K2O 处理产量最高, 氮素积累量、转运量和转运率以及不同器官分配量最大, 基肥氮素利用效率、植株对肥料氮吸收量和全生育期氮素利用率最大, 但拔节期到抽穗期氮素吸收比例、茎鞘氮素分配比例和植株氮生产效率最低; 常规粳稻产量高于杂交粳稻,其氮素利用率相对较大。

【英文摘要】Potassium, nitrogen and their interaction play important roles in plant growth, development and yield of rice. Appropriate potassium can stimulate nitrogen accumulation and translocation in rice. In order to identify plant nitrogen absorption, distribution and utilization characteristics of rice under potassium supply, a field experiment was conducted with four potassium rates (0, 90, 180, 270 kg ha − 1 K2O) using conventional japonica cultivars (Wuyunjing 7 and Wuxiangjing 14) and hybrid japonica cultivars (86 you 8, Siyou 422) from 2004 to 2005 on Experimental Farm of Nanjing Agricultural University, Jiangsu province,China. Potassium application increased rice yield (4.56 − 14.77%) and nitrogen accumulation during growth stages, with the maximum from elongation stage to heading stage, but nitrogen uptake ratio decreased. Potassium application enhanced nitrogen transport amount and percentage after anthesis, as well as nitrogen accumulation in different rice organs, nitrogen distribution percentage in leaves and panicles, whereas declined nitrogen distribution percentage in culm and sheath.

【题目】GmFtsH9 expression correlates with in vivo photosystem II function: chlorophyll a fl uorescence transient analysis and eQTL mapping in soybean
【中文关键词】无
【英文关键词】Chlorophyll a fl uorescence transient parameters;Expression quantitative trait loci (eQTLs); FtsH protease;JIP-test Soybean
【中文摘要】无
【英文摘要】Filamentation temperature-sensitive H (FtsH) is an ATP-dependent zinc metalloprotease involved indiverse biological functions. There are 12 FtsH proteins in Arabidopsis, among which AtFtsH2 plays an important role in regulating the turnover of photosystem II (PSII) reaction center D1 protein and the development of the photosynthetic apparatus. Here, we have identi fi ed 11 FtsH genes in the soybean genome by a bioinformatics approach. These soybean FtsH genes corresponded to seven Arabidopsis FtsH genes, suggesting that the main characteristics of soybean FtsH genes were formed before the evolutionary split of soybean and Arabidopsis. Phylogenetic analyses allowed us to clone a soybean AtFtsH2-like gene designated as GmFtsH9. The predicted protein of GmFtsH9 consists of 690 amino acids and contains three typical FtsH proteins conserved domains. The expression level of GmFtsH9 was determined in a soybean recombinant inbred line population under a pot experiment conducted for measuring chlorophyll a fl uorescence transient parameters, photosynthetic CO2 fi xation rate (PN), and seed yield. Expression quantitative trait loci (eQTL) mapping revealed two trans-acting eQTLs for GmFtsH9. The signi fi cant correlation of gene expression level with chlorophyll a fl uorescence transient parameters and the presence of overlapping eQTL (QTL) between gene expression level and chlorophyll a fl uorescence transient parameters indicated that GmFtsH9 could be involved in regulating PSII function. These results further lead to the understanding of the mechanism underlying FtsH gene expression, and contribute to the development of marker-assisted selection breeding programs for modulating soybean FtsH gene expression.

【题目】烟叶中高效氯氟氰菊酯残留半定量ELISA筛选方法的建立
【中文关键词】烟叶;氯氟氰菊酯;半定量;ELISA
【英文关键词】tobacco;lambda—cyhalothrin;semi—quantification;enzyme linked immunosorbent assay(EL1SA)
【中文摘要】烟草中农药残留是烟叶品质和出口检验的重要指标。本文以高效氯氟氰菊酯为研究对象,分别在烟叶基质和PBS 缓冲液中建立高效氯氟氰菊酯的ELISA 检测标准曲线。并在线性检测范围内,连续3 天、添加3 个水平的高效氯氟氰菊酯,以此研究烟叶基质对 ELISA 检测的影响。获得的烟叶基质和缓冲液中高效氯氟氰菊酯的回收率分别在94%-157%, 87%-118% ,变异系数分别是 6.8%-22.1%,3.5%-6.6%。结果表明烟叶基质对ELISA 检测干扰较大,在前处理不做净化的条件下,定位为高效氯氟氰菊酯的半定量筛选检测较为合理。试验以空白烟叶添加适当浓度的高效氯氟氰菊酯(如设定的超标限量)为对照,间接竞争ELISA法检测待测样品,制定了结果判断标准,建立了烟叶中高效氯氟氰菊酯的半定量ELISA 筛选方法。对50个高效氯氟氰菊酯施药后的烤烟烟叶同时采用ELISA 和气相色谱法(GC)分析,ELISA 法检测样本超标检出率为34% ,GC法仪器法检出率为22% 。 以GC法为参照,ELISA 法假阳性率为12% ,假阴性率为 0 ,结果表明该方法可以作为大量烟叶样本中的高效氯氟氰菊酯快速筛查使用。
【英文摘要】Pesticides residue is an important quality targets for tobacco. In this article, we have established the ELISA method for lambda-cyhalothrin in tobacco matrix and PBS respectively. To determine the matrix effect to the detection, three different levels concentrations of lam bda-cyhalothrin were spiked into the samples. The overall recoveries for tobacco and PBS were in the range of 94%~157% and 78%~118%, and the coefficients of variation (CVs %) are 6.8-22.1 ,3.5-6.6 respectively. It could be concluded that tobacco matrix has a large influence to the ELISA method, if the samples we re detected without pretreatment, it appeared to be mo re suitable that the ELISA method were performed as semi-quantitative method. We also used the drug-free tobacco spiked with certain concentration lambda-cyhalothrin as the control of over standard and formulated the standard of ELISA result determination. Fifty

tobacco samples were detected by the ELISA and gas chromatography (GC) method; the rates of over standard by ELISA and GC are 34% and 22%. Comparing with GC method, the rate of false positive for ELISA method was 12% and fasle negtive was 0. It is demonstrated that this semi-quantification ELISA method could be used the fast screening for lambda-cyhalothrin in tobacco.

【题目】Multiple quantitative trait loci Haseman-Elston regression using all markers on the entire genome
【中文关键词】Haseman – Elston回归,数量性状基因座,标注,基因组
【英文关键词】Haseman – Elston regression,quantitative-trait-loci, markers,genome
【中文摘要】在20世纪70年代开发的Haseman – Elston(HE)回归仍然在普遍使用的检测基因之间的联系一个定量性状和遗传标记,尽管该技术已被多种方式改善,预计较高的误报率积极的数量性状基因座(QTL),因为它是基于一个单一的QTL模型。我们已经扩展的起源HE回归到多QTL他(MQHE)的回归,所以在整个基因组中的所有标记,同时可以利用。参数已被惩罚的最大似然法估计的,并已为了优化程序相比几个响应变量的表型差异。该方法已经过测试,通过模拟已知的祖先的血统人口玉米自交系。这些仿真结果表明,特质产品是最佳的响应变量的表型差异。产生的假阳性率由MQHE回归基本上是低于所产生的任一方差分量分析或原点何回归。 MQHE回归,与性状产品作为响应变量,对现有方法的一组已知的祖先的自交系(或品种)QTL作图表示一个显着的改善。
【英文摘要】The Haseman – Elston (HE) regression, developed in the 1970s, remains in common use to detect genetic linkage between a quantitative trait and a genetic marker.Although the technique has been improved in a number of ways, it predicts a high rate of false positive quantitative trait locus (QTL) because it is based on a single-QTL model. We have extended the origin HE regression to multi-QTL HE (MQHE) regression, so that all markers across the entire genome can be exploited simultaneously. The parameters have been estimated by the penalized maximum likelihood method, and several response variables for phenotypic difference have been compared in order to optimize the procedure. The method has been tested by simulation in a pedigree population of maize inbred lines of known ancestry. These simulations show that the trait product is the optimal response variable for phenotypic difference. The false positive rate produced by the MQHE regression is substantially lower than that generated by either variance component analysis or the origin HE regression. The MQHE regression, with the trait product as the response variable, represents a significant improvement on existing methods for QTL mapping in a set of inbred lines (or cultivars) of known ancestry.

【题目】Multiple loci in silico mapping in inbred lines
【中文关键词】电子定位;连锁不平衡;惩罚最大似然相似性;假阳性率
【英文关键词】in silico mapping; linkage disequilibrium; penalized maximum likelihood; identity-by-state; false-positive rate
【中文摘要】玉米自交系种质资源新基因的发现,在电子定位技术(ISM)及其延伸的重大进展。然而,从一个比较高的假阳性率(FPR)技术受到他们不考虑解决已确定的数量性状位点(QTL)的连锁不平衡(LD)标记的效果。此外,它尚未被确定它是否是最优的使用绝对性状作为响应变量差异。为了解决这些问题,本文提出的多个位点ISM(MLISM)的方法,它使用的整个基因组的所有标志,伴随着被处罚的最大似然。这里提出的方法进行了验证与玉米自交系的已知祖先的血统人口由一系列的仿真实验。模拟研究的结果表明,最好的响应变量是特征的产品。 MLISM FPR大幅减少和虚假QTL的LD的数目的数目的比例围绕所识别的QTL的标记物是充分降低。 MLISM方法,产品作为响应变量的特征,是自交系种质资源的新的

QTL定位在对现有方法的改进。
【英文摘要】The in silico mapping (ISM) technique and its extension represent major advances for novel gene discovery in germplasm resources of inbred lines. However, the techniques suffer from a relatively high false-positive rate(FPR) and they do not consider the effect of linkage disequilibrium (LD) markers around the identified quantitative trait locus (QTL). In addition, it has not yet been established whether it is optimal to use absolute trait differences as the response variable. To address these problems, this article presents the multiple loci ISM (MLISM) approach, which uses all markers on the entire genome, along with a penalized maximum likelihood. The method proposed here was verified by a series of simulation experiments with a maize pedigree population of inbred lines of known ancestry. Results from the simulated studies show that the best response variable is the trait product. The MLISM FPR is substantially decreased and the proportion of the number of false QTL to the number of LD markers around the identified QTL is adequately reduced. The MLISM method, with the trait product as the response variable, is an improvement on the existing methods for novel QTL mapping in germplasm resources of inbred lines.

【题目】Mapping epistatic quantitative trait loci underlying endosperm traits using all markers on the entire genome in a random hybridization design
【中文关键词】胚乳性状;上位,惩罚最大似然法;数量性状位点;三倍体遗传
【英文关键词】endosperm trait; epistasis; penalized maximum likelihood method; quantitative trait loci; triploid inheritance
【中文摘要】三倍体胚乳其营养品质是有重大的经济意义,位图胚乳性状位点(ETL)可以提供一种有效的方法对转基因提高粮食品质.但是最三倍体的ETL映射方法不产生两个主要的影响ETL的无偏估计。一个随机杂交的设计是一种替代方法,也可以使用来克服这个问题。然而,的上位性具有重要的作用在复杂性状的遗传结构的解剖。因此,在这项研究中,试图在随机交配设计的胚乳性状三倍体遗传模型的上位性ETL(eETL)的映射下。胚乳性状是指的随机混合动力线,连同已知的标记基因型信息其相应的亲F2植物,被用来估算,高效和不带偏见的位置和所有的使用惩罚最大似然法的影响eETL。的方法,在这篇文章中提出了一系列的Monte Carlo模拟实验验证。模拟研究的结果表明,该方法提供了准确的估计的eETL参数与低的假阳性率和相对短的运行时间。这种新的方法,使我们能以同样的方式作为二倍体数量性状三倍体eETL映射。
【英文摘要】Triploid endosperm is of great economic importance owing to its nutritious quality. Mapping endosperm trait loci (ETL) can provide an efficient way to genetically improve grain quality.However, most triploid ETL mapping methods do not produce unbiased estimates of the two dominant effects of ETL. A random hybridization design is an alternative method that may be used to overcome this problem. However, epistasis has an important role in the dissection of genetic architecture for complex traits. In this study, therefore, an attempt was made to map epistatic ETL (eETL) under a triploid genetic model of endosperm traits in a random hybridization design. The endosperm trait means of random hybrid lines, together with known marker genotype information from their corresponding parental F2 plants, were used to estimate, efficiently and without bias, the positions and all of the effects of eETL using a penalized maximum likelihood method. The method proposed in this article was verified by a series of Monte Carlo simulation experiments. Results from the simulated studies show that the proposed method provides accurate estimates of eETL parameters with a low false-positive rate and a relatively short running time. This new method enables us to map triploid eETL in the same way as diploid quantitative traits.

【题目】Methodologies for segregation analysis and QTL mapping in plants
【中文关键词】贝叶斯分析,同源性,性状性,芯片定位,惩罚最大似然法,数量性状定位
【英文关键词】Bayesian analysis,Identity-by-descent,Identity-by-state,In silico mapping, Penalized maximum likelihood,Quantitative trait locus
【中文摘要】大多数生物学和经济上的重要性是数量性状。为了发现数量性状的遗传结构,有两种方法已成为在中国的普及。一个是建立一个分析模型的混合主要基因+多基因遗传和数量性状位点(QTL)的发现。在这里,我们回顾我们的进步,采用这两种方法。首先,我们提出了联合分离分析的多代混合主基因+多基因遗传。其次,我们扩展了多位 Lander and Green (1987), Jiang and Zeng (1997)的方法更广义的方法。我们的方法处理扭曲,显性及缺失的标记,包括链接的偏分离位点上的地图距离的估计效果。最后,我们开发了数个QTL作图方法。在Bayesian压缩估计方法(BSE),我们建议的方法来测试的QTL效应的意义和研究的QTL定位QTL效应的方差的先验分布的效果。为了减少运行时间,被处罚的最大似然法获得通过。为了挖掘新基因作物玉米自交系正常的作物育种工作的过程中产生的三种方法进行了介绍。如果有据可查的家谱历史上的线索是可用的,两个阶段的方差成分分析和多QTL的Haseman埃尔斯顿回归的建议,如果不可用,在电子定位,提出了多个位点。
【英文摘要】Most characters of biological interest and economic importance are quantitative traits. To uncover the genetic architecture of quantitative traits, two approaches have become popular in China. One is the establishment of an analytical model for mixed major-gene plus polygenes inheritance and the other the discovery of quantitative trait locus (QTL). Here we review our progress employing these two approaches. First, we proposed joint segregation analysis of multiple generations for mixed major-gene plus polygenes inheritance. Second, we extended the multilocus method of Lander and Green (1987), Jiang and Zeng (1997) to a more generalized approach. Our methodology handles distorted, dominant and missing markers, including the effect of linked segregation distortion loci on the estimation of map distance. Finally, we developed several QTL mapping methods. In the Bayesian shrinkage estimation(BSE) method, we suggested a method to test the significance of QTL effects and studied the effect of the prior distribution of the variance of QTL effect on QTL mapping. To reduce running time, a penalized maximum likelihood method was adopted. To mine novel genes in crop inbred lines generated in the course of normal crop breeding work, three methods were introduced. If a welldocumented genealogical history of the lines is available, two-stage variance component analysis and multi-QTL Haseman-Elston regression were suggested; if unavailable, multiple loci in silico mapping was proposed.

【题目】Using three overlapped RILs to dissect genetically clustered QTL for Wber strength on Chro.D8 in Upland cotton
【中文关键词】QTL, Wber 强度,染色体D8,陆地棉
【英文关键词】QTL, Wber strength,Chro.D8,Upland cotton
【中文摘要】在不断变化的纺纱技术中纤维强度是棉花Wber质量的一个重要特征。QTL为Wber质量,分子标记辅助选择(MAS)eVectively改善Wber品质棉花品种。我们以前identiWed的主效QTL来自7235陆地棉Wber强度。以WNE-的地图Wber强度QTL,在本研究中,我们选择了三个重组自交系(RIL),7TR-133,7TR-132,和7TR-214,7235和TM-1回交之间的交叉发展TM-1开发三个大的作图群体。为Wber强度性状的表型数据收集在南京(JES/ NAU)和新疆(BES / XJ)在2006年和2007年。使用这三个回交群体构建了三个简单的重复序列(SSR)遗传连锁的地图上Chro.24(D8)。 SSR遗传图谱构建了907个人(7TR-133英镑的TM-1)F2(流行),670(7TR-132英镑的TM-1)F2(流行B),940(7TR-214英镑TM-1)F2(流行乐C)。 SSR位点之间的平均距离为0.62,1.7,和0.56 cM的三个地图。 MapQTL软件检测WVE-聚集的QTL(2.5<LOD<29.8)Chro.D8的Wber强度分析后的3个RIL回交F2/F2:3后代在JES/ NAU和ES/ XJ2年以上的。五QTL为Wber强度总表型变异(PV)的28.8-59.6%。
【英文摘要】Fiber strength is an important trait among cotton Wber qualities due to ongoing changes in spinning technology. Major quantitative trait loci (QTL) for Wber quality enable molecular marker-assisted selection(MAS) to eVectively improve Wber quality of cotton cultivars. We previously identiWed a major QTL for Wber strength derived from 7235 in Upland cotton. In the present study, in order to Wne-map Wber strength QTL, we chose three recombinant inbred lines (RIL), 7TR-133,7TR-132, and 7TR-214, developed

from a cross between 7235 and TM-1 for backcrossing to TM-1 to develop three large mapping populations. Phenotypic data for Wber strength traits were collected in Nanjing (JES/NAU) and Xinjiang (BES/XJ) in 2006 and 2007. Three simple sequence repeat (SSR) genetic linkage maps on Chro.24(D8) were constructed using these three backcrossed populations. The SSR genetic maps were constructed using 907 individuals in (7TR-133 £ TM-1)F2 (Pop A), 670 in (7TR-132 £ TM-1)F2 (Pop B), and 940 in (7TR-214 £ TM-1)F2 (Pop C). The average distance between SSR loci was 0.62, 1.7, and 0.56 cM for the three maps. MapQTL 5 software detected Wve-clustered QTL (2.5 < LOD < 29.8) on Chro.D8 for Wber strength following analysis of three RIL backcrossed F2/F2:3 progenies at JES/NAU and ES/XJ over 2 years. Five QTL for Wber strength exhibited a total phenotypic variance (PV) of 28.8 – 59.6%.

【题目】QTL mapping of agronomic and fiber traits based on a four-way cross population in Gossypium hirsutum L.

【中文关键词】QTL定位 四倍体 陆地棉 纤维品质性状

【英文关键词】QTL mapping, four-way cross population, Gossypium hirsutum L.,fiber traits

【中文摘要】四陪体(4WC),涉及4个不同的自交系经常出现在棉花育种计划。然而,连锁分析和分子标记技术在棉花数量性状位点(QTL)的映射已经在很大程度上被应用到从两岸之间的两个近交系群体,和QTL解剖的结果进行4WC人口在。在这项研究中,试图建立一个遗传连锁图谱,并确定产量和纤维品质性状的QTL来自四个不同的自交系陆地棉的连锁图谱,构建了285个SSR标记和一个形态轨迹,覆盖在4WC 2113.3 cM的,约42%的棉花基因组的总的复合长度。一共有31 QTL5.1-25.8%的表型变异解释进行检测。 24个QTL在不同环境表现出较高的稳定性,6 QTL特定环境下的。几个影响多个性状的基因组片段进行了鉴定。使用4WC的QTL定位的优点进行了讨论。本研究提出的第一个例子QTL定位4WC人口陆地棉使用。这里给出的结果将产量和纤维品质性状的遗传基础,提高认识,使更多的分子标记辅助选择陆地棉品种人群中。

【英文摘要】Four-way cross (4WC) involving four different inbred lines frequently appears in the cotton breeding programs. However, linkage analysis and quantitative trait loci(QTL) mapping with molecular markers in cotton has largely been applied to populations derived from a cross between two inbred lines, and few results of QTL dissection were conducted in a 4WC population. In this study, an attempt was made to construct a linkage map and identify QTL for yield and fiber quality traits in 4WC derived from four different inbred lines in Gossypium hirsutum L. A linkage map was constructed with 285 SSR loci and one morphological locus, covering 2113.3 cM, approximately 42% of the total recombination length of the cotton genome. A total of 31 QTL with 5.1 – 25.8% of the total phenotypic variance explained were detected. Twenty-four common QTL across environments showed high stability, and six QTL were environment-specific. Several genomic segments affecting multiple traits were identified. The advantage of QTL mapping using a 4WC were discussed. This study presents the first example of QTL mapping using a 4WC population in upland cotton. The results presented here will enhance the understanding of the genetic basis of yield and fiber quality traits and enable further marker-assisted selection in cultivar populations in upland cotton.

【中文关键词】四倍体棉花,黄萎病,QTL定位, MAS

【英文关键词】Tetraploid cotton; Verticillium wilt; QTL mapping; MAS

【中文摘要】棉花黄萎病菌是棉花生产商和消费者最关注的。控制棉花抗病品种的发展主要策略是要确定Verticilium耐药基因棉花,产生的F2和BC1群体过一个宽容的海岛棉品种的无功。海岛棉7124,一个敏感的品种,陆地棉 Junmian1。个人植物对疾病的反应进行了量化,用叶性状在苗期和血管组织成熟阶段的特点。遗传连锁图谱构建SSR,RGA和DDRT标记。叶性状的4个QTL,位于字符。 A5,A7,A8和3个QTL的血管组织特征字符。 A5,A7和A9检测复合区间作图法(CIM)接种在F2中与非落叶隔离BP2。种植BC1S2家庭分别接种菌株,BP2,VD8和592。在BP2幼儿园,一个QTL位于字符。 D4的叶性状和两个QTL字符。 D4和A8的血管组织特征detected.We检测到两个QTL字符。 A5和A8的叶性状和3个QTL字符。 A5,D5,D11为血管组织的特征在在VD8苗圃中生长的植物。在592个幼儿园,3个QTL字符。 A5和D5的叶性状和两个QTL字符。 D5和D11的血管组织性状进行检测。本QTL定位结果显示,在不同人群中,4个QTL在苗期和成熟期表示,和一些抗黄萎病QTL控制存在两个稳定的QTL分别位于不同的染色体上,并在不同的发展阶段不同菌株。与这些QTL的标记,可以方便的使用黄萎病抗性基因在棉花抗病育种计划。

【英文摘要】Verticillium wilt (Verticillium dahliae) is a major concern for cotton producers and consumers. The major strategy to control disease has been the development of resistant varieties of Gossypium. To identify Verticilium resistant genes in cotton, we generated F2 and BC1 populations by crossing a tolerant cultivar of Gossypium barbadense var. Hai 7124 with a susceptible cultivar, Gossypium hirsutum var. Junmian 1. Individual plant reaction to disease was quantified using a leaf trait in the seedling stage and a vascular tissue trait in mature stage. Two genetic linkage maps were constructed with SSR, RGA and DDRT markers. Four QTLs for the leaf trait, located on chr. A5, A7 and A8 and three QTLs for the vascular tissue trait on chr. A5, A7 and A9 were detected by composite interval mapping (CIM) in F2 inoculated with a non-defoliating isolate BP2. BC1S2 families were planted separately and inoculated with the isolates, BP2, VD8 and 592. In the BP2 nursery, one QTL located on chr. D4 for the leaf trait and two QTLs on chr. D4 and A8 for the vascular tissue trait were detected.We detected two QTLs on chr. A5 and A8 for the leaf trait and three QTLs on chr. A5, D5 and D11 for the vascular tissue trait in plants grown in the VD8 nursery. In the 592 nursery, three QTLs on chr. A5 and D5 for the leaf trait and two QTLs on chr. D5 and D11 for the vascular tissue trait were detected. The present QTL mapping results revealed that two stable QTLs existed in different populations, four QTLs expressed at both the seedling and mature stages, and some QTLs controlling resistance to Verticillium wilt were located on different chromosomes and in different developmental stages for different isolates. The markers associated with these QTLs may facilitate the use of Verticillium wilt resistant genes in resistant breeding programs for cotton.

【题目】Structural elucidation of the polysaccharide moiety of a glycopeptide (GLPCW -II) from Ganoderma lucidum fruiting bodies

【中文关键词】灵芝,糖肽,NMR谱,多糖部分,结构分析

【英文关键词】Ganoderma lucidum; Glycopeptide; NMR spectroscopy; Polysaccharide moiety; Structural analysis

【中文摘要】从灵芝子实体中分离出一种水溶性的糖(GLPCW-II)的DEAESepharose快流和Sephacryl S-300的高分辨率色谱。的糖肽的分子量的1.2x104沓(通过HPLC测定),并包括90%的碳水化合物,8%的蛋白质,使用的苯酚 - 硫酸酸方法和BCATM的蛋白质测定试剂盒,分别确定。多糖部分的组成主要由D-葡萄糖,L-岩藻糖,和D-半乳糖中的比为 1.00:1.09:4.09。为了便于结构 - 活性研究,阐明的GLPCW-II多糖部分的结构使用1H和13C核磁共振光谱包括COSY,TOCSY,HMBC,HSQC,和ROESY,结合的甲基化衍生物用GC-MS,和示出包括具有以下结构的重复单元:

【英文摘要】A water-soluble glycopeptide (GLPCW-II) was isolated from the fruiting bodies of Ganoderma lucidum by DEAESepharose Fast-Flow and Sephacryl S-300 High Resolution Chromatography. The glycopeptide had a molecular weight of 1.2x104 Da (determined by HPLC), and consisted of 90% carbohydrate and 8% protein as determined using the phenol-sulfuric acid method and the BCATM protein assay reagent kit, respectively. The polysaccharide moiety was composed mainly of D-Glc,L-Fuc, and D-Gal in the ratio of 1.00:1.09:4.09. To facilitate structure – activity studies, the structure of the GLPCW-II polysaccharide moiety was elucidated using 1H and 13C NMR spectroscopy including COSY, TOCSY, HMBC, HSQC, and ROESY, combined with GC – MS of methylated derivatives, and shown to consist of repeating units with the following structure:

【题目】A Microsatellite-Based, Gene-Rich Linkage Map Reveals Genome Structure, Function and Evolution in Gossypium
【中文关键词】SSRs,连锁图谱 棉花 基因组结构,功能,进化
【英文关键词】SSRs,Linkage Map,Gossypium,Genome Structure,Function,Evolution
【中文摘要】功能基因图谱的基因组结构,功能和进化,以及基因的克隆和分子标记辅助选择,在提高农业的重要特征的研究中起着重要的作用。从表达序列标签(EST)开发的简单重复序列(SSR标记),EST-SSR(ESSR),可以作为推定的功能标记位点,轻松地标记相应的功能基因。在本文中,2218 eSSRs,1554 G.雷蒙德和来自754陆地棉衍生无害环境技术的开发和使用屏幕多态性,以提高我们的骨干异源四倍体棉花遗传图谱。 1554 G.的雷蒙德衍生eSSRs中,744 eSSRs能够成功地扩增多态性与我们的两个对映的父母,TM-1和海7124,呈现出多态性比率为47.9%。然而,只有多态性比率为23.9%(159/754)从G.棉花衍生eSSRs的。之间的多态性,主题型,组织起源是没有关系的,但似乎与重复类型的多态性。 ,整合后这些新的eSSRs的,我们的增强遗传图谱包含1790个位点在26个连锁群,,占地面积3425.8厘米,1.91厘米的平均intermarker距离。这种基于微卫星基因丰富的遗传连锁图谱包含71.96%的功能标记位点,其中87.11%是ESSR基因位点。共有132桥接13 / DT对染色体部分同源的复制位点。两个相互易位A2和A3之间的多倍体化后,A4和A5之间的,染色体被进一步证实。的975个EST 1122 ESSR位点标记在地图上显示,60%有明确的的BLASTX点击(1E 10)的UniProt数据库和475相关的主要的三个主要基因本体论ategories的生物的基因的功能分析过程中,细胞组分,和分子功能;许多的ESTs与两个或多个类别的功能。这里给出的结果将提供新的见解,为今后的调查功能和进化基因组学研究,特别是那些与改良棉纤维。
【英文摘要】The mapping of functional genes plays an important role in studies of genome structure, function, and evolution, as well as allowing gene cloning and marker-assisted selection to improve agriculturally important traits. Simple sequence repeats (SSRs) developed from expressed sequence tags (ESTs), EST – SSR (eSSR), can be employed as putative functional marker loci to easily tag corresponding functional genes. In this paper, 2218 eSSRs, 1554 from G. raimondii-derived and 754 from G. hirsutum-derived ESTs, were developed and used to screen polymorphisms to enhance our backbone genetic map in allotetraploid cotton. Of the 1554 G. raimondii-derived eSSRs, 744 eSSRs were able to successfully amplify polymorphisms between our two mapping parents, TM-1 and Hai7124, presenting a polymorphic rate of 47.9%. However, only a 23.9% (159/754) polymorphic rate was produced from G. hirsutum-derived eSSRs. No relationship was observed between the level of polymorphism, motif type, and tissue origin, but the polymorphism appeared to be correlated with repeat type. After integrating these new eSSRs, our enhanced genetic map consists of 1790 loci in 26 linkage groups and covers 3425.8 cM with an average intermarker distance of 1.91 cM. This microsatellite-based, gene-rich linkage map contains 71.96% functional marker loci, of which 87.11% are eSSR loci. There were 132 duplicated loci bridging 13 homeologous At/Dt chromosome pairs. Two reciprocal translocations after polyploidization between A2 and A3, and between A4 and A5, chromosomes were further confirmed. A functional analysis of 975 ESTs producing 1122 eSSR loci tagged in the map revealed that 60% had clear BLASTX hits (,1e 10) to the Uniprot database and that 475 were associated mainly with genes belonging to the three major gene ontology ategories of biological process, cellular component, and molecular function; many of the ESTs were associated with two or more category functions. The results presented here will provide new insights for future investigations of functional and evolutionary genomics, especially those associated with cotton fiber improvement.

【题目】SSR genetic linkage maps of A-genome diploid cotton (Gossypium arboreum L.)
【中文关键词】二倍体 遗传连锁图谱,亚洲棉分子标记,SSR
【英文关键词】diploid; genetic linkage map; Gossypium arboreum; molecular marker; simple sequence repeat.
【中文摘要】本研究介绍了第一个种内的遗传连锁图谱的A-新开发的简单重复序列(SSR)标记使用派生从两个亚洲棉品种(棉L.)江玲中棉和浙江萧山绿恕的杂交的189个F2植株的基因组二倍体棉。在亲本间的多态性进行检测,使用6 092对SSR引物。两百年68双更好的多态性SSR引物,被挑出来的F2群体进行分析。共有320多态位点的生成和用于构建与JoinMap3.0连锁图谱。两百年和67个位点,其中包括3个表型性状进行映射在对数比值比(LOD)≥3.0的13个连锁群。在地图的总长度为2508.71 cM的,相邻标记之间的平均距离为9.40 cM的。染色体的任务是,根据该协会的骨干四倍体特定地图使用的89个类似的SSR位点的联系。 A-基因组染色体的同源连锁群上的13套房间的比较发现,在和DT亚基因组染色体在很大程度上是共线。与反转的染色体表明,异源多倍体伴随着同源染色体重排。染色体间的复制位点提供分子证据表明,A-基因组二倍体亚洲棉花是多陪体的。
【英文摘要】This study introduces the construction of the first intraspecific genetic linkage map of the A-genome diploid cotton with newly developed simple sequence repeat (SSR) markers using 189 F2 plants derived from the cross of two Asiatic cotton cultivars (Gossypium arboreum L.) Jianglingzhongmian × Zhejiangxiaoshanlushu. Polymorphisms between the two parents were detected using 6 092 pairs of SSR primers. Two-hundred and sixty-eight pairs of SSR primers with better polymorphisms were picked out to analyze the F2 population. In total, 320 polymorphic bands were generated and used to construct a linkage map with JoinMap3.0. Two-hundred and sixty-seven loci, including three phenotypic traits were mapped at a logarithms of odds ratio (LOD)≥3.0 on 13 linkage groups. The total length of the map was 2 508.71 cM, and the average distance between adjacent markers was 9.40 cM. Chromosome assignments were according to the association of linkages with our backbone tetraploid specific map using the 89 similar SSR loci. Comparisons among the 13 suites of orthologous linkage groups revealed that the A-genome chromosomes are largely collinear with the At and Dt subgenome chromosomes. Chromosomes associated with inversions suggested that allopolyploidization was accompanied by homologous chromosomal rearrangement. The inter-chromosomal duplicated loci supply molecular evidence that the A-genome diploid Asiatic cotton is paleopolyploid.

【题目】Identification and Molecular Mapping of a Fusarium Wilt Resistant Gene in Upland Cotton
【中文关键词】分子定位 枯萎病,抗性基因,棉花
【英文关键词】molecular mapping, Fusarium wilt, resistant gene, upland cotton
【中文摘要】枯萎病(FW)是造成全球经济损失最大的棉花病虫害之一,造成发黄,萎蔫,落叶,血管组织的损伤并最终导致死亡。鉴定是与FW基因的分子标记将电阻为精英棉花品种的关键。陆地棉种内F2是由具有高度抗病品种中棉所35(ZMS35)和感病品种Junmian1,画面简单重复序列(SSR标记)紧密联系在一起的FW抗性基因杂交。 FW被确定在F2:3家通过评估幼苗叶片焊接在自然感染情况症状和血管组织损伤植物成熟2年以上。结果表明,以3:1的比例作为一个简单的单基因性状在F2:3家FW电阻隔离。分子标记鉴定一个FW抗性基因紧密联系在一起的SSR标记JESPR304的“ 280号染色体D3(C17)。我们建议该基因命名为FW ｆ。复合区间作图法检测　　到4个QTL为FW阻力位在Chr.A7(C7),D1(C15),D9(C23)和D3,分别。其中,一个主要的QTL被标记(LOD> 20)的时间间隔内的0.06-0.2 cM的标记JESPR304附近,并解释了52.5-60.9%的表型变异。数据证实了存在的主要基因Chr.D3。这是WRST报告的主要贡献FW阻力在棉花基因的分子定位。因此,本研究提供了一个机会,了解基因控制的抗性,FW并进行分子标记辅助选育发展FW抗病品种的。
【英文摘要】Fusarium wilt (FW) is one of the most economically damaging cotton diseases worldwide, causing yellowing, wilting, defoliation, vascular tissue damage and ultimately death. IdentiWcation of molecular markers linked to FW genes is vital to incorporate resistance into elite cotton cultivars. An intraspeciWc F2 in Gossypium hirsutum L. was developed by crossing with a highly resistant cultivar Zhongmiansuo 35 (ZMS35) and a susceptible cultivar Junmian1 to screen simple sequence repeats (SSRs) closely linked to the FW resistance gene. FW was identified in F2:3 families by evaluating seedling leaf symptoms and vascular tissue damage at plant maturity under natural Weld infection conditions over 2 years. The results showed that FW resistance segregated in a 3:1 ratio as a simple monogenic trait in F2:3 families. Molecular mapping identified a FW resistance gene closely linked with the SSR marker

JESPR304 ¡ 280 in chromosome D3(c17). We proposed to name this gene FWR. A composite interval mapping method detected four QTLs for FW resistance in Chr.A7(c7), D1(c15), D9(c23) and D3, respectively. Among them, one major QTL (LOD > 20) was tagged near marker JESPR304 within an interval of 0.06 – 0.2 cM, and explained over 52.5 – 60.9% of the total phenotypic variance. The data confirmed the existence of a major gene in Chr.D3. This is the Wrst report of molecular mapping of a major gene contributing FW resistance in cotton. The present research therefore provides an opportunity to understand the genetic control of resistance to FW and conduct molecular markerassisted selection breeding to develop FW resistant cultivars.

【题目】关联图分析——一种基于连锁图的QTL综合分析方法
【中文关键词】连锁图,数量性状基因座,统合分析,关联图分析
【英文关键词】Linkage map, quantitative trait loci, meta-analysis, the association graph analysis
【中文摘要】通过统合分析整合多个独立实验QTL(quantitative trait locus)定位结果获得的一致性QTL,可为标记辅助育种和基因图位克隆提供坚实基础.但是这种方法没有充足的生物学背景支撑,而且遗传图谱间不同映射会严重影响分析结果.为此,本文提出一种基于连锁图的QTL综合分析法,简称关联图分析.首先,利用连锁群构建图模型;然后,利用非监督分类法来寻找基因组间具有模式性共分离趋势的标记区间;最后,通过频繁集挖掘法对这些标记区间挖掘以获得与QTL紧密连锁的分子标记(区间).新方法通过Monte Carlo模拟研究和3个棉花QTL定位结果的综合分析予以证实.新方法的优点在于:不需要构建参考图谱;利用基因组间的分子标记模式性共分离趋势来查找特异性QTL,在一定程度上排除了初始QTL的干扰;通过非特异性QTL获得的具有潜在育种价值的分子标记,在作物育种上更有利用价值. 更多还原。
【英文摘要】Consistency of QTL meta-analysis to integrate multiple independent experiments QTL (quantitative trait locus) positioning results obtained for marker-assisted breeding and gene map-based cloning to provide a solid foundation, but this approach is not adequate biology background support, and geneticdifferent mapping between the map will seriously affect the analysis of the results of this, this paper proposes a linkage map based QTL analysis, referred to as the association graph analysis. Firstly, the linkage groups to build a graph model; then, the use of non-supervised classification method to find the genomebetween mode sexual trends were isolated marker interval; Finally, these marker interval mining frequent set mining method to obtain molecular markers tightly linked to the QTL (interval) of the new method through Monte Carlo simulation study and three cotton QTL mapping resultsa comprehensive analysis be confirmed. advantage of the new method: There is no need to build a reference map; the mode using genomic molecular markers were isolated from trends to find the specificity of QTL excluded, to a certain extent on the initial QTL interference; through non-specificQTL with molecular markers of potential breeding value, use value in crop breeding more and more to restore.

【中文摘要】针对DDOS和蠕虫的特点,提出了一种NeTraMet和QOS相结合的主动防御机制,实现对DDOS和蠕虫经济高效的防治。在蠕虫检测上考虑了无特征蠕虫和有特征蠕虫两种情况;一般基于流量的DOS检测方法预警时,网络实际已经受到一定程度的攻击而且发生阻塞,为了能够更早预警DDOS攻击,提高网络生存性,在DDOS检测中提出了可疑流量线,当流量达到可疑流量和攻击流量之间时,就启动防御机制,利用路由器的QOS功能,尽量减少攻击流的消耗带宽,维持网络正常服务。最后在NS2中进行模拟验证。

【英文摘要】According to characteristics of DDOS and worm,a proactive defense mechanism based on NeTraMet and QOS which im-plements economical and high-efficiency defense of DDOS and worm is presented.They considered two situations of characteristic worm and no characteristic worm on worm detection;usually when DDOS detection method based on traffic warns,network has been attacked and blocked to some degree in fact,so they developed suspicious traffic line in order to find out DDOS attack flows early on DDOS de-tection and improve network survivability,and when traffic is between suspicious traffic and attack traffic,proactive defense system is proposed which can reduce bandwidth consumption by attack flows and maintain network normal service with QOS of router.It is simu-lated and testified in NS2 at last.

【题目】不同穗型小麦花后物质运转及产量对氮肥的响应
【中文关键词】小麦;不同穗型;氮肥运筹;物质运转;产量
【英文关键词】wheat ; different spike-types ; nitrogen management ; assimilates transportation ; yield
【中文摘要】在大田条件下,以多穗型小麦‘烟农19’和大穗型小麦‘兰考矮早8’两个不同穗型的冬小麦为材料,研究了不同施氮量及氮肥基追比例对小麦营养器官花前贮藏同化物再运转,花后同化物输入籽粒量,产量及产量构成因素的影响。结果表明,氮肥水平在225~300kg/hm2范围内,多穗型小麦‘烟农19’和大穗型小麦‘兰考矮早8’籽粒产量的形成均以花后绿色器官光合同化为主,其次才是花前积累干物质的再动员分配。大穗型品种‘兰考矮早8’籽粒产量的形成较多穗型品种‘烟农19’更依赖于花后绿色器官同化,积累干物质再运转分配只占籽粒产量的15%左右。两种穗型品种小麦花前贮存物质再动员分配对籽粒产量的贡献都随着氮肥后移而降低。随着施氮量的增加,运转物质对籽粒产量的贡献率呈降低趋势。综合物质运转和产量表现‘,烟农19’施氮量300kg/hm2,基追比例5:5时较适宜‘;兰考矮早8’施氮量262.5kg/hm2,氮肥基追比例7:3时较适宜。

【题目】Identi fi cation, inheritance and gene mapping of resistance to a virulent Soybean mosaic virus strain SC15 in soybean
【中文关键词】无
【英文关键词】Soybean mosaic virus;virulent strain SC15;screening for resistance sources;genetic analysis;genemapping
【中文摘要】无
【英文摘要】Soybean mosaic virus (SMV) is one of the major pathogens for soybeans worldwide. Among the 21 strains identi fi ed under uniform identi fi cation system in China, SC15 can infect all 10 of the di ff erentials, is the most virulent strain and has been prevalent especially in Southern China. In this study, 10 elite accessions resistant to SC15 were identi fi ed from 205 soybean lines. P1,P2,F1,F2 and 200 recombinant inbred lines (RIL) of the cross RN-9 (resistant, R) • 7605 (susceptible, S) were used to study inheritance of resistance to SC15. F1 was identical to RN-9 ,F2 segregated in a 3R : 1S phenotypic ratio, whereas RILs segregated in a 1R : 1S genotypic ratio. This indicated that a single dominant gene, designated as RSC15, conferred the resistance. A genetic linkage map of a segment of C2 linkage group was constructed using SSR markers identi fi ed by bulked segregant analysis of RIL population, where RSC15 was mapped between Sat_213 and Sat_286 with distances of 8.0 and 6.6 cM to the respective fl anking markers.

【题目】Isolation and Functional Characterization of a SERK Gene from Soybean (Glycine max (L.) Merr.)
【中文关键词】无
【英文关键词】Phylogenetic analysis;Quantitative real-time PCR;Somatic embryogenesis;Somatic embryogenesis receptor-like kinase;Soybean (Glycine max (L.) Merr.)
【中文摘要】无
【英文摘要】It is well accepted that somatic embryogenesis Nserves a primary role in plant regeneration. However, it is also a model system to explore the regulatory and morphogenetic events in the life of a plant. To date, a suite of genes that serve important roles in somatic embryogenesis have been isolated and identified. In the present study, a novel gene designated as GmSERK1 was isolated from soybean (Glycine max (L.) Merr). Sequence and structural analysis determined that the GmSERK1 protein, which encodes 624 amino acids, belongs to the somatic embryogenesis receptor-like kinase (SERK) gene family. GmSERK1 shared all the characteristic domains of the SERK family, including five leucine-rich repeats, one proline-rich region motif, transmembrane domain, and kinase domains. DNA gel blot analysis indicated that a single copy of the GmSERK1 gene resides in the soybean genome. The GmSERK1 tissue-specific and induced expression patterns were explored using quantitative real-time PCR. Dissimilar expression levels in various tissues under different treatments were found. In addition, transient expression experiments in onion epidermal cells indicated that the GmSERK1 protein was located on the plasma membrane. The results from this study suggested that GmSERK1, a member of the SERK gene family, exhibits a broader role in various aspects of plant development and function, in addition to its basic functions in somatic embryogenesis.

【题目】Long-day effects on the terminal in fl orescence development of a photoperiod-sensitive soybean [Glycine max (L.) Merr.] variety
【中文关键词】无
【英文关键词】Soybean (Glycine max (L.) Merr.);Photoperiod;Long-day;Terminal in fl orescence;Reversion;Stem-termination
【中文摘要】无
【英文摘要】The type of terminal in fl orescence is a key component for identifying soybean type. In this study, a late maturity and photoperiod-sensitive determinate soybean, cv. Zigongdongdou, was used to investigate effects of long-day (LD) on the formation and development of the terminal in fl orescence. After emergence, soybean seedlings were subjected to 12 h short-day (SD) photoperiod for 13 days to induce the initiation of terminal in fl orescence. The plants were then moved to 16 h LD treatment (LDT) for 0, 1, 2, 3, 4 and 5 wks, respectively. After LDT, plants were moved back to 12 h SD condition until the end of the experiment. The LDT greatly affected morphological and anatomical features of terminal in fl orescence as well as the developmental rate of plants. Reversed fl owers could be found in the reversed “ in fl orescences ” in plants with 2 – 5 wks LDT. Such changes were con fi rmed through morphological observation and anatomical dissection. In the long-day treatments, the formation of fl owers and the development of terminal in fl orescence could be reversed and plant type of a soybean could be further changed. This long-day effect was a cumulative process, which increased with the increase in the duration of LDT.

【题目】Low-nitrogen stress tolerance and nitrogen agronomic ef fi ciency among maize inbreds: comparison of multiple indices and evaluation of genetic variation
【中文关键词】无
【英文关键词】Genetic variation;Low-N stress tolerance;N-agronomic ef fi ciency;N-use ef fi ciency;Maiz
【中文摘要】无
【英文摘要】Limited information is available on genetic variation in low-nitrogen (low-N) stress tolerance and N-use ef fi ciency (NUE) among maize inbreds. To unveil this information, a panel of 189 diverse maize inbred lines was evaluated under contrasting levels of N availability over 2 years. Low-N agronomic ef fi ciency (LNAE), absolute grain yield (GY) at low-N conditions, and the ratio betweenGY at low-N and optimum-N conditions were taken into account to represent low-N tolerance. Additionally, N-agronomic ef fi ciency (NAE) along with other agronomic traits was also analyzed. Analysis of variance revealed signi fi cant effects of genotype on LNAE, NAE, and GY. The estimated broad-sense heritability was 0.38 for LNAE while it was only 0.11 for NAE, implying that selection based on LNAE should be more effective than NAE. LNAE exhibited highly positive genotypic and phenotypic correlations with GY, ear kernel number (EKN), kernel weight, plant height (PH), and chlorophyll content at low-N conditions, while it was negatively correlated with grain-N content and anthesis-silking interval. Path analysis indicated that the EKN at low-N stress had the highest positive effects on LNAE.

【题目】Mapping of quantitative trait loci for kernel row number in maize across seven environments
【中文关键词】无
【英文关键词】Kernel row numbers;Quantitative trait loci;Mapping;Maize;Major QTL
【中文摘要】无
【英文摘要】Genetic factors controlling quantitative inheritance of grain yield and its components have been intensively investigated during recent decades using diverse populations in maize (Zea mays L.).Notwithstanding this, quantitative trait loci (QTL) for kernel row number (KRN) with large and consistent effect have not been identi fi ed. In this study, a linkage map of 150 simple sequence repeat (SSR) loci was constructed by using a population of 500 F2 individuals derived from a cross between elite inbreds Ye478 and Dan340. The linkage map spanned a total of 1478 cM with an average interval of 10.0 cM. A total of 397 F2:3 lines were evaluated across seven diverse environments for mapping QTL for KRN. Some QTL for grain yield and its components had previously been con fi rmed with this population across environments. A total of 13 QTL for KRN were identi fi ed, with each QTL explaining from 3.0 to 17.9% of phenotypic variance. The gene action forKRN was mainly additive to partial dominance. A large-effect QTL (qkrn7) with partial dominanceeffect accounting for 17.9% of the phenotypic variation for KRN was identi fi ed on chromosome 7near marker umc1865 with consistent gene effect across seven diverse environments. This study has laid a foundation for map-based cloning of this major QTL and for developing molecular markers for marker-assisted selection of high KRN.

【题目】有机肥施用量对甜高粱饲草产量和品质的影响
【中文关键词】甜高粱 有机肥 尿素 干物质产量 品质
【英文关键词】Sweet sorghum Organic fertilizer Urea DM yield Quality
【中文摘要】通过田间试验研究有机肥施用量对甜高粱(Sorghum saccharatum Moench)饲草产量及品质的影响。结果表明:在有机肥基肥(发酵牛粪)和追肥(尿素)施氮量相等的条件下,随着有机肥基肥施用量的增加,甜高粱的株高、单株鲜重和单株干重、酸性洗涤纤维和中性洗涤纤维含量不断增加,粗蛋白含量和体外消化率不断下降;地上干物质产量和可消化干物质产量随有机肥基肥施用量的增加而显著增加,而单位面积粗蛋白产量在处理间无明显差异;追肥后,株高的生长速度和粗蛋白含量在短时间内随着追肥用量的增加而显著增加,但干物质生产能力以不施有机肥基肥而施较多追肥的处理最差。因此,在甜高粱饲草生产中,施足有机基肥可显著提高产量。
【英文摘要】Effect of organic fertilizer applications on yield and quality of sweet sorghum in the field was studied.Results showed that the plant height,fresh and dry weight of single plant,the content of acid-detergent fiber and neutral detergent fiber increased under the same nitrogen content with increasing organic fertilizer application,whereas crude protein and In vitro dry matter digestibility decreased.Both dry matter yield above-ground and digestible dry matter yield increased with increasing organic fertilizer application.The difference of crude protein yield among treatments had no significant change.Using increased urea,the content of crude protein and the growth rate of plant height were significantly improved in less time,but the productivity of dry matter was lowest for the treatment without organic fertilizer.These results showed that the sufficient organic fertilizer as basal fertilizer should be applied to obtain high yield in sweet sorghum.

【题目】Overexpression of TaNHX2 enhances salt tolerance of ‘composite’and whole transgenic soybean plants
【中文关键词】无
【英文关键词】TaNHX2;Soybean;Salt tolerance;Transformation;Agrobacterium rhizogenes;Agrobacterium tumefaciens
【中文摘要】无
【英文摘要】Salinity is a major factor resulting in extensive loss of agricultural production. Genetic transformation has become a powerful tool for studying gene function and for improving crop salt tolerance. In this study, a TaNHX2 gene was transformed into a plant cloning vector under the control of cauli fl ower mosaic virus 35S promoter, and then introduced into Agrobacterium rhizogenes strain K599. Explants of soybean were transformed with A. rhizogenes and ‘composite’ plants consisting of wild-type shoots and transgenic hairy roots overexpressing TaNHX2 were produced. When exposed to salt stress, ‘composite’ plants displayed high salinity tolerance at 171 mM NaCl in vermiculite and in solid medium supplemented with up to 200 mM NaCl, whereas control plants displayed chlorosis and died within 15 days under above treatment conditions. We subsequently obtained soybean plants overexpressing TaNHX2 through A. tumefaciens-mediated transformation and studied four homozygous lines of TaNHX2. Transgenic lines displayed an enhanced salt tolerance in plant biomass and fl ower number per plant, compared with wild type plants grown on sand culture containing 150 mM NaCl. Furthermore, transgenic plants of line C12-11 showed longer survival, less growth inhibition and greater number of fl owers than wild type plants. Taken together, theseresults indicated that TaNHX2 gene could enhance salt tolerance of soybean, and A. rhizogenes-mediated transformation system could be used as a complementary tool of A. tumerfaciens-mediated transformation to rapidly investigate candidate gene function in soybean.

【题目】不同秸秆培养基对平菇生长影响的比较研究
【中文关键词】秸秆 培养基 平菇 比较分析
【英文关键词】straw bales ; substrate ; oyster mushroom ; comparative analysis
【中文摘要】为了解不同作物秸秆主料培养基对栽培平菇所表现出的差异,以便于因地制宜指导生产,特进行试验。设置12种秸秆材料作主料配制培养基栽培平菇,观察并记录。结果表明,平菇菌丝在各培养基中的生长速度、长势及头茬子实体产量都表现出明显差异。根据各培养基的成分特点,主要表现在以下几个方面:当C/N在20~50之间,且培养基中可溶性糖与粗纤维的质量比在1附近时,菌丝生长情况最好,产量最高;当C/N在20~50之间,可溶性糖与粗纤维的质量比大于1.5以上时,菌丝长势差,易死菇或不出菇;当可溶性糖与粗纤维质量比在1附近,但C/N过大,超过50以上,菌丝生长速度慢,长势差,产量低。综上,秸秆成分影响平菇生长,用不同秸秆作主料栽培平菇时,必须根据其成分特点作适当调整。
【英文摘要】In order to know the dissimilar result of using several straw and stalk substrates to plant oyster mushroom and to convenient for adjusting measures to local conditions in yielding mushroom,so the tests were set up especially.Twelve kinds of straw and stalk substrates were put up to plant oyster mushroom,observe and memorize in every period.Results showed that the growth speed,the way corp was growing,the yield for the first time of the oyster mushroom ' s mycelial present remarkable difference.According as the ingredients of the different substrates,there were several aspect characteristics in the tests:First,when the range of C/N was from 20 to 50,and that the ratio between the disolubility glucide and the gross fibrin in the substrate was near the 1,the mycelial ' s growth was the best,the yield for the first time was the highest;Second,when the range of C/N was from 20 to 50,but the ratio between the disolubility glucide and the gross fibrin in the substrate was higher than 1.5,the way corp was growing of the mycelial was worse,the mushroom in small was easy to die;Third,when the ratio between the disolubility glucide and the gross fibrin in the substrate was near the 1,but the range of C/N was more higher than 50,the growth of the mycelial was slow,the way corp was growing was worse,the yield for the first

time was lower.Because the ingredients of straw bale work on the growth of oyster mushroom,the straw and stalk substrate must be adjusted before using it to plant oyster mushroom.

【题目】Somatic embryogenesis and plant regeneration in Chinese soybean (Glycine max (L.) Merr.)—impacts of mannitol, abscisic acid, and explant age
【中文关键词】无
【英文关键词】Soybean;Somatic embryogenesis;Mannitol;Abscisic acid;Enzyme-linked immunosorbent assay
【中文摘要】无
【英文摘要】From a preliminary experiment on 98 Chinese soybean varieties, 12 varieties with somatic embryogenesis frequency ranging from 0.0% to 85.7% were selected for further study in order to enhance the efficiency of somatic embryogenesis and plant regeneration. The effects of differentmannitol concentrations, abscisic acid (ABA) concentrations, and embryo explant ages (sizes) were investigated. Significant differences in somatic embryogenesis were found among the 12 soybean varieties, with initiation frequencies varying from 22.1% to 89.0% under suitable mannitol concentration, and with N25281, N25263, and N06499 having the highest somatic embryogenic capacity. The results showed that all three factors were relevant for raising rates of callus initiationand somatic embryogenesis, but with differential responses among the genotypes. The treatment of 3.0% (w/v)mannitol, 5mgl − 1 ABA, and a 4- to 5-mm-sized explant was found to be optimal for somatic embryogenesis, generating the highest explant-based regeneration rate at 83.0%. The greatest average number of plantlets regenerated per explant (1.35) was observed in N25281. The above results provide a basis for efficient regeneration of soybean and are informative for the development of genetic transformation systems in Chinese soybean germplasm.

【题目】Verification and fine-mapping of QTLs conferring days to flowering in soybean using residual heterozygous lines
【中文关键词】无
【英文关键词】soybean, backcross line, RHL (residual heterozygous line), SSR (simple sequence repeat) marker, flowering date, QTL fine-mapping
【中文摘要】无
【英文摘要】The results of QTL mapping based on a primary mapping population should be further verified and refined for its real utilization in marker-assisted selection or map-based cloning. The primary mapping population contains 114 BC1F1 plants of the backcross between Essex (maturity group V, MG V) as the donor parent and ZDD2315 (MG II) as the recurrent parent. In this study, a genetic linkage map with 250 SSR markers spanning a total length of 2963.5 cM on 25 linkage groups (LG) was constructed using software MAPMAKER3.0. Six kinds of genetic statistical models of 4 softwares, i.e. WinQTL Cartographer Version 2.5, IciMapping Version 2.0, MapQTL Version 5.0 and QTLnetwork Version 2.0, were used to map QTLs conferring days to flowering of the BC1F3 lines. Nine QTLs were mapped on 6 different linkage groups (LG). Of those, 6 QTLs were detected by at least two different genetic statistical models, while the other three were detected by only one procedure. Among the three QTLs, Flwdt7 was mapped between Sat_213 and Satt643 on LG C2 with only 11.0% contribution rate. For confirmation of Flwdt7, 5 RHL populations were developed

through selfing eight BC1F5 plants heterozygous at seven markers around the locus. The RHL populations with the same segregating loci were bulked and used to construct a secondary linkage map of the specific segment using software JoinMap ® 3.0. The genetic distances among the markers on the specific segment became shorter than those of the whole genome map. On the secondary map, Flwdt7 was mapped between Satt277 and Satt489, next to its primary interval Sat_213 – Satt643, with distance 1.40 cM to Satt277 and 0.45 cM to Satt489, confidence interval narrowed to 2.7 cM, and contribution rate increased to 36.8%. The results were confirmed with significance analysis among marker genotypes on individual loci and comparison analysis of target marker intervals among near isogenic lines (plants). Thus the strategy by using residual heterozygous lines for QTL fine-mapping on target segments based on primary whole genome scanning with multiple mapping models was demonstrated to be effective.

【题目】两种藻胆蛋白对人喉癌Hep-2细胞的光动力杀伤效果
【中文关键词】条斑紫菜藻胆蛋白碘钨灯光动力疗法人喉癌细胞株Hep-2
【英文关键词】Porphyra yezoensis Phycobiliprotein Iodine tungsten lamp Photodynamic Therapy Human laryngeal cancer cell line Hep-2
【中文摘要】从条斑紫菜中提取高纯度R-藻红蛋白(R-PE) 和R-藻蓝蛋白(C-PC) , 采用MTT 法测定主要研究了不同浓度(10、25、50 和100 μg/ml) R-PE 和C-PC 分别介导的光动力效应对人喉癌Hep-2 细胞的生存率的影响。实验结果显示, 两种藻胆蛋白的光动力作用对Hep-2 细胞具有杀伤作用。在浓度为100 μg/ml, 照射剂量为50J/ cm2 的条件下, 藻蓝蛋白对应的细胞存活率为64%, 藻红蛋白对应的仅为57%; 单用碘钨灯处理, Hep-2 细胞的存活率达到86.9%; 而单独使用这两种藻胆蛋白处理Hep-2 细胞, 培养24h 后, 低浓度藻胆蛋白(10、25 μg/ml) 对细胞的抑制效果不明显, 高浓度对细胞生长具有一定的抑制效果, 抑制率为68%。实验证明条斑紫菜R-藻红蛋白和C-藻蓝蛋白具有可开发人喉癌治疗光敏剂应用前景。
【英文摘要】In this paper, high purified R-Phycoerythrin (R-PE) and C-Phycocyanin (C-PC) were extracted fromPorphyra yezoensis, and they were applied as photosensitizer to study on inhibitory effect of photodynamic reaction onhuman laryngeal cancer cell line Hep-2. With MTT assay, effects of R-Phycoerythrin and C-Phycocyanin concentrations(10, 25, 50 and 100 μg/ml) and illumination dose on cancer cell photodynamic therapy reaction with irradiation of iodinetungsten lamp were analyzed. The results showed that the photodynamic effects of these two phycobiliproteins on Hep-2were remarkable. With 100 μg/ml concentration of C-PC and R-PE and 50J/ cm2 illumination dose of iodine tungstenlamp, the survival rates of the cancer cells were 64% and 57%, respectively. The survival rates of the cancer cells onlytreated by illumination of iodine tungsten lamp was 86.9%. The inhibition rates of the cancer cells treated only withhigher concentration of phycobiliproteins (R-PE, C-PC≥50 μg/ml) were about 68% after they cultured for 24hs. It wasindicated that the R-Phycoerythrin and C-Phycocyanin extracted from Porphyra yezoensis would become a new kind ofphotosensitizer and could be applied to photodynamic therapy of cancer.

【题目】两种藻胆蛋白激光光敏对人肝癌细胞株SMMC-7721体外杀伤作用研究
【中文关键词】条斑紫菜, R-藻红蛋白, C-藻蓝蛋白, 光敏作用, 细胞凋亡, 肝癌细胞
【英文关键词】Porphyra yezoensis, R-phycoerythrin, C-phycocyanin, photodynamic therapy, cell apoptosis, liver cancer cell
【中文摘要】用3-(4, 5-二甲基噻唑-2)-2, 5-二苯基四氮唑溴盐(MTT)法测定提取自条斑紫菜的R-藻红蛋白(R-PE)和C-藻蓝蛋白(C-PC)经激光介导对人肝癌SMMC-7721 细胞的杀伤率, 并检测细胞凋亡率。结果显示在120 mg/L 浓度下, R-PE 在氩离子激光器100 J/cm2 辐照下对应的细胞存活率为27%, C-PC 在He-Ne 激光器35 J/cm2 辐照下对应的细胞存活率为47%; 单用2 种激光器辐照对应的细胞存活率分别为65%和70%; 单用2 种蛋白处理细胞在72 h 后出现对细胞生长的显著抑制, 最大抑制率分别为31%(R-PE, 120 mg/L)和27%(C-PC, 250 mg/L)。120 mg/L 的2 种藻胆蛋白在对应激光辐照下, 于照后8 h 达到细胞凋亡率最大值, 分别为31.54%(R-PE)和32.54%(C-PC)。本实验证明条斑紫菜R-PE 和C-PC 具有可开发成为光敏剂的应用前景。
【英文摘要】We studied the effect of photodynamic therapy with phycobiliproteins on human liver cancer cells in vitro. With 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay (MTT assay), we used two phycobiliproteins, R-phycoerythrin(R-PE) and C-phycocyanin (C-PC) prepared from Porphyra yezoensis, to determine the killing rates and apoptosis rates of humanliver cancer cells (SMMC-7721) mediated by laser. When the concentration of R-PE was 120 mg/L, the survival rate of human livercancer cells was 27% after treated by Argon laser with 100 J/cm2 doses, while the survival rate in the control group (without addingR-PE) was 65%. When the C-PC concentration was 120 mg/L, the survival cell rate was 47% after treated by He-Ne laser with35 J/cm2 dose, while the survival rate in the control group (without adding C-PC) was 70%. After handled only with these two kindsof phycobiliproteins for 72 h, the growth of cancer cells presented significant inhibition. The maximal inhibition rates reached up to31% with R-PE (120 mg/L concentration) and 27% with C-PC (250 mg/L concentration) respectively. After irradiated by laser for 8 h,the maximal cell apoptosis rates were 31.54% with R-PE and 32.54% with C-PC, respectively. It indicated that R-PE and C-PC extracted from Porphyra yezoensis could develop to new photosensitizers for cancer photodynamic therapy

【题目】缢蛏(Sinonovacula constricta)cDNA 文库的构建及肌动蛋白基因的研究
【中文关键词】缢蛏, cDNA 文库, 序列分析, 肌动蛋白基因
【英文关键词】Sinonovacula constricta; cDNA library; Sequence analysis; Actin gene
【中文摘要】采用SMART(switching metchanism at 5’end of RNA transcript)技术构建缢蛏cDNA基因文库。并对cDNA文库的滴度,重组率和插入片段的大小进行了检测。结果表明,该cDNA文库的滴度为5.50×104cfu/ml,重组率为92.5%,插入片段的长度大多在1kb以上。对478个克隆子进行了测序,共得到430个有效序列,其中166个序列无同源性,264条序列具有同源性。从中得到肌动蛋白(actin)cDNA的全长1538bp,开放阅读框(ORF)为1131bp,编码376个氨基酸,其预测蛋白的分子量为41.78kD,等电点为5.30。该氨基酸序列与其它物种的同源性大都在90%以上。
【英文摘要】SMART (switching mechanism at 5’-end of RNA transcript) technique to construct full-length cDNA library with Sinonovacula constricta was adopted and the library titre, recombinant rate, and the length of inserted cDNA were measured. The results indicate that this library’titre reached 5.50×104 cfu/ml; the percentage of recombination was as high as 92.5%. The PCR results show that the average size of inserts was larger than 1000bp. 478 clones were sequenced and 430 valid sequences were obtained, in which 264 cDNA sequences showed similarity to known genes. Actin was found by aligning it with those of the homologues in the NCBI database’s Blast program. Its full-length was 1538bp, including an open reading frame (ORF) encoding apolyeptide of 376 amino acids with predicted molecular weight of 41.78kD and theoretical isoelectric point of 5.30. The amino acids sequence aligned with other species was higher than 90%, meaning actin is a high conserved gene.

【题目】Comparison of crop model validation methods
【中文关键词】无
【英文关键词】crop models, validation methods, comparison
【中文摘要】无
【英文摘要】In this paper, the many indices used in validation of crop models, such as RMSE (root mean square errors), Sd (standard error of absolute difference), da (mean absolute difference), dap (ratio of da to the mean observation), r (correlation), and R2 (determination coefficient), are compared for the same rice architectural parameter model, and their advantages and disadvantages are analyzed. A new index for validation of crop models, dap between the observed and the simulated values, is proposed, with dap<5% as the suggested standard for precision of crop models. The different kinds of validation methods in crop models should be combined in the following aspects: (1) calculating da and dap; (2) calculating the RMSE or Sd; (3) calculating r and R2, at the same time, plotting 1:1 diagram.

【题目】Probiotic properties of lactic acid bacteria isolated from stool samples of longevous people in regions of Hotan, Xinjiang and Bama, Guangxi, China.
【中文关键词】Lacticacid bacteria; Longevous peoplestool; Probiotics; Antimicrobial activity
【英文关键词】Lacticacid bacteria; Longevous peoplestool; Probiotics; Antimicrobial activity
【中文摘要】A total of 567 lactic acid bacteria (LAB) strains were isolated from the stool samples of longevous people in regions of Hotan, Xinjiang and Bama, Guangxi, China. In order to reduce the number of strains for further examinations, 36 isolates were screened out for further examination whilst the other strains, which had lower probiotic properties, were not suitable for yogurt production due to the absence of growth in pH 3.5 MRS medium and no curding during fermentation, and so were excluded. The result of identification by API, sequence analysis of 16S rRNA and random amplified polymorphic DNA (RAPD) analysis showed that there were three strains of Lactobacillus acidophilus, 10 strains of Lactobacillus rhamnosus, three strains of Lactobacillus casein, three strains of Lactobacillus brevis, two strains of Enterococcus faecium, two strains of Enterococcus faecalis, four strains of Bifdibacterium infantis, three strains of Bifdibacterium brevise, three strains of Bifdibacterium bifidium, two strains of Bifdibacterium adolecentis and one strain of Bifdibacterium longam among the 36 isolates. These strains were evaluated by in vitro methods including survival upon exposure to pH 2.0, 3.0 and/or 0.3% oxgall and adhesion to the human colon adenocarcinoma cell line Caco-2 as well as antimicrobial activity against potential pathogens. The results presented here show that L. rhamnosus LV108, L. rhamnosus F, B. brevise R39 and B. infantis R42 are acid and bile tolerant, adhere to the cultured human intestinal Caco-2 cell line, antagonistic activity against potential pathogenic bacteria infection in vitro, and so are potential strains for probiotic use.
【英文摘要】A total of 567 lactic acid bacteria (LAB) strains were isolated from the stool samples of longevous people in regions of Hotan, Xinjiang and Bama, Guangxi, China. In order to reduce the number of strains for further examinations, 36 isolates were screened out for further examination whilst the other strains, which had lower probiotic properties, were not suitable for yogurt production due to the absence of growth in pH 3.5 MRS medium and no curding during fermentation, and so were excluded. The result of identification by API, sequence analysis of 16S rRNA and random amplified polymorphic DNA (RAPD) analysis showed that there were three strains of Lactobacillus acidophilus, 10 strains of Lactobacillus rhamnosus, three strains of Lactobacillus casein, three strains of Lactobacillus brevis, two strains of Enterococcus faecium, two strains of Enterococcus faecalis, four strains of Bifdibacterium infantis, three strains of Bifdibacterium brevise, three strains of Bifdibacterium bifidium, two strains of Bifdibacterium adolecentis and one strain of Bifdibacterium longam among the 36 isolates. These strains were evaluated by in vitro methods including survival upon exposure to pH 2.0, 3.0 and/or 0.3% oxgall and adhesion to the human colon adenocarcinoma cell line Caco-2 as well as antimicrobial activity against potential pathogens. The results presented here show that L. rhamnosus LV108, L. rhamnosus F, B. brevise R39 and B. infantis R42 are acid and bile tolerant, adhere to the cultured human intestinal Caco-2 cell line, antagonistic activity against potential pathogenic bacteria infection in vitro, and so are potential strains for probiotic use.

【题目】缢蛏微卫星序列分离及特性分析
【中文关键词】缢蛏; 微卫星; 磁珠富集; PCR
【英文关键词】Sinonovacula constricta; microsatellite; enrichment by magnetic beads; PCR
【中文摘要】分析了缢蛏(Sinonovacula constricta)基因组文库中微卫星序列的特性及微卫星引物的遗传特征。采用磁珠富集珐和PCR筛选法,以CA15为探针,快速分离含有微卫星序列的阳性克隆。结果表明,在筛选的210个白色菌落中,得到58个微卫星序列,阳性克隆率为27.6%,核心重复序列为两碱基和三碱基的微卫星居多,其中完美型占39.7%,非完美型39.7%,复合型占10.3%,非完美型与复合型共存的占10.3%。微卫星重复次数主要集中在20~40次之间,占66%,最高为63次。除探针中使用的CA重复单元外,还观察到
AG/TC,AT/TA,AAC/TTG,CAA/GTT,TGA,AAT,AGAA,GTTT/CAAA,AAAT/TTTA,TTTC,CCTA,TCTA,TCCC,TGCC,GTTTCT,CTGTT,CACACC,TATACA,TTTTG的重复序列。利用Primer Premier5.0设计引物24对,经过初步筛选得到适合的微卫星引物18对,为今后未知微卫星标记的开发,群体遗传结构的分析,优良品种的选育提供基础。 更多还原
【英文摘要】The microsatellite sequences and microsatellite primers were analyzed in razor clam(Sinonovacula constricta).The positive clones of microsatellites were isolated using the magnetic bead hybridization selection method and PCR selection method with the(CA)15 prone.A total of 210 white colonies were screened using a PCR-based technique,and there were 58 microsatellite repeat motifs by sequencing(27.6% of white colonies screened).Besides the motif of CA contained in the oligoprobe,we also found other 19 types of microsatellite repeats including
AG/TC,AT/TA,AAC/TTG,CAA/GTT,TGA,AAT,AGAA,GTTT/CAAA,AAAT/TTTA,TTTC,CCTA,TCTA,TCCC,TGCC,GTTTCT,CTGTT,CACACC,TATACA and TTTTG.According to Weber(1990),the microsatellite sequences obtained could be categorized structurally into perfect repeats(39.7%),imperfect repeats(39.7%),and compound repeats(20.6%).Among the microsatellite repeats,20~40 repeats arrays were most abundant,accounting for 66%.The largest length of microsatellites was 63 repeats.Finally,24 microsatellite primers were designed by software Premier Primer 5.0 and 18 pairs were applied for the population genetic studies.They may be applied for the population genetic diversity and developing genetic linkage maps.

【题目】Optimisation of hydrolysis conditions for the production of the angiotensin-I converting enzyme (ACE) inhibitory peptides from whey protein using response surface methodology
【中文关键词】ACE inhibitory peptide; Whey protein hydrolysate; Response surface methodology
【英文关键词】ACE inhibitory peptide; Whey protein hydrolysate; Response surface methodology
【中文摘要】In the present research, the effect of process conditions on the angiotensin-I converting enzyme (ACE) inhibitory activity of whey protein concentrate hydrolysed with crude proteinases preparation from L. helveticus LB13 was investigated systematically using response surface methodology. It was shown that ACE inhibitory activity of the whey hydrolysates could be controlled by regulation of three process conditions (hydrolysis temperature, pH and enzyme to substrate (E/S) ratio). Hydrolysis conditions for optimal ACE inhibition were defined using a response surface model. E/S ratio at 0.60, pH at 9.18 and temperature at 38.9 ° C were found to be the optimal conditions to obtain high ACE inhibitory activity close to 92.2% and DH of the whey protein

was 18.8%.

【题目】Purification and characterization of CEP from Lactococcus lactis ssp. lactis
【中文关键词】CEP; Purification and characterization; Whey protein hydrolysate; ACE-inhibitory activity
【英文关键词】CEP; Purification and characterization; Whey protein hydrolysate; ACE-inhibitory activity
【中文摘要】The cell-envelope proteinase (CEP) of Lactococcus lactis ssp. lactis LB12 was released from cells by treatment with lysozyme, purified by ammonium sulfate precipitation and chromatographed on DEAE-Sephadex A-25 and Sephacryl S-300 HR. The purified CEP is a monomer structure and has molecular mass of about 53 kDa. Optimal activity occurred at pH 7.5 and 40 ° C. It is a metallopeptidase, activated by Mn2+, Mg2+, Ca2+, inhibited by Co2+, Zn2+, Ni2+ and EDTA, and a serine proteinase which is inhibited by PMSF. The sequence of the first 13 amino acids of the N-terminal of the CEP was determined to be Asp-Val-Phe-Ala-Pro-His-Met-Ala-Asn-Val-Ala-Ala-Val, and the whey protein hydrolysate produced by the CEP displayed ACE-inhibitory activity.

【题目】福建缢蛏野生群体与养殖群体的ITS-1和ITS-2分析
【中文关键词】缢蛏; ITS-1; ITS-2; 遗传多样性
【英文关键词】Sinonovacula constricta; ITS-1; ITS-2; genetic diversity
【中文摘要】采用PCR技术对福建缢蛏的霞浦野生群体(WP)和漳湾养殖群体(CZ)进行了ITS-1和ITS-2的多态性分析。利用贝类通用引物扩增了ITS-1和ITS-2序列,PCR产物经纯化、测序、同源序列比对,获得长度分别为495 bp的ITS-1和485 bp的ITS-2核苷酸序列,其中分别包括25 bp和22 bp的插入缺失。ITS-1和ITS-2片段的T、C、A、G四种碱基的平均含量分别为13.6%、30.2%、28.3%、29.7%(ITS-1),16.2%、33.7%、19.5%、30.6%(ITS-2),A+T含量显著低于G+C含量。序列分析显示,野生群体和养殖群体的单倍型多样性指数、多态位点数、平均核苷酸差异数分别为1.0、40、10.54(ITS-1),0.96、27、11.91(ITS-2)和1.0、28、8.23(ITS-1),0.96、28、10.16(ITS-2),揭示出福建两个缢蛏群体的遗传多样性均较为丰富,其变异主要

源于碱基的插入和缺失,野生群体的多样性较高于养殖群体,但是遗传组成存在着较高的一致性,群体间没有遗传分化。
【英文摘要】ITS-1 and ITS-2 polymorphism were analyzed by PCR technique to Xia-pu wild populations(WP) and Zhang-wan cultured population(CZ) of Sinonovacula constricta in Fujian.The ribosomal internal transcribed spacer regions ITS-1 and ITS 2,were amplified by PCR using universe primers.Two nucleotide sequences were got with very suitable sizes of 495 bp and 485 bp for studies on genetic variation and phylogeny,including 25 bp and 22 bp indels respectively.The mean contents of T,C,A and G were 13.6%,30.2%,28.3% and 29.7% in ITS-1 and 16.2%,33.7%,19.5% and 30.6% in ITS-2.The content of G+C was significantly higher than A+T in the two fragments.The results showed that the haplotype diversity,number of segregating sites and average number of differences were 1.0,40,10.54(ITS-1);0.96,27,11.91(ITS-2)and 1.0,28,8.23(ITS-1);0.96,28,10.16(ITS-2) in the wild population and cultured population,respectively.The genetic diversity of these two populations of S.constricta were high in Fujian and the wild population was a little higher than the cultured population,but the genetic composition was similar between two populations.

【题目】Biomass-based rice (Oryza sativa L.) aboveground architectural parameter models
【中文关键词】无
【英文关键词】biomass, plant architectural parameter, model, rice (Oryza sativa L.)
【中文摘要】无
【英文摘要】To quantify the relationships between rice plant architecture parameters and the corresponding organ biomass, and to research on functional structural plant models of rice plant, this paper presented a biomass-based model of aboveground architectural parameters of rice (Oryza sativa L.) in the young seedling stage, designed to explain effects of cultivars and environmental conditions on rice aboveground morphogenesis at the individual leaf level. Various model variables, including biomass of blade and blade length, were parameterized for rice based on data derived from an outdoor experiment with rice cv. Liangyou 108, 86You 8, Nanjing 43, and Yangdao 6. The organ dimensions of rice aboveground were modelled taking corresponding organ biomass as an independent variable. Various variables in rice showed marked consistency in observation and simulation, suggesting possibilities for a general rice architectural model in the young seedling stage.Our descriptive model was suitable for our objective. However, they can set the stage for connection to physiological model via biomass and development of functional structural rice models (FSRM), and start with the localized production and partitioning of assimilates as affected by abiotic growth factors. The finding of biomass-based rice architectural parameter models also can be used in morphological models of blade, sheath, and tiller of the other stages in rice life.

【题目】Antioxidant activityof an exopolysaccharide purified from Lactococcus lactis subsp. lactis 12
【中文关键词】Lactococcus lactissubsp. lactis12; Exopolysaccharide; Isolation and purification; Antioxidation activities
【英文关键词】Lactococcus lactissubsp. lactis12; Exopolysaccharide; Isolation and purification; Antioxidation activities
【中文摘要】A novel exopolysaccharide (EPS) was obtained by ultra-filtration, ion exchange and sizing chromatography from a culture of Lactococcus lactissubsp. lactis12. The EPS was mainly composed of fructose and rhamnose with a mean molecular weight of 6.9 × 105 Da. The EPS and its antioxidant properties were evaluated in vitro and in vivo. The EPS displayed strong antioxidant effects, exhibited the ability to scavenge hydroxyl and superoxide anion radicals, and significantly decreased the level of malondialdehyde

(MDA), even while increasing the activity of catalase (CAT) and superoxide dismutase (SOD) in mice in a dose-dependent manner. The results suggest that the EPS has direct and potent antioxidant properties.

【题目】Bacillus macorous合成γ-CGT酶过程中阻遏效应与指数流加发酵

【中文关键词】γ-CGT酶; 直链麦芽低聚糖; 分解代谢阻遏; 最大比生长速率; 指数流加

【英文关键词】γ-CGTase, linear maltooligosacchaeides, catabolite repression, maximal specific growth rate, exponential feeding

【中文摘要】考察了不同搅拌转速、pH值和温度条件下,细胞生长、γ-CGT酶产量与培养液中直链麦芽低聚糖积累的关系.细胞的最大比生长速率为0.2h-1是γ-CGT酶产量从增长到下降的拐点.发酵液中直链麦芽低聚糖的存在能促进细胞生长并引起胞内的FDP,ATP和G6P含量增加,而对产酶显示出分解代谢阻遏效应.指数流加结果显示,通过限制细胞的比生长速率,可将阻遏作用控制在较低水平,酶产量得到了大幅度提高,是分批发酵酶产量的7.9倍,达到2565U/mL.

【英文摘要】The Influences of agitation speed,temperature and pH-controlling strategy on cell growth,linear maltooligosaccharides accumulation in broth and γ -CGTase yield were investigated in the batch culture of Bacillus macorous.When the maximal value of specific growth rate was higher than 0.2 h- 1,the γ -CGTase yield decreased.The linear maltooligosaccharides generated during fermentation can promote the cell growth and elevate the intracellular contents of FDP,ATP and G6P,which demonstrated a repression effect on the production of γ -CGTase.Hence,the exponential feeding mode of nutrients was carried out to control the catabolite repression by limiting the specific cell growth rate.The highest yield of γ -CGTase obtained in fed-batch was 2 565 U/mL,which was 7.9 times of that in batch fermentation

【题目】Function and safety assessment of Lactococus lactis subsp. lactis LB12 as potential probiotic strain

【中文关键词】Key words: Yogurt; Lactococus lactis subsp. lactis LB12; acid and bile tolerance; antimicrobial and antibiotic sensitivity; cholesterol-lowering effect

【英文关键词】Key words: Yogurt; Lactococus lactis subsp. lactis LB12; acid and bile tolerance; antimicrobial and antibiotic sensitivity; cholesterol-lowering effect

【中文摘要】The effect of yogurt fermented by Lactococus lactis subsp. lactis LB12 isolated from traditional Chinese pickled cabbage on serum cholesterol and triacylglycerol levels were investigated in mice. In the same, the characterizations of the strain, such as acid-tolerance, bile-tolerance, antimicrobial activity, antibiotic sensitivity and safety were also examined. The serum total cholesterol, triglyceride and bile acid levels significantly decreased of mice given a high-cholesterol diet supplemented with yogurt fermented by Lactococus lactis subsp. lactis LB12. Characterization of L. lactis subsp. lactis LB12 showed that it was bile- and acid-tolerant, resistant to five commercial antibiotics tested, and possessed antimicrobial activity to pathogenic Escherchia coli and Staphylococcus aureus. None of morphological changes was noted as a result of L. lactis subsp. lactis LB12 treatment, nor were there significant differences in the visceral weight indices of the lymph nodes, spleen, bacterial translocation, or aberration rate of sperm of mice compared to control. The results indicated that L. lactis subsp. lactis LB12 might be effective as a probiotic with cholesterol-lowering activities.

【题目】4个群体文蛤的RAPD分析

【中文关键词】RAPD;文蛤;遗传多态性;聚类分析
【英文关键词】Meretrix meretrix;RAPD;genetic diversity;cluster analysis
【中文摘要】用建立的高重复性RAPD优化体系,对文蛤Meretrixmeretrix4个不同地理群体(广西文蛤Gh、白壳文蛤Gb、山东文蛤S、江苏文蛤J)的个体进行RAPD分析,获得了较好的重复性条带。从20个随机引物中筛选出6个引物进行RAPD扩增,结果显示:Gb群体有11条特征带,Gh群体有2条,这些特征性RAPD扩增带可以作为这两个群体的RAPD分子标记;J群体和S群体没有明显特征带,可能预示这两个群体间遗传渐渗导致种质资源趋向同质化;Gh、S、J群体多态比例差别不大,为61.54%~62.86%,而Gb群体仅为33.33%。采用修正后的Shannon多态性指数方程进行遗传多态性分析,结果显示:Gh、S、J群体多态性指数分别为0.189、0.195、0.200、Gb群体仅为0.115。研究结果表明,文蛤不同群体的遗传地理分化明显,Gh、S、J群体遗传多样性水平较高,而Gb群体的遗传多样性较低,可能预示该群体分布范围较小、群体数量不大,应加强对其资源的保护。Gh与Gb群体为同一栖息地,除壳色和壳形态差异外,遗传多态性差距悬殊,已超出种内变异范围,二者是否为不同种或具生殖隔离的地理亚种,还待于深入研究。
【英文摘要】DNA samples of four populations(Gh,Gb,S,J)of clam Meretrix meretrix were analyzed using an optimized RAPD system with high reproducibility.Six primers were amplified bands from 20 primers.The results showed that Gb population had 11 specific bands,and the Gh 2 specific bands,which acted as molecular markers of distinguishing the different populations.The J and S populations had no specific bands.The Gb population had polymorphic locus proportion of 33.33%,and the others had the proportion from 61.54% to 62.86%.The Shannon ’s index of phenotypic diversity(H) of the Gb was 0.115,and the others from 0.189 to 0.200.The results showed that Gh,J,and S populations had high genetic diversity,surely belonging to Meretrix meretrix,but the Gb low,indicating that the Gb would be a small population,an independent species or subspecies.Whether Gb group belongs to Meretrix lusoria,Meretrix larmarckii,or even a new species of genus Meretrix needs further research.

【题目】The probiotic properties of Lactobacillus buchneri P2
【中文关键词】cholesterol removal; isolation; Lactobacillus buchneri P2; mechanism;probiotics
【英文关键词】cholesterol removal; isolation; Lactobacillus buchneri P2; mechanism;probiotics
【中文摘要】Abstract Aims: To isolate new lactobacilli strain with cholesterol‐lowering effect and analyse its probiotic properties and possible mechanisms of cholesterol removal.Methods and Results: The strain with cholesterol‐lowering effect was isolated from pickled juice. The acid and bile tolerance and antimicrobial activity were tested. The free cholalic acid, the cholesterol in supernatant fluid, washing buffer and cell extract, the cholesterol removed by growing, dead and resting cells were quantified. The isolated strain with high cholesterol‐reducing rate of 43·95% was identified as Lactobacillus buchneri (Lact. Buchneri) P2. It had acid and bile tolerance and antimicrobial activity. Moreover, it could remove cholesterol via coprecipitating with deconjugated bile salts, assimilating and adsorbing by cells. And the assimilation was considered to be the main reason of cholesterol removal. Conclusions: The isolated Lact. buchneri P2 showed probiotic properties of cholesterol reduction, acid and bile tolerance and antimicrobial activity and could remove cholesterol via different ways. Significance and Impact of the Study: A new strain of Lact. buchneri P2 with efficient cholesterol‐reducing ability was isolated to provide species diversity of lactobacilli for functional dairy products. And the possible mechanism of cholesterol removal by Lact. buchneri was discussed.

【中文摘要】采用聚丙烯酰胺垂直电泳技术(PAGE)对来自山东野生、江苏野生、浙江养殖、广西野生白色壳4个文蛤M eretrix m eretrix群体两种组织(消化腺、闭壳肌)的EST、MDH、ME、ADH、SOD、CAT等6种同工酶进行了分析。结果显示:文蛤不同组织之间、不同群体之间、养殖群体和野生群体之间的同工酶酶谱均有较明显的差别;广西白壳群体的多种同工酶酶谱与其它几个群体相比有较大差异,说明该种群与另外3个群体种质差异较大,亲缘关系较远。对山东野生、广西普通壳色和广西白色壳色3个群体的4种同工酶(EST、AMY、MDH、SOD)进行了研究,结果表明:广西普通壳色群体和山东群体的酶谱相似,而与广西白色壳群体差异明显,初步推测广西白色壳群体为文蛤属的其他种类;在文蛤各群体中均找到了特征性酶带,可以作为区别于文蛤不同群体的蛋白标记,用于文蛤种质资源的分析鉴定,并可为选育优良品种文蛤提供遗传依据。 更多还原
【英文摘要】Vertical polyacrylamide gel electrophoresis(PAGE)technique was used to analyze six isozymes(esterase EST,malate dehydrogenase MDH,malic enzyme ME,alchol dehydrogenase ADH,superoxide dismutase SOD,catalase CAT)in adductor muscles and digestive glands of clam Meretrix meretrix in four populations(three natural populations from Shandongm(S),Jiangshu(J) and Guangxi(G,Gb),and hatched population from Wenzhou(Z)).The basic electrophoretic patterns of the 6 isozymes revealed that Gb population showed a significantly different isozymes phenotypes at EST,SOD,ME and MDH from the other population.The EST and AMY isozymes bands of Z was found to decrease compared with S,indicating that human activities may affect the genetic variation within and between populations.No significant differences in the isozymes phenotypes in SOD,AMY,CAT,ME,and MDH was observed between populations of S and G,but EST demonstrated a significantly different at isozyme phenotypes between S and G,showing distinct specific of geographical population.

【题目】Scavenging and anti-fatigue activity of fermented defatted soybean peptides
【中文关键词】Soybean peptides; Fermentation; Radical scavenging; Anti-fatigue; Defatted soybean meal; Bacillus subtilis
【英文关键词】Soybean peptides; Fermentation; Radical scavenging; Anti-fatigue; Defatted soybean meal; Bacillus subtilis
【中文摘要】Many bioactive peptides possess specific biological properties that make these potential ingredients of health-promoting foods. Increasing attention is being focused on physiologically active peptides derived from soybean proteins. In this study, soybean peptides were produced by fermentation of defatted soybean meal with Bacillus subtilis SHZ and purified by ultrafiltration and gel chromatogram. Free radical scavenging property and the effect on anti-fatigue of the peptides were evaluated in vitro and in vivo, respectively. Swimming endurance tests of mice were carried out after 20 days of soybean peptides administration (0, 100, 200, 400 mg/kg BW/day for control, low-dose, middle-dose and high-dose group, respectively). And the blood lactate and hepatic glycogen of mice were determined. Results showed that the purified peptides exhibited significant ($P < 0.01$) scavenging potencies on superoxide

(62%) and hydroxyl (96%) at a concentration of 10 mg/ml. The average swimming time of the low-, middle- and high-dose group was increased by 20.91, 45.45 and 70% compared with that of control group, respectively. And administration with soybean peptides could significantly accelerate the clearance of blood lactate after mice swimming ($P < 0.01$). The hepatic glycogen storage of middle and high dose groups were obviously increased ($P < 0.05$). It suggested that the soybean peptides produced by fermentation could significantly alleviate physical fatigue of the mice.

【题目】大连群体两种壳型菲律宾蛤仔的双列杂交

【中文关键词】菲律宾蛤仔; 双列杂交; 壳型; 杂种优势
【英文关键词】Ruditapes philipp inarum; diallel cross; shell shape; heterosis

【中文摘要】为探讨不同壳型菲律宾蛤仔的杂种优势,于2007年6月开展了壳宽型(W)和壳扁型(P)两种壳型菲律宾蛤仔的双列杂交。实验由2个杂交组PW(P♀×W♂)、WP(W♀×P♂)和2个自交组WW(W♀×W♂)、PP(P♀×P♂)组成。结果表明,杂交子代壳宽与壳长的比值、放射肋数介于两个自交子代之间,表现为中间型。浮游期间,幼虫未表现出生长优势,但表现出一定的存活优势,幼虫大小存在显著的母本效应。PW和WP子代的存活优势分别为(3.43±0.54)和(4.21±0.55)。室内培育阶段,杂交子代稚贝表现出明显的生长、存活优势,但母本效应逐渐减弱,PW和WP子代的生长优势分别为(10.76±2.25)和(8.28±1.88),存活优势分别为(5.52±0.62)和(11.10±2.41)。养成期间,杂交子代的生长、存活优势更加明显,母本效应消失,PW和WP子代的生长优势分别为(16.22±0.23)和(14.80±1.50),体重的杂种优势分别为(50.29±1.13)和(35.27±2.43),存活优势分别为(12.30±1.37)和(17.45±0.75)。以上结果说明两种不同壳型蛤仔杂交可以产生杂交优势,随着个体发育杂交优势越来越明显。

【英文摘要】In order to investigate heterosis of two lines of Manila clam(Ruditapes philippinarum) with different shell shapes,the diallel cross of wide-shell(W) and plate-shell(P) was conducted in June,2007.The experiments consisted of two hybrid groups [PW(P♀×W♂),WP(W♀×P♂)]and two self-fertilized groups [WW(W♀×W♂),PP(P♀×P♂)].The results show that the shell width/shell length(W/L) and numbers of radiocostae of hybrid offspring are between those of offspring of two self-fertilized groups.At planktonic stage,instead of the larval growth heterosis,the larval survival heterosis and maternal effect of larval size are observed,the survival heterosis of offspring of PW and WP are(3.43±0.54) and(4.21±0.55),respectively.At nursing stage indoor,both growth and survival heterosis are found,and the maternal effects decrease,the growth heterosis of offspring of PW and WP are(10.76±2.25) and(8.28±1.88),the survival heterosis are(5.52±0.62) and(11.10±2.41).At grown out stage outdoor,the growth and survival heterosis of offspring is significant,the maternal effects disappeared.The growth heterosis of offspring of PW and WP are(16.22±0.23) and(14.80±1.50),and the weight heterosis are(50.29±1.13) and(35.27±2.43),respectively;the survival heterosis are(12.30±1.37) and(17.45±0.75).The above results indicate crossing of Manila clam with different shell shapes has heterosis which increase with development.The study will lay theoretic basis for utilization of heterosis of Manila clam with different shell shapes.

【题目】Mapping quantitative trait loci associated with chlorophyll a fluorescence parameters in soybean [Glycine max (L.) Merr.]
【中文关键词】无
【英文关键词】Chlorophyll a fluorescence parameters
JIP-test Photosynthesis Quantitative trait loci (QTLs)
Recombinant inbred line (RIL)
Soybean (Glycine max (L.) Merr.)
【中文摘要】无
【英文摘要】Chlorophyll a fluorescence parameters canprovide qualitative and quantitative information aboutphotosynthetic processes in chloroplasts. JIP-test andmodulated fluorescence (MF) parameters are commonlyused chlorophyll a fluorescence parameters. This study wasconducted to identify quantitative trait loci (QTLs) associatedwith JIP-test parameters, MF parameters, and photosyntheticrate (PN), and to examine the relationshipsamong them in soybean (Glycine max (L.) Merr.). Pot andfield experiments were performed to evaluate 184 recombinantinbred lines (RILs) for five JIP-test parameters(ABS/RC, TRo/ABS, ETo/TRo, REo/ETo, and PIABS), fourMF parameters (Fv/Fm, Fv0/Fm0, UPSII, and qP), and PN.Significant correlations were commonly observed amongJIP-test parameters, MF parameters, and PN. QTL mappinganalysis identified 13, 9, and 4 QTLs for JIP-test parameters,MF parameters, and PN, respectively, of which 13were stable. Four major genomic regions were detected:LG A2 (19.81 cM) for JIP-test parameters, LG C1 (94.31and 97.61 cM) for PN and MF parameters, LG M(100.51 cM) for JIP-test and MF parameters, and LG O(30.61 – 49.91 cM) for PN, JIP-test, and MF parameters.These results indicate that chlorophyll fluorescenceparameters, especially UPSII and qP, could play animportant role in regulating PN, and that JIP-test and MFparameters could be controlled by the same or differentgenes. The QTLs identified in this study will help in theunderstanding of the genetic basis of photosynthetic processesin plants. They will also contribute to the developmentof marker-assisted selection breeding programs forphotosynthetic capacity in soybean.

【题目】菲律宾蛤仔两道红与白斑马品系的三元杂交
【中文关键词】菲律宾蛤仔; 两道红; 白斑马; 三元杂交
【英文关键词】Ruditapes philippinrum; two-band red strains; white zebra strains; three way crosses
【中文摘要】为了提高菲律宾蛤仔壳色品系的生产性能,于2009年8月,以具有较快生长速度的两道红(R)F2和具有显著杂种优势的白斑马(WZ)F2为试验材料,开展了两个蛤仔品系的三元杂交。其中白斑马品系生长快,抗逆性强,是由生长最快的珍珠白(W)和抗逆性最强的斑马蛤(Z)杂交产生的二元品系。试验由RR(♀R×♂B)、RWZ(♀R×♂WZ)、WZR(♀WZ×♂R)、WZWZ(♀WZ×♂WZ)4个试验组组成。获得了三元正反交组合RWZ、WZR,比较了各试验组子代在不同阶段生长、存活的杂种优势并分析了壳色遗传机制。结果表明,正反交组的单亲杂种优势具有明显的不对称性,正交组RWZ的生长与存活性状得到了明显的改良;WZR的存活性状得到了一定程度上的改良。从生长上看,在浮游期,RWZ、WZR的单亲杂种优势分别为+1.70、-2.92;双亲生长优势为-0.68,主要受到卵源与配对策略交互作用的影响,其次为母本效应;在稚贝培育期,RWZ的单亲生长优势为+9.71,WZR单亲生长劣势为-6.57,总体上尚未表现出双亲生长优势,其大小仅为+0.90。从存活上看,RWZ、WZR在浮游期的单亲存活优势分别为+4.47、+3.05;双亲存活优势为+3.60,主要受到配对策略的影响,其次为母本效应;正反交组在稚贝阶段的单亲杂种优势分别为+13.09、+7.30;双亲存活优势为+9.00。R×R、R×WZ、WZ×R、WZ×WZ子代的壳色分别表现为两道红、两道红白斑马、两道红白斑马、白斑马;白斑马自交后代仍然为白斑马,未出现壳色分离,且三元正反交的子代壳色表现一致,说明壳色为非伴性遗传。
【英文摘要】In order to improve the phenotypic character of Manila clam Ruditapes philippinarum,three way crosses between Two-band Red (R:fast growth) and White Zebra strains (WZ:obvious heterosis) were conducted in August 2009.The generation F2 of White Zebra strain was from two way crosses between Pearl White and Zebra strains.The experiments consisted of two self-fertilized groups(RR,WZWZ) and two hybrid groups(RWZ,WZR) .Then the growth,survival,heterosis and shell color genetic mechanism were investigated in the study.The results showed that the single-parental heterosis was asymmetrical between two reciprocal crosses,and the growth and survival were clearly improved in RWZ group,whereas only survival heterosis was observed in another group.Considering growth,the value of mid-parental heterosis was-0.68,and that of single-parental heterosis was + 1.70 for RWZ,and-2.92 for WZR,respectively.It was mainly affected by the interaction between egg origin and mating strategy,next is maternal effect during planktonic stage.The value of mid-parental heterosis was only + 0.90,and that of single-parental heterosis was + 9.71 for RWZ,and-6.57 for WZR during juvenile stage.Considering survival,the value of mid-parental heterosis was + 3.60,and that of single-parental heterosis was + 4.47 for RWZ,and + 3.05 for WZR,respectively.It was mainly affected by the mating strategy,next that is maternal effect during planktonic stage.The value of mid-parental heterosis was + 9.00,and that of single-parental heterosis was + 13.09 for RWZ,and + 7.30 for WZR during juvenile stage.The shell color of generation for R × R,R × WZ,WZ × R,WZ × WZ were two band red,two band red with white zebra,two band red with white zebra and white zebra,respectively.The generation of white zebra was still white zebra on the outer shell color,that is,no shell color separated for two way hybrids.These results indicated that coloring was linked to sex and was not of sex-linked inheritance.

【题目】QTLs associated with soybean tolerance to low phosphorus stress based on flower and pod abscission
【中文关键词】无
【英文关键词】soybean — flower and pod abscission rate — lowphosphorus
tolerance — recombinant inbred line — quantitative
trait loci
【中文摘要】无
【英文摘要】Low phosphorus (P) stress limits soybean production. A population of152 recombinant inbred lines (RILs) derived from a cross between Bogao (P sensitive variety) and Nannong 94-156 (P tolerant variety)and 248 markers were used to map quantitative trait loci (QTLs) forlow-P tolerance. Two pot culture trials were conducted and low-Ptolerance evaluated using flower and pod abscission rate under low Pand normal P. Conditional QTLs and epistasis for tolerance to low Pwere also analysed. A conditional QTL (near Satt274) on linkagegroup D1b+W was identified which conferred low-P toleranceepistatic effects and coincided with previously discovered QTLs. Anadditive QTL, qFARLPG-07, for flower abscission rate under low Pwas detected with a LOD score of 7.79 and explained 32.3% ofphenotypic variation. It was detected at the same interval of thecorresponding QTL for other traits across years. This region coincidedwith two conditional QTLs (cqFARLPG-07 and cqPARLPG-07), fromthe P-tolerant parent Nannong 94-156 related to low-P tolerance.These results will provide a basis for further fine mapping and eventualcloning of the P-efficiency genes in soybean.

【题目】Overexpression of a soybean O-acetylserine (thiol) lyase-encoding gene GmOASTL4 in tobacco increases cysteine levels and enhances tolerance to cadmium stress
【中文关键词】无
【英文关键词】Cadmium Cysteine O-Acetylserine
(thiol) lyase Soybean Transgenic tobacco
【中文摘要】无
【英文摘要】O-Acetylserine (thiol) lyase (OASTL, EC2.5.1.47) catalyzes the final step in cysteine biosynthesis.The soybean GmOASTL4 gene was overexpressedin tobacco. Transgenic plants showedmarkedly increased accumulation of transcripts andhigher cysteine content compared with the wild-type.Upon exposure to cadmium stress, OASTL activityand cysteine levels increased significantly in transgenicplants. Cadmium accumulation and the activityof both superoxide dismutase and catalase enzymeswere enhanced in transformants. These results demonstratethat overexpression of GmOASTL4 in tobaccocan enhance cysteine levels and increase tolerance tocadmium stress.

【题目】北方广适型超级稻品种吉粳102高产栽培技术研究
【中文关键词】吉粳102;高产栽培;栽培因素
【英文关键词】Jijing 102; High yielding cultivation; Cultivation factors

【中文摘要】摘要:[目的]为吉粳102的大面积推广提供科学依据。[方法]采用五因素二次回归正交旋转组合设计,研究5个因子(施氮量、施磷量、施钾量、播种密度和每穴苗数)及每个因子的5个水平对吉粳102产量的影响。[结果]各因素对吉粳102的作用表现为:施氮量>施磷量>密度>每穴苗数>施钾量。5个栽培因素与产量均呈明显的抛物线关系。施氮量对产量的效应最为明显。施氮量与每穴苗数呈负的交互作用。模拟结果表明,吉粳102的最高产量10 896 kg/hm2。当吉粳102产量达到10 500 kg/hm2时,要求施氮量为132~167 kg/hm2,施磷量为87~113 kg/hm2,施钾量为51~98 kg/hm2,移栽密度为30 cm×(13.9~19.4) cm,每穴苗数为2~4棵。[结论]建立了吉粳102的高产栽培技术体系。
【英文摘要】Abstract:[Objective] The study aimed to provide the scientific basis for extension of Jijing102 in large scale. [Method]The five factors quadratic regression orthogonal rotational combination design was taken to study the effects of 5 factors (N rate, P rate, K rate, sowing density and seedling number per hole) and 5 levels of each factor on the yield of Jijing 102. [Result] The effects of each factor on Jijing 102 showed as N rate > P rate > sowing density >seedling number per hole> K rate.The relationship between5 cultivation factors and yield all showed a parabola type.The effect of N rate on yield was the most obvious. The N rate and seedling number per hole had a negative interaction.The simulated result showed that the highest yield of Jijing 102 was 10896 kg/hm2. If the yield of Jijing102 reached10 500 kg/hm2, the N rate of132-167 kg/hm2, Prate of87-113 kg/hm2, K rate of 51-98 kg/hm2, sowing density of 30 cm×(13.9-19.4) cm and seedling number per hole of 2-4 plants were required. [Conclusion]The technical system of high yielding cultivation for Jijing 102 was established.

【题目】Mapping of QTL associated with salt tolerance during seedling growth in soybean
【中文关键词】无
【英文关键词】simple sequence repeat (SSR), recombinant inbred line (RIL).
【中文摘要】无
【英文摘要】Salt stress is an important factor affecting the growth and development of soybean. The inheritance andexpression of traits associated with salt tolerance during the seedling stage are complex. The present study was conducted toidentify quantitative trait loci (QTLs) associated with salt tolerance during seedling growth in soybean. Field and greenhouseexperiments were conducted to evaluate 184 recombinant inbred lines (RILs) derived from a cross between Kefeng No. 1 andNannong1138-2 for salt tolerance andQTLsthat are associated with salt tolerance. The molecularmapof this RIL population,covering 2625.9 cM of the genome, converged into 24 linkage groups and consisted of 221 SSR markers and 1 diseaseresistantgene (Rsc-7). QTL mapping was conducted

using WinQTLCart. Eight putative QTLs significantly associated withsalt tolerance were identified. One QTL was identified both in field and greenhouse experiments. In the field, salt tolerancewas assessed (tolerance rating, TR) visually on a 0 (death) to 5 (unaffected by salt stress) scale. Three QTLs were detected ontwo linkage groups explaining 7.1 – 19.7% of the total phenotypic variance for salt tolerance. In the greenhouse, plantsurvival days (PSD) and percentage of plant survival (PPS) under salt stress were measured. Six QTLs were detected on sixlinkage groups, and explained 7.8 – 19.2% of total phenotypic variation for salt tolerance. A major QTL was identifiedbetween markers Sat_164 and Sat_358 on linkage groupGin both the field and greenhouse. ThisQTLqppsN.1 was identifiedin the same location as a salt tolerance QTL previously reported in soybean. The detection of new QTLs will provideimportant information for marker-assisted selection (MAS) and further genetic studies on salt tolerance in soybean.

【题目】Cytokine gene expression of peripheral blood lymphocytes stimulated by lipopolysaccharide
【中文关键词】Lipopolysaccharide; lymphocytes; TLRs; cytokines
【英文关键词】Lipopolysaccharide; lymphocytes; TLRs; cytokines
【中文摘要】Lipopolysaccharide (LPS) is a predominant glycolipid in the outer membranes of gam-negative bacteria that stimulates monocytes, macrophages, and neutrophils to produce cytokines. The aim was to study the expression profile of TLRs and cytokines and determine the role of LPS in the peripheral blood lymphocytes. Lymphocytes were isolated from the peripheral blood of chickens and induced with LPS, total RNA was extracted and reverse transcribed into cDNA. The mRNA expression level of TLRs and inflammatory cytokines were quantitatively determined by semi-quantitative RT-PCR. The result showed that lymphocytes were expressed mRNA of TLRs (TLR1/6/10, TLR3, TLR4, TLR5 and TLR7) and interleukins (IL-1, IL-8, IL-18 and TGF-4). LPS will significantly (P<0.05) induce the expression of TLR4, IL-1, IL-8 and IL-18, and non significantly (P>0.05) induce the mRNA expression of TLR1/6/10, TLR5 and TGF-4. LPS plays an important role in the innate immune response of lymphocytes to pathogen.

【题目】插秧密度对寒地粳稻的产量及产量构成因素的影响
【中文关键词】密度;寒地粳稻;产量;产量构成因素
【英文关键词】Density; Japonica rice in cold region; Yield component
【中文摘要】摘 要:以松粳6号和超级稻松粳9号两个寒地粳稻品种为试验材料,研究了不同插秧密度对寒地粳稻产量及产量构成因素的影响。结果表明,不同插秧密度对两品种千粒重影响相对较小,而对每穴穗数和每穗粒数的影响相对较大。

在黑龙江省第一积温带地区,松粳6号和超级稻松粳9号的最适插秧行株距为30cm×13.3cm和30cm×16.7cm。
【英文摘要】Abstract: “ Song jing 6 ” and super rice vatiety “ Song jing 9 ” from the cold zone were used in this experiment to study effects of different transplanting density on the yield and yield component of Japonica rice. The results showed that the effects of different transplanting density on their 1000-grain weight was relatively less than those on spike number per hill and kernel number per spike. In the area of the first accumulated temperature zone of Heilongjiang Province, the optimum transplanting density for Song jing 6 was30×13. 3cm, and that for super rice Song jing 9 was 30×16.7cm.

【题目】文蛤不同地理群体自繁和互交F1代的早期生长性状
【中文关键词】文蛤; 种群; 自繁; 生长; 杂种优势
【英文关键词】Meretrix meretrix; population; mating; growth; heterosis
【中文摘要】为了培育文蛤新品种,开展了不同地理群体文蛤(山东野生群体和江苏野生群体)的自繁和互交实验,获得了2个自繁群体和2个互交群体,运用方差分析对4个群体子一代的浮游幼虫和稚贝(1~12月龄)的主要性状进行了比较。结果表明,各实验组的受精率、受精卵的孵化率、胚胎发育和浮游幼虫生长无明显差异;2个月龄内稚贝各实验组生长发育差异不明显;3-12月龄稚贝生长性状主要表现为S♀×J♂>S♀×S♂>J♀×S♂>J♀×J♂,其中前3个组合之间差异不显著,但均与第四组合差异显著;互交组的杂种优势率范围在6%~168%。杂种优势在不同性状表现不同,活体重的杂种优势高于壳长、壳高和壳厚;同时各性状指标受季节性温度变化影响较大,5-10月份是高速生长期,而12月份以后处于低生长状态。获得的4个群体将作为进一步选育的基础群体,子一代的变异性增加为进一步选育奠定了基础。
【英文摘要】Matings and crosses within and among two different geographic stocks from Shandong and Jiangsu populations in Meretrix meretrix were produced in order to breed new strains for farming. Two populations,designated S♀×S♂ and J♀×J♂,were from matings of wild populations of Shangdong and Jiangsu. Two populations,that was S♀×J♂ and J♀×S♂,were from crosses between Shangdong and Jiangsu respectively. The traits of fertilizing rate,hatching rate,growth of D-larvae and growth of juveniles (1-12 months age) were analyzed by ANOVA. The results showed that the fertilizing rate and hatching rate of matings and crosses were not significantly different at the end of second month. There were great changes of growth of juveniles in early-term (3-12 months). Growth of S♀×J♂,S♀×S♂ and J♀×S♂ had no significant difference from each other,but all had significant difference with J♀×J♂ at the early-term (3-12 months). The results indicated that there was different extent heterosis (6%-68%) for growth in F1 crosses. The uptrend among traits was wet weight being greater than other three traits of shell length,shell width and shell height respectively. There were obviously higher growth rate and lower variation coefficicent in S♀×J♂,which indicated the Shandong population would be a good parental stock as maternal for genetic breeding. Water temperature could affect growth of Meretrix meretrix significantly,and the growth rate reached a peak in October and November,but reached a nadir after December. Four populations gained were considered as the basic populations to breed new strains. Increased variation parameters in first filial generation(F1) of cross could be a very good potential for selection of new strains.

【题目】Hypoglycaemic effect of comatin, an antidiabetic substance separated from Coprinus comatus broth, on alloxan-induced-diabetic rats

【中文关键词】Coprinuscomatus; 4,5-Dihydroxy-2-methoxy-benzaldehyde; Non-enzymatic glycosylation; Hypoglycaemic; Alloxan
【英文关键词】Coprinuscomatus; 4,5-Dihydroxy-2-methoxy-benzaldehyde; Non-enzymatic glycosylation; Hypoglycaemic; Alloxan
【中文摘要】Comatin, an inhibitor of the non-enzymatic glycosylation (NEG) reaction, was isolated from Coprinuscomatus fermentation broth by macroporous resin separation, followed by chromatographic purification using a C18 reversed-phase column. The compound was identified as 4,5-dihydroxy-2-methoxy-benzaldehyde by high-resolution MS, IR, NMR and UV analyses. The hypoglycaemiceffect of comatin, on both normal and alloxan-induced-diabeticrats, was investigated in the paper. The blood glucose concentration of normal rats treated by the comatin at 80 mg/kg body weight was reduced from 5.14 mM to 4.28 mM in 3 h. Also, the concentrations of fructosamine, triglycerides and total cholesterol in induced-diabeticrats were significantly decreased. These results indicated that comatin could maintain a low level of blood glucose and improve glucose tolerance.

【题目】超级稻品种光合特性研究
【中文关键词】超级稻;净光合速率;蒸腾速率;气孔导度;胞间CO2浓度
【英文关键词】Super rice variety; Net photosynthesis rate; Transpiration rate; Stomatal conductance; Intercellular CO2 concentration
【中文摘要】摘要:[目的]为超级稻品种的推广与应用提供科学依据。[方法]以5个超级稻品种为试材,观察它们的净光合效率、蒸腾速率、气孔导度、胞间CO2浓度的日变化,研究超级稻品种的光合特性。[结果]各参试水稻品种的净光合速率由大到小依次为:吉粳88>农大19>吉粳83>九稻48>吉粳102;各品种蒸腾速率早晨高晚间低,日变幅较小,日均值最高的是吉粳88。吉粳88的气孔导度早晨高,之后下降,15:00时明显升高后又下降,且日均值最高。各水稻品种的胞间CO2浓度均表现为早晨较高,之后下降,下午略有上升,之后呈下降趋势,日均值最低的是吉粳88。[结论]超级稻吉粳88的各项光合生理指标均有利于光合速率的提高,优于其他参试水稻品种。
【英文摘要】Abstract:[Objective] The study aimed to provide the scientific base for popularization and application of super rice varieties. [Method] With 5 super rice varieties as tested materials, their daily change of net photosynthesis rate, transpiration rate, stomatal conductance and intercellular CO2 concn. Were observed to study the photosynthesis characteristic of super rice variety. [Result]The net photosynthesis rate intested rice varieties in order was Jigen88> Nong da 19> Jigen83>Jiudao48> Jigen102.The transpiration rate in each variety was high in the morning and lower in night and their daily variation amplitude was smaller, with the dailymeanvalueofJigen88 being highest. The stomatal conductanceofJigen88washighest in the morning and then was decreased, and was also risen obviously and then reduced at15:00, with highest daily mean value. The intercellular CO2 concn. in each variety was higher in the morning and then was decreased slightly, and was also risen in the afternoon and then was reduced, with the highest daily mean value being for Ji gen 88.[Conclusion] The various photosynthetic physiological indexes of super rice Jigen88 was in favor for increasing the photosynthetic rate, so it excelled to other tested rice varieties.

【题目】东北寒地早粳稻品质相关及主成分分析
【中文关键词】寒地;早粳稻;稻米品质;相关分析;主成分分析
【英文关键词】cold region; early japonica rice; quality of mid rice; correlation analysis; principal components analysis
【中文摘要】摘 要:对163份寒地早粳稻品种(系)的主要品质指标进行了分析,并采用相关分析和主成分分析方法研究了品质性状间的关系。结果表明,来自吉林和黑龙江早粳稻品种(系)163个中:有67.5%的品种的整精米率和58.3%品种的直连淀粉含量能够达到国标一级标准;但垩白粒率和垩白度高,分别仅有6.1%和1.2%的品种达到了国家一级优质米标准,达标率低。在选出的4个影响稻米品质的主因子中,粒形因子、碾磨因子和外观因子对稻米品质的累积贡献率为65.7%,为主要因子。由于稻米品质性状间的相关性和主因子的贡献率不同,寒地水稻品质育种应首先注意粒形和碾米品质的选择,以提高品质育种效率。
【英文摘要】Abstract:One hundred and sixty three early japonica rice varieties (or lines) from Heilongjiang August First Land Reclamation University were analyzed by correlation and principal components analyses. The results showed that the variety with 67.5% head milled ratio and amylase content conformed to primary national standard, but the chalky rice rate and chalky degree were high. Based on the high quality rough rice qualitative index of China (GB/T17891-1999),6.1% and 1.2% of the varieties were of First class standard in grain quality score. Compared with other quality traits, chalking should be one of the most important breeding aims. Four principal component factors affecting grain quality were selected. The cumulative contribution rate of grain shape, milling and appearance quality to grain quality was 65.7%. It was suggested that grain shape and milling quality should be particularly considered in rice grain quality breeding.

【题目】菲律宾蛤仔家系的建立及早期生长发育

【中文关键词】菲律宾蛤仔; 家系; 生长; 发育
【英文关键词】Ruditapes philippinarum; family; growth; development
【中文摘要】采用不平衡巢式设计建立33个菲律宾蛤仔家系(11个父系半同胞家系和33个全同胞家系),并对各家系蛤仔的卵径、受精率、孵化率及生长、存活和变态的相关指标进行了分析。结果表明:各家系蛤仔的卵径、受精率无显著差异(P>0.05,n=90),但孵化率有明显差异(P<0.05,n=90)。在不同时期各家系蛤仔的生长情况不同。幼虫期间,9日龄C2生长最快比生长最慢的F2平均壳长大28.24%,且差异显著(P<0.05,n=90)。D3绝对生长最大比平均值高37.24%。稚贝期间,40日龄I1生长最快比生长最慢的B3平均壳长大78.29%,且差异显著(P<0.05,n=90)。I1绝对生长也最大比平均值高87.61%,其中400~500μm个体占30%,500μm以上个体占53.33%,家系内个体趋于大型化,而B1、B3家系内个体生长性状出现衰退现象,趋于小型化,300μm以下个体分别占整个家系的83.33%、90%。在相同时期各家系蛤仔的存活率不同。幼虫期间,9日龄I2存活率最高比平均存活率高94.14%,E3存活率最低比平均存活率低72.65%。稚贝期间,40日龄时各家系稚贝的存活率较高,都在85%以上。变态期间,同胞家系出现变态延迟及变态规格小型化现象。附着变态时间从第15天延迟至22天,变态平均规格为(193.18±12.15)μm,K1变态最小规格为(183.00±14.42)μm,以K为父本的3个家系变态规格普遍偏小,表现出父本效应。各家系变态率不同,存在明显差异,E3家系变态率最高为(94.33%±0.58%),B2家系变态率最低为(7.33%±2.08%)。综合33个同胞家系的各项指标,I1早期生长抗逆性状最优,可进一步作为优良品种选育的育种材料。
【英文摘要】A total of 11 half-sib families and 33 full-sib families were generated by using the method of unbanlanced nest design,in Sept. 2007. Phenotypic traits of different families,such as egg sizes,fertilization rates,embryonic hatching rates,larval and juvenile growth,survival and metamorphosis were analyzed. The results showed that the differences in egg sizes and fertilization rates among the full-sib families were not significant,but those in embryonic hatching rates were significant(P>0.05,n=90). The growth of each family was not the same at different stages.The fastest growth family named C2 was significantly larger than the slowest growth family named F2 by 28.24% in average shell length (P<0.05,n=90)at 9 days of larval stage. D3 whose Absolute growth was the largest of all families was bigger than the average Absolute growth by 37.24%.The fastest growth family I1 at 40 days of nursing stage was significantly larger than the slowest growth family B3 by 78.29% in average shell length(P<0.05,n=90). Moreover,I1 was the largest of all families in Absolute growth,and it was bigger than the average Absolute growth by 87.61%,the distributions of shell length between 400-500 μm and above 500 μm accounted for 30% and 53.33% of total shell length among I1 ,respectively. However,the growth trait depression families B1 and B3 involved in miniaturization,the distributions of shell length below 300 μm accounted for 83.33% and 90% of total shell length of B1 and B3 ,respectively. The survival of each family was different at the same stage. The highest suevival family I2 was significantly larger than the average survival by 94.14%,and the lowest growth suevival family F2 was obviously smaller than the average survival by 72.65% at 9 days of larval stage. The survivals of all families at 40 days of nursing stage were higher than 85%. The study of full-sib families at metamorphosis stage presented some phenomena,such as metamorphism time delay and metamorphism individual miniaturization. The metamorphosis time was delayed from 15 to 22 days. The average metamorphic size was (193.18±12.15) μm. The smallest metamorphic size family was K1 with(183.00±14.42) μm of shell length,and the metamorphic sizes of three families which were generated through each female mated with the same male named K were generally smaller than other families,and this was mainly due to paternal effect.The metamorphosis rates were significantly different among the full-sib families.The highest metamorphic rate family was E3 with the rate of (94.33%±0.58%),and the lowest metamorphic rate family was B2 with the rate of (7.33%±2.08%). These results suggest that I1 is a family with the best early growth and development traits,and it could be used to produce high-quality seed which presents short culture cycle,and higher production in artificial selection breeding.

【题目】寒地超级稻龙稻5号株型结构研究
【中文关键词】黑龙江省;超级稻;株型
【英文关键词】Hei long jiang; super rice; plant type
【中文摘要】摘要:通过对黑龙江省超级早粳稻品种龙稻5号的株型研究发现,寒地超级稻龙稻5号根系发达,在根干重、根直径、根表面积和根体积等方面都比对照品种具有较大优势;茎秆粗壮,分蘖力强和抗倒伏性强;叶片肥厚,无论长宽都远高于对照品种,且叶片上举基角明显小于对照品种;从穗部性状来看龙稻5号属于直立大穗型品种,一次枝梗的产量贡献率较大。研究认为寒地超级稻品种龙稻5号具有理想株型模式的特点,并且在品质、抗性等方面都有较大的优势,是适合于黑龙江省寒地稻作区生态特点的优质超级早粳稻品种。
【英文摘要】Abstract: The experiment was conducted with Longdao No.5,the super rice in Heilongjiang province.The results showed that :Longdao No.5 had well developed root system and greater advantage at dry root weight,root diameter,root surface and root volume than the check variety.It had stocky stem,high tillering ability and strong lodging resistance.The leaves were hypertrophy and had a grate longer and wider than the check variety,and its basal angle was narrower than the check variety. Longdao No.5 belonged to the big erect panicle type variety, and the first panicle branches made a higher contribution for yield. It was said that Long dao No.5 had the characteristics of ideal plant type and great advantage at quality and resistance. It was a good quality japonica rice variety in Heilongjiang province.

【题目】不同壳色菲律宾蛤仔品系F_2的表型性状
【中文关键词】菲律宾蛤仔; 壳色; 品系; 表型性状;
【英文关键词】Ruditapes philippinarum; shell color; stains; phenotypic traits;
【中文摘要】于2007年9月,对选育的菲律宾蛤仔不同壳色品系(C:对照组;Tr:两道红品系;Tw:两道白品系;Ab:玛瑙黑品系;Or:海洋红品系;Pw:珍珠白品系;Z:斑马蛤品系;W:波纹蛤品系)F1和F2的表型性状进行了研究。结果表明,1龄F1的壳长以Pw最大,与Tr差异不显著(P>0.05),明显大于对照组及其它品系,Z壳长最小且与其它品系差异显著(P<0.05),C的壳长明显小于Tw、Ab(P<0.05),但与Or、W差异不显著(P>0.05);F1鲜重也以Pw最大,Z最小,且与其它品系差异显著P<0.05),Tr、Tw、Ab和Or鲜重差异不显著(P>0.05),但明显大于C(P<0.05);F1产卵量Pw、Tr明显高于其它品系,Z、C明显小于其它品系(P>0.05),Tw、Ab、Or和W彼此差异不显著(P>0.05);F2的表型性状,C的孵化率低于其它品系(P<0.05),但与Tw无显著差异(P>0.05),各壳色品系间卵径、受精率和D形幼虫大小差异不显著(P>0.05)。浮游期结束时(9日龄),W与Z幼虫壳长明显大于其它品系(P<0.05),Tw、Ab、Or、Pw、Z彼此间差异不显著(P>0.05);幼虫存活率大小顺序为,Ab、Z>Or、W>Tw、Pw>Tr>C,彼此差异显著(P<0.05)。变态时间和变态规格各品系间无显著差异(P>0.05),变态率大小的顺序为Ab>Z>Tw>Or>Pw>W>Tr>C,彼此差异显著(P<0.05)。室内培育阶段结束时(240日龄),Ab壳长最大,但与Or、Tr差异不显著,Z壳长最小,但与C、W差异不显著(P>0.05),C与Pw、W,Tr、Tw、Or之间,以及Tw与Pw差异也不显著;Z的存活率最高,明显高于除Ab外的其它品系,C的存活率最低,明显低于除Tr、Tw外的其它品系,W>Or>Pw,彼此差异显著(P<0.05)。360日龄时,Pw壳长和鲜重最大,显著大于其它壳色品系(P<0.05),Ab和Z壳长和鲜重显著小于其它壳色品系(P<0.05);Ab和Z的存活率高于其它品系(P<0.05),但与Or、Pw差异不显著(P>0.05),Or存活率高于C(P<0.05),其它各品系存活率无显著差异(P>0.05)。从相对产量上看
,Z(678.63%±56.80%)>Ab(554.88%±69.42%)>Or(527.23%±76.21%)>W(475.97%±90.25%)>Pw(405.90%±55.19%)>Tw(224.89%±47.85%)>Tr(178.50%±34.50%)>C(100.00%±22.10%)。
【英文摘要】The study on phenotypic traits of different shell color strains F1 and F2(C:the control strains;Tr;two-band red strain;Tw:two-band white strain;Ab:agate-black strain;Or:ocean-red strain;Pw:pearl-white strain;Z:zebra strain;W:wave strain.) of Manila clam was conducted in September 2007.The results showed that the shell length of Pw F1 was the greatet,and significantly greater than others except Tr(P<0.05),the shell length of Z was the smallest,and significantly smaller than others(P<0.05),there were no obvious differences in shell length among C,Or,W,between Tr and Tw,among Tw,Ab,Or,among Ab,Or,W(P<0.05).Both fresh weight and

fecundity of Pw F1 were the greatet,that of Tr were the second greatet and significantly greater than others(P<0.05),those of Z were the smallest,and significantly smaller than others(P<0.05),there were no remarkable differences between C and W,among Tw,Ab,Or in fresh weight and between C and Z,among Tr,Ab,Or,W in fecundity(P<0.05).No significant differences in egg-diameter,the fertilized rates and size of D larvae were observed among all strains(P<0.05),the hatching rate of C was significantly lower than those of other strains except Tw(P<0.05).By end of pelagic period(9 d),the shell lengths of W and Z were significantly greater than those of other strains(P<0.05),there were no remarkable differences in shell length among Tw,Ab,Or,Pw,Z,W(P>0.05) ;the sequences of survival rates were following:Ab,Z>Or,W>Tw,Pw>Tr>C,there were significant differences among them(P<0.05).No remarkable difference in both metamorphic time and metamorphic size among all strains was observed(P>0.05).There were such a sequence in metamorphic rates as follows:Ab>Z>Tw>Or>Pw>W>Tr>C,there were significant differences among them(P<0.05).By the end of indoor rearing period(240 d),the shell length of Ab were significantly greater than those of other strains except Or,Tr(P<0.05),the shell length of Z were significantly smaller than those of other strains except C,W(P<0.05),there were no remarkable differences in shell length between C and Pw,W,Tr,Tw,Or,and between Tw and Pw;the survival rate of Z was remarkably higher than those of other strains except Ab(P<0.05),the survival rate of C was remarkably lower than those of other strains except Tr,Tw(P<0.05).On day 360,both shell length and fresh weight were the greatet and remarkably greater than those of other strains(P<0.05),the shell length of Ab and Z were significantly smaller than those of other strains(P<0.05),the survival rate of Ab and Z were significantly higher than those of other strains except Or,Pw(P<0.05),the survival rate of Or was significantly higher than that of C(P<0.05),there was no remarkable difference in survival rate among other strains(P<0.05).The order of relative yields was as follows:Z(678.63%±56.80%)>Ab(554.88%±69.42%)>Or(527.23%±76.21%)>W(475.97%±90.25%)>Pw(405.90%±55.19%)>Tw(224.89%±47.85%)>Tr(178.50%±34.50%)>C(100.00%±22.10%).

【题目】寒地水稻“稳健高产”栽培技术
【中文关键词】寒地水稻;稳定;健壮;高产;栽培技术
【英文关键词】None
【中文摘要】寒地稻区无霜期短、热量资源不足、低温冷害及稻瘟病发生频繁。目前,水稻大面积生产中农民施肥多采用“超量施N肥”、“大头肥”,导致水稻前期长势过旺,植株纤嫩,抗性减弱,后期早衰,成熟度下降,且易发生倒伏、感病而减产,达不到高产目的。寒地水稻“稳健高产”栽培技术主要以提高稻谷成熟度为目的,通过协调当地气候条件、土壤肥力、栽培技术三者之间的平衡关系,依据该生态区优质高产水稻的生长规律、影响因子及调控措施等共性技术,稳定产量构成因子、健壮植株群体素质,以达到高温年创高产甚至超高产、低温年稳产甚至创高产的优质高产目标,为实现寒地水稻创超高产生产提供技术保障。

【题目】Fermentation parameter and partial biochemical characterisation of milk clotting enzyme from Chinese distiller’s yeast
【中文关键词】无

【英文关键词】milk clotting enzyme, fermentation conditions, biochemical characterisation
【中文摘要】无
【英文摘要】A strain F34 producing milk clotting enzyme with high yield was obtained from Chinese distiller ’ s yeast, using casein plate prescreening and fermentation reselection. The optimum fermentation medium for milk clotting enzyme production was as follows: 5.0% rice flour and bran digest, 5.0% bean flour digest, 0.5% CaCl2, 0.5% KCl, initial pH 4.5. The optimal fermentation parameters was at 34 ° C for 60 h. The enzyme action was optimal at 50 ° C and at about pH 5.5. In the absence of substrate the enzyme showed good stability at 40 ° C and pH 3.5. Ca2+, Zn2+, Fe3+ and Fe2+ showed stimulation on the milk clotting activity; K+ and Mg2+ showed weak stimulation; Na+, Cu2+, Co2+ and Li2+ showed inhibition. The results indicate that this milk clotting enzyme may partially substitute calf rennet in the cheese manufacture.

【题目】寒地水稻产量性状相关及聚类分析
【中文关键词】超高产育种;相关分析;主成分分析;聚类分析
【英文关键词】Super high yield breeding; Correlation analysis; Principal component analysis; Cluster analysis
【中文摘要】摘要:[目的]探究影响水稻超高产育种的相关性状。[方法]应用表型主成分分析法,对黑龙江省20个水稻品种9个产量相关性状进行了相关和聚类分析。[结果]水稻产量相关性状间存在着错综复杂的相关关系。在6个影响水稻产量的主因子中,功能叶因子和产量因子对水稻产量的累积贡献率为96.56%;20个水稻品种被归为3类,显示出遗传距离较近、遗传基础狭窄的特点。[结论]水稻超高产育种中应注意剑叶叶面积和结实率、千粒重的选择。
【英文摘要】Abstract:[Objective] The research aimed to study correlated traits in rice super high yield breeding. [Method] Nine yield properties of20 varieties from Heilongjiang provincial rice regional trial were analyzed with the method of correlation and cluster analysis. [Result] There was a complex relationship among yield properties. Six principal component factors affecting yield were selected. The cumulative contribution rate of factor of function leaf and factorofyieldwas96.56%. Twenty varieties could be classified into three groups according to genetic distance, showing near genetic distance and narrow genetic basis. [Conclusion] Leaf area of the flag leaf rate of seed and 1 000 grains weight should be particularly considered in rice super high yield breeding.
